## C 1 C

CICERO (Mrarcus Tullius), the celtbated Roman orator, was burn in the ycar of Rome $C_{1}+7$, about Ry years be fore Chrit. His ithor Mareus Tullias, who was tif the equatian order, wok great care of his eriu cation, which was directed particulatly with a now to the bar. Yond Thelly, at his firtapparance in public, dechamed with fech whemence aganll Sylla's party, that it becane expedient for him to retire into Gretce; whot he head the Athemian orators and phillofopers, and greatly impreyed b the in doquence and knowledge. Hus he met with T. Pomponius, whe had been lin theolfollow; and who, fom his heve to Atheris, and fending o ereat part of his days in it, obtaned the funame of athicer; and liere they revied ard contured that roted friemhip whinholifted be
 and affection. From ithens lee palfed intos Afias and after an excurfion of two years came bach again into Italy.

Cicero was now anived at Rome; and, afier one year more fput at the bar, obtained, in the next place, the dignity of quare tor. Among tive caufe which he pleaded before his queformip, was that of the famens comedian Rofcins, whom a lingular mert in his ait had recommended to the fumiliarity aud fiendtaip of the great in men in Rome. The quathors were the general rectivers or treafuress of the reputio, and were fent amually inte the provinces diflituted to them, as they ahways were, by lot. The ifland of Sicily happened to fail to Cicero's hare; and that Fart of it, for it was confuerable tnoush to be fir vided into two provinces, which was cuhed Lihhorm. Thio nfice be received, not as a gift, but a truft; and he acçuited himbelf fo well in it, that he gained the love and admitation of all the sicilians. Before he left S'ely, be made the tor of the ifland to fee every thing that was curious, and efpecially the city of Sysacule : where he diforered the tomb of Archimedes to the magifretes who were fhowing him the cuidg. tits of the phice, but who, to hisfurprife, knew nothing of any fuchionb.

We bave no account of the precife time of Cicero's marriage with Terenti? out it is fuprofed to have been cutcorated iminuluately afier his retarn foom his travels to lialy, when he was about 30 years old. He was now difengaged foom his quettorthip in Sicity, by which fint hep, in the legel gradation and akiont of public ho nours, he gained an immediace rigat to the ienate, and an actual admiftion inso it daring life; and fettled again in Ror:e, where be employed himfelf confantly in defuding the perfons auc properties

## C I C

of its chizens, and was indeed a gencral patron. Five rieres. years were almoll chapled fince Cicero's clection to the quetlouthip, whith was the propel ieterval preferibed hy law before he could hold the next offise of edile; to which he was now, in his 37th yar, elected by the uamimous fufrages of ail the tribcs, and preferably to all his competiturs. After Ciccro's daction to the athethia, !ut before his entrance moon the office, he undertiok the faned profuatinon of C. Verres, the late ywe.m of Sicily; who was charged with many Dagrant atto of ingntlice, rapine, and cru:ty, duriug his triennial govenment of that ifland. This was one of the muln momorable trandactions of his lif: ; for which lee was granily and jully celebrated by antiquity, and for which. be wall, in all aysen, to admired and heemed by the frience of inankind. The refult was, that, by his dilimence and addrefs, he fo coafonacal Hortenfur, though the reigning onator at the bar, and ufually thyled the ling of the form, that he had nothing to fay for his client. Verres, defpairing of all defence, fubmited immidiately, without expecting the fentence, to a valuntary exile; where he lind many years, forgoten and deforted by all hisfriends. He is faid to have been recieved in this mifuable fituation by the genervity of Cicern; yet was pruferibed and mardered after ill by Mrik Antony, for the fake of thofe fine Itatues and Curmaian rethls of ahich he lad plandered the Sicilians.

After thic ufual interval of two years from the time of his being chotun adile, Cicero offered himielf a candutate for the preturhip; and, in three different affenblis comened for the choice of pretors, two of which were diffulved withont effect, he was Ėeclared every time the fift protor by the fuffrages of all the cen:turies. Inc was now in the carcer of his furtunes: and in fighe, as it were, of the confulthip, the grand whect of his ambition: and thentre, when his pretorhip was at an end, he wonld at accept any foreign province, the uhal rewand of that maxitracy, and the chict fuit whith the gencrality propofal fom it Ho had no particular lose for money, nor genius for arms; fo that thufe governanents lad no charms for him: the glory which he purfucd was to thine in the eyes of the city as the guardian of its laws; and to reach the magintrates huw to executi, the citizens how to obey, them.

Bing now in his 43 d year, the praper nge required hy lawe he dechared timelf a canvidate for the comfulthip along with tix compesit re, L. Sculpitius Gedba, L Sergius Conilina, C. Ant mius, I. Ci Thus L.nngimus, (1, Comificius, and C. Licinius Sacudus. The
two fird were patricians; the two next pleceians, yet noble; the two lat the fons of fathers whollad firtt imported the public honours into their familics: Cicuro was the only tece man, as he was called, among them, or one of equeftrian rank. Thefe were the competitors; and in this competition the practice of lrihing was carried on as openly and as hamefully by Antomius and Catiline as it ufually is at our clections in Dritain. However, as the els ¿ion approachad, Cicero's intertll appeared to be fuperior to that of all the candidates: for the nobles themfelves, though always envions and decirons to deprefs hin, yet cat of regard to the dangers which theatened the city from many quarters, and feemed teady to burf out into a flame, began to think him the only man qualified to preferve the rcpublic, and break the cabals of the defperate by the vigour and prodence of his adminiftration. The nethod of choofing confuls was not by an open vote; but by a kind of ballot, or little tickets of wood diflributed to the citizens, with the names of the feveral candidates inferited upon each : but in Cicero's cafe the people were not content with this fecret and filent way ; but, before they came to any ferutiny, loudly and univeratly proclaimed Cicero the firft conful: fo that, as he himfeif fays, "he was not chofen by the votes of particular citizens, but the common fuffrage of the city; nor declared by the voice of the crier, but of the whole Roman people."
Ciceso had no fonner enterd upon his office than he had occafion to exert himfelf againt P. Servilins Rullus, one of the new tribunes, who had been alarning the fenate with the promulgation of an Agrarian law ; the purpofe of which was to create a decemvirate, or ten commifioners, with abiolute power for five years over all the revenues of the republic, to difribute them at pleafure to the citizens, \&e. Thefe laws ufed to be greedily received by the populace, and were propofed thercfore hy factions magiftrates as oft as they had any puist to carry with the multitude againlt the public good; fo that Cicero's firft bufinefs was to quiet the apprchenfions of the city, and to baffle, if polfithe, the intrigues of the tribune. Ac-, cordingly, in an attful and elegant feeech from the roftra, he gave fuch a turn to the inclimation of the people, that they 1 ejected this law with as much eagernoffs as they had ever received one. But the graud affair of all, which contituted the glory of his confulflip, and has tranfmited his name with fuch luftre to pollerity, was the fkill he fhowed, and the unwearicd pains he took, in fuppreffing that horrid confpiracy which was formed by Catiline and his accomplices for the fubverfion of the communwealth. For this great fervice he was honoused with the glorions title of fater patria, "the father of his cuuntry," which he retained for a long time after.

Cicero's adminillation was now at an end; tut he had no fooner quitted his office, than he began to fuct the veight of that envy which is the certain fruit of illuftions merit. He was now, therefore, the common matk, not only of all the fagious, againtt whom he had declared perptual war, but of another party not lefs dangerous, the envious ton: whofe united Spleen never left him from this moment till they had driven him ont of that city which he bad folately prefuntd. Cicero, upon the expiration of his conful.
hip, took care to fend a particular accomm of his Cicern. whole adminittration to Pompey, who was finiming the Mithridatic war in Afia; in hopes to prevent any wrong imprefloms there from the calumies of his enemies, and to draw from him fome public dechara. tion in praife of what he had been doing. But Pompey beng informed by Metellus and Cxfar of the ill humour that was rifing aeqainft Cicero in Rome, aufwerd him with great coldineis; and inttead of paying him any compliment, tonk no notice at all of what had pated in the affair of Catiline: noon which Cicero expectulates wih him ia a leter which is thal extant.

About this time Cicero bought a houfe of M. Ctaflus on the Palative-hill, adjoining to that in which he had always lived with his father, and which he is now fuppored to have given up to his brocher Qaintius. The houfe coft him near L. 30,000, and feems to have been one of the nublell in Rone. It was built atour 30 years before by the famous tribune M. Livius Drufus: on which occation we are told, that when the architect proniiced to build it for him in fuch a manner that none of his neighbours hould overlook him; "But if you have any fkill (replied Drufus), contrive it rather fo that all the world may fee what I am doing." The purchafe of fo expenfive a houfe raifed fome cenfure on his vanity; and elpecially as it was made with borrowed money. This circumfance he himfelf does not difemble ; but fays merily upon it, that " he was now plunged fo decply in debt, as to be ready for a plot, only that the confpirators would nos trut him."

The moft remarkable event that lappened in this year, which was the 45 th of Cicero's life, was the pollution of the mytteries of the bona dat by P. Clodius: which, by an mhappy tain of confequences, involved Cicero in a great and unexpesed calmint. Clodius had an intrigue with Cedars wife Pompeia, who, acemding to anmal cuitum, was now celebrating in her houfe thofe awml facrilices of the goddefs, to which no male creature ever was admitted, and where every thing mafculine was fo fermpuloutly excluded, that even pictures of that frit were covered during the cererony. It flatered Clodins's imagination greatly to gaia accefs to his miftefs in the midit of lier boly minilly; and with this view he dreiled himfelf in a woman's habit, that by the benefit of his finooth face, and the introduction of one of the maids, he might pafs without difcovery: but by fome miftake betwen him and his guide, he loll his way when he cane within the houfe, and fell in unhuckily among the other female fervants. Here he was detected by his, voice, and the fervants alamed the whole company by their hrieks, to the great amazement of the matrons, who thetw a veil over their facred myfteries, while Clodius found means to efcape. The Rory was prefently fpread abroad, and raifed a general fandal and horror throughout the city. The whole defence which Clodius made when, by order of the lenate, he was brought to a tiial, was to prove himfelf abfent at the time of the fact; for which purpof he produced two men to fwear thai he was then at luteramna, atout two or thee days journey from the city. Bu Cicero being called upon to give his teflimony, citpofed, that Clodius had kun with him that rery incrn-

Cicco. ing at his houfe in Rome. Irritated by this, Clocius formed a feheme of revenge. This was to get himfelf chofen tribune, and in that office to drive Cicero ont of the city, by the publication of a law, which, by fome Atratagem or other, he hoped to obtride upon the people. But as all patricians were incapable of the tribunate by its original inflitution, fo his firft Acp was to make himfelf a plebeian, by the pretence of an adoption into a plebeian houfe, which could not yet be done withunt the fuffrage of the people. The firtt triumvirate was now formed; which was nothing elfe in reality but a traiterous confpiracy of three of the mof powerful citizens of Rome, to extort from their country by violence what they could not obtain by law. Pompey's chief motive was to get his acts confrmed by Cefar in his confulfinip, which was now coming on; Crfar, by giving way to Pompey's glory, to advance his own; and Craflus, to gain that afcendence by the authority of Pompey and Caxar, which he could not fuatin alone. Cicero might have made what terms he pleafed with the thiumvirate; and been admitted even a partner of their power, and a fourth in their leagne: but he would not enter into any engagements withethe three whofe union he and all the friends of the republic abhorred. Clodius, in the mean time, had been pufliing on the bulinefs of his adoption: which at laft he effeeted; and began foon after to threaten Cicero with all the terrors of his tibunate, to which he was now advanced without any oppolition. Both Cefar and Pompey fecretly favoured his feheme: not that they intended to ruin Cicero, but only to keep him under the lath; and if they could not draw him into their meafurs, or make him at leatt keep quiet, to let Clodius loole upon him. Cipfar, in particular, wanted to ditlrefs hin fo far as to force him to a d pendence on himfelf: for which end, while he was privately enconraging Clodius on purfine him, be was propoting ex. pedients to Cicuro for lis fecmity. But though his fortunes ficmed now to be in a tattering condition, and his enmies to gain ground daily upon him; yet he was unwilling to owe the oblivation of his fafety to any man, far lefs to Cwfar, whofe defigns he always fufpected, and whofe fehemes he never approved. This ftiffnefs in Cicero lo exafperated Cofar, that he refolved immediately to affit Clodins with all his power to opprefs him; while Pompey was all the while griving him the Honget affurances that there was no danger, and that he wonld fooner be killed himfelf than fuffer him to be lunt.

Clodits, in the mean time, was obliging the people with feveral new laws, contrived chielly for their ad. vantage; the defign of all which was only to introduce, with a betver grace, the ground plot of the play, the bmilhment of Cicero. In hert, having canfed a law to be enacted, importing, that any who had condemued a Roman citizen unheard foould himfelf be banifhed, he foon after impathed Cicero upon it. It was in vain that this great man went up and down the city foliciting his canfe in the habit of a fuppliant, and attended by many of the firtt young noblemen whom he had taught the rules of eloquence; thofe powers of fpeaking which had fo often been fuccefs. ful in defending the caufe of others, feemed totally to forlake his own : he was banilled by the votes of the peopk 400 miles from Italy; his houles were ordered
to be demflimed, and his goods fet up to fulc. It cannot be denied, that in this great calamity he did not behave himfelf with that firmnefs which might reaforably be expected from one who had borne fo glorious a part in the republic ; confcious of his integrity, and fuffering in the caufe of his country: for his letters ate generally filled with fuch lamentable exprefions of grief and defpair, that his beft friends, and even his wife, were forced fometimes to admonifh hin to ronfe his courage, and remember his former character. Aiticus was conftantly putting him in mind of it; and fent him word of a report that was brought to Rome by one of Caffus's freed-men, that his affiction had difordered his fenfes. He was now indeed attacked io his weaket part; the only place in which he was vulnerable. To have been as great in allistion as he was in profperity, would have been a perfection not given to man: yet this very weaknels flowed from a fource which rendered hin the more amiable in all the other parts of his life; and the fame tendernefs of difpofition which made him love his friends, his children, and his country, more paffonately than other men, made him feel the lofs of them more feably. When he had been gone a little more than two months, a motion was made in the fenate by one of the tribunes, who was his friend, to recal him, and repeal the laws of Clodius; to which the whole houfe readily agreed. Many obftructions, as may be eafly imagined, were given to it by the Clodian faction; but this made the fenate onfy more refolute to effect it. They palfed a vote, therefore, that no other bufinefs fhould be done till Cicero's return was carried: which at laft it was; and in fo fplendid and triumphant a manner, that he had reafon, he fays, to fear, left people hould inarine that be himfelf had contrived his late flight for the fake of fo glorious a reforation.

Cicero, now in his 50 h year, was reftored to his former dignity, and foon after to his former fortunes; fatisfaction being made to him for the ruin of his ellates and houfes; which $l_{d}$ t were built up again by himfelf with more magnificence than before. But he had domettic grievances about this tine, which touched him very nearly; and which, as he fignilies obfeurely to Atticus, were of too delicate a nature to be exprefled in a letter: They arofe chiefly from the petulant humour of his wife, which began to give him frequent occafions of chagrin ; and, by a ferics of repeated provocations, confirmed in him that fettled difguit which at laftended in a divorce.

In the 5 Gth year of his age, he was made proconful of Cilicia; and his adminiltration there gained him great honour. About this time the expectation of a breach between Cexar and Pompey engaged the greneral attention. Craflus had been deffroyed with his army fome ycars before in the war with the Parthians; and Julia the daughter of Cafar, whom Pompey married, and who, while the lived, was the cement of their mion, was alfo dead in child-bed. Cæfar had put an end to the Gallic war, and reduced the whole province to the Roman yoke: but though his commifion was near expiring, he feemed to have no thoughts of giving it up and retuming to the condition of a private fubject. He pretended that he could not poffibiy be fafe if he parted with his army; efpecially while Pompey held the province of Spain A. 2 prolonged a beach Cisero foon larnal iom las fiched, the he vas acturning from lis promice of cillich. Bate is he

 AT a poce: thouy, in the orn of ob beach, he was catomined with ib handef to frow Pompey. He clearly forefow, what he dedared whiment icmaple to his fritudis, thet which fred foever gut the buther, the Wer mat neceffiliy enf in a tyrmor. The uny diffornce, lat haid, was, thet if hair amion compered,

lic no fomer anived at the city, howezer, than he fill, as le tulls us, intu the very Hmae of civil difcord, and found the war in uffect proclamed: fur the Ferate had jur wied a decece, that Caxar hound difband his army by a cortion day, or be declard an enemy; and Gatir's inden narch tuwards Kone efictuatly confrmed it. In he midit of all this hursy and corfifon, ( - ar was extomely fincitous abont Cicero; not do madis to rain him, for that was not to Ee capeeted, as to prewal with him to Rame nenter. Elo wrote to him ferent times to that eficet; and employed all their connmon friends to prets lim with kuters on that tulject: : ill which was done; but in wai:, for Cicero wid impateret to be gone to Pompry. In the mean time, thefe haters give us a mant iesfible proof of the: high ellem: $n d$ credit in which (icoro flominad at his time in Rone; when, in a contult for empins, which fince alone was to docide, we fie the chicfo on both fides fo fulicions to guin a man to the paty, who lat no peculiar hill in arms or talerte for war. Pufaing, however, the whit or all his deliterations, the mbaked at lenuth to follow Pomper, who had been chaged io cuit Italy lome t:me before, and wes then at 1)yrrhachium ; and anrived fafery in his camp with his ton, his bruther, and his nepter, commiting the fortuas of the whate fanily to the iffee of that caufe. After the battle of Tharaliz, in what Pompey was defeated, Cicero refurred into Italy, and was afterwards recuised into Erent fayour by Cofar, who was now dechared dictatom the ficond time, aml Maik Artony his manter of horfe. The may eably imarime, what we find inded foom his lettere, that he was not a lute eifecrepofd at the thounhts of a imerviow with Coiz, and the indicnity of offering himict to a comatror agairit whom the had been in arms: fur though upon many accounts pe trad reafon to expuct a kind riception from Caran, yot he hardy thonght his life, he fers, worth Leggint ; fune what was siven by a maluer might always te themany again at phafure But at their micter lie had tonnection thlay wh any thing that vas behow has dinnif: fuc Cafar no fooner haw him than to kighted, rat to embrice him; and walked with him aum, convelag very faminity, for feveral fuhenges.

Cocero was bin inis of year, and forced at lat to pait with his wite 'limentia; whofe humour and
 worran of a iuperic us and tubblent fririt: and though te harl barme ber forvifenefs in thin vigour of health, and foumithy fate of his frimass; yot, in a suclining life, foured by a continual fuccomon of nor-
tifications from :dmoad, the want of eafe and quict at hume vas no longer tultalle to him. But he wa; inmediately opputild by a new and mot cruel affiction, the death of his beloved daughter Tullid. who dided in ciakbed foon after her divote from hr third hatme Dulabedn. She was about 32 yerra oid at the time of her death; and, by the fere himes which are left of lec chacter, appears to have beea. an escelient and admiratle woman. She was moll affectimatily and pionfly weferant of her father; and, to the wharl graces of lar fex, laving added the mure folle accomphments of kowledge and polite letters, was ditaithed to be the companion and delighat of his are ; and was iudty clieemed not only as me of the beth, bu the meth leaned, of the Roman lajies. His alliction for the death of this daughter was fo great, that, to Aun all company as much as he could, be removed to Atticus's howfe, where he lived cliafty in his libary, teming ovor every book he cominect with on the inbjett of moderating griff. Put fanding lis rufidence licte too public, and a greater refort to him than ie could bear, he retived to Aituria, one of his fats mes Abuium; a litte ifland on the Latian suore, at the month of a river of the tame nase, covered with wedd and groves cat isto thady walks; a fcenc of all others the fittelt to indalge melanchuly, and where he cond dive a free courfe to his grief. "Here (fi) she to Atticus) I he without the fpeech of man; (xery monning carly I hide myelf in the thickelt of the wood, and never come ont till the evening. Next to gourdf, untings is fo dear to me as this lolitude; and my whole cunserfation is with my books." Inded his whole time was employed in litide elfe than radurg and uriting dating ciefar's adminiltration, which he could acver cheortuly fobuit to ; and it was within this period that he drew up one of the grave of thofe phitorophical pieces which are fill extant in lis works.

Upon the death of Cafar, Octavins his nephew and heir coming into Italy, was profented to Ciecro by Hirtius and Panfa, who the flomget profeffons on the part wf the young man that he would be governed enticiy by his direction. Indeed Cicero thought it necellay to cherif and cncourare Octavius, if for nothing offo, yet to keep him at a cialance from Antony; but cold wot yot be perfiaded to enter heartly into lais affirs. He lupected his youth and wane of experience; and that he had not ftreagth enourg to deal. with Antony ; and, abuve all, that he had no good difpolition tuw ards the confpirators. He thought it impofibl he frould ever be a friend to them; and was perfuaded ratier, that if ever he got the upper hand, lis uncle's acts would be more vindently enforced, and his death more cradly revenged, than by Antony himfulf. And when Cicero did confent at latt to unite limefef to Octarins's interelts, it was with no other view but to arm him with a power fufficient to opprefs Ano tony; yet fo checked and limited, that he fhould not be able to opprefos the repullic.

In the hurry of ail thife policics, he was fill profecuting his itudies with his ufual application; and, befides fome philufophical picees, now timithed his book of vifices, w the duties of man, for the ufe of his fon: A work admined by all fucceding ages as the mott perfect fylum of Ikithen morality, and the nobied eflurt

## C. 1 C

 through life with imooence and happunts. However, he paid a contanat attention to public affars ; nifired na opportunities, hat did wery thiar that haman produce combla for the recorioy of the rephe lic: for all that viguar with whon it was maknay thin laft efort fur itaif was entioly oning to lis comento and autherity. This appears from thofe memorble Philippics which from time to time he palinned aymun Antony, is well as from othr monuments of antinuity. But all was ia wain: for thourh Antony's and wa, entioly deatel at the fiege of Moden, which made mans people imagiae that the war was at an end, and the libeny of Rome entblitad ; yo the wath of thic confuls Panfand Hirtus in that attion tate ibe fital blow to all Ciecon's formes, and was we immediate caute of the ren of the repablic.Oftavins having fublucd the fenate to his mind, marched $t$ woras Gail to mate Antomy and Lejpi-
 their armies int, italy, in order to hista a perfomal finterview with hian; which had beon privady concorted for fettling the terms of a twisheleague, and dividing the power and provinces of healy anomg themetes. The phace spoinced for this imorven was a fonll inam alont two miles from fonman, fomed by the siver Rom nus which mans mar that city. Eree they mot, and fenent three day, in a dofe comferenee thationt the then of then accommudation: and the lat thing they wefutled was the litu of a profeription which they were determined to make of their enemich. Thit, as the wrie:s thil na, weationed much difinenty and varan conters ameng then;' itl cach in his turn confented to facrifoe fonse of his ben friends to the rexage and effentment of his conleagues. Cieero was at his Tufonin villa, wim he firt scccived the nows of the proforiptom, and of his being included in it. It was the dehg of the thamvirate to keep it a fecet, if poflibie, to the mome.t of excention; in order to furpuife thefe whom they had dellined to dehmation, before they were aware of their danser, or had time to make their efape. Eut fome of Cicro's frimals fund means to give hime ealy notice of it; upon which he fit forward ta the fer-fice, Tith a defign to trasport himfolf ont of the reach of his cnemies. Thore, fomling a volfl ready, he petionts embarked; but the winds being adeetic, and the foa unealy to him, after he had fuidd about two laurnes along the coaft, he was ciniscel to land, and fiend the night on thore. From thence be was forced, ha the importunity of his fervants, on board agnin; but was foom afterwards obliged to land at a conntry-fat of his a mile from the fore, weary of life, and decluring he was efolved to die in that country which he had fo ofien faved. Here he fopt forndly for fone time, till lis fervants once more forced him away in a liter towards the fhip, having heard that he was purfued by Antony's affiffins. They were fearee departed when the affoffors arrived at his houfe; and, pereeiving him to be fied, purfued him immediately towards the fea, and overtouk him in a wood that was near the fhore. Their leader was one Popilius Lenas, a tribune of the army, whole life Cicero had formerly defended and faved. As foon as the foldiers appeared, the fervants prepared to defend their maRer's lifo at the hazard of
their own ; int Cown commanded them to ": $\mathrm{f}^{\circ} \mathrm{B}$ duwn and make no ecfitance. They foon cont whis -rad heat and hishands, retursing with them to lione es the mat a ruade pariat th their criel emply

 of momery and ond ring the leal the thend apon the
 city; and whe drew tears from erary oye to fee thedo
 fherivaly from that place in dafone of tian lase, the fonimes, and the mertits of the Ranna pople, on
 tra, ors. The dobs of the rat, fur an haterato of that age, caricd only a private und partichar tor-
 cow the repalj": ind!"; and femed to condm and ettalhifh the perquetual fovery of Roms.

 Chero, and that better citions were farifiecd to the Bi. p, vol. jendany of the trinnvirs without excitig fomath indignation. If we take an impatial furvey of Cicero's conduet and principts, avowed in has ont cpillohary coroupomene, and tace him throng all the laty. rinthis of his contradictory letters, we fall find more to bame than to adnire; and difcover, that the detioe of alvaning his formaca, and making himfelf a ama, wore, fom his outet in life, the only objects he had in vicw. The good of his combtry, and the ditates of ilem ftendy vitun, were not, as in Betus and Citto, the conaltat fprings of lis avtions. The mistortuncs
 wher, and hound him in his true colours; from th:t time to dis death, puhllmimity, irefolution, and unworldy refinag, taincul his judanent, and perplesed every tha, be "ifhel to take. He futtered Pompey and canged to Cefar, while in his private leturs he abofed them buth altermetel: Ife acknowledges in a itter th hid fiend, the time-ierving Atticus, that, althensha foe was at prefont determined to fupport the canfe of Rume and literty, and to bear misfortune like a pialofopher, there was one thing which would gain him ore to the triumvirs, and that was their procuring, for him the vacant angurhip; fo pitiml was the bribe to which he would have laerificed his honour, Lis opimion, and the commonweath. By his wavering improdent conduct, he contributed greatly towards it dethection. After reproaching the cunfpirators furleaving lim ont of the fecret, and loading them with the mon latering compliments on their delivering Rume fiom Cafar's tyranny, he call, Catica an affuring to pay his court to the boy Oet.vius, by whom hie was comptety duped. His praifo of this trimenvir are in the highert ftain of panegyric. Mark Antony well knew, that the virulent abife which Cicero was continually pouring ont againt him, was not an effulion of patrintic zeal or virtuous indignation, hut merely the cullitions of perfonal hatred. He the efore caufed Cicero to be killed, as an angry man thac has bien fthang famps on a venomous animal that cormes within reach of his foot. The cloak he threw over the body of Brutes, and the fpeech he pronounced at the fight of that hero when dead, differ widely from the treatment he gave the remains of Ciccro; and flow, that he

Civepo,
made a diftinction between a Roman who oppofed him from political motives, and one whole ematy arofe from private pique."

Cieero's death happened on the 7 th of December, in the 6 th year of hir age, about ten days from the fettlement of the firt trinmvirate; and with him expired the fhort empire of cloquence among the Romans. As an orator he is thus characterifed by Dr Blain. "In all his orations his art is confpicuous. He begins commonly with a regular exordium ; and with much addrels prepoffefles the hearers, and fudies to gain their affections. His method is clear, and his arguments are arranged with exact propriety. In a fuperior clearnefs of method, he has an advantage veer Demolthenes. Every thing appears in its proper place. He nevertrics to more till he has attempted to convince; and in moving, particulanly the fofter paffons, he is highly Eucceísful. fro one ever knew the force of words better than Cicero. He rolis them along with the greatelt beany and magnificence ; and in the fructure of his fentences is eminently curious and exact. He is always full and flowing, never abrupt. He amplifies every thing; yct though his manner is generally diffufe, it is often happily varied and accommodated to the fubject. W"hen an important public object roufed his mind, and demanded indignation and £usce, he departs confiderably from that loofe and declamatory mamer to which he at other times is addicted, and becomes very forcible and vehement. This great orator, however, is not without his defects. In moth of his orations there is too much art, even carried to a dergrec of oftentation. He feems often detisous of obtaining admiration rather than of operating conviction. He is fometmes, therefore, fhowy rather than fulid, and diffufe where he onght to have been urgent. His fentences are always round and fonorous. They cannot be accufed of monotony, fince they poffefs vaicty of cadence; but from too great a fondnefs for magraficence, he is on fome occafions deficient in trength. Though the fervices which he had performed to his country were very confiderable, get ha is too mach his own panegyrit. Ancient manners, which impofed fewer refleants on the fide of decorum, may in fone degrec cacufs, but cannot entirely juthify, his ranity."

CICHORIUM, succory: A genus of the poJygamia xqualis order, belonging to the fyngenefa clafs of plants; and in the natual method ranking under the 49 th order, Compofita. The receptacle is a little paleaceous; the calyx calyculated; the pappus almoft quinquedentated, and indiftinetly heiry.

Species. 1. The intylons, or wild fuecory, grows naturally by the fides of cuads, and in hady lanes, in many places of Britain. It ferids out long leaves from the roots, from between which the falks arife, growing to the height of three or fon: fect, and branching out into fmaller ones. The fowers come out from the fides of the flalks, and are of a fine blue colour. They are fucceeded by oblong leeds corered, inclufed in a down. 2. The fpinofum, with a prickly forked ftalk, grows naturally on the fea-coafts in Sicily, and the illands of the Aichipelago. This fends out from the root many long leaves which are indented on their euges, and fpread flat on the ground; from between there arife the halks, which have very fow leaves,
and thofe are fmall and entire: there Ralks are divided in forks upward, and from between them come out the flowers, which are of a pale blue colour, and are fucceeded by fecds thaped like thofe of the common forts. The enss of the fmaller branches are terminatod by ftar like fpines which are very harp. 3. The tadivis, or fuccory with broad crenated leaves, differs from the wild fort in its duration, being only aunual, whereas the widd fort is perennial.

Culturc, \&c. The lait fpecies may be confidered toth as an anmual and biennial plant. If fown early in the fpring, or even any time before the beginning of June, the plants very commonly fy up to feed the fame fummer, and perith in autumn. If fown in June and July, they acquire perfection in antumn, continue till the next fpring, then thout up ftalks for fower and feed, and foon after perih. The inner leaves are the ufeful parts. Theic when blanched white to render them crifp and tender, and reduce them from their natural ilrong tatte to an agreeably bitter one, are then fit for ufe. They are valued chietly as ingredicnts in antumn and water falads, and for fome culinary ufes. The priscipal feafon of them is from the latter cod of Augut till Chriltmas or longer, accoiding to the temperature of the feafon; though the curled kinds generally retitt the frots of our ordinary winters, and remain in tolerable perfection cill March or April. They are propagated by feeds fown in an open fot of ground, from which the plants are to be removed into open beds or burders, where they may remain to grow to fuli lize. The feafon for fowing thefe feeds is from the beginniag of June to the ead of July ; and to have a regular fupply of plants, it is proper to perform thre difireat fowings at about thece week's or a month's interval. The great excellence of endive is to have its inner leaves finely whiitned or blayched. They natural y incline to whitenetis of themelves; dui this may be greatly imperved by art when the plants are arrived at full growth. Different methocis are practifed for this purpute, fuch as tying the loave together ; or taking up the plants, and replanting them dircetly, almolt to their tops, in ricges of dy carth, laying buards or tiles flat wass on the top of the plants; brit the firt is found to anfwer the purpofe moft effectually. The proper time for beginning this work is, when the leaves are almoll full grown; that is, when they are fo far advanced that the leaves of the different plants interfere with one another, and their hearts are fill and bufhy: but they are not all to be tied ap at once, only a due fupply of the largett and furwardeft plants, once escry ten or twelve days according to the demand; for the blanching takes up about three wecks. Blanching in ridges of earth, however, is fometimes practiled in winter when a fovere frolt is litting in; for by burying them in the earth almof to their tops, they are more out of the power of the cold. In N, comber, or Decemiver, when hard weather is approaching, let a piece of light ground, that lies warm, be trenched up in one of more harp ridges two or three feet wide at botiom, and near as wuch in height, fideways to the fun, making the fides as fleep as puffoke, that the wet may run quickly off; then, in a ciry dity, tuke up a quantity of joui full growia
plants,

Ciftori1 m .

Cicindela. plants, with their ronts entire, and diveling then of damaged leaves, gather each plant chofe in your hand, placiug them horizontaliy in the funny fitic of the tidge of earth phoft to their tops, and about fix or eight inches each way dillant. In fevere frolt, it will be proper to bellow funse covering on the plants.

Meclicinal sfes. The roots and leaves of the wikd fuecory, and leeds of the enaive, are articles of the materia medica. The firt has a moderatcly bitter tafle, with fome degree of rouchnefs; the leaves are fomewhat lefs bitter; and the dirker coloured and more deeply jarged they are, the bitterer is their talle. Wild fuccory is an ufful detcregent, aperient, and attemating medicine, acting without much irritation, tending rather to enol than to heat the body; and, at the farme time, corroborating the cone of the inteflines. All the parts of the plant, when wounded, yield a milky faponaceous juice. This, when taken in large quantities, io as to ketp up a gentle diarrhoca, and continaed for fo:ne weeks, has been found to produce excellent effects in fcorbutic and other chronical diforders. The qualities of the endive are nearly of the fame kind. The feeds are ranked among the four leffer cold nues.

CICINDELA, the Sparkler, in zoology, a genus of infects belonging to the order of coleoptera. The antenne are fetaccons; the jaws are prominent, and furnilhed wihh teeth; the eyes are a little prominent; and the breaft is roundifl and marginated. There are I4 fpecies. The campeftris, or ficld-fpatkler, is one of the mult beautiful of the genus. The upper part of its body is of a fine oreen colour, rough, and rather bluin. The undr fide, as alfo the lexs and antenne, are of a flot colour, gold and red, of a copperifh calt. The cyes are vely prominent, and give the head a broad appearance. The thorax is angulat, and narrower than the head; which corititutes the character of the ciciudele. It is rough, and of a green colvur tinged with guld, as well as the head. The elytra are delicatuly and irregularly dotted. Each of them has fix white ipots, viz. one on the tup of the elytrum, at it outward angle: three more along the ontward cdige, of which the midalemoll forms a kind of lunula: a fifth, on the middle of the elytra, oppofite the lunnla; and that one is broader, and tolerably round: lattly, a fixth, at the extremity of the clytra. There is alio fometimesfeen a black fot on the middle of each elytrum, appofite to the fecond white foot. The upper lip is alfo white, as is the upper fide of the jaws, which are very prominent and flarp. This infect runs with great fivifunefs, and flics eafly. It is found in dry fandy places, efpecially in the beginning of foring. In the fame places its larva is met with, which refenhes a long, foft, whitifh worm, armed with fix legs, and a brown fcaly head. It makes a perpendicular round hole in the ground, and keeps its head at the entrance of the hole to eatch the infects that fall into it; a fpot of ground is fometimes entirely perforatcd in this manner. The infects belonging to this genus are in general very beantifol, and merit the attention of the curious in their microfcopic obfervations; fome are minute, though not inferiur in fplendor, therefore beft fuited for the amufement. Living fubjects are ever preferable to dead ones. The larva of all this genus
live under ground; and are, as well as the perfcet infects, tigers in their nature, attacking and deftroying all they can overeome.

CICISBEO, as Italian term, which in its etymoln. gy fignilise a cuifferer; which has been buthowed in Italy both on toves, and on the fe who to cmetward ap. pearance act as fuch, attendine on married ladics with as mach atocition and referet as if they weve thio lovers. This Italian cutom has tiecn fowken of very repronchfully by fome witers: Mr Baretti has taken great pains to vindicate it. He afcibes it to a fpirit of gallantry, denived from the ages of chivaly, and much heighened and retined! $y$ the revival of the Platonic philofuphy in Iialy, about the thirteenth century; and by the verfes of Petrach in compliment to the beautiful Laura, and his numerous imitators.

CICLUT, or Cicluch, a frong frontier town of Dalmatia, fituated on the river Nurentlia, in E. Long. 17. +0. N. Lat. 45.20. It is furrounded with walls built in the ancicnt manner, and was taken by the Vcnetians from the Torks in 1694.

CICONES, a people of Thrace near the Hebras. Ulyffes at his return from Troy conqueted them, and phandered their chief city fimarus. They ture to piecez Orpheus for his obfcene indulgencies.

CICU'TA, propetly lignities an hollow intercepted between two knots, of the flalks or reeds of which the ancient thepherds ufed to make their pipes. It is now, however, generally ufd to tignify the water hemlock, and alfo the common fort ; but Linuzus has deferibed the latter under the old name of Comiun. S.c that article.

There ate thee fpecies of water-hemlock; the virof, the bulbifera, and the maculata. Of the er the firt is the only one remakab'e, and that for the poifonous qualities of its roots, which have been often knowa to dettroy chilluen who eat them for parfinips.
Cicuta is alfo ufed, chiffy among the aucients, for the finice or hino exprefed from the above plant, being the conmon poifon whorewith the fate criminals dit Athens wete put to deatl: Though fome have fuggeitud, that the phifonous draught to which the Athenians doomed their criminals was an infriflated juice componded of the juice oficura ard fome vehor corrolive herbs.

Sosrates draik the cirita.-Plato, in his dialogue on the immortaliy of the foul, cofreves, that "The executioner advifed Suerates not to talk, for fear of caufing the cicuta to "perate tow fowly." M. Petit, in his Glfervotiones Alfiellunt, remarks, that this advertifement was not given by the exccutioner out of humanity, but to fave the ciruta: for he was only alo lowed to much poifon fer unn, which, if he exeeeded, he was to furnim at his uwn expence. This conAtruction is confirned by a paftage in Plutarch: the executioner who hinifered the cionta to Mocion, not having enough, Phecion gave lim money to buy move; obering by the way, "t that it was odd noough, that at Athens a man mutt pay for coery thing, even his own death."

CID (Roderizo I)ias ly), a Caflilian officer, who was very fuccetsful againt the IMoms, under Ferdirand II. kirg of Cafile; but whofe name would hard. ly have been tememberd, if Conpelle had mot made.

Chrio his pathon fur (hmere the fubject of an admired tra- Cedy, founded on a limple but alfeting iacident. The Cis is defperately in love with Chimene, d.atheter of the Count de Gumes: but he is at vaiance with the Count and being challenged by him, kills him in at cus The Tonflat between luve and homour in the breat of Chmene, who at length pardoris and manties the Cill, forms the beauty of the picce. If died in : $=9^{\text {a }}$.
Cii)ARIS, in antiquity, the mitre wed by the Jewith high prietts. The R bbins lay, that the bonnet ufed by priett: in general was made of a piece of linen cluth if yards lung, which covered their heads like a lectmet of turban: and they allow no oiler diference between the high priell's bounct and that of other prielf, than thet the one is fatter, and more in the sumb of a turoant; wheress that worn by ordinary priefto rof foneting more in a puint.
CICNANI (Carlo), an Itelian painter, was born at Bologna in 1628 : aid was the diciple of Atbani. Ife was eltemad by pope Clement XI. whin nominated himplame of the academy of Botorna, and ivaded hin with farous. Cignati dad at Furli in 1719. The cupcla of la Madona del Fusco at Furit, in which he reprefented Caradife, is an admirable work. Iifs pilicipa! pictures are at Rome, Dologna, and Forli.

CYGOLI, or Crwon, the painter. See Croli.
Cilita, the Eye-lashes. Sie Aratomy, p. - Gú. col. 1.
(IILATED Leaf, among botanical witers, one Guround with paralicl filaments fomewhat like the hairs of the eyedids.

CILICPA, an ancient kingdom of Afia, lying beween the 3 the and foth degree of north latitude: hounded on the eall by Syria, or rather by Mount Ananus, which feparates it from hat kingdom; by Pamphlin, on the well; by Inaria, Cappudocin, and Armenia Minot, on the norith: and by the Mediteranean fea, on the foull. It i , fu turrounded by feep and cragey monnains, chio thy the Taurus and A manars, that it mas be defended by a handul of tefulute men a raint a numerous array, there being but three nar-
 luta, or the gates of Cllita; one on the fute of Cappadocia, called the Prifs of Mont Tamps and the other two callad the Fofs of Alom Amoms, and the Pafs of Sisite. The whine country was divited by the ancieats into Cilicia :Ifora, and Cilcia Campettris: the former called by the Crecks Trubsa or Sconv, from its abownting for with has: and to thioday the whele provime is called by the Turks, Tas mikieth,

A cording to Jutentw, chicia was mita peopled by Taminh the fion of Javan, and his defendents, whence the whole consty was ramed Tarfiss The ancient inhabitunts were in procefo of cime driven out by a colony of Pumaicians, who, urder the conduct of Ci fix, firt futiod in the inand of Cyprus, and from thence paled into the emnory which, frum the leaker, they calcul Cillis. Athenwards, feveral wher colonies frow difiesent nations fertud in this kinglom, particuaty from Syria and Greere; whence the Cilicians in fome flaces nicd the Greek tongue, in whers the $\mathrm{S}_{\mathrm{y}} \mathrm{iac}$; but the former greatly cormpted 1 ly the Perfin, the predominant language of the country be$3 n^{\circ} 8 \mathrm{I}$ 。
ian a diakeet of that tonguc. We find no mention of the kings of Cilicia after their fettement in that country, till the time of Cyrus, to whon they voluntarily fubmitted, continuing fubject to the Perlians :ith the overthrow of that enipire ; but governed to the time of Artaxerxes Maemon, by kings of their own natiun. After the duwnfal of the Perfan empire, Cilieia became a province of that of Micedon; and, on the death of Alexander, fell to the hare of Selencus, and continued under his defeendents sill it was reduced to a Roman province by Pompey. As a procoufular province, it was fult groverned by Appius Claudius 1'ulcher; and after him by Cicero, who reduced feyeral Arong holds on Mount Amanus, in which fome Cilicians had fortified themfetves, and held out againit his predec:flur. It was on this oceafion that the divilin, furmenly mentioned, into Trachea and Camputris, took place. The later became a Roman province; but the former was governed by kinas appointed by the Romans, till the reign of Vefpatian, when the family of Tracondemeritus being extinet, this part afomade a proviace of the empire, and the whole divided into Chlicia Primai, Cilicia Sermad, and Ifauria; the firft tocis in all Cilicia Campettris, the fecond the cont of Cilicia Trachea, and the laft the in!and parts of the fane divition. It is now a province of Aliatic Turky; and is called Covanaria, having been the lat proviace of the Caramanian king dom which beld out againot the Oteman race.

That part of Chicia called by ane ancicots Cilikia Compentio, was, if we belite Ammians Manctlinus, one of the mot fruitul countries of Aha; Fat the wetern part equally barren, though farmus, even to this day, $f$ or an excellent breed of holles, of which 600 are yearly fent to Coufuntin ple for the Special nit of the Grand Signor. The air in the inlard parts is ruchoned wholefome; but that un the fea-coalt ve:y dangerous, tipecially to itrangers.

The rivers of any note are the Pyramus, which ifies on the north fide of mount Taurus, and emptics iffelf into the NIEditeranezn between Iffus and Magraflus ; ard the Cydun, which furings from the Antiannus, pafis through Tar'us, and difembenges ititif ins the Ao litenalican. This lad is famous for the rapidity of its tream, and the coldnefs of its waters, which proved very danterous to. Alexamer the Great.

The Cilicians, if we believe the Greek and Roman lifforians, were a rough unpolifhed race of perple, unfair in their dealings, cruet, and liars even to a proverb. In the Ruman times, they became great! $y$ addicted to piracy. They firl began, in the time of the Mithridatic war, to infert the neighbeuring provinces along with the Pamphylians; and, being chaboldened with fuccefo, they foon wenured as far as the coalts of Grece and ltaly, where they touk a vall number of Alaves, wiom they told to the Cypriots and the king of Exypt and Syia. They were, however, at latt defeated and entirely fuppreflid by Pumpey the Creat. See (Hipnoy of Rome.

Curctat Tom in the natural hilory of the ancicnt:, a bitminous fubllase improperly called an eath, which, by builing, becane tough like bid lime, and was ufed inftead of that fublance to cover the focks of the vines for preferving them frum the worms. It probably ferved in this oflice in a fort of suable ca-
facity,

Cilicium pacity, driving away thefe animals by its natifeous fmell, and entangling them if they chanced to get amongt it.

CLLICIUM, in Hebrew antiquity, a fort of habit made of coarfe lhuff, formerly in ufe anong the Jews in times of mourning and diltrefs. It is the fame with what the Septuagint and Hebrew verfions call fackeloth.

CILLEY, an ancient and famous town of Germany, in the circle of Autria, and in Upper Carniola. It is the capital of a county of the fame name, and is fituated on the river Saan, in E. Long. 15.45. N. Lat. 46.28.

CILURNUM, (Notitia;) a town of Britain: thought to be Collerton, or Collerford, in Northamberland; but Walwic, or Scilicetler, according to Cambden.

CIMA, or Sima, in architecture, the fame with Cymatium, or Ogee.
CIMABUE (Giovani), a renowned painter, born at Florence in 1240 , and the firlt who revived the art of painting in Italy. He painted, according to the cultom of thofe times, in frefco and in diltemper; colours in oil not being then found out. He excelled in architecture as well as in painting; and was concerned in the fabric of Sancta Maria del Fior at Florence : during which employment he died at the age of 60, and left many difciples.

CIMBRI, an ancient Celtic nation, inhabiting the northern parts of Germang. They are faid to have been defcended from the Afiatic Cimmerions, and to have taken the name of Cimbri when they changed their old habitations. When they frif became remark:ible, they inhabited chiefly the peninfiula now called Futlend, and by the ancients Cimbrica Cberfonefus. About 113 years before Chrift, they left their peninfula with their wives and children; and joining the Tuetones, a neighbouring nation, took their journey fouthward in queft of a better country. They firlt fell upon the Boii, a Gaulifh nation fituated near the Hercynian foreft. Here they were repulfed, and obliged to move nearer the Roman provinces. The republic being then alarmed at the approach of fuch multitudes of barbarians, fent an army againft them under the conful Papirius Carbo. On the approach of the Roman army, the Cimbri made propofals of pace. The conful pretended to accept it ; but having thrown them into a difadvantageous fituation, treacheroufly attacked their camp. His perfidy was rewarded as it deferved; the Cimbri ran to arms, and not only repulied the Romans, but, attacking them in their tum, utterly defeated them, and obliged the frattered remains of their forces to conceal themfelves in the neighbouring forefts. After this victory the Cimbri entered Tranfalpine Gaul, which they quickly filled with flaughter and defolation. Here they continued five or fix years, when another Roman army under the conful Silanus marched againf them. This general met with no better fuccefs than Carbo had done. His army was ronted at the firlt onfet; in confequence of which, all Narbonne Gaul was expofed at once to the ravages of thefe barbarians.

About 105 years before Clurit, the Cimbri began to threaten the Roman cmpire itfelf with deftrection. The Gauls marched from all parts with a defigu to

Vor. V. Fart I.
join them, and to invade Italy, The Roman army was commanded by the proconful Crpio, and the conful Mallius; but as theie two commanders could not agree, they were advifed to feparate, and divide their forces. This advice proved the ruin of the whole army. The Cimbri immediately fell upo: a flrons detaclment of the confular army commanded by Mi. Aurclins Scaurus, which they cout off to a man, atted made Scaurus himfelf prifoner. Mallius being greatly intimidated by this defeat, defired a reconciliation with Cxpio, but was haughtily refufed. He moved nearer the conful, however, with his army, that the enemy might not be defeated without his having a thase in the action. The Cimbri, by this movement, imagining the commanders had made up their quarrel, lene ambaffadors to Mallius with propofills of peace. As they could not help going through Crepio's camp, he ordered them to be brought before him; but finding they were empowered to treat only with Mallius, he could farce be reftrained from putting them to death, His troops, however, fosced him to confer with Maillius about the propufals fent by the barbarians: but as Crepio went to the conful's tent againll his will, fo he oppofed him in every thing; contradicted with great ubitinacy, and infulted him in the groflett manner. The deputies on their return acquainted thin countrymen that the mifundertanding between the Ruman commanders flill fubfifled; upon which the Cimbri attacked the camp of Cæpio, and the Gauls that of Mallius. Both were furced, and the Romans flaughtered without mercy. Eighty thoufand citizens and allics of Rome, with 40,000 ficrants and futlers, perifleed on that fatal day. In thort, of the two Roman armies only to men, with the two gruerals, efcaped to carry the news of fo dreadful a defeat. The conquerors deltroyed all the fpoil, purfuant to a vow they had made before the battle. The gold and filver they threw into the Rhone, drowned the horfes they hat taken, and pat to death all the prifoners.

The Romans were thrown into the utmof conternation on the news of fo terrible an averthrow. They faw themfelves threatened with a deluge of Cimbii and Gauls, numerous enough to over-run the whole country. They did not, however, defpair. A new army was raifed with incredible expedition; no citizen whatever who was fit to bear arms being exemptcd . On this occafion alfo, fencing -matters were firt introduced into the Roman camp; by which mean : the foldiers were foon rendered in a manner invineibs. Marius, who was at that time in high reputation ou account of his victories in Afriea, was chofen commander, and waited for the Cimbri in Tranfulpine Gaul: but they: had refolved to enter litaly by two different ways; the Cimbri over the eaflern, and the Teutones and utler ailics over the wellern Alps. 'The Roman general therefore mathed to oppofe the latter, and defeated the Ambroncs and Teutones with great thaughter". 'The Cimbri, in the mean ime, * see fioz entered Italy, and frack the whole country with ter-broes and ror. Catullus and Sylla attempted to oppofe them: T $T$ itn $\%$ but their foldiess wire fo intimidated by the fisce countenances and terible appearance of thefe barlaridrs, that nothing could prevent their flying herore them. The cily of Rone was now toinly idefuce.

## C I M $\left[\begin{array}{lll}10\end{array}\right] \quad$ C I M

Cimer, heis; and, had the Cimbri only marched brifily fo:wads, they had undoubtedly become monters of it ; but they waited in expectation of being joned the the allice the An:brones and Tentoncs, not hwing heard of their defeat by Marius, till the fenate had time to real him to the deface of his country. By thir or Cer he joined his amy to that of Caullus and S:Ma; and upon that umin was dedared commanter in chiet. The Roman army coniluch of $5^{2,30 e}$ mgan. The cavaler of the Cimbri were nee more than $: 5,000$, int their toot femed immumerable; for, being drawn ap in a faure, they are facid to have curered jo fuilonges. The Cinbri attacked the Konnes with the ntmot fury ; bet. bein Eunascutomed to bear the heas of Italy, they foon began tolofe their Arengtio, and were eafily overcome. But they had put it out .f then power to fly; for, that ther might keep their ranks the bette, they liad, Fike the bartariane, tied theme fates together with contis falened to their betts, is that the Romans made a moit termble bavock of them. The bathe was thecefure foon over, and the whole day employed only in the moft terrible butchery. An hawdrd and twenty thoufand were lilled on the fied of́ battle, and 60,000 taken priouers. The victurious Romans then marched to the enemy's camp; where they lad a new battle to fight with the women, whom they found morefierce than even their hufband's liad teea. From their carts and waggons, which formed a kind of fortification, they dicharged howers of darts and arrews on friends and foes without ditinction. Then they frit foffocated thicir children in their arme, and then they put an end to their own lives. Thie greateit part of them hanged themfelves on trees. One was fourd bancingat a cart with two of her chilldren at her heels. Nany of the men, for want of trees and fakes, tied terings in running knots about their nocks, and faltened them to the tails of their forfes, and the horms and fict of their uxen, in order to firangle themitiocs that way; and thus the whole multitude was deltroyed.

The country of the Cimbri, which, after trous terrible cataitophe, was left a mere defart, was again peopled by the Sogthians; who, being driven by Pompey cut of that vait face between the Euxine and the Capian ica, maxched towargs the north and welt of Europe, frobduing ail the mations they met with in their way. They conquered Rukia, Saxony, Wetphalia, and other countries as far as Finland, Norway, and Swedon. It is pretenced that Wodin their leader traveried fo many countries, and endeavoured to fublue them, only with a view to cxcire the people againgt the Romans; and that the fuirit of an motity which he had excited operated fo powerfully after his death, that the northern rations combined to atack it, and never ceafed their fircurions till it was tovilly fubverted.
3's:2 cizanar. beionging to the order of henaptera. The rotrom is indeded. The arterne sre luager than the thoras. The wings are felled togtehcr cols-wife: the upper chas are cortacious from their bale turards their middie. The bath is fut ; the thuray margined. The fuet were froted f. ramis,

This gervs is divided into dificer: fections, as followe: 1 , Thefonithua wings. 2. Thofe in which the
efcutcheon is estended fo far as to cover the abdomen and the win-s. 3. The c leoptrati, whofe clytra are whol!y ceriactous. 4. Thof whofe elyera are membranaceoss; thefe are very mach deprefted like a leaf. 5. In which the tiorax is arned on each fide with a Fpine. 6. Thofe which are of an oval form, wathout fpines on the thorax. 7. In which the antenne become fetaceous towards their point. 8. Thofe of an oblong form. 9. Thufe whofe antennse are fetaceous, ant as long as the body. 10 . Thefe which have their thiche amed with fines. II. Thofe whofe bodies are !agy a id narrow. Liamxus enunerates no fower than 121 fpecies, to which feveral have becn added by uther naturalits. A very peculiar fpecics was difcovered by Dr Sparman at the Cape, which he has yamed Comex pardatoxis. He obfered it as at noon-tide he fulthe for fletter among the branches of a larub irom the intolerable heat of the fun. "Tho" the air (hays ke) was extremely thil and calm, fo as hardly to have fraken an afpen leaf, yet I thought I faw a litte withered, pale, crumpled ieaf, eaten as it were by caterpillars, flitteriag from the tree. This appeaced to me fo wery extraordinary, that I thought it worth my while fuddenly to quit my verdan bower in order to contemplate it ; and I could fcarcely believe my eycs, when I faw a live infect, in thape and culour refeinbling the fragment of a withered leaf, with the edges tumed up and eaten avar, as it were, by caterpiliars, and at the fame time all over befet with prickles. Nature, by this peculiar form, has certainIy extremely well defended and concealed, as it were in a malk, this infect from birds and its other diminative foes; in all probability with a view to preferve it, and employ it for fome important office in the $\sqrt{5}-$ fiem of her tconony; a fyttem with which we are too litcle aequainted, in general too little inverigate, and, in every part of it, can never fufficiently admire with that refpect and veneration which we owe to the great Author of nature and Ruler of the univerfe."

The larse of bugs only difer from the perfect in fect by the want oi wines; they run over plants; grow and change to chrylalids, without appearing to underge any material difference. They have only rudiments of wings, which the laft transformation unfolds, and the infect is then perfect. In the two firt ftages they are unable to propagate their feecies. In their perfect flate, the female, fecundated, lays a great nomber of eggs, which are often found upon plants, placed one by the fide of another; many of which, newed through à glafs prefent fingular varieties of configuration. Some are crowned with a row of fmall hairs, others bave a circular fillet ; and moll have a piece which forms a cap; this piece the larva puhtes off when it forces open the egg. Releafed by nature from their prifon, they overfpread the plant on which they feed, extracting, by the belp of the ruitrum, the juices appropriated for their nourihment; even in this tate, the larve are not all fo peaceably inclined ; fume are voracious in an emineat degree, and fpare neither fex nor fecies they can conquer. In thei perfect itate they are mere candibais, glutting themfelves with the blood of animals; they deltroy caterpillars, 月ies, and even the coleopterous tribe, whofe hardiefs of ciytra one would imagine was proof a-

Cimitifuga rainft their attacks, have fallen an cafy prey to the II Cilu:oia, harp piercing nature of the rofrum of the bug, and the uncantious naturalitt may experience a fecling feverity of its nature. The cimex lectularius or houfebug, is particularly acceptable to the palate of fiders in general, and is even fought after by wood-bugs; which is not indeed furprizing, when the general voracity of this genus is confidered.

The methods of expelling houfe-bugs are varions, as oil of turpentine, the fmoke of corn-mint, of narrowleaved wild crefs, of herb-robert, of the reddifh agaric, of muftard, Guinea pepper, peats or turf, $\varepsilon_{i} c$. (ise alfo Dug and Cimififuga).

CIMICIFUGA, in botany: A genus of the polyandria order, belonging to the dicecia clafs of plants. Thie male calys is almot pentaphyllous; there is no corolla; the flamina are 20 in number: the female calyx is almoft pentaphyylous; no corolla; the thamina 20, and barren; the caplintes from 4 to 7 , polyfpermous. Mefferfchmidius, in the Ifis Siberica, gives it the following character and name: Cimicifuga fotidu, with the leaves of the herb Chritlopher, bearing a thyrtis of ycllow male flowers with a red villous feed, the feedveffel in form of a horn. This whole plant fo refembles the actea racenofa, that it is difficult to dillinguifh them when not in flower; but in the fructification it greatly differs from it, the cimicifuga having four pithils, the actea but one. Jacquin fays, that it is a native of the Carpathian mountains. It has obtained the name of cimicifuga, or bugboue, bcth in Siberia and Tartary, from its property of driving away thofe infucts; and the botanifts of thofe parts of Europe which are infefted by them, have long defireed to naturalife it in their feveral countries. Gmelin mentions, that in Siberia the natives alfo ufc it as an evacuant in droply; and that its effeets are violently emetic and draftic.

CIMMERII, anciently a pcople near the Palus Mrootis. They invaded Afia Minor $128+$ years before Chrit, and feized upon the kingdom of Cyasares. After they had been mafters of the country for 28 years, they were driven baek by Alyattes king of I y-dia.-The name alfo of another nation on the weftern coaft of Italy. The country which they inhabited was fuppofed to be fo gloomy, that to exprefs a great obfcurity the expreflion of Cimmeriun darkinefs has proverbially ben ufed; and Homer, according to Plutarch, drew lis images of hell and lluto from the gloony and difmal country where they dwelt.

CIMMERILIM (anc. geog.), a town at the mouth of the Palus Mreotis; from which the Bofphorns Cimmerius is named; that drait which joins the Euxine and the Palus Mreotis. Cimmerii was the name of the people, (Homer): and here flood the Promontorium Cimmerium, (Ptolcmy) ; and hence probably the modern appellation Crim.

Cammprum (anc. geog.), a place near Baiae, in Campania, where formerly tood the cave of the fibyl. The people ivere called Cimuerii; who living in ful)terraneous kabitations, from whel they iflued in the night to commit robberies and other acis of violence, never faw the light of the fun (Homer). To give a natural account of this fable, Foftus fars, there was a valley furrounded with a pretty high ridge, which precluded the morning and evening fun.

CIMOLIA terra, in natural hittory; a name by
which the ancients expreffed a very wiluable niedici- Cimatit nal cath; but which lateor ages have foppofed to be no other than our tobacco-pipe day and fuller's $\underbrace{\text { Cimom, }}$ carth.

The cimelia teran of the ancients wins found in feveral of the iflands of tio. Archiplage: Pu, tomberly in the ithand of Cinolus, $f_{r} m$ whence it han its name.
 flanmations, and the like, being applicd by way of catazhafm to the part. They alfo uted, as we do, what we call cimolid, or fulter's carth, for the cleanfing of clothes. This earth of the ancients, though fo long difregardec, and by many fuppoked to be luft, is yet very plentilul in Argentiere (the ancient Cinolus), Sphanto, and many of thofe illands. It is a marl of a lax and crmmbly texture, and a pure bright white colour, very foft to the tonch. St adhens firmly tis the tomgue: and, if thrown into water, raifes a litule hiffing and cbullition, and moulders to a tine powder. It makes a confiderable effervefence with acids, and fuffers no change of colour in the fire. Thefe are the characters of what the ancients called fimply terro cimolia: but befides this, they had, from the fame piace, another tarth which they called by the fune general name, but dittinguiftred by the epithet purple, purpo. refens. This they deferibed to be fattifh, cold to the tonch, of a mixed purphe colsur, and nearly as hard as a fone. And this was evidently the fubtance we call fectiles, or the foap-rock; common in Connwall, and alfo in the inand of Argentiere, or Cimolus.
Cmona Alla, the officinal name of the earth of which we now make tobacco-pipes. Jts ditinguifaing characters are, that it is a denfe, compact, heary carth, of a dull white colour, and very clufe texture; it will not calily lreak between the fingers, and fightly fains the fikin in handing. It adheres firmly to the tungue; melts very flowly in the mouth, and is not readily diffuithe in water. It is found in many places. That of the inc of Wight is much efteemed for its colomr. Great plenty of it is found ncar Pole in Dorfethire, and near Wedenfony in Staffordhire.

Cimorta Nigra, is of a dark lead colour, hard, dry, and heavy; of a fmooth compact texture, and not vifcid: it docs not colour the hands; crumbles when dry; adhers to the tongue; diffufes flowly in water: and is not ated upon by acids. It burns perfectly white, and acquires a coufiderable hardnefs. The chief pits for this clay are near Northampton, where it is ufed in the manufacture of tobacco-pipes. It is alfo mixed with the citche clay of Derbyfhire, in the proportion of one part to three, in the manufacture of the hard reddifh brown ware.

CIMOLUS, (anc. geog.) one of the Cyclades, notw called Argentire.

CIMON, an Athenian, fon of Miltiades and Hegifipyle. He was famous for his dcbaucheries in his youth, and the reformation of his moruls when anived to years of difuretion. He behaved with grat courage i.t the battle of Salamis, and rendered himfelf popular by his munificence and valour. He defeated the Perfian Heet, touk 260 hips, and totally routed their land aimy, the very fane day, A. U.C. 284. The money that he obtained by his victories was not applied for his own private ufe, but with it he fortified and cubellifhed the city. He fome time after loth all

Cinalea his popularity, and was banifhed by the Athenians, who (1) declared war agaiuft the Lacedxmonians. He was recalled from his exile; and at his return he made a reconciliation between Lacedw non and his conintrymen. He was afterwards appointed to carry on the war againt Pertia in Egypt and Cyprus, with a flect of 200 fhips, and on the coalt of Alia he gave battle to the enemy, and totally ruined their fleet, A. U. C. 304. He ditd as he was befieging the town of Citium in Cyprus. He may be called the latt of the Greeks whofe fpirit and boldnefs defeated the ammies of the hatbarians. He was fuch an inveterate enemy to the Perian power, that he formed a plan of totally deftroying it: and in his wars he lad fo reduced the Perfians, that they promifed in a treaty not to pafs the Chelidonian iflands with their fleet, or to approach within a day's journey of the Grecian feas. See Attica.

CINALOA, a province of Mexico in South America, abounding in corn, cattle, and cotton; and rendered extremely pi\&turefque, by a number of beautiful cafcades of clear water that fall down from the motatains. It lies on the eaftern coalt of the fea of Ca lifornia, and has a town of the fame name, fituated in N. Lat. 2 of.
cinara, in botany, the Artichoke. See Cynara.
CINCHONA, in botany, a genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking with thefe plants, the order of which is doubtful. The corolla is funnelbaped. with a woolly fummit; the capfule inferior, bilocular, with a parallel partition. Limneus deforibes two fpecies: I. The corymbifera, corymbbearing cinclona, or white Peravian baik, with oblong lanceolate leaves and axillary corymbs; and, 2. The officinalis, or coloured Peruvian bark, with elliptic leaves downy underneath, and the leaves of the conolla woolly. Both fpecies are natives of Peru, where the trees attain the height of 15 to 20 feet. The former particalarly abounds in the hilly parts of Quito, growing promifcuounly in the forelts, and is fpontancoufly propagated from its feeds. Both forts have allo been found in the province of Santa Fe .

The bark hak fome odour, to mof perple not unfiealant, and very perceptible in the dillilled water, in which floating globules, like effential oil, have been wherved. Its iafte is bitter and aftingeni, accompasied with a degree of pungency, and leaving a conilderally lefting impreffon on the tongue.

According to fome, the Peruvians learned the ufe of the bark by obforving certain animals affected with intermittents inftinctively led to it; while others fay, that a Peruvian having an ague, was cured by happening to drink of a poul which, from fonse trees liaing fallen into it , tanted of cinchona; and its ufe in yangrene is faid to lave originated from its curing cne Aa aguifl patiens. Abont the year 1640 , the lady of the Spanifh viceroy, the Comitiffa del Cinchon, was cured by the bark, which has therefore been callod Cortax or Pulvis Comitifir, Cinciona, Chinathira, or
 aina; and from the interft which the Cardinal de tugo and the Jefuit fathers took in its ditribution, it 1an been called entex or Puras Curdmatis ait 2uto, ye

On itn firt introdution into Europe, it was reprobated hymany minent phyficians; and at different periocis long after, it was confidered a dangerous remedy ; but its character, in procefs of time, became very univerfally eflathithecl. For a number of years, the bark which is rolled up into fhort thick quills, with a rough coat, and a briwht cunamon colour in the infide, which broke brittle, and was found, had an aromatic flavour, a bitterith altringent tafte, with a degree of aromatic warmth, was efteemed the befl; though fome efteemed the large pieces as of equal goodnefs. During the time of the late war, in the year 1779, the Huffar frigate took a Spanilh fhip, loaded principally with Peruvian bark, which was much larger, thicker, and of a deeper reddif colour than the bark in common ufe. Soon after it was brought to London, it was tried in St Bartholomew's Hofpital, and in other hofpitals about town, and was faid to be more efficacious than the quill bark. This put practitioners on examining into the hitory of the bark, on trying experiments with it, and on making comparative trials of its effeets with thofe of the bark in common ufe on patients labouring tuder intermittent complainis. In July 1782, 1ir Williain Saunders publifhed an account of this red bark; in which he fays, that the fmall quill bark ufed in England, is either the bark of young trees, or of the twigs or branches of the old ones; and that the large bark, called the red bar'k from the deep colour, is the bark of the trunk of the old trees: and he mentions a Mr Arnot, who himfelf gathered the bark from the trees in Peru; and Monf. Condaminé, who gives an account of the tree in the Memoirs of the Academy of Sciences ac Paris in the year 1738; who both fay, that taking the bark from an old tree effectually kills it; but that moof of the young trees which are barked, recover, and continue healthy; and that for thefe reafons the Spaniards now barked the younget trees for foreign markets, though they fill imported into Spain fome of the bark of the old trees, which they efteemed to be much more efficacious than what was got from the young. From thefe accounta Dr Saunders concludes, that the large red bark brought to London in the year 1779 was of the fame kind as that ufed by Sydenham and Merton, as it anfwers to the defcription of the bark ufed in their time, which is given by Dale and other writers on the materia medica, who were their contemporaries. Dr Saunders fay3, that it is not only Atronger and more refinous, but likewife more efficacious and certain in its efect, than the common bark, and had cured many agues after the other had faiicd.

A fpecies of cinchona has allo been difcovered in the Welt India iflands, particularly in Jamaica: It is accurately defcribed by Dr Wright, under the title of Cinchona Famaicenfis, in a paper publihed in the Philufophical Tranfactions. In Jamaica it is called the fors-fate leech, and grows from 20 to 40 feet high. The white, furrowed, thick outer bark is not ufd; the dark brown inner bark has the common flavour, with a mixed kind of a tafte, at fint of horfe-radifh and ginger, becoming at lat bitter and aftringent. It feems to give out more extractive matter than the cinchona officinalis. Some of it was i.mported from St Lucia, in confequence of its having been ufed with advantage in the army and navy during the laft war; and it has latcly been treated of at confiderable length by

## C I N

 bark is found to be confiderably emetic and cathartic, which properties it is laid to lofe on drying.The pale and the red are chicfly in ufe in Britain. The pale is brought to us in pieces of different fires, either flat or quillid, and the powder is rather of a lighter colour than that of cinnamon. The red is generally in much larger, thicker, flateih pieces, but fometimes alfo in the form of quills, and its powder is reddifl like that of Armenian bole. As already obferved, it is much more refinous, and poffeffes the fenfible qualities of the cinchona in a much higher degree than the otlee forts; and the more nearly the other kinds refemble the red bark, the better they are now confidered. The red bark is heavy, firm, found, and dry ; friable between the teeth; does not feparate into fibres; and breaks, not fuivery, but fhort, clofe, and imooth. It has three layers: the outer is thin, sugged, of a reddifh brown colour, but frequently covered with moffy mater: the middle is thicker, more compact, darker coloured, very refinous, brittle, and yields firlt to the peftle: the inmolt is more woody, fibrous, and of a brighter red.

The Punvian bark yields its virtues both to cold and boiliag water; but the decoction is thicker, gives out its talle more readily, and forms an ink with a chalybeate more fuddenly than the fref cold infution. This infufion, however, contains at leaft as much extractive matter, but more in a ftate of folution; and its colour, on flanding fome time with the clalybeate, becomes darker, while that of the decoction becomes more faint. When they are of a certain agre, the addition of a chalybeate renders then green; and when this is the cale, they are found to be in a liate of fermentation, and effete. Mild or cauftic alkalies, or lime, precipitate the extractive matter, which in the cafe of the caullic alkali is rediffolved by a farther ad. dition of the alkali. Lime-water precipitates lefs from a frefh infufion than from a fre? decoction; and in the precipitate of this laft fome mild earth is perceptible. The infufion is by age reduced to the fame ftate with the freth decoction, and then they depolite nearly an equal quantity of mild earth and extractive matter; fo that lime-water, as weil as a chalybeave, may be ufed as a teft of the relative ftrength and periflable wature of the different prtparations, and of different barks. Accordingly cold infufions are found by experiments to be leis perifhatie than decoctions; infulions and decoctions of the red bark than thore of the pale: thore of the red bark, however, are found by leugth of time to feparate more mild earth with the hane-water, and more extracted matter. Lime-water, as precipitating the extracted matter, appears an equally improper and difagreeable mentltruum.

Water is found to fufpend the refin by means of much lefs gum than has been fuppred. Rectified fpirit of wine extracts a bitternefs, but no aftringeney, from a rcliduum of 20 affufions of cold water; and water extracts all ringency, but no biternefs, from the refiduum of as many affutions of reftified fuirit. This refidua in both are inlipid.

From many ingenious experiments made on the Peravian bark by Dr Irvine, which are now publifhed in a differtation which gained the prize-medal given by the Harveian Suciety of Edindurgh for $15_{8} 3$, the
power of different menftrua, as aating upon Peruvian Cimena, bank, is afeetained with greater accuracy than had be. fore been done: and it appears, that with refpect to comparative power, the fluids after mentioned act in the order in which they are placed.

Dulcfied fpirit of vitriol.
Caunt ley.
French brandy.
Rherifh wine.
Soft water.
Vinegar and water.
Dulcihed firit of nitre.
Mild volatile alkali.
Rectified fpirit of wine.
Mild vegetable alkali.
Lime-water.
The antileptic powers of vinegar and bark unitad are double the fum of thofe taken feparately. '1 the aftringent power of the bark is increafed by acid of vitriol; the bitter tatle is deflroyed by it.
The officinal preparations of the bark are, 1. The powder: of this, the firlt parcel that paffes the fieve being the molt refinous and brittle layer, is the ftrongeft. 2. The extract : the watery and $f_{p}$ irituous extract eonjoined form the moft proper preparations of this kind. 3. The refin : this cannot perhaps be obtained feparate from the gunmy part, nor would it be defirable. 4. Spiritnous tincture: this is beft made with proof-fpirit. 5. The decoction : this preparation, tho' frequentily employed, is yet in many refpects inferior even to a timple watery infufion.

The beft form is that of powder; in which the conftituent parts are in the moft effectual proportion. The cold infution, which can be made in a few minutes by agitation, the firituous tincture, and the extract, are likewife proper in this refpect. For covering the talte, different patients require different vehicles; liquorice, aromatics, acids, port-wine, fmall becr, porter, milk, butter-milk, \&c. are frequently employed; and thofe who diflike the tafte of the bark: itfelf, vary in their aceounts to which the preference is due: or it may be given in form of electuaty with cur-rant-jelly, or with brandy or rum.

Practitioners have differed much with regard to the mode of operation of the Peruvian bark. Some have aferibed its virtues entirely to a ttimulant power. But while the ftrongeft and moft permanent ftimuli have by no means the fame effect wich bark in the cure of difeafes, the bark itfelf hows hardly any ftimulant power, either from its action on the Romaeh, or on other fentible parts to which it is applied. From its action on dead ani:nal fibres, there can be no doubt of. its being a powerful aftringent ; and from its good effects in certain cafes of difeafe, there is reafon to prefume that it is a fill more powerful tonic. To this tonic power fome think that its action as an antileptic is to be entirely attributed: hut that, independently of this, it has a very powerful effect in refifting the feptic procefs to which animal fubitances are naturally fubjected, appears beyond all difpute, from is- efferts in refiting putrefaction, not only in dead animal foIdds, but even in animal fluids, when entirely detached. from the living body.

But although it be admitted that the Peruvian bar's âto powerfuily as all zilringtut, as a tunic, and as an

## C. I N

Cinchonz. antifeptic; yet theefe priuciples will by no means explain all the effects delived from it in the cure of dif. eafes. And accordingly, fom an artificin combinaion in which thefe pows ale conbincd, or in which they exila even to a ligher degree, can the good confequences refulting from l'eruvian bark be obtained. Many practitioners, therefore, are difpofed to view it as a fpeeific. If by a fperific we mean an infallible remedy, it cannot indeed be comblered as intitled to that appellation; but in as far as it is a very powerfut remedy, of the operation of which no fatisfactory explanation has yet been given, it may with great propristy be denominated a fpecific. But whatever its mode of nperation may be, there can be no doubt that it is daily employed with fuccels in a great variety of different difeales.

Ie was firlt introduced, as has already been faid, for the cure of intermitcont fevers; and in thefe, when properly exhibited, it rarcly fails of fuccefs. Practitioners, however, have differed with regard to the beft mode of exhibition ; fome prefer giving it jull before the fit, foome during the fit, others immediately after it. Some, ayain, order it in the quantity of an ounce, between the lits; the dofe being the more frequent and larger according to the frequency of the fits; and this mode of exhibition, although it may perlaps fometimes lead to the employment of more bark than is neceffary, we contider as upon the whole preferable, from bcing beff fuited to moll flomachs. The requifite quantity is very different in different cafes; and int many vernal intermittents it feems even hardly neceffary.

It often pukes or purges, and fometimes oppreffes the flomach. Thefe, or any other effects that may take place, are to be coumtracted by remedies particularly appropriated io them. Thus, vomiting is often reflrained by exhibiting it in wine; loofenefs by combining it with opium; and oppreffion at flomach, by the addition of an aromatic. But unlefs for obviating particular occurrences, it is more fucceffful when exhibited in its fimple flate than with any addition; and there feems to be litile ground for believing that its powers are increated by crude fal ammoniac, or any other additions which have frequently been made.

It is now given, from the very commencement of the difeafe, without previous evacuations, which, with the delay of the bark, or under dofes of it, by retarding the cure, often feem to induce abdominal inflammation, fcirrlhus, jaundice, hectic, dropfy, \&ec. fymptoms formerly imputed to the premature or intemperate wif of the bark, but which are belt obviated by its early and large ufe. It is to be continued not only till the parexs fms ceafe, but till the natural appetite, frength, and complexion, return. Its wie is then to be gradually left off, and repeated at poper intervals to lecure againt a relapfe; to which, however unaccountable, independently of the recosery of vigour, there often feems to be a peculiar difpofition; and efpecially when the wind llows from the eall. Although, however, molt cractunts conjoined with the Pcruvian bark in intermittents are rather prejudicial inan otherwife, yet it is of ahantage, previons to its ufe, to empty the ali. mentary canal, particularly the flomach; and on this account good effects are often ubtained from premifing an emetic.

## 14 ] <br> C I N

It is a medicine which feems not only fuited to both Cinchona, formed and latent intermittents, but to that flat of fibre on which all rigidly periudical difeafea feem to depend; as periodical pain, inflammation, hemorrhagy, fpafm, cough, lofs of external funfe, \&c:

Balk is now ufed by fome in all continned fevers: at the fame time attention is paid to keep the bowels clean, and to promote when neceffary the evacuation of redundant bile; always, however, fo as to weaken a; hitte as $p$ flfible.

In confluent fmall-pox, it promotes languid eruption and fuppuration, diminithes the fever through the whole courfe of $i$, and prevents or corrects putreteence and gangreue.

La gangrenous fore throats it is much ufed, as it is extenally and internally in every fpecies of gangrene.

Ia contagions dyfentery, after due evacuation, it has been ufed by the mouth, and by injection with and without opium.

In all thofe hemornhagies called pafive, and which it is allowed all hemorthagies are very apt to becone, and likewife in other increafed difcharges, it is much ufed; and in certain undefined cafes of hæmoptytis, fome allege that it is remarkably effectual when joinew with an abforbent.

It is ufed for obviating the difpofition to nervous and convulfive difeales; and fome have great confidence in it joined with the acid of vitriol, in cafes of phathitis. ferophula, ill-conditioned ulcers, rickets, feurvy, and in tlates of convalefcence.

In thefe cafes in general, notwithitanding the ufe of the acid, it is proper to conjoin it with a mitk diet.

In dropfy, not depending on any particular local affection, it is often alternated or conjoined with diuretics, or other evacnants; and by its early exhibition after the water is once drawn off, or even begins to be freely difcharged, a frefh accumulation is prevented, and a radical cure obtained. In obllinate venereal cafes, particularly thofe which appear under the form of pains in the bones, the Peruvian bark is often fuccefsfully fubjoined to mercury, or even gisen in conjunction with it.

CINCINNATUS, the Roman dictator, was taken from the plough, to be advanced to the dignity of conful; in which office he reflored public tranquility, and then returned to his rural employments. Being called forth a fecond time to be dicte or, he conquered the enemies of Rome, and, refufing all rewards, retired again to his farm, after he had been dictator only 16 days. The fane circumilance appeared once more in the soth year of his age. Hu died 376 years before Chritt.

Order of Cincinnestres, or the Cincinnati, a fociety which was eftablithed in America foon after the peace, and contifts of the genetals and officers of the army and navy of the United Stzetes. This iutlithtion, called after the name of the Romarr dictato: mentioned in the preceding article, was intended to perpetuate the memory of the revelution, the friendhaip of the oflicers, anci the union of the fats:s: and alfo to raife a fund for the relief of poor withows and orphans whofe hufban's and fathers had fallen duing the war, and for their defcendants. The faciety wes fubdivided intodate focieties, which were to meet on the

## C I N [ $\left.\begin{array}{lll} & 15 & ]\end{array}\right] \quad$ I N

Cincure $4^{\text {th }}$ of July, and with other bufincfs depute a number of their members to convene ar rally in general meetings. The members of the nditution were 10 be di-

Atinguinhed is wearing a medal, cmblematical of the defign of the fuciety; and the honours and advantages vere to be hereditary in the elict male heirs, and, in defaut of male nifu, in the collateral male heirs. Honorary members were to be admitted, but without the herctilaty advantages of the fociety, and provided their aunher fhould never exceed the ratio of one to four of the officers or their defcendants. Though the afpayent defigns of this fociety were harmefs and hons arable, it did not efcape popular jealoufy. Views of a deeper nature were imputed to the franers; and the inktumion was cenfured and oppoled as giving birth to a military nobility, of a dangerous arillocratic power, which might ultimately prove ruinous to the liberdies of the new empire. But the principal ground of apprehenfon was the fuppofed right of inheritance conncled with this honour to render it herediary; which, however, hath been given up and totally difclaimed by the fociety.

CINCTURE, in architectute, a ring, lilt, or orlo, at the top and bottom of the fhaft of a colman, feparating the fhaft at one end from the bale, and at the other from the eapital.

CINEAS, a Theffalian, miniter and friend to Pyrrhus king of Epirus. He was fent to Rome by his malter to fue for a peace, * which he, however, could not obtain. He told Pyrrhus that the Roman fenate was a venerable affembly of kings; and oblerved, that to Gight with them was to fight againft anotler Hydia. He was of fuch a retentive memory, that the day after his arrival at Rome he could call every fenator and knight by his name.

CINERITIOUS, an appellation given to different fubftances, on account of their refembling athestither in colour or confiltence; hence it is that the cortical part of the brain has fometimes got this epithet.

CINNA (L. Coin.), a Roman who oppreffed the republic with his cruelties. He was banifhed by Octavius for attempting to make the fugitive flaves free. He joined himfelf with Marius; and with him at the head of the flaves he defeated his enemies, and made himfelf conlu! even to a fourth time. He maffacred fo many citizens at Rome, that his name became odious; and one of his officers affaffinated him at Ancona, as he was preparing war againft Sylla.

Cinna (C. Helvius), a poet intimate with Czar. He went to attend the obfequies of Carar, and being miftaken by the populace for the other Cinna, he wis torn to pieces.-Alfo a grandfon of Pompey's. He confpired againft Auguftus, who pardoned him, and made him one of his moft intimate friends. He was conful A. U. C. 758, and made Aurgatus his heir.

CINNABAR, in natural hillory, is either native or factitious.

The native cinnabar is an ore of quickfilver, moderately compact, very heary, and of an elegant friated red colour.

Facitious cimmabar is a mixture of mercury and fulphur fublimed, and thus reduced into a fine red glebe. The bell is of a high colour, and full of libres like aeedles. See Chemistry, $n^{\circ} 1404$.

The chief ufe of cinnaber is for painsing. Although
the body is compofed of culplur, which is of a light C' nemen colour, and mercury which is white as filver, it is neverthedi $f$ of an excecting Atrong red erlour. Lumps Cingue. of it are of a deep brown ced without brilliancy; but when the to o wreat intendity of its colour is dimitrifhed ty bruifing and dividing it into fmall parts, (whicl: is a method generally ufed to leffon the intenfity of all colours), the red of the cinnabar becomes more and more exalted, flame colomed, and exceenlingly vivid and brilliant: in this thate it is callad vermillion.

Cinnabar is often employed as an internal medicine. Iloffman greatly recommends it as a fedative and antifpafmodic: and Stahl malses it an ingredient in his tomperant powder. Oth - intelligent phyficians deny that cinmabar t ken internally hãs any medicinal quality. 'Their oprimion is grounded on the infolubility of this fubllance in any mentruum. This queftion concerning its internal utility cannot be deciled withome futher refearches and experiments; but cinnabar is cortainly ufed with [ucecfs to procure a mercurial fumigation, when that method of cure is proper in venereal difeafes. For this purpofe it is burnt in an open fire on red-hot coals, by which the mercury is difengaged and forms raponre, which, being applied to the body of the difeafed perfon, penetrate through the pores of the fkin, and produce effects fimilar to thefe of mercury adminittered by friction.

CINNAMON, the bark of $t$ wo feecies of laurus. The true cinnamon is from the laurus cinnatomum; and the bafe cinnamon, which is often fold for the true, is from the laurus caffia. See I, aterus.

Cinnamon-Water, is made by ditilling the bark firf infufed in fpirit of wine, brandy, or whitewine.

Clowe-CINNAMON, is the bark of a tree growing in Brazit, which is often fuhftituted for real cloves.

White Cinnomon, ealled alfo Wintcr's bark, is the bark of a tree frequent in the iffe of St Domingo, Guadalupe, sic. of a thaip biting ratte like prpper. Some ufu it inftead of nutmeg; and in medicine it is efteemed a fomachic and antifcorbutic. See CAnella.

CINNAMUS, a Greek hiflorian, wrote a hiflory of the cattern empire, during the reigns of fohn and Manuel Commenes, from IIIS to 1143. His ftyle is reckomed the bet of the modern Greek authors. He died after 1183 .

CINNERETH, Cinereth, Chinncreth, (Moles) ; or Genuefarcth, (anc. genc.) a lake of the Lower Galilee; called the Sea of Gulilice, (Mathew); of Tibe.. rius, (John). Its name Gorleforeth is from a fmall cogrominal diftrict upon it. Ín breadth 40 Itadia, in length I40. 'The water freeh and fit to drink, and abounding in frf.

CINQUEPOIE, in botany. Sec Pottntilla.
CINQUE.PORTS, five havens that lie on the eaft pari of England, towards France; thus called by way of eminence on account of their fuperior importancer. as having been thought by our kings to meric a particular regard for their prefervation argainft invafion, Hence they have a particula policy, and are governed by a keeper with the title of Lord-avariden of the Cingue-forts.

Cambden tells us, that William the Conqueror firf
daughter, who efcaped his purfnit and Aed to Arabia, where, after the lad brought forth, Ale was cilanged into a tree which lill bears her name. Cinyras, ac. cording to fome, fabbed limfelf.

CION, or Cyon, in gardening, a young moot, fprout, or fprig, put forth by a tree. Grafting is performed by the application of the cion of one plant upon the ftock of ancther. To produce a tock of cions for grafting, planting, Esc. the gatdeners fometimes cut off the bodies of trees a little above the ground, and only leave a fump or root Atanding: the recundant fap will not fail next fpring to put forth a great number of fhoots. In dreffing dwarf-trees, a great many cions are to be cut off.

CIOTAT, a fea-port town of Provence in France; famous for Mufcadine wine. It is feated on the bay of Laquea, between Marfeilles and Toulon; and the harbour is defended by a ftrong fort. E. Long. 5. 30. N. Lat. 43. 10.

CIPHER, or Cypher, one of the Arabic characters or figures ufed in computation, formed thets, 0 . See Arithmetic.

Cipher is allo a kind of enigmatic charater, compofed of feveral letters interwoven, which are :renerally the initial letters of the perfons names for whom the ciphers are intended. Thefe are frequently uled on feals, coaches, and other moveables. - Anciently, merchants and tradefmen were not allowed to bear arms: in lien thereof, they bore their ciphers, or the initial letters of their names, artfully interwoven about a crofs; of which we have divers inflances on tombs, \&c. See Devise.

CIPHER, denotes likewife certain fecret characters difguifed and varied, ufed in writing letters that contain fome fecret, not to he underitood but by thofe between whom the cipher is agreed on.

De la Guilleticre, in his Lacedamon ancient and modern, endeavours to make the ancient Spartans the inventors of the art of writing in cipher- Their fcytala, according to him, was the firlt flateh of this myfterious ant: thefe fcytale were two rollers of wood, of equal length and thicknefs: one of them kept by the cphori; the other by the general of the army fent on any expedition againft the enemy. Whenfoever thofe magiftrates would fend any fecret orders to the general, they took a flip of parchment, and rolled it very jufty about the feytala which they had referved; and in this thate wrote their intentions, which appeared perfect and confifent while the parchment continued on the roll: when taken ofr, the writing was maimed, and without connection: but was eatily retrieved by the general, upon his applying it to his feytala.

Polybius fays, that IEneas Tactitus, 2000 years agn, collueted whither 20 different manners of witing fo as not to be unjerftood by any but thofe in the lecret; part whereof were invented by himflelf, and part uled before his time. - Trithemius, Cap. Porta, Vigenere, and P. Niceron, have written exprefsly on the fubject of cipbers

As the writing in cipher is become an art: fo is the reading or unravelling thereof, called deciphering. - The rules of deciphering ase different in cifferent languages. Dy obferving the following, you will foon make out any common cipher writien in Engliih.

1. Obferve

## C I $\mathrm{P} \quad[17]$

1. Oblerve the letters or characters that moft frequently occur ; and fet them down for the fix vowels, including $y$; and of thefe the molt frequent will generally be $e$, and the kati frequent $u$.
2. The vowels that mull frequently come together are $e a$ and $04 \%$.
3. The confonant moft common at the ends of words is $s$, and the next frequent $r$ and $t$.
4. When two fimilar characters come together, they are mott likely to be the confonants $f, l$, or $s$, or the vowels $e$ or o.
5. The letter that plecedes or fullows two fimilar characters is either a vowel, or $1, m, n$, or $r$.
6. In deciphering, begin with the words that confint of a lingle letter, which will be either $a, I, o$, or $\mathcal{J}$.
7. 'Then take the words' of two letters, one of which will be a vowel. Of thefe words the moft frequent are, an, to, be, by, of, on, or, no, fo, as, at, if, in, is, it, be, me, my, us, ave, am.
8. In wods of three letters there are mof commonly two confonants. Of thefe words the moll frequent are, the, and, not, but, yct, for, tho', bow, why, all, you, her, his, ber, our, who, may, can, did, was, are, has, bad, let, one, tron, fix, ten, EC:-Some of thefe, or thote of two letters, will be found in every fentenct:
9. The moit common words of four letters are, this, that, then, thers, with, when, from, bere, fome, mof, none, they, then, whom, mine, your, Self, muf, ruill, bave, been, were, four, five, nine, \&c.
10. The molt ufual words of five letters are, there, thefe, thofe, which, wise, while, fince, their, floall, might, sould, would, ought, threc, feven, eight, Ex.
Ix. Words of two or more fyllables frequently begin with double confonants, or with a prepotition; that is, a vowel joined with one or more confonants. The moft common double confonants are $b l, b r, d r, f t, f r, g h, g r$, $p h, p h, p r, f, f b, / p, f, t h, t r, w h$, wur, \&c. and the molt common propolitions are com, con, de, dis, ex, im, in, int, mis, per, pro, pro, re, fub, fup, un, \&c.
11. The double confonants moll frequent at the end of long words are, $c k, l d, l f, m, n d, n, r, r m, r n, r p$, rt, fin, $\rho, x t$, acc. and the moft common terminations are ed, en, er, es, et, ing, ly, fon, fion, tion, alle, ence, ent, ment, full, lefs, nefs, \&e.

- In On Plate CXXXV1L.* fig. 7. is given an example of a cipher wrote in arbitrary characters as is commonly practifed. It will be eafly deciphered by obferving the rules: but when the characters are all placed clofe together, as in the example fig. 8. and as they always fhould be, the deciphering is much more difiicult.

To decipher a writing of this fort, you mult firft look for thofe characters that moft frequently occur, and fet them down for vowels as before. Then obferve the fimilar characters that come together; but you muft remember that two fuch characters may here belong to two words. You are next to remember the combinations of two or three characters that are moft frequent; which will be fome of the words in the feventh and eighth of the foregoing rules; and by obferving the other rules, you will infallibly difcover, with time and attention, any cipher wrote on thefe principles.

When the words are wrote all clofe together, if the key to the cipher were to be changed every sword, according to a regular method agreed on beo

Vol. V. Part I.
tween the parties, as might be done by either of the Cipher. methods mentioned in $\mathrm{N}^{\circ}$ II. below, with very little additional urouble, the writing would then be extremely difficult to decipher. 'I'he louger any letter wrote in cipher is, the more eafy it is to decipher, as then the repetitions of the characters and combinations ate the more frequent.

The following are the contents of the two foregoing ciphers; in which we have inveited the order of the words and Icters, that they who aredefinous of trying their talent at deciphering, may not, inadvertently, read the explanation before the cipher.

The perfon that receives thefe cards infl faces them in the order agred on, and trancribes the firf letter on every card. He then huffis them, according to onder, and trarferibes the fecond letter on eaeh card. He chuftes them a fecond time, and tranferibes the third letters: and $\mathrm{f}_{\mathrm{o}}$ of the reit.

If the earls were to be findited the feeond time by threes and fours, the thid time by two and fours, $\mathcal{E} \circ$ it would make the cifber flill more difficult to difcove: : though as all cipliers depend on the eombin?. tion of letters, there are faree any that may not be deciphered with time ard pains; as we hall thow fitther on. Thofe ci, hers are the bell that are by their nature mof free from fufpieion of being ciphers; as for e:ample, if the letters were there wrote with fympathesie ink, the cards misht then pafs for a common pack.
II. By a dial. On a piece of fquare pafteboard ABCD, tif. 3. 4. draw the circle EFGF, and divide :t intu 26 equal parts, in each of which muft be wrote one of the letters of the alphabet.
On the infide of this there muf be another circle of pareboard, ILMN, moveable round the centre 0 , and the externity of this mutt be divided into the fame number of equal parts as the other. On this alio mult be wrote the letters of the alphatet, which, however, need not be difpofed in the fare order. The perfon with whom you correfpond me? have a ímilar dial, and at the beginning of your letter you mult put any two leteers that anfuct to each other when you have lised the dial.

Exam. Suppofe you would write as follows: "if you will come over to us, you frall have a peufion, and you may fill make a fham oppofition." You begin with the lettere Mc, which flow how the dial is fixed: then for If you, you write un juc, and fo for the reft, as you will fee at fig. 6 .

The fame intencion may be anfwerd by a ruler, the upper part of which is fixed and the lower part made to hlide; but in this cafe the upper part muit contain two alphabets in fuccufion, that fome ketter of that part may cundantly correfpoad to one in the lower part. The divilicns ftanding directly over each other in a Araight lise will be much mone obvions than in the eircumference of a circle. Or two firaight pieces of paltetroa-d tegulanly divided, the one containing a fingle and the other a doutle alphabet, would anfwer ex. adty the fame purnufe. In this cafe a blank face may be left at each end of the fincle alphabet, and one or two weights being placed on both the ficces will keep them fready.

UI. The correforialing $\sqrt{\text { Gacts. }}$ Take two pieces of

## : 8 C I P

pafthnard or hifi paper, through which you men cut long 'quares, at different diflances, as you will fee in the fullowing example. One of thefe pieees yon keep yourfalf, and the other you give to your correfiondent. When you would ferd him any fecet intelligenee, you lay the pardebard upon a paper of the fame lise; and in the fpaces cut out, you write what you would have underttod by him only, and then fill up the internediate $f_{p a c: s}$ with fomewhat that inakes with thofe words a different enfe.

Ithail Ef much obliges to you, as reading aune enfarges my attention prifent, if you will lind me any one of the pight v.lumes of the Speetator. I hope you will excule $\mid$ find fredom, but for a winter's evening Ion't know a better entertainment. If I |fiij to retum it foon, never tuat me for the time to come.

A paper of this fort may be placed four diferent ways, either by putting the botom at the top, or by turning it over; and by thefe means the fuperffuous words may be the more cafily adapted to the fenfe of the others.

This is a very eligible cipher, as it is frce from fufpicion, kut it will do only fir thort reffages: for if the fpaces be frequent, it will be vety difficult to make the concealed and cbvious meanings agree together: and if the fenfe be not claar, the witing will be liable to fufpicion.
IV. The muffical ciphor: The conftruction of this cipher is fimilar to that of $\mathrm{N}^{*}$ 11. The circle EFGII (fig. 3.) is to be divided into twenty-fix equal parts, in each part there mult be wrote one of the letters of the alphabet: and on the anterior circle ILMN, moveatle round the centre $O$, there is to be the fame number of divifions: the circumference of the innel eircle mult be ruled in the manner of a mufic paper; and in each divition there is to be placed a note, difo fering either in figure or pufition. Lafly, within the mufieal lines place the three keys, and on the outer circle, the figures that are commonly uled to denote the time.

Then provide yourfeif vith a ruled paper, asd place one of the keys, as fuppofe that of ge re fol, againf the time two-fourths at the heginning of the paper, which will inform your corref fondent how to fix his circle. Fou then copy the nutes that aufver to the feveral letters of the words you intend to write, in the manner expreffed at fig. 5 .
A cypher of this fort may be made more dificult to difcorer by frequently changing the key, and that will not in the lealt embarrafs the reader. You may likewife add the mark 范 or b to the note that begins a word, which will make it more eafy to read, and at the fame time give the mufic a more natural afpect. This eipher is preferable to that of $\mathrm{N}^{\circ} \mathrm{II}$. above, as it may be inclofed in a letter about common affairs, and pafs unfufpected.

CIPPUS, in antiquity, a low column, with an in. fcription, erected on the high reads, or other places, to fhow the way to travellers; to ferve as a boundary; to mark the grave of a deceafed perfon, धer. failles, remarkable for a numery founded here by Louis XIV. The nuns are obliged to take care of the education of 250 girls, who ram prowe their familics to have been noble from the fthe generation on the father's dide. They canot enter before $\%$, nur ofter 12 years of age: and they continue there till they are 20 years and 3 months odd. The houfe is a mot magnificent tructure.
CIREXA, inchanter's night-shade: A qemus of the monorymia arder, belonging to the diandria ciafs of plants; and in the matural necthod rank ner ninder the 4 Sth order, Assergare. The condala is dipatalons; the calys dipmikus, fuper'or, with one timenthe lied. There are two feccies, one of which is a native of Erain, and the wher of Garmany. They are low herbaceous plants with white flowers, and poffefied of no remarkable property.

CIRCASSIA, a large com itry of Ahia, fituated between +5 and 50 degres of morth latitude, and between to and 50 of and homitude. It is lounded by Rufiad on the noeth; ly Allucan and the Cafpian far on the eall ; by Georga and Dasitan on the futh: and by the niver Don, the Palus afeutis, and the Bhack Sea, on the welt. This comity bas !ourd heen cet:brated for the cxtraurdinary beality of its women; and liere it was that the praztice of inculuatrag for the finall-pox fort began. 'Terki, the pincipal city, is feated in a very facions plain, vely fwanpy. towards the fea-fide, in 43 der. 23 mom. nom latitude: it is abort three werts in cremper, well fortiical with ramparts and baftions in the moderustyle, well flesed with cannon, and has almays a conderable garvifun in it, under the command of a governor. The Circailian prince who refides here, is ahowed five hadred Ruro fians for his guard, but none of his own fubjects are pernitual to dwell within any part of the fortifications. Ever lince the reduetion of thofe pate to the obedience of Ruffa, they have put in all places of thength, not ouly Kuffan gartifons and governors, but magifirates, and priflls fur the exercite of the Chrikian religion; yet the Circalian Tartars are governed by their own princes, lords, and judges; but the fe adminifite juftice in the name of the emperor, and in matters of importance, not without the prefence of the Ruflam governors, being :." oblized to take the vath of all egiance to his imperial majety. The apparel of the men of Circaftia is ruch the fame with that of the Nagayans: only their caps are fomcthins larger; and their chaks being likersife of coarfe clath or heep隹ins, are faftened only at the neck with a tering, and asthcy are not large cunugh to cover the whole body, they turn them round according to the wind and weather. The men here are meh better favomed than thole of Naguya, and the women extremely well haped, with exceeding fine features, finonth clear complexions, and beautifn black eyes, which, with their holack hair hanging in two treffes, one on each fide the face, give them a mof lovely appearance: they wear a black coif on their heads, covcred with a fine white aloth tied under the chin. During the fummer they atl wear oully a fmock of tivers colvurs, and that upen fo low befure, that one may fee below their navels: this, with their beautiful faces always uncovered (conBary to the cuilom of molt of the other provinces in
thele farts), their good hmmour and lisely freedom in Circaifus. converfation, altugether render them very atamany: $-\infty-\infty$ notw ithfandiug wbich they have the reputation of being wery chafe, though they feldom want opportunity; for according to the accounts of a hate tratciker, it is an ethablifhed point of good manners anong them, that as foom as any perion comes in to fpeak to the wife, the hanand eques ont of the houic: but whether this continency of theirs procecds from their own generofty, to recompence their hutbands for the conlidence they pat in them, or hasits fumatation only in fome, he pretemio not to dotomine. 'F'heir langurge they have in comamon with the other nuighbouring 'Tatars, adthomb the ched peonte amony them are alion not ifnom it the Rumbion: their religion is Pagenifn; foe notwitho fanding they we circuacifon amons them, they have nuther prict, akcoran, or mofque, like other Mahometans. Every body here offers his own facrince at picafire: for which, howerer, they have cortain days, ettablifaed rather by cuftom them any politive command: thar mot fulma facsince is uftered at the deaih of their nearelt frimb; upon which occolion bothemen and women noct in the fidd to be pretent at the offering, which is an he-guat ; and having killed, they flay it, and drecth the kin with the head and borns on, upon a crols at the tup of a long pole, placed commonly in a quickfet hodgre (tu lecep the cattle from it): and near the phace the facrifice is offered by boiling and rowling the dich, which they afterward; eat. Wisen the foall is over, the men rife, and haviur, paid their adoration to the thin, and muttered ove fome certan prayers, the women withdraw, and the men condude the coremeny with drinking a great ghantiy of aquavitie; and this generally ends in a quam! before they part. The face of the country is fatantly divemfed with mountains, valleys, woods, lakes, anrl rivers; and, though nut much cultivated, is far from beins unfmio ful. In fummer the inhabitants quit the towns, and encamp in the fields like the neighoouring Tanars; occalionally fhifting their thations along with their fooks and herds. Betides game, in which the country greatly abounds, the Cireaffians eat beef and mutton; but that which they prefer to all ollers is the Acth of a young horfe. Their bread confits of thin cakes of banley meal, baked upon the hearth, which they always eat new; and their ufand drink is wator or mare's milk; from the latter of which they dillil a Spirit, as molt of the T'artar nations. They allot no fixed loura for the refrefments of the table or fleep. which they indulge irregularly, as inclination or conveaience dictates. When the men make excurfions iuto an enemy's e mutry, they will pals feveral days and nights fuccefincly with int llecping; but, at their return, deyote as much time to repofe as the flace in which they had before with -he'd from that gratification. When they eat, they fit crofs-legged on the floor, the Rin of fome animal ferving them infted of a carpet. In removing from one part of the country to anctlice, the women and cbildren are carred in wisrons, whichare a kind of travelling houfes, and drawa by usen or cat mels, they never ung horfes for draught. 'Their breed of the latter, however, is reckoned excectiag good; and they are accuftumed to fwim atmott any river on hurfuback. The women anl chaldran fanke tobacco as well as the men; and this is the mont accept-

Cive table commodity whichatravellercan carry with him incircte. to the Tartar countics. There are here no public inns, which indeed are maneceftry; for fo great is the hofpi-
talicy of the people, that they will contend with cach other who fall entertain any dranger that happens to come among them. - The principal branch of their trafte is their own chidden, efpecially their daughters, whom they fell for the we of the feraglios in 'Turky and Pollis, where they frequently marry to gieat advantage, and make the fortune of their familics. 'The merchants who cone from Conlantinople on purchafe thole girls, are generally Jews, who, as wcll as the mothers, are faid to be eatremely eareful of preferving the challity of the young women, knowine the value that is fet by the Turks urom the manks of virginity. The sreater part of the Citcaffians are Chritizans of the Greek chureh ; but there arc alfo both Mahometans and Pagans amonglt them.

ClRCE (Eib. hill.), a daughter of Sol and Perfeis, celebrated for her howledge of magic and venomomas herbs. She was filler to Aetes king of Colchis, and to Pafiphac the wife of Minos. She married a Sirmatian prince of Colldis, whom the mordered to obtain the kingdom. She was expelled by her fubjects, and carried by her father upon the coatts of laly in an ifland called Nica. Ulytes, at his return from the Trojan war, vilited her contls; and all his companions, who ran headong into pleafure and voluptuoninefs, wete clanged by Circe's potions into tilthy fwine. llyifes, who was fortifed againll all enchantmenta by an herb, called moly, which he had rectived from Mereury, went to Circe, and demanded fword in hand the reftoration of his companions to their former ftate. She complied, and loaded the hero with pleafures and horours. In this voluptuous retreat Ulyffes had by Ciree one fon called Telegonas, or two, according to Hefod, called Agrius and I,atinus. Cor one whole year Ulyfes forgot his glory in Circe's a ths. At his departure the nymph advifed him to defeend to hell and to confalt the manes of Tircfas concerning the fates that attended him. Circe mowed herfelf cracl to Scylla her rival, and to Picus.

CIRCENSIANgames, a gencral term under which was comprehended all combats exhibited in the Poman circus, in imitation of the Olympic games in Grecee. M, 价 of the feafts of the Romans were accompanied with Cireenfan games; and the magiftrates, and other officers of the republic, frequently prefented the people with them, in order to procure their favour. The grand games were held five days, commencing on the 15 th of September. See Circus.

CIRCLE, in geometiy, a plane figure comprehendcd by a fingle curve line, called its cirenmference, to which right lines diawn from a point in the middle, called the centre, are equal to each other. See Geometry.

Circess of the Sphere, are fuch as cut the mundane fphere, and have their periphery either on its moveable furface, or in another immoveable, conterminous, and equidiftant furface. Sec Sphere. Hence arife two kinds of circles, moveable and immoveable. The frift, thofe whofe furipherics are in the moveable furface, and which therefore revolve with its diarnal motion; as, the mondians, \&c. The latter having their
periphery in the immoveable furface, do not revolve; Cireles. as the ecliptic, equator, and its parallels, \&c. Sec Geography.

Cisojes of titiade, otherwife called almucanars, are circles parallel io the horison, havins their common pole iu the oenith, and flitl diminiming as they apo phoach the genith. See ilmucanara.

Dinend Ciseres, are immorable cincles, fuppofed to be deferibed by the deven tars, and other points of the heasens, in their dimnal rotation round the earth ; or when, in the rotation of the earth roumes its axis. 'lhe dumal circles are all mequal: the equator is the biggent.

Howny Comats, in dialing, are the lines which flow the hows on dials; theught thefe be not drawn circular, hut nearly fraight. See llaming.

Cikides of Latitut, or Scomdaries of the E:liptia, are great circles parallel to the plane of the ecliptic, paifing through the poles thereot, and thourh crery Alar and planct. T'key are fo called, becaule they forve to meafure the latitude of the fats, which is nothing but an arch of one of thefe cindes intercepted between the dar and the collptic. Sce larirube.

Cisetfes ff 1 nergituh, are fevoral lefler cirches, paralld to the ecliptic; stitl diminihise in proportion as they reecde from it. On the artas of thefe circles. the lon ritude of the flars is reckoned.

Ciraly of peratual Ahpariton, one of the lelfer circles, paralles to the equator; deferibed by any point of the fplere touching the nortben point of the horizon; ind carried about with the dimmal motion. Alf the flars included within this circle never fot, but are cuer vilible above the horizon.

Circif of forpotual Occu!ation, is another circle at a like diffance from the equator; and contains all thote flars which never appear in our hemifphere. 'The itars fituated between thefe circles altemately rife and fet at certain times.

Poldi Curcias, are immoveathe circles, parallel to the equator, and at a diftance from the poles equal to the greatelt declination of the ecliptic. 'That next the nothern pole is ealled the arctic; and that next to the fouthern one the antarctic.

Fairy-Cinctr. Sce Fatry-Cirlef.
Druditul Ciretes, in Britifh topagraplyy, a name given to certain ancient inclafures formed by rude Hones circulanly arranged, in the manner reprefented on Plate CXXXV.* Thefe, it is now generally agreed, were temples, and many writers think alfo places of Vol iv folemn aftumblies for councils or elecions, and feats of judgment. Mr Borlace is of this opinion. "Intead, therefore (fays he), of detaining the reader with a difpute, whether they were places of worthip or council, it may with great probability be afferted, that they were ufed for both purpofes; and having for the moit part been firt dedicated to religion, naturally became afterwards the curize and fore of the fame community." Thefe temples, though generally circular, occafonally differ as well in ligure as marrnitude: with relation to the fult, the mont fimple were compofed of one circle: Stonchenge confifted of two circles and two ovals, refpectively concentric ; whill that at Bottalch near St Juil in Cornwall is formed by fonr interfecting circles. And the great temple at Abury in

Circle. Cirenacel liones.

Wilthire, it is faid, deferibed the forute of a feraph or fiery llying ferpent, reprefented by circles and sight lines. Some befides circles have avenues of tlone pillars. Mort, if not all of them, have pillats or altars withen their penetralia or contre. In the artiche of magnitude and number of dones, there is the greateit varicty; fome circles being only twetre feet diameter and formed only of twelve flowes, whilt others, fuch as Stonchenge and Ahury, wotained, the furt one houdred and forty, the fecond fix hundred and difty two, and occupied many acres of ground. All thefe difierent numbers and mealures and arrangements had their pretonded reference: either to the allronomical divitions of the year, or fome myteries of the druidied relision. Mr Borlace, huwerer, fuppofes, that thofe very finall circles, fometimes formed of a low bank of carth, fometimes of thones aced, and fiequently of loofe fimall Itones thrown together in a circular form, cocloling an area of abous there yards dianeter, without any larger cincle round them, were originally places of bursal.

Cikcer, in logic, on Longical Cikces, is when the fame tems are proved in orbem by the fame terms; and the parts of the fyllogifna alcemately by cach other, both directly and indirectly.

Chates of the Empire, fuch movinces and principalities of the German empire an have a right to be prefent at dicts. Maximilian I. divided the empire into fix, and fome years after into ten circles. This lat divifion was confirmed by Charles V. The circles, as they fland in the Imperial Matricola, are as follow: Antria, Burgundy, the Lower Khine, Bawaria, Upper Sasony, Franconia, Swahia, Upper Rhine, Welt1hatia, and the Lower Saxony.

CIRCONCELLIONES, a fpecies of fanatics, fo called becaufe they were continually rambling round the houfes in the cumentry. They took their rile among the donatits, in the reign of the emperen Conltantine. It is ineredible what ravages and cruchies thefe vagabonds committed in Africa through a long feries of years. 'They were illiterate, favage peafants, who anderilood only the Punic language. Intoxicated with a barbarous zeal, they renounced agniculture, profefled continence, and affunced the title of "Vindicators of jutlice, and Protectors of the uppert." To accomplith their mifton, they enfranchifed flases, fcoured the roads, forced mallers to alight from their chariots, and run before their flaves, whom they obliged to mount in their place; and difcharged debtors, killing the creditors if they refufed to cancel the bonds. But the chief objects of their cruelty were the catholies, and efpecially thofe who had renomed donatim. At lifft they afed no fworels, becaufe God had forbidden the ufe of onte to Peter; but they were armed with chan, which they called the chots of Ifrael; and which they handled in fuch a manner as to break a man's bones without killing him immediately, fo that he langruifhed a long time and then died. When they took away a man's life at once, they looked upon it as a favour. They became lefs formpulous afterwards, and nade ufe of all forts of arms. Their fhout was Praifa te to God. 'Thefe words in their mouths were the firgnal of nlaughter, more terrible than the roaring of a lion. They had invented an unheard of punifhment; which was to cover with lime diluted with vincgar,
the eyes of thofe unhappy wetches whom they had Circonecl. crufhed with blows, and covered with wronds, and to abandun them in that condition. Nower was a ftronger proof what horrors fuperttition can leget in minds dellitute of knowledge and humanity. Thefe brutes, who had made a vow of chaftity, grave themfelscs up to wine and all forts of inmmities, ruming about with women and young girls as drank as themfedus, whem they called fored rirgins, and who often cartid proofs of their incontinemec. Their chiefs took the mame of Chicfs of the Sumets. After having glutted themfelves with blond, they turned their rage upon themfelves, and fought death with the fane fary with which they gave it to others. Some forambed up to the tops of rocks, and call themfelves down headlong in multitudes; others burned themfelves, or thew themfelves into ihe fea. Thofe who propofed to acquire the title of martyrs, publithed it long before; upon which they were fealled and fattened like oxcil for the faughter; after thefe preparations they fet ont to be deflroyed. Sometimes they gave muncy to thofe whom they met, and threatened to murder them if they did not make them martyrs. Theodorat gives an account of a dout young man, who mecting with a troop of thefe fanatics, confented to kill them, provided be might bind them dirf ; and having ley this means put it out of their power to delond themfolves, whipped them as long as he was able, and then left them tied in that manner. Their bilhops pretended to blame then, but in reality made ufe of them to intimidate fuch as might be tempted to forfake their feet; they even honoured them as faints. They were not, however, able to govern thofe furious montlers; and more than once found themfetves under a nceeflity of ahandoning them, and even of imploring the aflifance of the fecular puwer againt them. 'flhe counts Uffacius and Tate rimus were employed to quell them; they dettroyed a great number of them, of whom the dotanills made as many martyrs. Urfacius, who was a good catholic and a religious man, having lot his hife in an engagement with the burbarians, the donatilts did not fail to trimmph in his dearh, as an chlét of the vengeance of heaven. Afrien was the theatre of thefe bloudy feenes during a great part of Conftantine's life.

CIRCUI'1, in law, fignifies a longer counfe of proccedings than is needful to recover the thing fued for.

Circuit, alfo fignifies the journey or progrefs, which the judges take wive every year, through the feveral connties of England and Wales, to hold courts and adminiller jullice, where recourfe cannot be had to the king's courts at Wenminiller: hence Eugland is divided into fix circuits, viz. the Home circuit ; Norfolk circuit; Midland circuit; Oxford circuit ; Weflern circuit, and Northern circnit. In Wales there are but two circuits, North and South Wales: two judges are afligned by the king's commilfion to erery circuit.

In Scotland, the judges of the fupreme criminal court, or conrt of julliciary, are divided into three feparate courts, cunfilling of two judges each; and the kingdom into as many diftricts. In certain boroughs of every ditrit, each of thefe courts by rota-
lanees,
Circuit.

## C 1 R

anit han are ariveri to hoti two comes in the yeat, in Fabletion Tping and antumn; which are caled cimoteron's.
Wharial Cos cita, denotes the conde of the eledtic haid from the charred fuffee of an cleerric body, to the oppofite larface into which the dicharge is mat? Some of the firit electercims apprenended, that the tame particies of the eiectric huid, which were thresa oa one fille of the clarged glats, atually made the whole circhit of the intervening conductors, and arrived at the oppofte fide: Whareas Dr Fianklia's theory on!y reguires, that the redundacy of chetric mattir on the charred furace fould pals into the wodies which form that pret of the circtit which is contigunni to is, driving forward that pate of the fuid which the menally pounds; and that the delacieroy of the canauted furface thould be fepmided by the nightouming conductors, whath fion the lat pirt of the circait. On this fuppelition, a vioratimy motion
 of the circuit. This checuit is alarys formed of the but contenems, let the learth of it be ever fo great. Many atempts were made, toth in France and England, at an canls perival in the hitory of clectricity, to weretain the ditance to which the electrie fluck night be caried, and the velocity of ita mation. The French philofophers, at diferent times, made it to pais through a circhit of geo wifes, and of 2000 toifes, or about two Engl the miles and a half; and they difhargel the Leyden phat through a bafon of vater, the furface of which was about an acre. And M. Momier found, hat, in paffing through an iron wire of 050 toifes in length, it did unt fpend a quarter of a fecond; and that its motion was initantancous through a wire of I 319 feet. In $17+7$, Dr Watien, and cther Englifa plilofophers, after many experiments of a fimilar lind, convered the cleetric matter throm at circuit of four miles; and they comelnded from this and another trinl, that its velocity is inftantaneous.

CIRCULAR, in a genersi tenfe, any thing that is defcribed, or moved in a round, as the cinumference of a cirche, or furface of a ghtue.

Circules Number, calle a allo pherival ones, according to fome, arz fuch whofe powers teminate in the routs thenfelves. Thus, for imfance, 5 and 6 , all Whofe powers do end in 5 and 6 , as the fyuare of 5 is 25 ithe fquare of 6 in 3 㱜, 民ic.

Cfactures Gither, is the method of fationg by the arch of a great cicle. See Natigation.
CIRCULATION, the act of moving round, or in a cirele; thas we fay, the circulation of the blood, sec.

Ciferlation of the EProd, the natural mation of the blood in a hing animal, wherey that fluid is aternately carried from the heart into all parts of the loody, ly the arterics, froms whence i is bruaght back to the hicart again by the veihs. Sec Akstosy, a: 125 .

In a fretur, the apparatus for the circulation of the blood is fumewhat diferent from that in alults. The foptum, whith feparates the two auricles of the leart, is juierced through with an aperture, calld the formnen oratic; and the truak of the pulmonay athry, a little after it has left the heart, fends ont a tube into the defeending aorta, callied the commanicating canal. The foxtus being boon, the foramen orake clofes by degrees, and the canal of communication dites up, and becomes a fimple ligament.

As to the velocity of the circulating blood, and the Ciremation time whercin the circakain is completed, feveral computations have becn made. Dy Dr Keil's account, the bloud is crizen out of the heart ineo the aorta with a velusity which woull carry it twenty-five feet in a minute: but this velocity is continually abated in the progrefs of the blood, in the numerous fections or branciacs of the arteries; fo that before it arrive at the extremities of the body, its motion is greatly diminitued. The fince of time wherein the whole mafs of biood ordinarly circulates, is varioully determined. Sone it ate it thua: Suppoing the heart to make two thoudatd pulfes in an hour, and that at every pulfe theme is expell.d an ounce of bhod; as the wholemof of blood is not ordinarily computed to cxeed twemtyfour potiads, it mult be circulated feren or eight time; over in the faze of an hour.

The curious, in microfapic obfervations, have found an eafy method of feeing the circulation of the bood in the budies of aninals: for there inquiries it is ne. cuffary to choofe fuch animat; as are fmall, and enaily manderable, and which are cither wholly or in part trarfparent. The obfervations made by this means are preferable to any others we can have recourfe to; fines, in diffoious, the animal is in a tate of pain, of dung; whereas in anirals fmall enough to be thus vewed, all is left in its ufal comfe, and we fie what nature does in her own unditurbed methol. In thefe creatures alfo, after viewing, as long as we pheafe, the natanal thite and carrent of the blood, we may, by prefture, and feveral other ways, impede its courfe; and by pateing varions mixtures into the creature's water, incuee a morbid flate, and holly fee the crealure de, either by means of this or by any cher method; and we may thus accurately obferve all the changes it undergoes, and fee what occafions the trembling pulfe, ec. of dying people.

The current of the blood in fmall animals, that is, its palling on through the vefiels, either to or from the leart, is very cafly fetu by the microfope; but its circulation, that is, its ruming to the extremities of the parts, and titnee returning, is more difficult ; becaule the vefits where this thould be feen are fo ex. tremaly minute, as not eafily to come under obfervation. The larger arteries are cafily difinguifhed from the veins by the motion of the blood through them, which in the veins is always finooth and regular; but in the arteries by feveral propultions after the manner of pulfation. Dut this differnce is not to be found in the more minute veffels; in all which, as well arteries as veins, the motion of the biood is even and regular.

The tranfparent membrane, or web between the toes of a frog's hinder foot, is a very proper object to oblerve the circulation of the blood in. The tails or thas of filhes are alfo very fine objects; and when the fin is very fmall, thefe are manageable, and afford a view of a great number of veins and arteries, with a very quick and beautiful fucceffion of blood through them. The tail of a founder may be very conveniently placed before the double microfonje on a plate of glaifs; and its body being fupported by fomething of equal height, the fifh will lic ttill, and the circulation may be fecn very agreeally. In the minutelt veffels thus examined, the blood ahways appears

C I If $\quad[23$
Xeculatinn, pate or colcunius, but in the large ones it is manifullcacuiss ly red. The ateries u\{a, lly bratch out eratimely before they join the veins to carry the bloon buck th the heret: but this is not always the cafe; for Mr Leweulaseds has obferved, that on each bile of the little frifles which give a ltiffets to the tall of a flounder, thete may be fen a wery open commanication of the veins and atteries; the bhood ruming towards the extremities through erterice, and returning baek again through reins, which were evidenty a contumation of thofe atteries, and of the fame diameter with them. The whie fith on the wal of which this examination was male, was not mors than half an inch in leagth; it is ealy to cunceive, thenfore, how fmall the tail mat be; and yet in it then were 68 vefiels whech carricd and returoed the hook; and yet thefe veffels were far from being the molt minute of all. How inconceivatly numerne than mut the circtumons in the whole lama body lue? Mr Lewenhourt: is of opinin, that a thoufned dif. ferent circulations are continualy corried oa in every part of a man's body in the breadeh of a fimger mat.

The tail of a nevt or water-lizard affords allo a very entertainine profped of the circulation of the blood through amot manbelefs fmall vefils; hat no wject hows it fo agreatly as one of thefe amimals while lo young as not to be above an inchlong; for then the whole body is fo very trmparen:, that the circulation may be feen in every part of it, as weil as in the tail; and, in thefe objects, nothing io more beantiful than the courfe of the blood into the tows and back again, where it may be traced alit tie way widh groat eafe. Near the hoad there are alfo found three finell fins which affori a very deligheful parfpect: there are all divided lise the leaves of pulspody; and in every one of the branches of thete, the blood may be very accurately traced, maning to the end through the arters, and there retarning back arain by a vein of the fame fize, and laid in the fance diredion; and as the velfels are vory numerous and large in this part, and the third or fourth marmitier may be ufd, there are fometimes feen 30 or 40 chmnels of ruming blood at once: and this the more as the globules of thood in the nerbe are large, and are fewer in number, in proportion to the quatity of 5 rum, than in any other animal: and their figure, as they are protruded throuch the veffels, changes in a very furpriting nanner. The imputus occationing the circulation, is great enough in fome animals to raife the blood fix, feven, or cighit feet lighl from the bloodveffel it furings out at ; which, howerer, is far exceeded by that of the fap of a wine in blecditg time, which will fometimes rife forty fect ligh.

Circulation of the fop of Pluhls. See Plante, and Sap.

Circonation of the Spirits, or Nervous Fluid. Sce Avatomy, no 136.

Crrculation, in chemiftry, is an operation whereby the fame apour, raifed by fine, falls back, to be returned and dittiled feveral times.

Crrculation of Money. See Commerce, and Money.

Subterranean Cixcleation. See Srrings.
CIRCULUS, in chemiltry, an iron inftrument in form of a ring, which being heated red-hot, and ap-
plical to the necks of retorts and other ghafs verims till Cir mom they grow hot, a few drops of coll water thrown upon bant them, or a cold b'at, will make the necks fly regulaty' Circtimes. and evenly oas.

Another method of durg this is, to tie a these, -man firt dipt in oil of turpention, woud the place whete gou would have it brak; ant then fatini; fere to the thread, and attervards frinklins the phom with cold water, the glafo wat crack exatily witue th: thend vastied.

CIRCUMANIDILNT, an appltation given tha thing that furrons ls another on all iados chedy wat in lo a akiag of the abr.

Clectmedhliones. See Circoncrajo. NEs.
CIRCTMICISION, the at of cuting of the prepuce: a cerensery in the Juwita and Mamenen re ligions, vinceis they celt off the forclkin of that males, when tre to profers the one or the ether law.

Cimonat ocurmencel in the time of Abrahan: and was, as at were, the foal of a covement tipulated between God and him. It was in thic year of the wond 2108 , that Nbaham, ly divine appeintacent, circumeted limath, and all the males of his fomily; fom what tiane it beame an ancuiary patatice among his duluedarts.

The cememony, however, was not contined to the Jews: Ferrdueth and Fhito Jurdeas obforve, that it citained alformone tha Egptans and Ethomianto Herodutus fays, that the cuthm was very ancient anong rachptople; fo that there was no determining whim of them berroxed it from the other. The fame hiftorian relates, that the inlahitants of Culdits alion aidd circumetion ; whence he concludes, that they were orginally Ieryptims. Ho adde, that the Phenicions and Syriat: wore likerife circumeifed; bat that they borrowed the partize from the Egyptians, Anclally, that a litale before the time when he wrote, circuncition had paited from Colhis, to the people inlubiting near Thermodoon and ₹arthenhus.

Maraam is sf opinion, that the Hetrews borrowed circumcifion from the Egyptians; and that God wa not the firlt author the eof ; citin? Dindorous Siculus, and Herodotus, as evidences on his fide. This latter popation feems direttly contrary to the teflimuny of ifofes, viouaffurcs, Gen. xvii. that Abralian, the 22 years of age, was not circuncifed till he had he exprefs commend of Gud for it. Pist as to the former fofition of Marham, it will admit of more de:bate. The arguments on both fides may be feen is one view in Spencer de Legibus Iflbrormm, l. 2. c. 4.

Be this as it will, it is certain the practice of circumcition among the Hebrews differed very conflerably fiom that of the Egrptians. Among the firt it was a ceremony of religion, and was performed on the eighth day alter the birth of the child. Among the latter, a point of mere decency and cleanlinefs; and, as fome will have it, of phyfical necefity; and was not Ferformed till the 13 th year, and then on girls as well ans hoys.

Among the Jews, the time for performing this rite was the cighth day, that is, fix full days, after the child was born: the law of Mofes ordained nothing with refpect to the perfun by whom, the inflrament with whick, or the manner how, the ceremony was to be ferform-

## C l R [ 2t ] C I R

Ceranci ed; the informent was cencrally a kuife of thone. ann The chind is wailly circumeifed at home, where the Cirumes rentor. father, or grodfatlecr, hohs him in his arms, white the operator takcs hold of the papace with one hand, and
with the other cuts it off; a third perfon holds a porringer, with fand in it, to catilh the blood; then the operator applices his mouth to the part, and, having fucked the blood, fpits it into a bow of wine, and throws a ftyptic powder upon the wound. This ceremony was ufually accompanicd with great rejoicings and featting; and it was at this time that the child was named in prefence of the company. The Jews invented feveral fuperfitions cuftoms at this ceremony, fuch as placing three itools, one for the circumcifor, the fecond for the perfon who holds the child, and the third for Elijah, who, they fay, affins invifibly at the ceremony, Eic.

The Jews difinguithed their profelytes into two forts, according as the $y$ became circumeifed or not: thofe who fubmitted to this rite were looked upon as chituren of Abratam, and obliged to keep the laws of Mofes; the macircumcifed were only bound to otferve the precepts of Noch, and were called noousbite.

The Turks never ci:cumaife till the feventh or eighth ycar, as having no notion of its being necerfary to falvation. The Perfans circuncife their brys at 13, and their girls from 9 to 15 . Thofe of Madagacar cut the fieth at three feveral times; and the molt zealous of the elations prefent, catches hold of the preputium and fwallows it.

Circumcifion is pratifed on women by cutting off the foreRin of the clitoris, which bears a near refemblance and analogy to the preputium of the male penis. We are told that the Egyptian captive-women were circuncifed; and alfo the fubjects of PreRer John.

Circuncision is alfo the name of a feaft, celebrated on the firt of January, in commemoration of the circumcifion of our Saviour.

CIRCUMIDUCTION, in Scots law. When partics in a fuit are allowed a proof of alledgeances; after the time limited by the judge for taking that proof is elapfed, either farty may apply for circumduction of the time of proving ; the effect of which is, that no proof can afterwards be brought, and the caufe mull be determined as it flood when circumduation was obtained.

CIRCUMIFERENCE, in a general fenfe, denotes the line or lines bounding a plane figure. However, it is generally ufed in a more limited fenfe, for the curve line which bounds a cincle, and othcrwile called a perithery; the boundary of a right-lined figure being expreffed by the term forimeter.

CIRCUMFERENTOR, an infrument ufd by
Piare
cexxy. It cunfits of a biats index and circle, all of a piece. in Vul. IV. The index is commonly about 14 inches long, and an inch and a half broad; the diancter of the circle is about fever inches. On this circle is male a chart, whofe meridian line anfwers to the middle of the breadth of the index, and is diviled into $3^{50}$ degrees. There is a brafs ring foldered on the circumference of the circle, on which ferews another ring, with a flat glafs in it, fo as to form a kind of box for the needke, $\mathrm{N}^{\circ} 8 \mathrm{~L}$.
fufpended on the pivot in the centre of the circle. CircamfeThere are alfo two fifthts to ferew on, and lide up and reneor, dowin the index; as atito a fpangle and focket ferewed $\underbrace{\text { Circumnex. }}$ or the back lide of the circle for pating the head of the faflin.

Hozu to aljeree the Quantity of an Angle ly the Circumficintor. Let it be required to find the quantity of the angle EKG; Prit place your inflrument at K , with the flower-de-luce of the chart towards you; then direct your lights to $E$, and obferve what degrees are cut by the fouth end of the needle, which let be 296; then, taming the intrument about, direet your fights to G , noting th:cn alfo what degrees are cut by the fouth end of the ncedle, which fuppore 247. This done, always fubtract the lefiter from the greater, as in this example, 247 from 296, the remainder is 49 degrees, which is the true quant:ty of the angle EKG.

A circumferentor is made by Mr Jones of Holburn on an improved conftruction. From a sery fimple contrivance, it is rendered fufficient to take angles with the accuracy of a conmon theodolite; and by it angles of altitude and depreffion may be olferved as readily as horizontal ones. The improvement chicfly conifits in an arm or index ( $G$ ), foapplied to the centre of the compais box, and within it, that, at the tine of obferving, by only flipping a pin ( $p$ ) out, the circle of degrees alone may move round, and leave the index ( $G$ ) fixed. This index will remain flationary, from its being attached to the focket that ferews on the head of the Aafis. On the end of this index, next the degrees in the box, there is graduated a nonius feale, by which the circle of 360 degrees is fuldivided into 5 minutes or lefs if detired. To take angles of attitude or depreflions, the inftrument is turned down on its ball and focket into a perpendicular pofition, and adjufted to its level by a plumb line (1), that is hung on a pin at the back of the box, and made to coincide with a mark made theron. Then by looking through the fimall fight holes ( $s$ ) purpofely made, the angles are Hown on the circle of degrees by the nonius as before. The arms ( $\mathrm{A} A$ ) of the infrument nip off (at BIB), and the whole packs into a cafe but $5 \frac{5}{5}$ inches fquare and 3 decp.

CIRCUMFLEX, in grammar, an accent, ferving to note, or diltinguifh, a fyllable of an intermediate found between acute and grave; and genetally fomewhat long. -The Greeks had three accents, the acute, the grave, and the circumflex; formed thus, ' $\because, \cdot$ In Latin, Englifh, French, \&c. the cireumfles is made thus :- The acute raifes the voice, and the grave falls or lowers it : the circumfex is a kind of undulation, or wavering of the voice, between the two. It is feldom ufed amung the moderns, unlefs to now the omiffion of a letter which made the fyllable long and open; a thing much more frequent in the Fruch than among us: thus they write pite for paft; tite for tefle ; fímis for fufmes, \&ic. They allo ule the circumflex in the participles; fome of their authors writing conneu, $p c u$, others conna, ph, \&c. Father Buffier is at a lufs for the reafon of the circumflex on this occalion.

The form of the Greck circumfles was anciently the fame with that of ours, viz. ${ }^{\circ}$; being a compofition of the

## C. I R [ $2 j$

 Circmeryo the other two accents a in one-But the copilts, chanration ging the form of the characters, and introducing the hanged alfo the form of the circme flex accent; and inttead of making a jult angle, roundcd it off, adding a dafh, though too much hate; and thus formed an $s$, laid horizontally, which produced this figure : infead of this ${ }^{\wedge}$.CIRCUMIGYRATION, denotes the whirling motion of any body round a centre ; fuch is that of the planets round the fun.

CIRCUMILOCUTION, an ambages, or tour of words, ufed either when a proper term is not at hand, to exprets a thing naturally and immediately by ; or when one choofes not to do it, out of refpect, or for fome other reaton. The word comes from circumloquor, " I fpcak about."

Circumlocution, in oratory, is the avoiding of fomething difagreeable or inconvenient to be exprefsed in direet terms; by intimating the fenfe thereof in a kind of paraphrafe, fo conccived as to foften or break the force thereof.

Thus Cicero, unable to deny that Clodius was flain by Milo, owns it, with this circumlocution, "Milo's " fervants being prevented from affiling their mafter, " who was reported to be killed by Clodius; they, in " lis abfence, and without his privity, or confent, did " what every body would expect from their own fer" vants on fuch an occafion."

CIRCUMPOLAR stars, an appellation given to thofe ftars, which, by reafon of their vicinity to the pole, move round it without fetting.

CIRCUMPOTATIO, in antiquity, a funeral feaft provided in honour of the dead. This was very frequent among the ancient Romans, as well as among the Athenians. Solon at Athens, and the decemviri at Rome, endeavoured to reform this cuftom, thinking it abfurd that misth and diunkennefs fhould mingle with forrow and grief.

CIRCUMSCRIBED, in geometry, is faid of a figure which is drawn round another figure, fo that all its fides or planes touch the infcribed figure.

CIRCUAISCRIPTION, in natural philofophy, the termination, bounds, or limits, of any natural body.

CIRCUMSTANCE, a particularity, which, tho' not effential to any action, yet doth fome way affeet it.

CIRCUMSTANTIAL evidence, in law, or the doctrine of prefumption, takes place next to pofitive proof: circumftances which either neceffarily or ufually attend facts of a particular nature, that cannot be demonflratively evinced, are called prefumptions, and are only to be relied on till the contrary be actually proved.

CIRCUMSTANTIBUS, in law, a term ufed for fupplying and making up the number of jurrors (in cafe any impanelled appear not, or appearing are challanged by any party), by adding to them fo many of the perfons prefent as will make up the number, in cafe they are properly qualified.

CIRCUMVALLATION, or Line of CikcumialLation, in the art of war, is a trench bordered with a parapet, thrown up quite round the befieger's eamp, by way of fecurity againlt any army that may attempt to relieve the place, as well as to prevent defertion.

Voz. V. Part I.

CIRCUMYOLUTION, in architećture, denotes $C$ the torus of the fpiral line of the Ionic order.

CIRCUS, in antiquity, a lange building, either round or oval, uffd for the cxhibiting of flows to the people. Some derive the word from Circe, to whom Tertullian attributes the invention. Caffodorus fays, Circus comes ì circuitu. The Romans, Servius obCerves, at firt had no other circus but that made by the Tiber on one fide, and a palifade of naked fwords on the other. Hence, according to Ifidore, came the term luli ciranfes, quafi circum enfis. But Sealiger ridicules that etymology:

The Roman circus was a large oblong edifice, arched at one enc; encompalfed with porticos, and furnifhed with rows of feats, placed afcending over each other. In the middle was a kind of foot-bank, or eminence, with oheliks, flatues, and polls at each end. This ferved them for the courfes of their ligiz and quadriges. There were no lefs than ten circules at Rome: the larget was built by the elder Tarquin, called Gircus Mavinus, between the Aventinc and Palatine mounts. It was fo called, either becaufe of its watt ci"cunference, or becaufe the great ganes were celebrated in it; or agaiu, becaufe it was coufecrated to the great gols, viz. to Vetunnus, Ncptune, Jupiter, Juno, Minerva, and the Dii Penates of Rume. Dionyflus Halicarnaffenlis fays that it was three ftadia and a half in length, and four jugera broad; and thefe meafures; according to Pliny, allowing to the Roman ftadia 625 Roman feet, each of which is 12 inches, will give for the length 2187 Roman feet, or fomewhat more than three Englifh furlorgs ; and as to the breadth, allowing for each of the jugera 240 Roman feet, it will be 960 Roman feet. It was beantified and enlarged by the Roman emperors, fo as to feat 250,000 fpectators. The moft magnificent cireufes were thofe of Augultus and Nero. There are fill fome remains of the circules at Rome, at Nifmes, and other places. The Romans were exceffively fond of the games exhibited in the circus: witnefs that verfe in Juvenal,

The Games of the CIEcus, which fome call Circenfunh
The Games of the CIRCus, which fome call Circenfunh
Games, were combats celebrated in the circuis, in honour of Confus the god of councils: and thence alfo calld Confintia. They were alfo called Roman Games, Ludi Romann, cither on account of their antiquity, as being coeval with the Roman poople, or becaufe ettablifled by the Romans: and the games held there, the great games, ludi magni, becaufe celebrated with more great games, ludin magni, becautc celebrated with more held in honour of the great god Neptune, who was their Confus.- Thofe who fay they werc iulituted in honour of the fun, confound the fompe circonfis, or proceffion of the circus, with the games.
The games of the circus were inftituted by Evander, and re-ftablifhed by Romulus: the pomp, or proceffion, was only a pat of the dimes, making the
prelude thereof, and confiting of a fimple civalcade of proceffion, was only a pat of the tames, making the
prelude thereof, and confiting of a fimple civalcade of chariots. Till the time of the elder Tarquin, they
were held in an ifland of the Tiber; ard nere called chariots. Till the time of the elder Tarquin, they
were held in an ifland of the Tiber ; ard uere called Roman ganes: after that pince bad tuilt the cincus, Roman ganes: ater that prive bas bar the culus, held there. There were fin kindo of exercifits in the
rcumpo.

## $C I R$

[ Cirenecher circus: the firl was wretling, and fighting with Il Cirus. fuords, with llyes, and with pikes; the lecond was racing ; the thid, faltatio, dancing; the fourth, dif-
ci, quoits, artows, and cetlus: all which were on foot: the fith was horfeeculing; the lixth, courfes of chariuts, whether with two hotes or with i, mit. In this lat cserelle, the combatants were at fint divided into two tquadrons or quadrils; then it io four ; each bearime the rames of the enlours they wors: fretio ofle, rulku, Ecc. At firlt there was only white and fad; then orsen was added, and blue. Domitian added two more coluurs, but they did not continue. It was 0 nomaus who firll invented this methed of didimguining the quadrils by colous. The green was for the whe repeefent the earth; the the for the fea, sic.

CIRENCESTER, an ancient town of Chouce?erthire in England. It was Itrongly fortified with walls and a calle in the time of the Romans. The anins of the wails and lareet are, or were lattly, to he feen in the adjacent meadow, where may Roman chin, chequered pavements, and inferiftions on matble, have been found. Two of the Roman confular ways coufs each other at this town. The fuff-way, which cones from Scotland, paffes through this councy and town to Totnels in Devonflire. The other, called Irminfluee, comes from Gloncether, and ruas along to South"ampton. Not many years ago they difcovered, by digging in a meadow rear the town, an ancient building under ground, 50 feet long, 4 broad, and 4 hish, and fupported by 100 brick pillars, curiouly imlaid with Rones of varions colours, fuppofed to have been a Rowan bath. Cirencellet has now but one church, in the windows of which are the remains of very valuable painted glafs. The town is governed by 2 high confahles, and it wards-men, who goven 7 ditimet wards; and it fends two members to parliament. It has a free fchoul, a charity fehool, with feveral almshoufes; and is feated on the river Churn, 36 miles north-eall of Brittol, and 88 weft by worth of London. W. Lorg. O. 2. N. Lat. 5 I .42.

CIRENZA, a city of Naples, capital of the Bafilicate, with an archbihop's fee. It was formerly a confiderable place, but is now of fmall confequence. It is feated on the river Bradano, at the foot of the Apenrinc mountains, in E. Long. 16. +4. N. Lat. 40.48.

CIRO-ferri, an exeellent Italian painter and architect, was born at Rome in 1614, and was the difciple of Peter de Cortona, whofe defigns he imitated with fuch exactnefs, that it is difficult to diftinguifh them. He was efteemed by Pope Alexander VII. and his three fucceftors, and died at Rome in 1689 .

CIRRUS, or Cipratis, in botany, a clafyer or tendril ; that fine firial Aring or fibre put out from the foot-flalks, by which fome plants, as the ivy and vine, fatten themfetves to walls, pales, or trees, for fupport. The texom is fynorymous to the capreolus, clavicula, and viticulas of other botanitis: and is ranked by Linnens among the fulcra, or parts of plants that ferve for protcetion, fupport, and defence.

Tendrils are fometimes placed oppofite to the leares, as in the vire; fometimes at the fide of the foot-dtalk

## 26 ] C I S

of the leaf, as in paffion-fiower; and fometimes, as in winged pea, pilan ochros, they ate emitted from the leaves themflues. With refpect to compofition, they are either fimple, that is, compofed of caic fibre or chood, as in the veuh; or compound, the is, conlift of two, ilmee, or more, as in the everlating pea. Litter fivect, folmum, dulcmara, bignomia, and ivy, fond forth tendrils which plant thenflues like roots in the acjucent walls, or the balk of the neightoming trees. Clafpers, lays the ingenious Dr Grew, are like trunk-rcot:, a mean betwist a ruot and a trank, but a compound of buth, as may be gathered from thein circumvolutions, in which they mutally afcend and defeend. In the mountins of tbe trank, continus the fanc anthor, clofpers feve for fuphort. Thus, in vines, the branches being very lone, fragite, and fender, winld be liable to freq rent breaking, whefs, by means of their clafpers, they were mutually contained tugether; fo that the whote care is divided betwixt the peadener and nature: the fonmer, with his ligaments of Wather, fenes the main tranches; and nature, with thofo of her own providing, fecures the lefs. Their aptitule to this end is foen in their convolutions, a mution not proper to any chther jatt: and alfo in their tuaghnefs, which is fo much the more remakable, as they are hemeterer than the branches from which they proceed. In the trailing of the trunk, tendrils ferve for thabikment and thade: thus, in cucumbers, the trunk and branches being loge and fragile, would bo drivea to and fro by the winds, to the great prejudice both of themelves and their tenaer frutis, were they not, by thele ligaments, held falt together, and preterved in affociation and good fellowihip. The fure claipers ferve likewife for Chade: fo that a matural arbour is formed by the branches of the cucumber, in the Same manner as an artificial one is made by tangling tozether the twirs of trees; for the branches, by the lioking of their clafpus, being couched tosether, the tender fruits lie under the umbage of a oover made of their own leaves. Molt of the pea bloum fowers have twining clalpers, that is, which wind to the right and back again.

CIRRI, iu ichthyology, certain oblong and foft appendages, not unlibe little worms, hanying from the under jaws or mouths of fome hifhes: thele cirri, commonly tranfated becrds, afford marks to dititinguin the different fpecies of the fifes on which they are found.

CIRTA, (anc. geog.) the metropolis and royal refrdence, not far from the river Ampfaga, in the inland parts of Numidia Propria. A col ny, furnamed Colonia Sittianorzm, very rich, when in the hands of Syphax. The colony was led by one P. Sittius, under the aufpices of Cæfar, and was furnamed Julia. Now called Corffantina, in Algiers. E. Long. 7. 0. Lat 35. 20.

CISALPINE, any thing on this fide the Alps. The Romans divided Gaul and the conntry now called Lombardy, into Cifalpioe and Tianfalpine. That which was Cifatipine with regard to the Romans, is Tranialpine with regard to us.
CISLEU, in Hebrew chronology, the ninth month of their ecclefratical, and third of their civil, year, anfwering nearly to our November.
CISPADANA CAllia, (anc.geog.)adifrict of Italy,

to the fonth of the Po, ocropied by the Gauls in the time of the kings of Ronse, Feparated from Liguia on the wet, as is the wethe by the lrit, running forn fouth to noth inte the P ; ; bumned on the fouth by the A pernine, ald on thic and by the Alriatic. The term is fomal analsically, there being nuch mention in Cicern, Tacituc, Shetomins, and ancient inferipions, mave of the Tranfocdan; which and Cifpadsai are tems ufod with refpet in Rome. I'tuleny calis the Cifadana peculialy Gatha Torata, extunting between the Po and Apemane, to the Supis and Rubicon.

ClBSA, or Ciscum (anc. geog.), a town of the Hither Spain, in Lacitania, on the call fre of the I. beres, (thoughe on be Guidman.) Where the Canthaginians were fifl defeateo by Sopio. Another Cofid of Thrace, fiowat-d on the vier EEr. Potames, when Scylay wems to call Crofiz, or $\mathrm{Ca} / \sqrt{2}$; f, that the reading is wht fall.

CISSAMPELOS, in botme: A genve of the monodelphia weder. barasing to the dioceia chafs of phats; and in the natual method rarkerr under the wth order, Sormentaco. The male caln $x$ is ectraphyllons; ano corolla; the wet. rium whethaped; fur hamina with theil flam uis groan tugether. The female calyx is monop:athons and ligulat d rommin, or like a piece of gatur a little rounding. There is no corohn; three ilvies, and a monofpermous bery. Theriver tuo foceies, the pareira and capecta, both nativ of the wameft parts of America. The ront of the fermo. suplied extemally, is faid to be an antidote againft the bites of veromous ferpents. The plant beiner infufed in water, quickly fills the liqur with a mucilaginous fuoflarice, which is as thick as jelly; whence the name of freczing-quyh, by which this genus of plants kas becn dillinguined by the Braziliars.

CISSOID, in seometry, a curve of the ficond order, fift invented by Diocles, whence it is called the aiffiel of Diodes. See Fluxhows.
CISSUS, the walngrape: A genus of the mo nory it order, belonging to the tetrandria clafs of planes and in the natural method ranking under the 46 ch onder, Haderacte. The berry is monolpermous, forrunded by the calyx, and a quadripstate corolla. There are fonr fpecies, all of them natives of the ifland of Janaica, and fome of the other iflauls in the warm parts of America. They fe?d our flender branches, haviug tencrits at their juints, by which they falten to the neightouring trees, buthes, and any other fupport, mon: ing to a contiderable height. The fruit of fome of the fipecies are eaten by the negroes.
CISTERCIANS, in church hifory, a religious order toneded in the ath century by it Rubert, a Benedictine. Thy became fo powerful, that they gon verned almolt all Europe, both in fputuals and temporals. Cadinal de Vitri deferibing their obfuvances, fays, they neither wore flims mor fhurts: nor ceser eat flefh, except in ficknefs; and abtaind from filh, eggs, milk, and cheefe: they hy uporambede, in runics and cowls: they rofe at mingist to pray is: they font the day in tahour, waires, and prayer: and in all their exercifes offorsed a cortinual filence. The habit of the ciltercian monks is a white robe,
in the nature of a caTock, with a black Reapulary and hoond, and is gite with a wonden gidlle. The nans wear a whice thin, and a black oupulary and girdle.

CISTERD, dennes a finhterraneons referwir of amin-water; or a cifll leving an a receptacle for rain or wher water, for the necefiry uiss of a fomily. 'Thereate likewife lat-citernc, jar-cilems, \&o.

Anhors mention a cillem at Contratinopls, tha vaules of which are fuppoted by two tows of pillars, 212 in each row, each pillar beingtwo feet in diameter. 'They are planted circularly, and in roubituling to that of the centrc.

Anciently there were cifterns all over the country in Pateline. Thare were fome likewte in cities and pro vat houfs. As the citics for the mof part were buit on montains, and the wins fill regulaly in Judea at two teafons in the year only, in faning and antum, pecple were obliged to keep water in cillerns in the eorntry to: the ufe of their cathe, and in cities for the coaveniency of the inhahitunts. There are Alll cillerne of very fage dimenfors to he feen in Pathine, fome whereof are 150 plees homg, and 54 wide. There is one to be feco at Kamah of 32 yace s in lenoth, and 28 in breadh. Wells and cilloms, pringre and fonstans, are generally confonuded in feripturelanguace.

CISTUS, the Rock-rose: A fanns of the monugyaia order, belonging to the polyandia clafs of plants; and in the natual method ranking under the 2 th arder, Refacer. The corolla is pentaperalous; the calys pentaphyllous, wiht two of ita leates fmallee than the refl. The feeds are contained in a caplule. There are 37 foecies, noft of them natives of the fouthern parts of Europe, but lardy enough to hear the open air in this comaty. They are batatiful evergreen flimbs, generally very branchy quire from the buttom, and forming diffused heads. 'They are very anamental in gardens, not only as evergreens, making a fine varicty at all feafon; with their leaves of difierent figurts, fizes, and thades of gicen and white, but alio as firl-rate flowering firabs, being vely profufe in moll clegant flowers of white, puaple, and yellow coluurs. Thefe Dowers whly lar one day; but there is a continual fuce ffit of of wones for a month or lix weeks on the fame plant; and when there are different fpecics, they will exnibit a complant bloom for near three months. They are proparated either by feeds or cutcings, and thate bell in a dry foil. Their proper lituation in thablery works fhould be towards the frent of the clumps and other compartments, in aff:mblare with the choicelt froubs of limilar growth, difp fins them fo as to make a varietf, and to have flefter from the other plints; but they oughe by no means to be crowded. Gum labianam is「nud apon a fpecis. F citus which gen's naturally in the Lovant, and is therefore called idudunifera. See Labdanum.
LI' 1 . DEL, a place fortifed with five or fix baflims, ind on a convenient gromud near a city, that it may co mond it incafo of a rebellicon.

CIMADELLA the capital town in the ifland of Mone, on the Meviburasan, with a new larbour. Thes. with the whole illand, were taken by general Stanhope and the confederate feet in 1708, and ceded D 2

## C I T [ 28

C"all. in Great Dritain by the treaty of Utrecht in 1713 : hat it was taken by the Iiench, after a brave defence, in $: 7576$; and reft reed by the peace. In 1782 , it was taken by the $S$ paniards, and confirmed to them at the fubfequent peace. It is 27 miles weft of PortMahon. E. Long. 3. 30. N. Lat. $39 \cdot 53$.

CITADINESCA, in natneal bitory, a name given by fome writers to the Ilorentise marble, which is fuppofed to reprefent towns, palaces, ruins, rivers, \&e. Thefe delineations are merely aecidental, and are commonly much affifted by the imagination, though the natural lines of a fone may formetines luckily enough reprefent the ruins of fone ancient building, or the comre of a river. In Eagland there is a kind of feptaris, or ludus Fl lmontii, which has fometimes pretty beautiful, thongh very irregular, delineations of this kind. The Florentine marble, as we fee it wrought up in the ornaments of cabinets, $\mathcal{E}$ c. owes a great deal to the fkill of the workmen, who always pick out the proper pieces from the mafs, and difpofe them in the work fo as to reprefent wbat they pleafe.

CITATION, in eeclefiaftical courts, is the fame with fummons in civil conrts. Sce Summons.

Citation, is alfo a quotation of fome law, antho. rity, or paffage of a book.

CITHIERON (anc. geor), a mountain and foref of Boootia, celebrated both in fable and fong. To the weit it ran obliquetr, a little above the SimsCrifreus, taking its rife contigrous to the mountains of Megara and Attiea; then levelled into plains, it terminates at Thebes, famous for the fate of Penthens and Actron; the former torn by the Bacchæ, the latter by his dogs; as alfo for the argia, or revels of Bacchus.

CITHARA, in antiquity, a mulieal inftrument, the precife ftructure of which is not known; fome think it refembled the Greek delta $\Delta$; and others the flape of a half moon. At firit it had only 3 ttrings, but the number was at different times increafed to 8 , to 9, and laftly to 24 . It was ufed in entertainments and private houfes, and played upon with a plectrum or quill, like the lyre.

CITHAREXYLON, mode-wood: A genus of the angiofpermia order, belonging to the didynamia clafs of plants; and in the natural method ranking under the 4 oth order, Perfomatr. The calys is quinquedentated, eampanulated, wheel-fhapect, and inclining to be funncl-flaped, with its fegments villous on the upper fide, equal. The fruit a difpermous berry; the feeds bilocular. There are two fpecies, both natives of the warm parts of America, where they grow ac) be laree trees, and are adorned with white flowers growing in fpikes. In Britain they appear only as thrubs, and muft be conftantly retained in the flove, where they make a fine apparance, being beautiful evergreens. They may be propagated either by feeds w cutings.

Cititith, Cetium, of Citium (anc. geog.), a inow of Cyprus, fituated in the fouth of the inand: farmous for the birth of Z'eno, author of the feet called Sistirs; dilmant two hundred Radia to the well of SaLamis (Diodorus Siculus). A colony of Phoenicians, called Chotin: And hence it is that not only Cyprus, bit the other iflands and many maritime places, are ralled Clam by the Hebews a now called Chan.

CITIZEN, a mative or inhahitant of a city, veted with the frectom and tiberties of it.

A cition of Rome has ditinemimed from a latanger, becate he blouged to no extan commonwelth tubject to the Ronams. A citizen is cither by bisth or clection; and funs may derive the right forn their fathers. 'To make a good Roman citionn, it was tueceflary to be an inhabitant of Rome, to be iarulled in one of the tribes, and to be capable of dignities. There to whom were granted the rights and privileres of Roman citizens, were only honorary citizens. It wan not lawful to fourge a citisen of Rome.

CITRINUS, in natural hitory, the name of a peculiar fpecies of furig ergfal, which is of a bequtiml yellow. Many of the common cryftals, when in the neighbourhood of lead mines, are liable to be accidentally tinged yellow, by an adnixture of the partickes of that metal; and all thefs, whether hower coarfer, have been too frequentiy confounded together under the name citrine: but Dr Hill bas afeertained this to be a peculiar fpecies of erytal dillerent from all the others in form as well as in colour; and diftinguifhed by the name of eliponacrofoftun hutidun the: aefens, pyramide trezio. It is never fond colourlefs like the other cryftals, but has great variety of tinges. from that of the deeper ochres to a pale lenon-colour. It is sery plentiful in the Weft Indies, and is fometimes found in Bohemia. Our jewellers have learned from the French and Italians, who are very fund of it, to call it citrine; and often cut flones for rings out of it, particularly out of the pyramid, which isalways finer than the column; and thefe, afier they have paffed through two or three hands, are generally miftaken for topazes.
Citron-tree, in botany. Sec Citrus.
Citrow-Wuter, a well known flrong water or cordial, which may be thus made: 'Take of fine thin le-mon-pecl, is ounces; of orange-pecl, 9 ounces; perfect nutmegs, $f$ ounces; the finelt and beft rectified fpirit of wine, 2 gallons and a half. Diget in balneo manie for one night: draw off with a flow fire; then add as much water as will jult make the matter milky (which will be about 7 quarts or 2 galions) ; and, lathy, add 2 pounds of tine furar. This compofition may be improved by frefh elder flowers, lung in a cloth in the head of the ftill, fprinkled with ambergreafe in powder, or its eftence.

Cithon-IVood, the wood of an American tree, called by the natives candlc-wood; becaufe, being cut into $f_{p}$ linters, it burns like a candle. The tree is frequent in the Leeward Iflands, and grows to a confoderable fice: the leaves are like thofe of the bay-tree, but of a finer green; the flower is fweet, and much like thofe of the orange; the fruit fucceeding thefe is black, and of the fize of a pepper-corn. The trunk is fo like the yellow faunders in colour, that there was once an opinion that it was the fame tree, and much of it was imported into Europe, and fold as fuch: but they were foon found to be different; the faunders being of a fweet leent, and but moderately heary and refinous; but the citron-wood confiderably licave, very oily, and of a ftrong fmell. It is of no known ufe in modicine; but is uled in France and Germany by the turners, leing a fine firm-grainel wood, and

## Citru:,

taking a finc polifh, and with age becoming of a vary beautiful browa.

CITPRUS, the Citron-terne: A genns of the po. lyadelphia order, lechongine to the icolandain olafs of plants. The calys is quinquofid; the petals ubl ing, and five in number: the anthere 20 , with their filaments growa torecher fo as to form various pencils. The fruit is ar unilocular be res:

Soecies. I. 'The Medica, or Citron-tree, hath an upright fmooth trunls, diviled at top into a lrancly frours.fhooting, full head, from atent 5 to 15 fect high, adorncd with large oval, fpern-flapued, thick leaves, having lincar foot-halks, ans momerous fowers from the lides of the branches, fucceeded by very large oblong oval, pointed, sough-rinded fovt. The varities are citron-tree with four finit ; wich fweet fruit: with long fruit; with warted finit; with recurved frat; and with blotched leaves.
II. 'The Lima, or Lemon-tree, hath an upright fnooth trunk, divided upward into a branchy regular head; from 12 to 15 feet high; large, oval, fearthaped, pointed, flightly faved leares, on linear footftalks: and many flowers from the fietes of the branches fucceeded by large oval fruit prominent at the top. The varieties are, the lemon-tree with four fruit; with facetifh fruit; with very lurge fruit called $I_{m p e}$ rial homen; with pew-happd fruit; with furrowed froit; with clufleral fruit; with childing frait; with whitifl fruit; with tricolor flrjped fatit ; with filver Atriped leaves; and with doulle flowers.
III. The Aurantium, or Orange-iree, hath an upright trunk dividing upward into a branchy, regular head, from 5 to 10 or I2 feet high; oral, fpear-thaped, entire leaves, having winged foat-alks and numerous white flowers at the ficles of the branches, fucceeded by globular finit compreffed at both ends. The moft noted varicties are, 1 . The seville orange. This is a very handfome tree, and the hardief of any; as in this country it fhoots freelj, produces large and beantifu] leaves, flowers thonger, \&ic. The fruit is large, rough, rinded, and four, of excellent quality for ecunomical ufes. 2. The China orange. This tree has moderately fized leaves, and a finooth, thin rinded, fweet fruit, of which there are feveral varietics in warm countries, where they grow in the open ground. 3. The great Shaddock orange, or pumplemoes, grows larger and fronger than the foregoing, with large, thick, and fomewhat ferrated leaves, and very large fruit, laving a reddifh pulp. It derives the name of Shaddock from one of that name that lint brought it from the Eaft Indies. 4. The Forbidden-fruit-tree, in trunk, leaves, and flowers, very much refembles the common orange-tree; but the fruit, when ripe, is larger and longer than the biggeft orange. It has fomewhat the tate of a fladiock; but far exceeds that, as well as the befl orange, in its delicious tafte and flavour. 5. The Homed orance is a tree of moderate fize, producing fruit which divide, and the rind runs out into divifions like horns. 6. The Hermaphrodite orange is a common fized tree, p:oducing fruit haped partly like an orange and partly like a citron. 7. The Dwarf orange tree, or nutmeg orange, has a long ftem and mall bufhy hach, growfag two or there fuct high: fmall oval leaves in chid.
IV. The Trifoliata, or Japonefor trom, is a thesny nerub growing naturally in Japan, where it is Ikewie known by the names of Ceces, and Kamatah homat. 'The trunk, we are told by liampier, acquires by are and culture the thichnofs of a tree. The branches and fhoots are unequal; in fome parts conurefled, in uiturs fredling, efpecially abont the fpins. Thefe procect fingly from the stem and branches; are foraight, ram out from a broad bafe into a very tharp point, and are protruded from the wood, with the common bark of which they are likewife invelted. The wood is loofe and foft; the bark of a hining erveen, moit and eafily parting from the wood. The leaves are few in number, fawed on the edges, wined, pliced without order, but gencrally growing under the ipines. They grow hy threes, like thase of trefoil, upon the extrenity of a common foot-flalk which is furninod on each fide with a membranaccous fringe or margin, fomewhat refembling the pedicles of the orange. The upper furface of the leaves is of a bright lucid green, the lower dark and habaceous. 'The flowers, which refemble thofe of the medlar, proceed fingly from the arm-pits of the leaves; are white, poffeffed of no great degree of fragrance, and confift of tive petals. The fruit is equally beautiful with a middle-fized orange; their inteinal itructure is alfo pretty much the fame: only the pulp is glutinous, of an unpleafant fmell, and a harih difagreeable talte. The feeds have the fame talke with the pulp, and are fhaped exactly like thofe of the orange.

Culture The three find fpectes merit paticular attention. They are elegant evergreens, rifing in this country from about 5 to 10 feet in height; forming full and handfome heads, clofely garnithed with benutiful large leaves all the year rome, and putting forth a profufion of fweet flowers in foring and early in fummer; which even in this climate are often fucceeded by abundance of fruit that fonctimes arrive at tolerable perfection. 'Ihough all the varicties were originally obtained by feed, yet the only certain method of contimuing the approved varicties is by budding or inarching them on flocks raifed from feed to a proper fize. As the young trees, however, are brought in plenty from abroad, this method is feldom practifed in this country: but for curiolity, it may be done by thofe who are fo inclined, in the following manner. Early in the fpring procurc fome kernels, which miy be had in plenty from rotten fruits, or others that are propenly ripened, obferving that for flucks, the citron, lemon, and Seville-orange, as being the freel thooters, are to be preferred; and of thefe the citron is the fromgell. Sow the kernels in March, in pots of rich light carth half on inch deep, and plange them in :-
 be wfed, bat the laster is profornde, giverg air, and frequent imiallenere of water. in two or thee weeke, the phants wili come up: anl in fex or eight weeks more, they will be adranced fow or tive inches ur more in heirlat. You mutk now give them more air and water; and about the midde of June hard a them to the full air, in which let them remain till OEtober; then more them into the green boufe, to fland till the fpriag, and in March or Apeil plant them fingly in fmall pots; being car fuit to thake them out of the feed pots with their roots entire. 'They muft be watered immediately after planting, and the watering matt be occafomally repeated. After this they are to be treatrd as woody exotics of the green-houfe; and in a year or two the largelt of thole defigned for focks will be fit forbudding.

The operation for buscing is parformed in the - Sine Inc-month of Augut, and is done in the common way*; cuation. only the buds mull be taken from trees of a good kird thit bear well. As f. on as ihe rperation is finifled, the pots with their plants men? be placed in the sreenhouf, or in a glafs-caf: o\%, where there is the convenience of a fpare tall-pit, where the heat of the bak is alnof exhaute?, the pots may be plunged therein fer two or three wecks. In either cafe, however, the air moll be admitted fretly by ape ing the front ghafes; allowing alf, a gight hade of mats in the middl: of hot fuafhine days, and fupplying them with water every two or thee days during this kind of weather. In three or four weaks the buds will be united with thefuck, when it will be proper to lonfen the bandages, that they may have room to frell; the buds, howerer, will all remain durmant till the next fpring. They may alfo be propagated by inarching, $\dagger$ Sce $I_{t}$ which is done in the common way $\dagger$ : but the methend (ar) ind of buddins if found to produce much band fomer thees, $^{\text {on }}$ and therefore $i s$ to be preferred. But the m.it cheap ated eqeditions mathod of procuring a collection of thele kinds of trees is by having recourle to finch as are imported from Spain, lialy, and Portupal. Thefe come ou r in chelts, with lit any earth to their roots, laving their roots and hasis a little trimned: they are commolly fam one inch to two or thare in diameter in the ftem: fron two to four or hee lect in height: and by the affitance of a bark-bed they readily take root atd grow freely: furming as good trees in two years, as could be raifed here by inarching or budding in 15 or 20 . They are fold in the ltalian warehoufes in $L$ mion. Their price is fromthree fhillings to a gumea cact, acconding th their fize; and they are gererally advetiled as foon as they arrive, which is early in the Eprisg, and the fonner the better. In the choice of thefe trees, it mont be obferved, that they ate commonif: budicd at fucc: beight in the dem, as to form heads from about two to four or hive feet high; and as they are frequently furnined with two budis, one on tach fide of the Atem, thefe fhe uld be chofen preferably to etleers; as they will form the malt regular heads Papastery to their flating, they muth be place? for a day of twe in tubs of water to plamp thein bak ano roe te; after this they mult te waned and cleaned, their branchestimmed to half a footorg, and the roots fited from dikafed parts, and all the fmall
dried fibres. Then they are to he planted in pots filled with light rich earth: and phonget in a tan-oed, where they are to remain for three or four monalis; after which they are to be tanined to the upen air, but will not bear it loneer than from the end of May till the midille or end of OAnber.

Sometimes thefe or"es, intead of buing kept in prots or tubs, are planted in the full ground; and where this can be done, it is by far the moft eligible mechud. Where this is inemded, thare mut be frames erected for the rupport of plafs and other covens, to defend the plants during inclement weather; and in this fituation the trecs grenerally fhoot Arong, produce large fruit, and may be trained either as wall or flandard thees. A fouth wall, in a dry lituation, is proper for training them as wall-trees: againlt which may be erected wonden frame-work a ping, either fixed or $m$ veathe, for the fuppont of chats frames for witter ; likewile for the greater protection of the tress in fevere frolt., there may be a fire-place with a flue or two caried alongf a low wall in the fronts and end:. To have the tress as fandards, a more capacious and lofty glafscafe firuld be eteeted againt the wall, in the manner of a hot-houfe, but higher; in this one or two rows of orange-trees may be planted, fuffering them to run up as fandards with only fome necertary pruning juft to preferve their resularity. In fome places there are lofty moveable glafseafes, fo that two or three rows of trees are plmied in a confpicuous part of the plafure-ground. In winter the frame is put ova them, and in fummer wholly taken alway; fo that they appear like a little orange-grove growing in the open zromal. The flowerint and frui- leting feafon of all the forts of cittus is in Jane and Jaly. They are often, efpecially the oran fetrees, greatly loaded with bluffrms; and when thele Aand very thick, it is proper to thin them a lattle, taking off the fmallell. It is alfo to be obeerved, that as the trees cominue blowing and fetting their fruit for three months, when a full crop of fruit is fer, it is of benefit to the trees and fruit to gather off the finperabundant bloffoms as they are produced ; thourh fome permit them to remain on account of their appearance.
$U_{j e s}$. The fruits of the citron, lemon, and orance trees, yield very aureeable acid juices; which, beffles the ufes to which they are commonly applied, anfwer combderable purpofes in medicine. When Commedore Aufon falled $r$ und the world, his mee were fo furprifingly rucovered frem the feury by the oranges which they found at the infond of Tinian, that it w:s afterwardsthought worthy of the attention of govermment to inquire isto the virtues of thefe fruits as an antiforbutic medicine. In Captain Con's's laft royage, he was fupplied with a quantity or orange and lemon juice infpiffated to a rol ; but his opinion of its efficacy is by no means great. The dearnefs of it is a great objection; and, unlef in conjunction with other thinge, he has not whered its cood effects. Sir John Pringle, in his difenurle before the Ruyal Society, when Captain Cook wos prefented with a medal by that refpectable body, differs a little from the Captain's opinion, and thinks that in the fa-fourry thefe fruits mutt neceffarily be very eflicacious. He approves, however, more of

## C I T

 Citrus the juices themfelves depurated, than the extrast ofCity. them; as this cannot be preparch without difinating many of the finer parts. The juice of lemons is wery frequently ufed for neuralifing alkaline calta for caline drauthts. The citron is feldon wied in this compty; though its peel, as wall as that of the lemon, is candied, and fold ans a freetmeat. The yellow peel of the lemon is an agrealle aromatic, as is alfo that of the orange ; and $i$ cold firdenatic conflitutions they prove excuient llumadics and caminatives, promoting appetite, warming the habit, and tlrengtheming the the of the vifcera. Ormpepeed, hovever, is very con-
 in efentin oil: to this ircmantance, themefere, herefard onght to be had in the were of thele mediomes. The gav ur of oranye.peel is likewife leis puiflable than that of lemens. Both are ingredients in many ctifinal preparations.
The young funt of the Sorille orance died are ufed in medicine under the name of aurort in cryafluentia. They are modentuly warm biterill mamaics, of a fuffeiently a srealle flavor. The Runers of the orangu-tree have been for fome tinse pall in crent efecm as a perfune. They are lig! !y - coniternss, of a fomewhat warm and bitter tefte. They yicld thir flavour by infuren to rectitred thirit, and in ditilation both to Pirit and water. The biter ratter i, diffived in water, and on evavoratimy the decotion remains entise in the extract. The diflind water we s formerly kept in the flops, but on account of the great caroity of the howers is mow laid afide: it is called ho fureion witers aqua nothe. An oil dililled from thele flowers is bronglit fromitaly under the name of oleunt, or efferric reroli.

CITTERN, a mufcal infrument much refembling the quitur, for which it has heen foequen! y miltaken. Anciently it was called the cigrom, and till lat ly was hetd in great contempt both in France and Britain. The pratice on it being very eafy, it was formenly the amufement and recreation of lewd women and their vigitors; infomuch, that in many of the old Engdifh dramatic writers, it is made the fymbol of a wo. man that lived by profitution. If was alio the common anufement of waitiag cu? as beine the moft ealy of all inftruments to play on, and therefore it was thought that al:noll every body could make ufe of it.

CITY, according to Cowel, is a town eorporate which hath a bifhop and cathedral church; and is callcod civitus, oppilum, and urbs: civitas, in regard it is governed by julice and order of magilacy ; oppidum, becanfe it contains a great mumber of inhabitants; and $w w^{-5}$, becaufe it is in due form furrounded with walls.

Kingdoms have been faid to contain as many cities as they have feats of arelbifihops and bifhops: but, according to Blount, city is a word that hath obtained fince the conqueft; for, in the time of the $\mathrm{S}_{\mathrm{x} \text { ons, }}$, there were no cities, but all the great towns were called burghs, and even London wa; then ealled Lonronburgh, as the capital of Scotland is called Edfinturgho. And long after the conqueft the word city is ufed proinifucully with the burgh, as in the charter of Leicefter, where it is both callcd civitas and lurgus: which dnows that thole writers were mitaken who tell us
every city was, of is, a tiflop's Sec. And though the wore chy limation with us lucha a bern corporme as hath

City.
 alnays fo.

A's to the anciert fate of cities and villares, whint
 london whom they dopaded for grotedion, and were foijg. Ct tu his anlitrary jurifdition. The inhahtants were depuise of the batach and moll umalienalle richta of humaniv. They comld rut difurfe of the chicets which their own imdeitry had acquired, either by a latter will or by any deed escuted coming their life. They !ad no right te appoint grancians for their chiditen dume their minority. They were not permitted tomany wihout purchaten the confent of the lord en whem they depended. If orce they had ermmunced a law-fuit, they daite not terminate it by an aecommodntion, becaufe that would have deprived the lurt, in whole comrt they pleaded, of the perquilites due to him on paffing his tentence. Survices of vari- Robertin's
 arted from them wihout mercy or muderation. The fuist of indultry wete checked in fome citics by abfurd regulations, and in ofhers by moneafable exations: now would he narrow and oppreffive maxims of a military anif urey have permitted it ever to rile to any dagete of height or vi vour.
" j "he feeclum of citios was fin eqablifacd in Italy, owing princifally to the imboduction of commerce. As foun as they began to thrn their attention towards this stject, and to curceive come idea of the advantages they mirtht dorive from it, they became impatient to thake off the yoke of their infolent lords, and to eftablith anoong themflues fuch a free and equal government as would render property fecure and induttry flourifhing. The German emperons, efpecially thofe of the Fraticonian and Suabian lines, as the feat of their government was far ditant trom Italy, poffeffed a fetble and imperfect juridiction in that country. Their petpena! cinareds, cibler with the popes or their own thbubent valfals, divental their attuntion from the interior police of Italy, and save conRant cmployment for their arms. The le circumtances induced fome of the flalian cities, towards the begiming of the ith contury, to affume new privileges; to tante together more chaftly : and to form themblves into todies politic, ander the govelament of laws etablithed by common confent. The rights which many cities acquired by buld or fortunate ufirpations, whers purchafed from the emperors, who deemed themfelves gainers when they received large furs for inmenities which they were no longer able to with hold; and fome cities obtained them granuitonlly from the facility or gentrolity of the princes on whom they depended. The great inereafe of wealch which the erufades brought into Italy, oecafoned a new kind of fermentation and activity in the minds of the people, and excited luch a general paffion for liberty and independence, that, before the conchution of the laft erafade, all the conficterable eities in that comntry had cither purchated or had extorted large immunities from the emperors.

This innovation was not long known in Italy before it made its way into Frasce. Leutis the Grofs, in or. der to caeate fome power that might counterbalance thofe fotent vaftals who controlled or gave law to the
roxn, find alsted the plan of conferms mew privi-

 which he entranchiled the ialabitants, abulimed all marks of Cervitude, and formed them into corporations or bodies nolitic, w be govemd by a conncil and magitrates of their oxn nomination. Thefe magiltrates hal the right of adminiftering jutice within their own precinexs; of levyint taxes; of embotying and training to arms the militia of the town, which took the field when requirel by the fovereign, under the command of offcers appointed by the community. The great barons intitated the example of their monarch, and eranted like immunties to the towns within their qemitories. They had wated fuch great fums in their expeditiuns to the Holy Land, that they vere eager to ta; huld on this new expedient for raing money by the fale of thofe charters of liberty. Though the conlitutinn of communities was as repugnant to their maxims of policy as it was adverfe to their power, they difregarded remote confequences in order to chain prefent relief. In lefs than two centuries, fervitude was abolithed in mont of the cities of France, and they became free corporations, intead of dependent villages without jurildiction or privileges. Much about the fame period the great citics of Germany bestan to acquire like immunities, and laid the foundations of their prefent li. berty and independence. The practice fpread quickly over Europe, and was adopted in Spain, England, Scotland, and all the other feudal kingdoms.

The Spanilh hillorians are almoft entirely filent concerning the origin and progrefs of commonities in that kingdom: fo that it is impoffible to fix with any degree of certainty the time and manner of their firt introduction there. It appears, however, from Mariana, that in the year 1350 eighteen citits had obtained a feat in the Cortes of Caftile. In Arragon, cities feem carly to have acquired extenfive inmunities, ingetlier with a thare in the leginature. In the year int 8 , the citizens of Saragoffa had nct only obtained political liberty, but they were declared to be of equal rank with the nobles of the fecond clafs; and many other inmunities, unknown to perfons in their rank of life in other parts of Europe, were conferred upon them. In England, the eftablithment of communities or corporations was potterior to the conquett. 'I he practice was borsowed from France, and the privileges granted by the crown were perfeetly fimilas to thofe above enumerated. It is not improbable, that fome of the towns in England were formed into corporations under the Saxon kings; and that the charters granted by the kings of the Norman race were not chart rs of enfranchifement from a ftate of havely, but a confirmation of privileges which

+ See Lor Lyttciton's Highory of Herry It. T.l. II. p. 317. they had already enjoyed $t$. The Englifh cities, however, were very inconfiderable in the rath century. A clear proof of this oceurs in the hittory jut refersed to. Fitz-Stephen, a contemporary author, gives a defersption of the city of London in the reign of Henry II. and the terms in which he fpeaks of its trade, its wealth, and the number of its inhabitants, would fuggett no inadequate idea of its fate at prefent, when it is the greatell and moft, slent city in Europe. But ail id ss of yrandeur and ragnificence are merely compurative. It appears fiom Peter of Blois, arrindeacon of London, who fourithed in the fame reign, No3.
and who had grod opportunity of being informed, that this eity, of which Fitz-Stephen gives Cuch a pompous account, contained no mone than 40,000 inhabitants. The other cittes were fmall in proportion, and in no condition to extort any cxtenfive privileges. That the conftitution of the boroughs of Scotland in many circumftances refembled that of the towns of France and England, is manifett from the Leges Burgorm annexed to the Regiam ALajefatem.

CIVE'T', a kind of perfume which bears the name of the animal it is taken from, and to which it is pecerliar. See Viverra.

Good civet is of a clear, yellowifh, or brownith colour ; not fluid nor hard, but about the confiftence of butter or honey, and uniform throughout; of a very frong fmell, quite offenfive when undiluted, but agreeable when only a fmall portion of civet is mixed with a large one of other fubitances. It unites eafly with oils hoth expreffed and diftilled, but not at all with watter or fpirit of wine: nor can it be rendered mifcible with water by the nediation of fugar. The yolk of an egg feems to difpofe it to unite with water; but in a very little while the civet feparates from the liduor, and falls to the bottom, though it does not prove of fuch a refinous tenacity as when treated with fugar and fpirit of wine. It communicates, however, fome thare of its fmell both to watery and fpirituous liquors: hence a fmall portion of it is often added in odoriferous tinctures, and fufpended in the llill-head during the diftillation of oduriferous waters and fpirits. It is rarels. if ever employed for medicinal purpofes. The Italians make it an ingredient in perfumed oils, and thus obtain the whole of its fcent; for oils wholly diffolve the fubitance of it. It is very rare, however, to meet with civet unadulterated. 'The fubftances ufually mixed with it are lard and butter ; which agreeing with it in its general properties, render all criteria for difinguifhing the adulteration impoflible. A great trade of civet is carried on at Calicut, Bafora, and other parts of the Indies, and in Africa, where the animal that produces the perfume is found. Live civet-cats are to be feen allo in France and Holland. The French keep them only as a rarity; but the Dutch, who keep a great number, draw the civet from them for fale. It is moflly ufed by confectioners and perfumers.

Chet-Cat, the Englith name of the animal which produces the civet. See Viverra.

CIVIC crown, was a crown given by the ancient Romans to any foldier who had faved the life of a citizen in an engagement.

The civic crown was reckoned more honourable than any other crown, though compoled of no better materials than oak-boughs. Plutarch, in the life of C. M. Curiolanns, accounts as follows for wing on this occafon the branches of this tree before all others: becaufe, fays he, the oaken wreath being facred to Jupiter, the great guardian of their city, they thought it the moft proper ormament for him who had preferved the life of a citizen. Pliny *, fpeaking of the *Lib. svi, honour and privileges conferred on thofe who hadcap. 4 . merited this crown, fays, "They who had once obtained it, might wear it always. When they appeared at the publie fpectacles, the fenate and people rofe to do them honour, and they took their feats on thefe oceations among the fenators. They were not ouly per-

Civet Civic.

Cividas perfonally excufed from all troubleine offices, but Civil. procured the fame iminunity for their father and grandfather by the father's inde.

CIVIDAD-de-las-I'almas, the capital town of the illand of Canary, with a bifhop's fee, and a good harbour. The houfes are well built, tho fories high, and fiat-roofed. The cathedral is a very handfone fltrufure; and the iulabitants are gay and rich. The air is temperate, and free from extremes of heat and cold. It is defended by a fimatl cattle feated on a hill. W. Long. $1+$ 35. N. Lat. 28. o.

CIGIDAD-Rcal, a town of Spain, in New Caftile, and capital of La Mancha 'The inhabitants are nuted for drelfing leather extremely wall for gloves. W. Long. 4. 15. N. Lat. 39. 2.

CIVIDAB-Roderigo, a flrong and confiderable town of Spain, in the kingdom of Leon, with a biflop's fee. It is feated in a fertile country, on the river Aquada, in W. Long. 6. 52. N. Lat. $4^{2} 3^{8 .}$
CuIDAD di Fruili, a fmall but ancient town of Italy, in Friuli, and in the territory of Venice ; feated on the river Natifona. E. Long. 13 . 25 . N. Lat. 46. 15.

CIVIL, in a general fewfe, fornething that regards the policy, public good, or peace, of the citizens or fubjects of the thate; in which fenfe we fay, civil govermment, civil hw, civil right, civil war, \&c.

Curis, in a pepular fenfe, is applied to a complaifant and humane behaviour in the ordinary intercourfe of life. Sec Ciminty.

Cris, in a legal foufe, is allo applied to the ordinary procedure in an action, relating to fome pecunary matter or interell ; in which fonfe it is oppofed to criminal.

Curts Death, any thing that cuts of a man from civil fociety; as a condennation to the galleys, perpetual banifhment, condemmation to death, outlawry, and excommunication.

Civis Lazu, is properly the peeuliar law of eacis flate, country, or city: but what we ufually mean by the civil law, is a body of laws compofed out of the belt Roman and Grecian laws, compiled from the laws of nature and nations; and, for the molt part, received and obferved throughout all the Roman dominions for above 1200 years. See Law, Part 1. $\mathrm{n}^{-} 43,44$.

It was firft brought over into England by Theobald a Norman abbot, who was elected to the fee of Canterbury in 1138; and he appointed a profeflor, viz. Roger firnamed Vicarius, in the univertity of Oxford, to teach it to the people of this country. Neverthelefs, it gained ground very flowly. King Stephen iffued a proclamation, prohibiting the fludy of it. And though the elergy were attached to it, the laity rather wifhed to preferve the old conntitution. However, the zeal and influence of the clergy prevailed ; and the civil law acquired great reputation from the reign of King Stephen to the reign of King Edward III. both inclufive. Many tranferipts of Juftinian's Inllitute are to be found in the writings of our ancient authors, particularly of Bracton and Fleta; and Judge Biackitone clferres, that the common law would have heen loit and over-run by the eivit, had it not been for the incident of fixing the court of common pleas in one certain fpot, and the forming the profeflion of the municipal law into an argereate body.

Vol. V. Parti.

## C I V <br> 331

It is allewed, that the eivil law contains all the principles of natural eqnity; and that nothing can be better calculated to form good fenfe and fond jud trinent. Hence, though in feveral conntries it has no other authority hat that of reafon and jultice, it is every where referred to for authority. It is not received at this day in any nation without fome altcrations: and fometimes the fcudal law is mixed with it, or genteral and particular cuftoms; and often ordinances and flatutes cut off a great part of it.
In Turky, the Bafilics are only ufed. In Italy. the canon law and cultums have excluded a grood part of it. In Venice, curlom hath almoft an abfolute goverment. In the Milanefe, the fcudal law, and particular cuftoms, hear fway. In Naples and Sicily, the conflitutions and laws of the Lombards ane faid to prevail. In Germany and Holland, the civil law is effecined to be the municipal law: but yet many parts of it are there grown obiolete; and others are altered, cither by the canon law or a different ufage. In Friezeland, it is obferved with more ftritnefs; but in the northern parts of Germany, the jus Saxonicum, Lubecenfe, or Culmenfe, is preferred before it. In Demmark and Sweden, it hath fearee any anthority at all. In France, only a part of it is received, and that part is in fome places as a cultomary law; and in thofe provinces nearett to Italy it is rcceived as a municipal written law. In criminal caufes, the civil law is more regarded in France; but the manner of trial is regulated by ordinances and ediets. In Spain and Portugal, the civil law is commected with the jus regium and cuflom. In Scotland, the tatutes of the federunt, part of the regix majettatis, and their cuikoms, controul the civil law.
In England, it is ufed in the ecclefiaftical coarts, in the high court of admiralty, in the court of chivalry, in the two univerfities, and in the courts of equity; yet in all thele it is retrained and directed by the common law.

Chill Society. Sce Law, Part I. $\mathrm{n}^{0} 12$.
Civil State, in the Britith polity, one of the general divifions of the Laity, eomprehending all orders of men from the higheft nobleman to the meaneft peafant that are not included uider the Military or Mari. time flates: though it may fometimes include individuals of thefe as well as of the Clergy; funce a nobleman, a knight, a gertleman, or a peafant, may become either a divine, a foldier, or a feaman. The divifion of this thate is into Noblity and Commonaly. See thefe articles.

CIVIL War, a war between people of the fame ftate, or the citizens of the fame city.

Ctyis Year, is the legal year, or anumal account of time, which every government appoints to be ufed within its own dominions; and is fo ealled in contradillinction to the natural year, which is meafured ex. aetly by the revolution of the heavenly bodies.

CIVILIAN, in general, denotes fomething belong. ing to the civil law; but more cfpecially the doctors and profeffors there of are called eivilians.

CIVILITY, a term ufed in commun life as fynonymons with complaifance or good-breeding.
Civility is jufly inculcated by didactic witers as a duty of no fight conlideration. Without civility, or goodbreeding, a cout would be the feat of violence and deE
fulation.

## C I V [ 34$] \quad$ C I V

Civilty. folalation. 'There, all the paffions are in fermentation, lecaufe all furfue what but Eww can obtain; there, if enmmes dil not embrace, they would ftab; there, fuites are often put on to conceal tears; there, mutnal forvices are profelfed, while motual inguris are intended; and there, the guile of the lerpent fimulates the gentlenel's of the dove. 'To what a degree mulk goodbreeding adorn the beauty of truth, when it can thus foften the defurmity of fallehood? On this fubject we have the Eollowing clegrant ubfervations in Khox's Effays, N'95.
"Howevar juft the complaints of the mifery of hife, jet grat ocations for the difplay of bencf. ecnce and liberality do not often occur. But there is an hourly necefity for the fittle kind offices of mutual civility. At the fame time that they give pleafure to othere, they aidd to our own happincfs and improvement. Habitual acts of kimderfs have a powerful effect in loftening the heart. An intercourfe with pohilhed and hamane company tends to improve the difpofition, beeaufe it requires a conformity of manners. And it is cestain, that a lenfe of decorum, and of a proper extemal behaviour, will reftain thofe whofe natural temper would otherwife break out in acrimonious and petulant converfation. Even the affectation of philanthropy will in time contribute to realife it. The pleafure refu'ting from an act of kindnels naterally excites a with to repeat it ; and indeed the genetal efteem which the character of benevolence procures, is Cufficient to imbuec thofe to wifn for it who ad only from the mean mowes of felf-intereft.
"As we are placed in a world where natural evil abounds, we ourtint to render it fupportable to each sther as far as homan endeavours can avail. All that can add a fweet ingredient to the bitter cup mult be infufed. Amid the multitude of thorns, every flower that will grow muft be caltivated with care. But neither ponp nor power are of themfelves able to alleviate the load of life. 'The heart requires to be foothed by fympathy: A thoufand little attentions from all around us are necefiary to rend r our days agreeable. 'The appearance of neglect in any of thofe with whom we are connedted, chills our bofom with chagrin, or kindles the fire of refentment. Nothing therefore feems fo likely to enfure happinefs as our mutnal endeavours to promnte it. Our fingle endeavours, originating and terminating in ourfles, are ufually unfuccedsful. Providence has taken care to focure that intercourfe which is neceffary to the exiftence of fociety, by rendering it the greatef fweetener of human life.
" 3 y reciprocal attentions we are enabled to become beneficent without expence. A finile, an affable addreis, a look of approbation, are often capahle of giving a greater pleafure than pecmiary benfits can beftow. The more participation of the fudies and amulements of others, at the fame time that it gratifies ourfelves, is often an act of real humanity; becaufe ofhers would mot enjoy them without companions. A friendly vifit in a folitary hour. is often a greater act of kindnefs than a valuable prefent.
"It is really matuer of fimprife, that thofe who are dininguifted by rank and opulence thould ever be unpopular in their neighbourhood. They muf know the value of popularity; and fusely nothing is more eafily abtained by a luperior. 'Their notice conters honour;
and the afpiring heart of man is always dulighted with dittinction. A gracious look from them diflufes happinefs on the lower ranks. But it ufually happens, that an overgrown ifheman is not the favourite of a uishburing country; and it is unfortunte, that pride of inadvertme often prevent men from asting the godlike part of making others happy, even when they might $d_{1}$, it without inconvenience to themfelves."

CIVITA-di-Penna, an ancient town of Italy, in the kiagdon of Naples, and in the Farther, Abrazzo, with a bithop's fee. It is fituated near the 'river Salino, 25 miles nosth eaft of Aquila. E. Long. 13. 3. N. Lat. 42.25.

Cumta-Caflithona, a town of Italy, in St Peter's patrimony, feated on a river, which, feven miles from thence, falls into the 「iber. E. Long. 13.5. N. Lat. 42. 15.

CIVITA. Tuchino, a place in Italy, about two miles north of the town of Corneto in the patrimony of St Petor. It is an hill of an oblong form, the fummit of which is almof one continued flain. From the quantity of medals, intaglios, fragments of inferiptions, Er. that are occafionally found here, this is belicied to be the very foot where the ancient and powerful city of Tarquinit once thood. At prefent it is only one continted field of corn. On the fouth. caft frde of it runs the ridge of a hill which unites it to Corneto. This ridge is at leaft three or four miles in length, and almoit entirely covered with artiticial hillocks, called by the inhabitants monti roff. About twelve of thefe hillocks have at different times been opened; and in every one of them have been found feveral fubterranean apartmenis cut out of the folid rock. Thefe apartments are of various forms and dimeufions: fome confrif of a large outer room, and a fmall one within; others of a frall room at the firlt entrance, and a large one within: others are fupported by a column of the folid rock left in the centre, with openings on every part. 'The entrance to them all is by a door about five feet high, by two and a half broad. Some of them have no lighat but from the door, while others feem to have had a fmall light from above, through an hole of a pyramidal form. Many of thefe apartments have an elevated port that runs all round the wall, being a part of the rock left for that purpofe. The moveables fomd in thefe apartments confitt chiefly of Etrufean vales of various forms: in fome indeed have been fuand fome plain facrophagi of Itone, with bones in them. 'The whole of thele apartments are ftuccoed, and ormamented in varsons manners: fome indeed are plain; but others, particlilarly three, are iichly adorned, having a double row of Etrufcan inferiptions running round the upper part of the walls, and under them a kind of frieze of figures in painting : fome have an onament under the figures, which feems to fupply the place of an arehitrave. The paintings feem to be in frefco; and in general refemble thole which are ufually feen upon Etrufcan vafes; thourh fome of them are perhapg. fuperior to any thing as yet feen of the Etrufean art in painting. In general they are Dight, but well conceived; and prove, that the artill was capable of produeing thines more fudied and better finifhed; thourh, in fich a cubrermanous fituation, the delicacy of a fir aifhed work would in a great meafure have been
throwas the immenfe number of thefe apartnents that yet remain to be opened, many paintings and inferiptions may be found fufficient to form a very ulfful and entertaining work. At prefent this great feene of anti. quities is almoll entirdy unknown, even in Rome. Mr Jenkins, refijent at Rome, was the fintt Englithman who vifited it.

Cinta-Ficchia, a fea-port town of Ytaly in the patrimony of St Peter, with a good harbour and an arfenal. Herc the Pope's galleys are flationed, and it has lately been made a free port; but the air is very unwholefrme. E. Leng. 12. 31. N. Lat. 45.5.

Civoli, or Crgoli, (Lewis), an Italian painter, whofe family-name was Curdi, was horn at the callle of Cigoli, in Tufeany, in the year 1559 . His ecce bomo, which he performed as a trial of ikith with Batruchio and Michatl Angelo da Caravaggio, was j:adged beter than thofe exccuted by them. He excelled in definning, and was empluyed by the popes and princes of his time. He died at Rome in 1013.

CIUS (anc. geog.) a town and river of Bithynia, which gave name to the Sinus Cianus. The town was afterwards called Pryju, Cius having been deftroyed by Philip futher of Perfeus, and iebuilt lyy Prufias king of Bithynia. In the river, Hylis, the Cavomite bog of Hercules, vas drowned ; (Apollonims Rhodius).

CLAC, among countrymen. To clack wool, is to cut off the fheep's mark, which makes the weighe lefs, and yields lefs cutom to the king.

CLACLIMANNAN, the name of a fmall fiere in Scotland, not exceeding eight miles in length and five in breadth. It is bounded on the fouth by the fiith of Forth; on the north and wefl by Pertlifhire; and on the eaft by Fife. The country is plain and fertile towards the frith, producing corn and pattare in abundance. It likexife yields great quantities of excellent coal, which is exported to Euglatid. France, and Hukland. It is watered by the rivers Forth and Devan, and joins the fhire of Kinrofs in fending a member alternately to partiament.

Clackmannan, a fmall town of Scotland, and capital of the county of that name, is fituated on the northern fhore of the Furth, in W. Long. 3. 40. N. Lat. 56.15. It Atands on a hill, on the top of which is the cafle, commanding a noble profpect. It was long the feat of the chief of the Bruces, who was hereditary fheriff of the county before the jurifdictions were abolithed. The large fquare tower is called after the name of Robert Bruce; whofe great fword and cafque are tlill preferved here. The hill is prettily wooded; and, witb the tower, forms a picturefque object. Clackmannan is thill the feat of the Bruces of Kemet.

CLAGENFURT, a flrong town of Germany, and capital of Carinthia, fituated in E. Long. 13.56. N. Lat. ${ }^{46} .50$.

CLAGE'T (William), an eminent and learned divine, born in $16+6$. He was preacher to the fociety of Gray's Inn; which employment he exercifed until he died in 1688, being then alfo one of the king's shaplains. Arcbbifhop Sharp gives him an excellent character; and bilhop Burnet has ranked him among thofe worthy men whofe lives and labours contributed to refcue the church from the reproaches which the fullies of others had drawn upon it. Dr Claget pu-
blithed reveral things; but his pincipal work is his "Difeourfe concerning the Operations of the Holy Spirit:" nor mut it be forgoten that lie was one of thofe excellent divines who made a moble fland againt the defigns of James II. to introdnce popery. Four volumes of his fermons were publifhed alter his death by his brother Nicholas Claget, archdeacon of Sudbury, father of Nicholas Claget afterwards bihop of Exeter.

CLAIM, in law, a challenge of interct in any thing that is in the poffelion of another.

CLAIR, obfcure. Sce Claroobicuro.
CLAIRAULT (Actexis), of the French acauemy of feiences, was one of the moft illutrinus mathe. maticians in Europe. He read to the academy in 1726, when he was not 13 years old, "amomoir upon four new geometrical carves of his siwn invention ;" and fupported the claracter he thus laid a fomdation for by various publications from time to time. He publihed, Elímens de G.omítrie, 17.1, in Svo; Elimens th Alyebre, $174^{6}$, in svo; Thérrie de ha Figure de la Terve, 17+3, in 8vo: Tables de lo Lune, $175+$, in 8 vo . He was concerned alfo in the Gournal des Siazans, which he funnifhed with many excellent extracts. He died in 1765 . He was one of the acallemicians who were fent into the north to determine the figure of the eatth.

CLAM, in zoology, a thell-fifh. Sce VENUS.
CLAMP, a piece of wood joined to another.
Clamp is likewite the term for a pile of ubburnt bricks buile up for burning. 'Thefe clamps ate built much after the fame manner as arches are built in kilns, viz. wilh a vacuity betwixt each brick's becadth for the fire to afcend by ; but with this difference, that inftead of arching, they trufs over, or over-fpan; that is, the end of one brick is laid about half way over the end of another, and fo till both dides meet within half a brick's length, and then a binding brick at the top tinifles the arch.

CLIMP in a, fhip, denotes a piece of timber applied to a maft or yard to prevent the wood from burlting; and alfo a thick plank lying fore and aft under the beams of the firft orlop, or fecond deck, and is the fame that the rifing timbers are to the deck.

Clamp-Nuils, fuch nails as are ufed to fuften on clamps in the building or repairing of hips.

CLAMPETIA (anc. geog.), a town of the Brutii, one of thofe which revolted from Hamibal, (Livy); called Lampetia by Polybius. Now Amamid, or Montia, a town of Calabia Ultra, near the bay of Euphemia. E. Long. 16. 20. N Lat. 39. 15.

CLAMPING, in joinery, is the litting a piece of board with the grain to another piece of boadd crofs the grain. Thus the ends of tables are commonly clamped, to prevent their warping.

CLANDESTINE, any thing done withont the knowledge of the parties concerned, or without the proper folemnities. Thus a marriage is faid to be cladide1line, when performed without the publication of bans, the confent of parents, \&e.

CLANS, is hifory, and particularly in that of Scotland. The nations which over-ran Europe were originally divided into many fmall tribes; and when they came to parcel out the lands which they bad conquered, it was natural for every chieftain to behow a portion, L 2
$\qquad$
Clim Cluse. - - d
in the fin place, upen thofe of his nwn tribe or family. Thele all hed their londs of him; and as the Cafety of each individual depended on the general union, thefe fimall focicties clung toguther, and were dillinguifhed by fome common appellation, either patronynical or local, long before the introduction of furnames or enfigns armorial. But when thefe became common, the defcencants and relations of every chicftain affurmed the fame name and arms with him; other vaffals were proud to initate their example; and hy degrees they were communicated to all thofe who held of the fame fuperior. Thus clanhips were formed; and, in a gencration or two, that confanguinity, which was at firft in a great meafure imaginary, was believed to be real. An artificial union was converted intn a natural one: men willingly followed a leader, whom they regarded both as the fuperior of theit lands and the chief of their blood; and ferved him not only with the fidelity of valfals, but the affection of friends. Iu the other feudal kingdoms, we may obferve fuch unions as we have defcribed, imperfectly formed; but in Scotland, whether they were the production of chance, or the effect of policy, or flrengthened by their preferving their genealngies both genuine and fabulous, clanhips were univeral. Such a confedency might be overcome; it could nat be broken: and no change of manners or government has been able, in fome parts of the kingdom, to diffolve affuciations which are founded upon prejudices fo natural to the human mind. How formidable were nobles at the head of followers, who, counting that cauie juft and honourable which their chief approved, were ever ready to take the field at his command, ard to facrifice their lives in defence of his perfon or of his fame! Againlt fuch men a king contended with great difadvantage ; and that cold fervice, which money purchafes, or authority extorts, was not an equal match for their ardour and zeal.

Some imagine the word clan to be only a corruption of the Roman colonia; buc Mr Whittaker afferts it to be purely Britifh, and to fignify a family.

CLAP, in medicine, the firl flage of the venereal difeafe, more ufually called a Gonorrhoea.

CLsif-Nef, in birding, a fort of net contrived for the taking of latks with the looking.glafs, by the method called daring or doring. The nets are fpread over an even piece of ground, and the larks are invited to the place by other larks faftened down, and by \& looking-glafs compofed of five pieces, and fixed in a frame fo that it is turned round very fwiftly backrards and forwards, by mcans of a cord pulled by a perion at a confiderable diftance behind a hedge. See Doring.

CLAR, or Clafr, in metallurgy, bone-ahes perfeetly calcined, and finely powdered, kept purpofely for covering the infides of Coppels.

CLARAMONT-powder, a ki:d of earth, called terra de Baira, from the place where it is fonnd; it is famous at Venice, for its efficacy in ftopping hemorrhages of all kinds, and in curing malignant fevers.

Precept of Clare constat, in Scots law, the warrant of a fuperior for entering and infefting the heir of his former valfal, without the interpofition of an inquef.

Nuns of St Clare, were founded at Affira in Italy,
aloout the t212. Thefe nuns obferved tine rule of St. Francis, and wore habits of the fame col sur with thole of the Francican friars: and hence were called Mernoreffes; and their houfe, without Aldgate, the Minories, where they were fettled when in ll brought over into England, about the year 1293. They had only three houfes hetides this.

Clare, a market-town of Sufolk, 13 miles fouth of Bury. E. Longe O. 35 N. Lat. 52.15. It gives the title of Earl to the dulie of Newerafle.

Clare is alfo the capital of a county of the fame name in the province of Comaught, in Ireland, fizuated about 17 miles northwelt of Limerick. W. Lung. 9. O. N. Lat. 52. 43.

CLARENCIEUK, the fecond king at arms, in called from the duke of Clarence," to whom he fill beIonged: for Lienel, 3 d fon to Edward 1 II. having by his wife the honour of Clare in the county of Thnmond, was afterwards declared duke of Ciarence; which dukedom afterwards efcheating to Edward IV. lie made this earl a king at anns. Whs ofice is to marnial and difpofe of the funera's of all the lower nobility, as baronets, knights, efquires, on the fouch fide of the Trent; whence he is fometimes called furroy or fouth-rey, in contraditiontion to nor ros.

CLARENDON (Conthntions of), certain confltutions made in the reign of Henry II. A. D. $116_{4}$, in a parliament held at Clarenton; whereby the king cliecked the power of the Pope and his clersy, and greatly narrowed the total exemption they clamed brom fecular jurifdiction.
Clarevdon (Earl of.) Sce Hyde.
CLARENNA, Tabulae (anc. geog.) ; a town of Vindelicia, at the confluence of the Lycus and Danube. Now Rain, a town of Bavaria, on the fouth fide of the Danube, at the confuence of the Lech. E. Long. i1. O. N. Lat. 48.45.
CLARENZA, the capital of a duchy of the came name in the Morea; it is a fea-port town, fituated on. the Mediterranean. E. Long. 21.40. N. Lat. 37.40.

CLARET, a name given by the French to fach of their red wines as are not of a dcep or high collur. See Wine.
CLARICHORD, or Manichord, a mufical inhtument in form of a fpinet.
It has 49 or 50 ftops, and 70 frings, which bear on five bridges; the fint whereof is the highett, the reft diminining in proportion. Some of the flings are in unifon, their mumber being greater than that of the fops. There are feveral litile mottoifes for paffing the jacks, armed with brafs-hooks, which fop and raile the chords inilead of the feather ufed in virginals and fpinets: but what diffonguifhes it mott is, that the chords are corered with pieces of cloth, which render the found fweeter, and deaden it fo that it cannot be heard at any confiderable dittance: whence it comes to be particularly in ufe among the nuns, who leara to play, and are unwilling to difturb the filence of the dormitory.
CLARIFICATION, the at of cleaning or fining any fluid from all heterogeneors matter or feenlencies.

The fubtances ufually employed for clarifying liquors, are whites of egg3, blood, and iinglafs. The two firt are ufed for fuch licquors as are clatifed whint

## C. L

avivatio bniling hot; the laft for thofe which are clarifed in the cold, fuch as wines, \&e. The whites of erys are beat up into a froth, and mixed with the liquor, upon which they unite with and entangle the inpure matters that fluated in it ; and piefently growing: hard by the heat, carry them up to the furface in form of a feum no longer diffoluble in the liquid. Blood operates in the fame manner, and is chicfly ufed in purifying the brine from whict falt is made. Geat quatities of ifmglafs are confumed for fining turbid wines. For this purpofe fome throw an entire piece, about a quarter of an ounce, into a wine celle; by degrees the glue diffolves, and forms a ikin upon the fur$\mathrm{f}_{\text {ace }}$, which at length fubfading, carties down with it the feeulent matter which floated in the wine. Others previoufly ciffolve the ifinglafs; and having boiled it down to a flimy confitence, mix it wihl the liquor, roll the caft frongly atout, and then fuffer it to thand to fette. Neuman quettions the wholefonenefs of wines thus purified; and affures us that he himfelf, after drinkiag only a few ources of fack thus clarified, but not fettled quire fine, was leized with ficknefo and vomiting, followed by fuch a vertiro, that he could not lland upright for a misute together. The giddinefs continued with a naufea and want of appetite for feveral days.

CLARIGATIO, in Roman antiquity, a ceremony that always preeted a formal deelaration of wat. It was performed in chis manner: firft four heralds crowned with vervain, were fent to demand fatisfaction for the iniuries done the Roman tate. Thefe heralds taking the yods to witnefs that their demands were jull, one of them, with a clear voief, demanded reflitution within a limited time, commonly 33 days; which being expireci without rellitution made, then the pater fatratus, or prince of the lecralut, proceeded to the enemies frontiers, and declared war.

CLARII Apmzlints Fanum (Strabo, Pliny), a temple and grove of Apollo, fituated hetween Colophon and Lebedos, in Ionia; called Claros (Thucydides, Ovid). The name alfo of a town and mountain there (Nicander); and of a fountain (Clemens Alexandrinus); the waters of which infpired with prophetic fury. Clarives the epithet of Apollo (Strabo).

CLARION, a kind of trumpet, whofe tube is riarrower and its tone aciter and ihriller than that of the common trumpet. It is faid that the clarion, now ufed among the Moors and Poituguefe, who borrowed it from the Moors, ferved anciently for a treble to feveral trumpets, which founded tenor and bafs.

CLARISSES, an order of nuns fo ealled from their founder St Clara or St Clare. (See St Clare). She was in the town of Affifa in Italy; and having renounced the world to dedicate herfelf to religion, gave birth to this order in the year 1212 ; which eomprehends not only thofe nuns that follow the rule of St Francis, acending to the firict letter, and without any mitigation, but thofe likewife who follow the fame rule foftened and mitigated by reveral popes. It is at prefent one of the molt flourifhing orders of nuns in Europe. After Ferdinand Coriez had conquered Mexico for the king of Spain, Ifabella of Portugal, wife of the emperor Charles V. fent thither fume nuns of the order of St Clara, who made feveral fettlements
there. Near their monatleries were founded communities of Indian young women, to be influcted by the chatifes in religion, and fuch works as were fuitable to pertons of their fex. Thete eommunities are fo confiderable that they ufually confilt of four or five hundred.

CLAREE (Dr Samuel), a preacher and writer of condiderable note in the reign of Charles II. was, duriug the inter-regnum, and at the time of the cjection, minifter of St Bennet Fink in London. In No. vember 1660 , he, in the name of the Preflyterian minilters, prefented an addrefs of thanks to the king for his declaration of liherty of confeitnce. He was one of the commiffoners of the Savoy; and behaved on that oceafion with great prudence and moderation. He fometimes attended the church as an liearer and communicant; and was much eflecmed by all that knew him, for his great probity and indultry. The molt valuable of his mumerous works are daid to be his Lives of the Puritan Divines and ather perfons of note, 22 of which are printed in his martyrology : the reft are in his Lives of fundry Eminent Perfons in this latter Age, folio; and in his Marrow of Ecclefiatticab İthory, in folio and quarto. He died in IGSO.

Clarie (Samuel), the ion of the former, was fellow of Pembroke-hall in Cambridge; but was ejected from his fellowhip for refung to take the engagements, as le was alfo atterwards from his rectory of Grendon in Buckinghamhire. He applied himfelt early to the ttudy of the feriptures; and his amotations on the Bible, primted together with the facred text, is highly commended by Dr Owen, Mr Buxter, and $\mathrm{D}_{1}$ Calam:. Ile died in 1701, aged 75.

Clarae (Dr Samuel), a very celebrated Englina divine, was the fon of Edward Clarke, Efq; alderman of Normich, and one of its reprefentatives in parlia. ment for feveral years; and born there Ottober 11 . 1675. He was influcted in claffical learning at the free-fehool of that town; and in liga removed thence to Caius college in Camoridge, where his uncommon abilities foon began to difplay themfilves. Though the philofophy of I)es Cartes was at that time the eftablimed philotophy of the univerlity, yet Clarke eafly mattered the new fysern of Navton; and in order to his firtt degree of arts, performed a public exercife in the fehools upon a queftion taken from it. He greatly contributed to the eitablifment of the Newtorian philofophy by an excullent traulation of, and notes upon, Rohatites "Phylics," whieh he finihed before he was 22 years of age. The fyttem of natural philofophy then geneatly tanglat in the univerfity was that written by Rohanlt, founded altogether upon Cartefian principles, and very ill tranflate 1 into Latin. Clarke gave a new trannation, and added to it fuch notes as might lead Audents infenfibly and by degrees to other and truer notions than could be found there. "And this certainly (fays Bithop Huadly) was a more prudent method of incroducing truth unknown before, than to attempt to throw alide this treatile entirely, and write a new one inftead of it. The fuccefs anlwered exceedingly well to his hopes; and he may jutlly be ftyled a great benefdctor to the univelfity in this attempt. For by this means the true phil fopliy has, without any noife, prevailed ; ant 6 this day his tranllation of Rohault is, generally fperk.

ferves, the grand, the proper, the decilive proof of the exiftence, perfections, and providence of the 1 , iny, mut be drawn from his works. On this proof, as being equilly fatisfacery to the profondell phihofopher and the memelt peafant, the caufe of religion will ever Itand feure. Neverthelef, if there be fuch a thing as an argument in priori, why may not fpeculative men be employed in its examination? Soveral able divines and philofephers have thought, and ttill thirk, that this argunent for the being and attributes of Gow, will thand the teft of the feverell feruciny; and therefore they cannot be blamed for endeavoung to fet it in a convinime light to others. As to the merit, indeed, of the whole work under confideration, incluting the evidences of natural and resealed religion, it is undoubtedly of the firlt order. Difficulties may be raifed on particular points, and the ableft and mot candid inquirers may fonctimes fee caufe to heftate with regard to the validity of the reafoning : but ftill, in general, the book reflects honour on the age as well as the author that produced it, and will defeend, with difinguifhed reputation, to a late pofterity. The defence, in particular, of the facred original and authority of Chrititanity, is adnirdely conducted.

In 1706 he pultifhed "A Letter to Mr Dudwell;" wheren atl the arguments in his cpitumary ditourfe againt the immortality of the foul are patticularly anfwered, and the judgment of the Cathers, to whom Mr Dodwell had appealed eoneerning that matter, truly reprefented. Bifhop Hoadly obierves, that in this letter he anfwered Mr Dodwell in fo excellent a manner, buth with regard to the philulophical part, and to the opinions of fome of the primitive writers, upon whom thefe doftrines were fixcd, that it gave pniverfal fatisfaction. But this eontroverfy did not ftop here; for the celcbrated Collins, coming in as a fecond to Dodwell, went much farther into the philofophy of the difpute, and indeed feemed to produce atl that could poffibly be faid againft the immateriality of the foul, as well as the liberty of luman actions. This enlarged the feene of the difpute; into which our author entered, and wrote with fuch a fpirit of clearnefs and demonftration, as at once fhowed him greatly fuperior to his adverfarics in metaphyfical and phyfical knowledre ; and made every int dligent reader rejoice, that fuch an incident had happened to provoke and extort from him that plenty of frong reafoning and perfpicuity of expreffion, which were indeed very much wanted upon this intricate and obfeure fubject. " And I am perfuaded (continues the binop), that as what he has writ in this controverfy comprehends the little that the ancients had faid weH, and adds thill more evidence than ever clearly appeared before, and all in words that have a meaning to them, it will remain the flandard of good fenfe on that fide of the quetion, on which he feent fo many of his thoughts, as upon one of his favourite points." Clarke's Jetter to Dodwell was foon followed by four defences of it, in four feveral letters to the author of "A Letter to the learned Mir Henry Dodwell ; containing fome Remarks on a pretended Demonflation of the Immateriality and natural Immortality of the Soul, in Mr Clarke's Anfwer to his late Epitolary Difcourle, \&c." They were afterwards all printed together; and the "Anfwer to 'loland's Amyntor" added to them.

39 C L A
In the midat of all thefe labours, he found time to chane. thow his regard to mathematical and phyfieal itedies, and exact knowledge and fill in them. And his naturab afiection and capacity for thefe fludies were not a litte improved by the friendmip of air lface Newton; at whofe ruqut he trandated his "Optics" into Latin in ! $70 \%$. With this verlion Sir llaace was fo highly plafed, that he prefented him with the furn of 1. 500 , or L. 100 fur cacil child, Clanke having thers five chiluren.

This year alfo, binhog Moore, who had long fermed a defign of tixing him more conficin ofly, procered for him the reciury of S' Beanet', Paul's Wharo in Londun; and foom ater caniod him wo crurt, and recummended him to the favour of quen Anne. She appointed him one of het chaplains in ordinary ; and, in confletation of his great merrit, and at the reguef of the binop, prefented him to the refory of St James's, Weltnintter, when it became vacant in $170 \%$. Upon his advanement to this hation, he tork the degree of 1).1). whan the public exercife which he performed for it at Cambridge was prodigioully admired. The quettions which he maintained were the e: I. "N thlm fidei Chriaime dogna, in faci is fieripturis tradicua, eft recte rationi diffentanem:" that is, "No articte of the Chrilian futh, djavered in the holy Scripturcs, is difagreeable to right reafon." 2. "Sine actionum hurranarum libertate nulla potef effe religio :" that is, "Without the liberty of human actions there can be no retigion." His the fis was upon the firlt of thefe quettions; which being thorouphy fifted by that moil acute difputant profefior James, he made an extcmpore reply, in a continued difcourfe for near half an hour, with fo littie lefieation, that many of the auditors declared thenfelves aftonihicd; and owned, that if they had not been within fight of him, they floculd have fuppofed him to have readevery word of it from a paper. After this, through the courfe of the fyllogiflical difputation, he guarded fo well againtt the arts which the profeffor was a complete maticr of; replied fo readily to the greatett difFiculties fuch an objector could propofe; and preffed him fo clofe and hard with clear and intelligitle anfwels, that pertaps there never was fuch a conAlite heard in thole fehools. The profeffer, who was a man of humour as well as learning, faid to bim at the end of the difpuation, "Profecto, me probe exercnitti;" that is, "On my word, you have worked me fufficiently;" and the members of the univerfity went away, admiring, as indeed they well might, that a man even of Clarke's abilities, after an ablence of fo many years, and a long difcourfe of bufinefs of quite another nature, fhould acquit himfelf in fuch a manner, as if this fort of academical exercife lad been his contlant tmployment: and with fuch fluency and purity of eyprefil $n$, as if he had been accullomed to no other language in converfation but Latin. The fame ycar, 17c9, he revifed and corrected Whillon's tranfation of the "Apoftolical Conflitutions" into Enelifh. Whifon teils us, that his con lludies having been chisfy upon other things, and having rendered him incapable of being alfo a critic in words and languages, he defired his great friend and great critie Dr Clarke to revife that tranlation; which he was fo kind as to agree to.

Clarke. In t712, he publithed a mon beautifil and pumpous edition of Calat's commentaries, adorned with elegant fculptures. It is intituled, " C. Julii Cetaris qua extant, accuratiffime cum libris editis $\mathcal{E}$ mit. upt:mis collata, recognita, se correda; acceffornt amotationes Samuelis Clarke, S' T. P. itern indices locoram, rerumque Sc $^{2}$ verborun, utiliflime." It was printed in 1712, folio: and afterwards in 1720 , 8vo. It was dedicated to the great duke of Mallhorough, "at a time," fays Bifhop Itoadly", "when his unequalled rictories and fucceffes had railed his glory to the highefl pitch abroad, and leffoned his interet and favour at home." In the publication of this book, the ductor took particular care of the punctuation. In the anmotations, he feleeted what appeared the beft and molt judicious in former editors, with fome corrections and emendations of his own interiperfed. Mr. Addifon has fpoken of this fulio cuition of Criar's commentaries in the fullowing words: "The new edition, which is given us of Cæfar's commentaries, has already been taken notice of in foreiga gazettes, and is a work that does honour to the Engtith prefs. It is no wonder that an edition hould be very correct, Whichhaspaffed thro' the hands of one of the moft accurate, learned, and judicious writers this age has produced. The beanty of the paper, of the characer, and of the foreral cuts with which this noble work is illufated, makes it the fineft book that I have ever feen; and is a true inftance of the Lngling genius, which, thongh it does nut come the firt into any art, generally carrics it to greater heights than any other conatry in the worlh." This noble work has rifen in value from that time to the prefent. A copy of this cdition in large paper, mont fplendidly bound in morocio, was cold at the Hon. Mr Beauclerk's fale for forty-four pounds; and it was faid to oe purchafed by the Duke of Graftom. "To a priace or a nobleman (Gays Dr Harwood), it was a cheap purchale; for it was the mut magnificent book I ever behehd. The binding con Mr-Beauclerk five guineas.

The fame year, 1712 , he publimed his celebrated book intituled, "The Scripture Doctrine of the Trinity, \&c." which is divided into thece parts. The firt is, a collection and explication of all the texts in the "New Teilataent," relating to the doctrine of the Trinity : in the fecond, the furegoing doctrine is fet forth at large, and explained in particular and diftinct propofitions; and in the third, the pienc.at paffages in the liturgy of the church of England, Elating to the doctrine of the Trinity, are comblerch. Bimop Hoadly applauds our author's method of proceeding, in forming his fentiments upon fo important a point : "He knew (fays he"), and all men agreed, that it was a matter of mere revelation. He dad not thercfore retire into his clofet, and fet hinfe if to invent and forge a planfible hypothefs, which might nit ealily upon his mind. He had not recourfe to abltract and metaphyfical reaConings to cover or patronize any fytem he might have embraced befure. Bur, as a Chritian, he laid open the New Teftament before him. He cearched out crery $t$ ext in which mention was wade of the thece perfons, or any one of them. He accurately examined the meaming of the words ufed abour sery one of then ; and by the belt rules of grammar and critique, ind by his fkill in language, he endeavoured to fix plainly what was declared about every perfon, and what was not. And what he thought :s ot ite tru:h, he yub. $\mathrm{N}^{\circ} 8 \mathrm{~g}$.
lified under the t' e titce of 'The Scripture Doetrine of the 'Trinity." "I am for (lays the bimop) from taking upon me to determine, in fo diffecult a quellion between him and thofe who made replits to him; bat this I hope I may be allowed to fay, that exey Chritian divine and layman ought to pay his thanks to Dr Clarke for the method juto which he brought. this difpute; and for that cullection of texts of the New Teftament, by which at laft it mult be decided, on which fide feever the wath may be fuppofed to lie." Whitton informs us, that fome time before the publication of this book, there was a meffage fent to him from lord Godolplan, and others of queen Anne's minitters, importing, "That the affairs of the public were with diflicalty then kept in the hands of thofe tinat were for liberty; that it was therefure an unfeafonable time for the publication of a book that would make a great noife and dillumbance: and that therefore they defired him to forbear till a fitter opportunity thould offer itfelf:" which menfage (lays he) the doctor had no regard to, but went on according to the dictates of his own confience with the publication of his book. 'The minillers, however, were very right in their conjectures; for the work made noife and dillurbance enough, and occalioned a areat number of books and pamphiets, witten by himlelf and others.

Books and pamphets, however, were not all which the "Scripture Ductriue of the Thinity" occafioned : it made its author obsoxious to the power ecelediat ical, and his book to be complained of by the Lower Honfe of convention. The D Defor drew up a preface, and afterwards gave in feveral explanations, which feemed to farifify the Upper Houle; at leatl the affair was not brought to any ifue, the meanbers appearing detirous to prevent diffenfions ami divinons.

In 1,15 and 1716 , he had a difpute with the celebrated Leibnitz, relating to the prineiples of natural philolophy and religion; and a collection of the papers which paffed between them was publifhed in 17:7. This perfomance of the doctor's is infcribed to her late majetty queen Caroline, then princefs of Wales, who was plealed to have the controverfy pals throngh her hands. It related chiefly to the important and dificult fubjects of liberty and neceifity.

In 1718 , Di Clarke made an alteration in the forms of doxology in the finging palms, which produced no fnall noife and difturbance, and occalioned fome pamphlets to be written. The alkeration was this:

> Tis God, through Cheilt, his mly Son, Inmertal glir! be, \&c.
> To C. .t, throigh Cf rin, his Son, ur Lord, Ail glory be therefore, \&.

A confuterable number of thefe feleet phalms and hy mins having leca difperted by the S ciety for Promutins Chritian Kinowledys, before the alteration of the duxologics was taken autice of, he was chatged with a delisn of impoliag upon the fociety: whereas, in truth, the edition of them had been prepared by him for the ufe of his uwn parith only, before the fociets had theurbis of puchating any of the copies: and as the ufual roms of doxology are not e?tablithed by any legal authority, eccleatalicil or civil, in this he had nut offend d.

Ibuat this cinc he was preiented by the lord Leehmeres

## C L A [ 4: ] C L A

!arke. 'mere, the chancellor of the duchy of Lancafter, to the matterhip of Wigton's hofpital in Leiceller. In 1724, lie publifhed 17 fermons preached on fercral occations, II of which ware never before printed; and the year following, a fermon, preached at the parifh-church of St James's, upon the ereCling a elarity-fehool for the education of women fervants. In ${ }^{1727}$, upon the death of Sir Ifaac Newton, he was offered by the court the place of mafter of the Mint, worth communilius chnnis 1200 or 15001 . a year. Dut to this fecular preferment he could not reconcile himfelf; and therefore ab. folutely refufed it. Whifton feems to wonder, that Clarke's elogifts hould lay fo little ftrefs upon this refufal, as to mention it not at all, or at leaft very negligently; while " he takes it," he fays, "to be one of the molt glorious actions of his life, and to afford undeniable convicion, that he was in earnent in his religion." In 1728 , was publifhed, "A Letter from Dr Clarke to Mr Benjamin Hoadly, F. R.S. occadioned by the Controverfy, relating to the Proportion of Velocity and Force in Bodies in Motion ;" and printed in the "Philofophical Tranfactions, $n^{\circ} 401$.

In 1729 , he publifled the 12 firt books of "Homer's Iliad." This edition was printed in tto, and dedicated to the duke of Cumberland. The Latin verfion is almof entirely new; and annotations are added to the bottom of the pages. Homer, Bifhop Hoadly tells, was Clarke's admired author, even to a degree of fomething like enthufiafm, hardly natural to his temper; and that, in this he went a little beyond the bounds of Horace's julgment, and was fo unwilling to allow the favourite poet ever to nod, that he has taken remarkable pains to find out, and give a reafon for ceery paffage, word, and title, that could create any fufpicion. "The tranfation," adds the Bilhop, "with his corrections, may now be 1 yled accurate : and his notes, as far as they go, are indeed a treafury of grammatical and critical knowledge. He was ealled to his tafle by royal command ; and he has preformed it in fuch a manner, as to be worthy of the young prince, for whom itwas laboured." The year of its publication was the latt of this great man's life. Though not robuit, he had always enjoyed a firm itate of health, without any indifpofition bad enough to confine him, except the fmall-pox in his youth; till, on Sunday May 11. 1729, going out in the morning to preach before the judges at Serjeant's-inn, he was there feized with a pain in his fide, which made it impofible for him to perform the office he was ealled to; and quiekly becane fo violent, that he was ohliged to be carried home. He went to bed, and thought himfelf fo much better in the afternoon, that he would not fuffer himfelf to be blooded; againlt which remedy, it is remarkable that he had entertained frong prejudies. But the pain returning violently about two the next morning, made bleeding abfolutely neceffary ; he appeared to be out of dancer, and continued to think himfelf fo, till the Saturday morning following; when, to the inexpreflible furprife of all about him, the pain removed from his fide to his head; and, after a very flort complaint, took away his fenfes fo, as they never returned any more. He continued breathing till between feven and eight of the evening of that day, which was May 17.1729; and then died, in his 5 th year.

You. V. PartI.

Soon afier his death were puthithed, from his original manuferipts, by his brother Dr John Clarke, dean of Sarum, "An Expofition of the Church Catechifm," and ten volumes of fermons, in 8 vo . His "Expofition" is made up of thofe lectures he read every Thurfday morning for fome montlis in the year, at St James's church. In the latter part of lis time he revifed them with great care, and left them completely prepared for the prefs. As to the fermons, few dit. courfes in the Englifh language are more judicios. and fewer thill are equally intructive. The reafoning and the practical parts are excellent, and the explanations of fcripture are uncommonly valuable. Though Dr Clarke had not the turn of mind which quatited him for moving the paffions, and indeed did not nake it his object, his fentiments, neverthelefs, are frequently expreffed with fuch a elearnefs of conception and fuch a force of language, as to prodace in well dipo fed readers all the effect of the pathetic. Several volumes of fermons have been publinhed fince his time. which are far fuperior in point of elegance and beane\%, and we have the highett ferife of their merit. But itit, if we were called upoa to recommend difcourfes, whicis abound with the moft folid inftruction, and promife the moft lafting improvement, we thould never forget: a Clarke and a Jortin. Three years after the Doetor's death, appeared alfo the Twelve Lat Books of the Iliad, publifhed in 4 to by lis fon, Mr Samuel Clarke, who informs us, in the preface, that his father had fio nifhed the annotations to the three firft of thofe books, and as far as the 359 th verfe of the fourth; and hat revifed the text and verfion as far as verfe 5 ro of the fame book. Dr Clarke married Catharine, the durghter of the Rev. Mr Lockwood, retor of Litle Miffingham in Norfolk; in whofe good fenfe and unblameable behaviour he was happy to his death. By her he had feven children, two of whom died befure him, and one a few weeks after him.

Of the character of this great divine, the following fhort delineation appeared fome years fluce in the Gentecman's Magazine: " Samuel Clarke, D.D. rector of St James's, Weftminfter: in each feveral part of uffell knowledge and critical laarning, perhaps without a fuperior; in all united, certainly without an equal : in his works, the betl defender of rcligion; in his practice, the greatef ornament to it : in his converfation communicative, and in an uncommon manner inftructive ; in his preaching and writings, ftrong, clear, and ealm ; in his life, high in the etteem of the wife, the good, and the great ; in his death, lamented by every friend to learning, truth, and virue." In the fame publication fome not incuious aneedotes concerning him are printed, collected by the Rev. Mr Jones of Welwy. We lean from them, that Dr Clarke was of a very lumane and tender difonition. When his young children amufed themfelves with tormenting and killing flies upon the windows, he not only forbad fuch practices, but calmly reafoned with them, in fuch a familiar manner, as was calculated to make a powerful impreftion apon their minds. If was very ready and condefeending in anfwering applications to him with refpect to feruples; numbertets iuftances of which oceurred in the courfe of his life. One thing of which Dr Clarke was peculially camtios. was not to lofe the leait minute of bis time. He al- Clarke. -
$\xrightarrow{\text { C'arke. }}$ ways carrica fome book about with him, which he would read whilt ridins in a conch, or walking in the ficlds, or in he had any fifure moments free from company or his other tludies. Nay, he would read evon in company itfelf, where he might 1 ake fuch a libery withont offence to goot mamers. 1 lis menory was remakably forong. Fie tuld Mr Pu!e of Logn, that he never fongot any thinernich had oncethoroughly apprehended and undertood. The Doctur, with his intimate friends, was perfectly tree and cafy; but if flangers were introduced, he behaved with mach circompoction, converfing only uron common topics. When he sifict Dr inkes, his uitual way was to fit with lim upon a conch, amd, sectang upou his bofom, to difeourfe with him, in the mun famidur manner, upon fuch fubjuts as were arrevible to the tathe and jub, ment of huth. When sir John Comaine lay upon his ckath-bed, and was in great confulion and trualle wemind, he font for Dr Chate, ard requedted to know of him whether he fomble recuive the faclamont, and what he thoud do in his fad condition. The Doctor, who was Well acquinted with Sir John's pulats and counce of life, feduely rephied, that he could not advite hin to recene the facramert, and that he did not think it likely tor be of any amat to him
 depared wibout adminiftering the commanion, having firlt recommended the dying oran to the mercy of Cod.

Dr Chatie was of a cheofth, and exen playfu] difpofition. An intimate friend of his, the late Reve if Bott, nifed to relate, that once when he ealjud upon him, he found him foimming topon a tible. Iit anoTher time, when the two Dr Claw $\%$, Mr Puit, and fereral mun of ability and hanire were together, and amuly themfeles ivith divertins tricke, Itr Bamuel Clarke, lucking out of the window, faw a grave blockhead approaching to the houfe: upon wheh he cried ont, "Boys, bu's, be wife, here comes a fool." 'I'his tura of his mind hith firce been contiamed hy Dr Warton, who, in his ublervations on the Eullowing line of Mr Yope,

## " Unthought of fraities cheat us in the wife,"

fays, "Who could imagine that Locke was fond of romanecs; that Nenton once Audicd altolory ; that Dr Clarke valned himfelf for his agility, and frequemtly amuled himfelf, in a private rom of his houfe, in haping over the tables and chairs; and that our author limfurf was a great epicure?" With refpect to what is here recorded of Dr Clarke, we can fearedy perfuade omfelves to confider it as a frailty. To be poffeffed of fuch a temper as his was, mufl have been no froll degree of happinefs; as it probably enabled him to purfue his important and ferious fludies with greater vivacity and vigour. To be capable of deriving amufement from trivial circumftances, indicates a heart at eafe, and may generally be regarded as the concomitant of vitue.

Clabke (William), an Englifn divine, was born at Haghmon-abbey in Shropthire, 1 by 6 ; and after a grammar-education at ehrewfory fohool, was fent to St John's college Cambridge, of whin he wals elected sellow, fan. 17.1716; B. A. 1731, N. A. 1735. HC

tory of Buxted in Suffex, at the particular recommendation of Dr Wotton, whofe daughter he married. In 1738 , he was mule probendary and relidentiary of the cathedral church of Chichefter: Some years beione this he had given to the public a fpecirnen of his literay abilities, in a pretice to his father-in-law Dr Wot-
 allorum IValice Prinipum; ut, Eectefiatical and Civit Laws of Ilowel, D Da, and other princes of Wales. There is reafon likewife to furnmie, that an exechlent Difcomfe on the Commerce of the Romans, which was highly extulled by Dr 'aylor in his Elements of the Civil faw, might have been written by our author. It came cither from his hand or from that of hiafriend Mr Bowyer, and is reprinted in that genthman's Mfifcellaneous 'Trate. But Air Clarke's chicf work was, The Cunnction of the koman, Saxon, atad Enmbith Coins: deducing the Antiquities, Culloms, and Mmners of each people to mourm times; pariculaily the Obesin of Pudal Tenmes, and of Parliamones: ' Clleflrated throughout with eritical and hitorical Remarks un warions Abibor, both facterl and profanc. This work was publihed, in one volume quarto, in 1767; and its appearance from the prefi was owing to the diffovery mada by Masin Falkes, Efy; of the oda Sawon pound. It was dedicated to the dake of Newcalile, whofe beneficent difpofition is celebrated for having confermel obligations upon the athor, which were not the ellects of importunity: Mr Clarke's performance was perufed in manufeript by Arthur Orm now, If fq; Speako of the henle of commons, who honourd him with fome ufefol lints and obicrations: bat he was chicfly indated to Mir Dowyer, who took upon him all the care of the publication, drew up feveral of the motes, wrote part of the differtation on the Roman fettere, and formed an admirable indox to the whok. By this work our author acquired a great and juft repptation. Indecd, it reflects honour upon the country by which it is produced; for there are few performances that ase more replete with profound and curious learning. Mr Clarke's laft promotions were the ehancellorthip of the church of Chichetter, and the vicarage of Amport, which were beflowed upon him in 1770. Thefe preferments he did not long live to enjoy, departing this life on the 2 If of October, in the following year. He had refigned, in 1768 , the rectory of Busted to his fon Edward. In Mr Nichols's Anecdutes of Bowyer, there are feveral letters and extracts of fetters, written to that learned printer by Mr Clarke, which difplay him to great advantage as a man of picty, a friend, and a fcho. lar.

In a fketeh of his charadter in the Biargrabiaz Britannica, fumifhed by Mr Hayley, who was his intimate acquaintance, he is reprefented as not only a man of extenfive crudition, but as pollefied of the pleafing talent of communicating his varrous knowledge in famihar converfation, without any appearance of pedantry or prefumption. Antiquitita were the favourite fludy of Mr Clarkc, as his publications fufficiently fhow: but he was a fecret, and by no means an unfuecefiful, votary of the mules. He wrote Englith verfe with eaft, clegance, and ipirit. Perintps there are few butco epigrams in our language than the following,
which lie compofer on feetrag the words Domus nhtione inforibed on the vanit belunging to the duhes of Rich mond in the eathedral of Chichetter.
Drd he win thus infrib'd :le wa!!,
Nen rabl, or 1 of believe it Pan',
Who fays the 6 is, wher "et it wan te,
Aneth ir holfe ne: made w th hames?
O, may we gather from thele woths,
"I hat home is t ot a houre of Lond?

Among the happier little pieces of his fportive poetry, there were fome animated hamas, defcribing the character of the twelve Euglilh poots, whofe portraits, engraved by Vertne, were the favourite ornament of his parlour: bat he fet fo modelt and humbte a value un his poetical compofitions, that they were feldom committed to paper, and are therefure very imperfectly preferved in the memory of thofe to whom he fometimes recited them. His tatte and judgment in poetry appears indeed very friking in many partan of his learned and elaborate Comenefina of Coins. Fis it. luftration of Nefor's cup, in particular, may be efleemed as one of the happieh examples of that light and leaty which the learning and lipirit of an cleyant antionarian may throw on a clondy and mittaken pafage of an anciont poct. In frive atention to all the daties of his Hation, in the molt active and mowearied charity, he might be regarded as a raciel to the mintfers of Cod. Though his income was never large, it was his cuttom to derote a flilling in every guinca that he received to the fervice of the pour. As a mafler, as a haftand, and a fatticr. his conduct was amiable and endaring; and to clofe this imperfect flecth of hum with his moft Ariking feature, he was a man of genuine unaffected piety."

CLARO-nbscuro, on Clatropseure, in paiating, the art of diffributing to adrantage tire lights aud fazdows of: piece, botl with refpect to the ealing of the eye and the ethet of the whole picce. sue Pantinc.
 nify a deliga confining oaly of two colurs, mot who ally black and white, but fometimes black and yellow; or it is a debgn wathed unly with one chour, the Thadows being of a dafly trown, and the lights lieightencd up by white.

The word is alio arplied to puints of two columes taken off at twice: whereof there axe whames in the cabinets of thote who are curtions in prims.

CLARUS, or Claros (anc. geug.), a town of Ionia, famons for an omacie of Apollo. It was buit by Manto, daughter of Thefins, who thed from Thebes after it had been denoged ly the Epiromi. She was fo afticted with her misfortunes, that a lake was formel with her teats, where the fint fomded the wacle. A pollo wats from thence tirnamed Churias. Alf, an inand of the Argean, between Tenedos and Scius.

CLARI, is botany. See Salia.
Ghotr-IMiter, is compofed of bandy, fugar, claryflowers, and cionamon, with a litue ambergris difonve in it. It Eutps digethion, and is cardiac. 'This water is rudered eithar pargative or emetic, by adding relin of ial 1 p and fumanys, or crocis metallorim. Some make clary-water of hrandy, juice of cherrics, flrawberries, and goofucrries, fugar, cloves, white perper, and coriander feeds; infufed, fugared, and frained.

CLASMIILPM, in natural hikory, the name of a genus of fuffin, of the clafs of the gypitums; the charactera of which are, that they are of a fofe textar, and of a dull apaguc look, being connonfed, as all the other syptinns, of irecrubarly ananged lat partichs.
The werd is derived fiom the Grale notara a fragnent or fmall particte; from the haky fimall partichs of which thete bexies ate comporit. Of this grons there is only one known fectics: thin is of a tolcrably regular amb even flrueture; thoush very coarie and harh to the tonch. It is of a woy hedy and beautiful red in colonr ; and is fomen in thick roundith malles, which, when bruken, are tole fecte compofed of irregular arrangenctit; of the partichen: and cmutate a itriated texture. It will nether give fire with flecl nor ferment with acif; ; but calchins very firely and eatily, and affords a very valuable plater of Paris, as do all the purer gypfuns. It is common in Italy, and is greatly eltecmed there; it is alfo found in fome parts of Eagland, particulanly 1)erbyfhire, hat there it is not much regarded.

CLASlers, or Tendrils. Sce Cirraus.
CLASS, an appellation given to the mon qenemal fubdivifions of :any thing: thus, mimat is lubdivided into the duffes quadrapeds, birds, fines, \&e. which ase again fublivided into ferifes or orders; and theit lait into genera. See borany and Zoology.

Ceass, is alfo ufed in fehorols, in a fynonymons fenfe with form, for a number of boys all learaing the hane thing.

Classic, or Classical, an epithet, chienf appliat to authors read in the clathes at fethools.
'linis term feems to owe its origin to Dullias Serins, who, in order to make an ellimatc of sery perfon's etlate, divided the Roman people into lix banis, which lue called chafers. The culate of the firt clats was mot to be under 200 l. and thete by way of eminatuce were alled chatai, "clafics": hace athers of the forl rank came to be called clafis, all the rell being faid to be ingou chatem: thus Aritote is a claffic author in phatufopy; Aquinas in fehool divinity, \&e.

CLassiclent was the alarm for bittle, given by the Komangenerals; and founled by trampets and ether martiof mufic thronghon the amy.

CLATHRI, in antiquity, bars of wood or iron, ufed in fecuring doors and window. There was a godefo called chatra, that previded over the clathri.

CLAVARIA, club-tor: A genns belunging to the cryptrgamia clafs of plants, and of the order of flang ; the $5^{\text {th }}$ th in the natural method. The fungus is finoorthand ublong. 'The hemotades, or oak kather club-iop, exacily relembles tanned leather, except that it is thimur and fofter. It is of no determinate form. It grows in the clefts and hollow, of old oaks. and $f$ netimes on ath in Iveland and in fome places of Inglane. \&c. In Ireland it is ufed to drets ulecers, and in Virginia to fpread plafters upon, intead of leather. The militaris, and one or two othe: feccics, are rematkabic for growing only on the head of a dead infect in the nymphatiate.

A modern writer on matural hifory (Mr Miller), has aficted the whole genus of clavaria to belung to the tribe of roophyter, that is, to the animal, and nut to the vegotable lingdom. According to his methool, he ranks them among the Vomes, under a fubdivition 122 which

## C L A [ 44 ] C L A

Chavarium which he terms Fungofa ofculis atomiferis; thereby un1 Clause. derftanding them to be compound animals with many orifices on their furface, from which are protruded
atoms or animaleales which have a vifible fpontaneous motion, fomething fimilar to what is now acknowledged to be a fact with regard to a numerous clafs of marine bodies termed corallines. This motion, however, has not been obferved by other naturalilts. Scheeffer has figured the feeds of Ceveral clavariæ as they appeared to him through the microfcope; and none of thefe fungi, when bunt, emit the flrong difaorceable finell peculiar to animal fubfances.

CLAYARIUM, in antiquity, an ailowance the Roman foldiers had for furnithing nails to fecure their fhoes with. 'They raifed frequent mutinies, demanding largefles of the emperors under this pretence.

CLAvATA vestrmenta, in antiquity, habits adomed with purple clavi, which were either broad or narrow. See Clayus.
CL.AUBLRGE (John), a learned profeftor of philofophy and divinity at Duiburg, was born at Solingen in r 622 . He travclled into Holland, France, and England, and in each country obtained the efleem of the learned. The elector of Brandenburg gave him public eeltimonies of his efteem. He died in 166 ; His works were printed at Amfterdam in 2 vols fto. The mof ctlebrated of thefe is lis reatife, entitled Logica ae'ms et nowa, \& c.

CLAUDE of Iorrain, or Claude Gelce, a celebrated landicape painter, and a ftriking example of the efficacy of indutry to fupply, or at leat to call forth, genius. Claude was born in 1600 ; and being dull and heavy at fchool, was put apprentice to a paftrycook : he afterwards rambled to Rome to feek a livelihood; but being very ill-bred, and unacquainted with the language, no body cared to employ him, Chance threw him at laft in the way of Augurtino Trafo, who hired him to grind his colours, and to do atl his loonfehold druderery, as he kept no other fervant. His matler hoping to make him ferviceable to him in fome of his greatelt works, taught him by degrees the rules of perfpective and the elements of defign. Claude at firf did not know what to make of thofe principles of art; but being encouraged, and not feaing in application, he came at length to underfand them. Then his foul enlarged itfulf apace, and culivated the art with wonderfil eagernefs. He exerted his utmolt indultry to explore the true principles of painting by an inceflant examination of nature, that genuine fource of excellence; for which purpofe, he made histudies in the open fields; where he very frequentl; continued from fun rife till the dusk of the evening compelled him to withdraw himfelf from his contemplations. It was his cuftom to ketch whatever he thought beauitul or Rriking ; and every curious tinge of light, on all kinds of objects, he marked in his thetches with a fimiar colour; from which he perfect. ed his landfapes with fucha look of real nature, and gave thea fach an appearance of truth, as proved fufecior to any antilt that ever painted in that ftyle.

The beauties of lis paintings are derived from natare berfelf, which he examined with uncommon aí Gucuity ; and Sudrat relates, that Clauce ufed to e: than to hin, as they walked through the fields, the cafes of the differen apoearances of the fame profpect
at different hours of the day, from the reflections or refractions of light, from dews or vapours, in the evening or morning, with all the precifion of a philofopler. He worked on his pictures with great care, endeavouring to bring them to perfection, by touching themsequenty orer again; and if any performance did not anfwer his idea, it was cuftomary with him to alter, to deface, and repaint it again everal times over, till it correfponded with that image pictured in his mind. Dut whatever ftruck his imagination, while he obferved nature abroad, it was fo ftrongly impreffed on his memory, that on his return to his work, he never failed to make the happieft ule of it.

His fisies are warm and full of luftre, and every object is properly illumined. His diftances are admiable, and in every part a delightful union and harmony not only excite our applaufe but our admiration. His invention is pleafing, his culouring delicate, and his tints have fuch an agrecable firectnefs and variety, as have been but imperfectly imitated by the belt fubfequent artifts, but were never equalled. He frequently gave an uncommon tendernefs to his fiaifhed trees by glazing; and in his large compolitions which he painted in frefco, he was fo exact that the diftinct fpecies of every tree might readily be diftinguithed. As to his figures, if he painted them himfelf, they are very indifferent; and he was fo confeious of his deficiency in this refpect, that he ufually engaged other artilts who were eminent to paint them for him ; of which number were Courtois and Philippo Laua. His pictures are now very rare, elpecially fuch as are undamaged ; and thofe are at this time fo valued, that no price, however great, is thought to be fuperior to their merit. In order to avoid a repetition of the fame fubject, and alfo to detect fuch copies of his works as might be injurious to his fame, by being fold for originals, it was his cuftom to draw (in a paper-book prepared for his purpofe) the defigns of all thofe pictures which were tranfmitted to different countries; and on the back of the drawings, he wrote the name of the perfon who had been the purchafer. That books, which he titled Liliro di Verita, is now in the poffeffion of the untike of Devonfhire.

Claude (John), a Proteftant divine, born in the province of Angenois in $16 \pm 9$. Meft. de Port Royal uling their utmolt endarours to convert M. de Turenne to the catholic faith, prefented him with a piece calculated to that end, which his lady engaged Mr Claude to anfwer; and his performance gave rife to the moft famous controverfy that was ever carried on in France between the Roman Catholics and Proteftants. On the revocation of the edict of Nantz, lie retired to Holland, where he net with a kind reception, and was honoured with a confiderable penfion by the prince of Orange. He died in 1687; and left a fon Ifaac Claude, whom he lived to fee minilter of the Walloon church at the Hague, and who publifhed feseral excellent works of his deceafed father.

CLAUDIA, a veltal virgin at Rome, who being fufpected of unchattity, is faid to have been cleared from that imputation in the following manner: the image of Cybele being brought out of Phrygia to Rome in a barge, and it liappening to fick fo fafl in the river Tyber that it could not be moved, the tying her girdle, the badge of chaltity, to the barge, drew

Clu. $x^{2}$ Cluadis.

## C L A [ 45 ] C L A

Claudia, it along to the city, which a thoufand men were unable Maudianus, to do.

Claudhat Aqua (Frontinus), water conveyed to Rome by a canal or aqueduct of eleven miles in length, the contrivance of Appius Claudius the cenfor, and the firff flructure of the kind, in the year of Rome 441. Called alfo Aqua Appat.

Cbionlat Cophat (Inferiptions), a name of Lugdunum, or Lyons in France; the birth-place of the emperor Claudius: A Roman colony, called Clualia, from its benefactur the emperor; and Cofia, from its plenty of all neceflaries, efpecially corn. Sec Lugdunum.

Clauda, or Cladial Viaz (Ovid), was that road which, beginning at the Pons Milvius, joined the Flaminia, palfing through Etruria, on the fourh fide of the Lacus Sabatinus, and Atriking off from the Caffia, and leading to Lnea (Antonine): large remains of it are to be feen above Bracciano (Hollicnius).

Clauda Lex, de Comitits, was enacted by M. Cl. Marcellus in the year of Rome 702. It ordained, that at public elections of magiftrates no notice thould be taken of the votes of fuch as were abfent. Another, de Ufieri, which forbad people to lend moncy to minors on condition of payment, after the deceafe of their parents. Another, cle Negrotiatione, by C. Claudius the tribune, 535 . It forhad any fentur or fatice of a fenator to have any veffel containing above 300 amphorex, for fear of their engaging themftwes in commercial fchemes. The fame law alfo forbad the fane thing to the feribes and the attendants of the queflors, as it was naturally fuppofed that people who had any commercial contections colld not be faithful to their trult nor promote the intereft of the Ilate. Another, 576, to permit the allies to retum to their refpective cities, after their names were inrolled. Liv. 4 r. c.g. Another to take away the freedom of the city of Rome from the colunifts which Cæfar had carried to Novicomum.
CLAUDIANTS (Claudius), a Latia poet, flourifhed in the $f^{t h}$ century, under the emperor Theodofius, and under his fons Arcadius and Honorius. It is not agreed of what country he was a native; but he came to Rome in the year of Chrith 395, when he was aloout 30 years old ; and there infinuated limfulf into Stilicho's favour; who being a perfon of great abilities both for civil and military affairs, though a Goth by bith, was fo confiderable a perfon under Flonorius, that he may be faid for many years to have governed the weftern empirc. Stilicho afterwards fell into difgrace, and was put to death; and it is more than probable that the poet was invulved in the misfortuncs of his patron, and feverely perfecuted in his perfon and fortunts by Hadrian, an Egyptian by birth, who was captain of the guards to Honorius, and fucceedd Stilicho. 'There is reafon, however, to think that he rofe afterwards to grat favour ; and obtained feveral honours both civil and militay. The princefs Serena had a great effeem for Clandian, and recommended and married him to a lady of grat quality and fortune in Libya. There are a few little poems on facred fubjects, which through niftake have been aferibed by fome critics to Claudian; and fo have made him be thought a Chiflan. But St Auftin, who was cotemporary with him, exprefly fays that he was a Heather. 'The time of Claudian's death is uncertain,
nor do we know any further particulars of his life than what are to be collected from his works, and which we have already related above. He is thought to lave more of Virgil in his ftyle than all the other imitators of him.

Claudus l. Roman emperor, A. I). 4r. The beginriner of his reign was very promining ; bue it was foon difooverd that little better than an ideot dilled the throne, who might cafly be made a tyrant: accordingly he became a very crucl one, through the influence of his emprefs, the infamous Meffalina: after her death, ne married his niece Agrippina, who canhed lim to be poifoned to make way for Nero, 1. D. 5t. Sice (Fifiory of) Rome.

Clauimus II: (Aurelins), furmamed Gothicus, fig. nalized himfelf by his courage and prodence under tha reigns of Valerian and Julian; and on the death of the latter was declared emperor in 269. He put to diath Ameolus, the murderer of Galienns; detcated the Germans; and in 260 marched againft the Coth, who ravaged the empire with an army of $300,000 \mathrm{men}$, which he at firft haraffed, and the next year entircly defeated: but a contagious difeafe, which had fpread through that valt army, was caught by the Komans; and the emperor himfilf died of it a fhort time after, aged 56. Pollio fays that this prince had the moderation of Augultus, the virtue of Trajan, and the piety of Antoninus.

CLAVES insule, a term ufed in the ille of Man; where all weighty and ambiguous caules are referred to a jury of twelve, who are called claves inflita, the keys of the ifland.

CLAVICHORD, and Clavicitheriun, two mufical inftruments ufed in the i 6 th century. 'They wore of the nature of the fpinet, but of an oblong figure. The firl is Atill ufed by the nuns in convents; and that the practitioners may not difturb the filters in the domitory, the frings are muffed with fmall bits of fine woollen cloth.

CBAVICLE. Sce Anatomy, $\mathrm{n}^{\circ}+6$.
CLAVICYMBALUM, in antiquity, a mufical in ftrument with 30 ftrings. Modern writers apply the name to our harpfichords.

CLAVI vestium, were flowers or ituds of purple interwoven with or fewed upon the garments of knights or fenators; only, for dillinction, the former ufed them narrow, the latter broad.

CLAVIS properly fignifies a KEY; and is fometimes ufed in Englifh to denote an explanation of fome cbfcure paffages of any book or writing.

CLAVIUS (Chritopher), a German Jefuit born at Bamberg, excelled in the knowledge of the mathematics, and was one of the chief perfons employed to rectify the katendar; the defence of which lie alfo undertook againtt thofe who cenfured it, efpecially Scaliger. He died at Rome in 1012 , aged 75. Hi, works have been printed in five volumes folio; the principal of which is his commentary on Euclid's clements.

CLAUSE, in grammar, denotes a member of a period or fentence.

Clause lignifics alfo an article or paticular Riprolation in a contraci, a charge or condition in a tell n ment, \&e.

CiAUSENBURG, a lurge city of Tranflvania.

Clautitus, Cliaufen. burg.

## C I, A

Cisvis, fituated on tine river Samos, in E. Long. $=0.50$. (II) N. N. Int. 4". roo.

CLATVS', in antiquity, on ornament upon the robes of the Roman fonatman heathers; which was more ar It is bead, according to the dimity of the perform: 1: me e the dilation of tunic anguli-clavia and laticlavin.

Cones, in medicine and forgery, is whited in fererat fignitications: . Clavus hyltericus, is a footing min in the local, between the pericranium and ensDim, which affect fact as have the ereon-fidands. 2. Chant schuman, according to Cobras, is a callers tubercle on the white of the eye, taking its denmmination from it a figure. 3. Clams inputs indurated theurgies of the uicuses $f$. It alto imports a charurcic: intummen of gold, mentioned by Amatus Infitanes, defigned to lee intuchuces into an caulcerated palate, fir the better articulation of the vice. And, 5. It dignities a callus, or com oat the font.

Cursors finnilis, in antiquity. So rude and imhorant were the Romans townes the rife of their fate, that the driving of fixing a nail was the only method they had of lisping a resider of the ; for which sentry it vas col (dachous aiolis. There was an alicent las, ordaining the chief pretor to fix a mail csery year on the Ides of September; it was driven into the rifles the of the temple of Jupiter Opt. Max. towards Minerva's temple. 'I his scutum ot keeping an account of time by means of fixing nails, was not peculiar to the Romans; for the Etrurian bled likewife to drive nails into the temple of their goddess Noria with the forme view.

CLAW, among zoologifs, denotes the harp-pointed nails with which the feet of certain quadrupeds and birds are furnihect.

CLAY, in natural history, a gents of earths, the characters of which are the fe: 'The: are firmly colerent, weight, and compact: faff, vied, and ductile to a great degree, while moil, froth to the touch; not deafly breaking between the fingers, nor readily diffurble in water; and, when mixed, not readily fabfading from it. SzeChevistri, n 6 th , \&c.

Clay farinks remakithy when drying; in fo much that Dr Lewis obferves, the purity of it may be known by the degree to which it thinks. IRe made expertments on it pure, and when mixed with various proportions of fond. Pure cay lase found flume one pat in 18 while diving: but, when mixed with twice its weight of land, only one part in 30.

The common clays are never free from filiccous earth: the bet method of obtaining the argillaccons - art in perfee purity is, by difolving Roman alum in water, filtering the Solution, aw d precipitating it by mid volatik alkali. When procured by llisarcthod, its feciaceravity is about 1305 ; it is fumble in acids with a little efferefonace; it forms abloom when the vitriolic acid; and deherefecnt felts with the ritucos and marine. When dry it aborbo water seedily, and becomes loft, and acquits foch a tenacity that it may te mould at pleafue ; it contracts, however, greatly in the fire, $1 \%$ when mmenoms cracks are oscafroned. With a certain degree of heat it becomes fo hard as to trike fire with ted, and by ins bluming it lobes its tenacity, the water being excluded by the approach of its particiosteward sack other. At-
ter hawing loft this property, it camot be made to affine it again mitlont being difulsed in an acid, and the" precipitated form it. Fixed alkalies aldo difohe it in the dry way, as acids do in the moil ; but of the le lat the ritrivic i, the mot proper, as it may be molt ealily concentrated.

According to Mr Kirman, the fpecige gravity of this earth, when prc, does not exceed 2000 . It is exceedingly diffusible in water, though fearcely more fosube than magnolia. It is combinable with acids, from whence it may be feparated like magnolia, but can farce he precipitated by the vitriolic acid, with which it forms alum, a fall that always contains an excels of acid, and has an attringent tate. When in combination with any of the le acids, it cannot be perecipitated by acid of fugar ; a criterion by which it is ditinguithed from all the other earths; every one of which (terra ponderosa alone excepted, which when united to the vitriolic acid, is not affected by any (1there excepting that of fur) is precipitated from the vitriolic, nitrous, and maine acids, by that of furor. The precipitation of the fe earths, however, does mot take place if there be an excels of the mineral acids, nor does it always appear before the liquors are eseporated. Though clay is hardened by a very along heat, it cannot be made thereby to aflame the properties of lime. By a mixture win cakureous eart<super>h it really melts; and hence M. Gerhard has fund it fahole in a crucible of chalk, though not in one of clay. Its felon is ant pemoned by fixed alkali, but bores and microcofmic flt difolve it; the former with a very fight eficrefoence, but the latter with a more par. ceptible one. It is leis affected by calces of lead than the calcareous sarthe are.
M. Beaune has formed a new hypothesis concerning this eat; luppuhng the bales of alan, or pure argillaces cath, to be nothing gaffe than flint; and comuna clay to be flliceons earth combined with a little vitriolic acid. This opinion has been examined by Mr Schecle, who began by trying, in the following manner, whether the hificous earth he in reality fouruble in vitroblic acid. He took an ounce of moantain coral reduced to power er, and mining it with three ounces of fall of tartar, molted the whole o; a forms fire. The mails was then difuluce in 20 ounces of water, and ats much diluted vitriolic ad poured upon it as was more than fificient for fatera ion. The liquor being then flowered and evaporated, yielded a drachan and :m half of alum, befides a quantity of fabacid viniolated tartar. It now remained therefore to determine whether the precipitated liticeons earth, by a repetition of the fane process, would thill continue to yeld ala. 'ill operation was therefore repeated Seven times, and a quantity of alum proceed at catch "proration. Mut when our author was about to be confrance in his opmion that M. Lemme was in the right, lee happened an intpece lis coactions, and perceived them tu le hill of little cavities, aud every where rough and uneven on the ide. 'Thus he began to fufpect that the alkali bad difulved part of the clay of his crucibles, by which means the alum had oven producad: and this fuppolition was verified by his afterwards wing a ancible of iron, when he could not obt an a dimple pastiche: of a mn, nor perceive the fmalket mad is of tuhtiva on the fillicupe earth.

## C LA

M. Beaume alfo pretends that cher contains a litele vituolic acid, and is thercfore Coluble in a large guantity of boiling water. Mr helacele hempife tried this cxperiment ; but found, that of feveral kinds of argillaceous tarth not the fmallett guantity was difolved; and he likewife made feveral experiments in order to obtain vitriolic acid from pare clay, but without fuccefs: neither was he ahle to obtain any luepar cither by means of alkali of tartar or with charconal fror cond he obtain with clay a vitridic neut ral fult from the refiduan of the diftilation of moriatio and nitrous acid.

The contraction of clay by heat has affrucd Mr Wedgewod an apportunity of conllowaing by its intans an inftrument for meaturing thote deerecs of heat which are anove the reat, of the feale of common thermometers, as deforibed undar the article Thermunttra.

Mr Scheele has made feveral exptrinctsts to difoover the propertics of alun when mixed wh other frobtances. A frumion of ahm, be thad, is decompofed by line-water ; anl if no more of the water be added than is cxactly requifite for the precipitation, the earth of alum fors a trmpanent precipitate like boilch itarch; and if the clear water be fitered, it is found to be a folmion of sypfem. On adiding inore lime-water than is neceflary for precipitation, tise precipitated mater is deflitute of the getatinous apparance jul mentioned. If the whele bicallowed to thand for a quarter of an hour, and frequently agitated during this time, no gypfum, nor cren lime, is found in the fitered liquor, enlefs too much lime-water bas been wed. On examining the precinitate in this cafe, our author found it to confif of carth of alun, felenite, and lime. This was difoovered firtt by trealing it with muriatic acid, which diffolved the aluminous earth, leaving the gypfum behind. The addition of caullic rolatile alkadi threw down a tranfparent gelatinons mafs, which was the earth of alum; and on fraining it again, and then aceding a fixed alkaline lixivim, the lime was throwa down; whence it appeared, that the lime and grpfum had feparated fiom the water, and united with the earth of aum.

To underfand the reafon of this uncommon precipitation, Mr Scheele next poured into a folution of alum a quantity of cauftic volatile alkali nore than fufficient to faturate the acid, in order to be certain of laving it all taken off. The precipitated earth was then clulcorated, and mixed witir a folntion of gyphum, that he might obferve whether the gypfum would feparate from the water, and precifitate with the earth of alum; which, however, dicl not take place. On mixing lime-water with the precipitate, he found that the former very foon lolt its cauttic tafte, and that the earth of alum became opacue. Some part of the water was flained, and lixivium tartari dropped into it ; lout it remained clear, hor was any precipitate formed by a folution of conrufive fublimate. He afterwards added muriatic acid to the balt precipitate, which it diffolved entirely withont leaving any gypfum behind; whence our anthor concludes, that thit carth of alum had united with the lime into a peculiar kind of compound.

Lattly, he now imagined, that this compound of earth of aium and lime might be capoble of fequating grpfun from water. To try this, he prefared a large
guantity of the compound earth, mixed it with a folu
 When be ionded, wo hion rimpice, that lac gytan itill remaned funconda in the water, whel that the preci-

 ceath of al wat the lance cince: when he fumat, that the whole was prectutatuas ixfore, for line and alo mimons eath having, fathen to the bortom akos iw th the eypfum, leanis the water pure. On the whome,

 is necellary toran exact latutation. 2. That calcarnous eath is capathe of fommeng an mana with the carth of alum. 3. That arphan camot cambine with the earth of alum; bis that if a Faperfusus quantity of lime be united with vituole acid, it will then fors as a bond of unton to combine explum with the cart') of alam, and thas form a rees comprand confoting of three cartha. Prac dar has aod dfect apom limavider.

Crontedt is of apiniom, that common chay, clpecially the blue, grey, and red kinds, may derive then origin from mad; and as the mul pocecel from werstables, it whl thence fullow, that tise vatetits of chay just montioned ate nothing the but the common mond al. icred, afor a lencth of time, by meand of water. 'this opinion, he think., meccises conliderable trength from the following circumblancis; giv. that a great quantily of feaplants rot crery year in the lakes, and are changed intes mad; very little of which, howetre, is feen upon the hores afte: the vaice is dried in 1 la fummer time; and that the clay begins where the moul? ceafes. Profefior Bergmanhas hikewnie linted, hat pure clay may be a calcareous enth combind with fono acid not yet diforered; ": but (fays he) compohitions of this kind ought to be confficied as primitive fuho ftances, with relpect to our knowledge of then, till they thall be experimentally decompoled: for no found knoriledge in natural philutoply can be ubtained from the conderation of mere pormbilites ; fince datly experience thows, that eron the moft probable fuppolitions have proved falie, when the means of putting them to the teil have afterwards been found out.""Now, therefore, (fays M. Magetlan), that the arsilitacous is acknowledged to be a limple primitive earth, which canot be decompofed into any other princinjes, nor formed by the combination of any other fimple fubfances we know, we ought to redl fatished at frce fent without endeavouring to account for itsfornation."

The primeipal fpecies of the argillaceous carths or clays are,

1. The argille aerata, or lar lund. It is generally found in fmall cakes of the harduefs of chalk; like which, alfo, it marks white. Its hardrafs is nearly like that of the teatites, and it feels lefs fat than ciays commonly do. It is of a frow-white colour, and about the fpecilic gravity of 1.66 g . When examined with a microfcope, it is found to confit of fmall tranfpaient cryAtals; and, from Mr Schreber's experiments, appears to be an argillaceous carth faturatcd with fixed air, in confeguence of which it ffiervetees with acius. It contains alfo a froall quantity of calcarcous cath, and fometimes of gypfum, with fome fligl.t traces of iron. It is fuend at Halles.
2. 'Ihe arsilla apya, porchain clay, the kaolin of

## C L A

the Chinefe，is very trfactory in the fire，and cannot in any common lrong fire be broupht into fution far－ ther than to acguire a tenacious foftaefs without lofing its．form．When broken，it has then a dim fhinins appenrance，and is of a folid texture；ftrikes fire with teed ；and has confequently the beft chemical proper－ ties of any fubtance whercof veffels can be made．It is found of an excellent quality in Japan，and likewife in different parts of Europe．In Sweden it is met with in coal－pits between the frata of coal．Cronfledt informs un，that he has feen the doot of a tree entirely changed into this kind of carth．

M．Magellan remarks，that we mult be careful to difinguilh between the pipe－clay of which there is plenty in Devomhire，and that ufed in the porcelain manufactures．The former，in a drong fire，burns to a Guih gecy or pigeon colour，the latter remaias white．The porcelain clay，according to our author， feems to be only a decayed feldt－par；and，confe－ guently，according to Mr leurgman，contains magnefia． Om porcclain clay contains likewife quartz，cryfals， and mica，parts of the granite which it originally com－ pofed．Wefore it is ufed，the quartz mutt be feparated， but the mica remains．

3．Combined with phlogiton，and including the white tobacco－pipe clay，with others of a grey，black， or violet colour．Mr Kirwan obferves，that many of the white clays become grey in a low degree of heat， becaufe the mineral oil with which they are mixed burns to a kind of coal，and tinges them；but this be－ ing confumed in a itronger heat，they again become white．The other clays evidently contain phlogiton； in confuquence of which，they beconc quite black internally on being expofed to a quick and itrong fire， affuming the appearance of common flints both in co－ lour and harducfs ；but if heated by degrees，they are firft white，and afterwards of a pearl colour．＇i＇hey contain a larger quantity of the inflammable principle in proportion to their apparent fatnefs；which may be judged of both by their fimoothnefs and unctuolity， and by their fhining when foraped with the nail．＂it is diffoult（fays M．Magellan）to determine whether this Itrongly adherent phtogifton is the caufe of the above－mentioned pearl－colour，or prevents them from being burned white in a trong fire ；yet no heterogene－ ous fubttance can be extracted from them except fand， which may be feparated from fome by means of water， but does not form any conlituent pat of clay．If they be boiled in aqua－regis in order to extradt their iron， they lufe their vifcofity．＂In the lefs unctuous clays， our author has found pure quart $\%$ in greater and fmaller grains，and he has likewife found chat clays of this kind fometimes attract phlogituon in the fire．

4．The lithemarga，or flone－marrow，when dry，feels as fat and flippery as foap，but is not wholly diffulible in water．When mixed with this fluid，it falls to pic－ ces either in larger or fmaller malles，fo as to affume the appearance of curds．In the fire it readily melts into a white or reddin frothy flag；which，in conle－ quence of its internal vacuities，is then of a larger w－ lume than it formerly was．In the mafs it breaks in－ to irregular fealy pieces．This kind is called fuller＇s carth（ewklera）in Sweden．In Crim Tartary it is called $k$ fole：ii；and is faid to be ufed there inttead of foap，for wadhing．It is found alfo in the Auftrian Tlanders in the barony of Lidegen，near Niverle，betong－ －${ }^{+}$） $8=$
ing to the Duke of Arenberg．It was nowed to M．Marctlan by the Duke＇s chancelor；who，from the uprightnefs of his behaviour，has obtained the ho nourable appellation of Fian de Bien．At prefent it is only found in leparate malles；but M．Magellan is of opi－ nion，that fome confiderable itrata of it might be met with，if properly learched for on the fpot，by digging the ground to a contiderable depth．

To this fpecies ditu belungs the yellowim－brown earth called ferva lemnia；which is of a hining texture， and falls to piecesin watcr witi a crackling noife．Ac－ cording to Mr Bergman，this is a compound of the argillaccous，iniceous，and magnefian earths．Its com－ ponent parts are the fame as thofe of the talc，but loofer，and in difierent proportions．M．Cronltedt remarks，that＂the terra lemnia cannot properly be called a fuller＇s earth，as it is never wied in the fulling butinefs，nor is likely to te applicable to it，as being betides very fcarce．The true fuller＇s earth of England agrees entirely with the defeription of the flone－nar－ row already given，and in colour and texture refembles that from Sweden，which is compofed of coarfe par－ ticles．The Hampflite fuller＇s earth is of a dully brown，inclining to green，with veins of a faint yel－ low ；and contains a fmall portion of muriatic acid， and of a yellow oily matter．Every fine clay that does not communicate a colour，is in greneral fit for the bu－ linefs of fulling；even the excrements of hogs，mixed with hutan urine，are ufed for this purpofe in various woollen manufactures．＇Ihe properties required in a good fuller＇s earth are，that it fhall carry off the oily impurities of the woollen cloth，and at the fame time thicken it by caufing the hairs or fibres to curl up． The bet is compofed of fine filiceous earth with argil－ la，and a little calcareons earth without vitriolic acid； a little martial calx，however，is not hurtful，if unat－ teaded with any active menltrum．

The terra lemnia is fo called from the ioland of Lemnos，now Statimane，in the Egean Sea，from whence it is procured．It is likewife called the Turki／b earth，on account of its being impreffed with the feal of the Grand Signior．

The Swedifh fuller＇s carth is found in a mountain named Ofmend at Ratwick in Ealt Dalecarlia．The Hratum is three feet thick，and the mountain itfelf is chiefly calcareous．It is of an afl colour；harder，and of finer particles，than the Lemnian earth．
＂All thefe fubtances（the fuller＂s carths），＂fays M．Magellan，＂are akin to zeolites，and likewife re－ femble fome marles．But in the Ofmundian teartlos， the connection of the parts is not merely mechanical，as in marles；which on that account effervelce ftrongly with acids，thongh they often contain a fmaller quantity of calcareous eath or magnelia than the litho marga．＂

The following table flows the proportion of ingre－ dients in cacir of the futher＇s carths．

| ＇Terre lemnis． |  |  | Ofmund fuller＇s earth． | Hame fore Uの． |
| :---: | :---: | :---: | :---: | :---: |

## C L A

 5. Bolur, bule, or hon clay, is a fine and denfe clay of varions colours, containing a large quantity of iron, fo that it is vely difficolt, or even impolfible, to know the natural and ipecific qualities of the hole ifferf. It is not fo ealily foftenet in water when indurated as the poreclain and common clays; but either falls to pieces in the form of fmall grains, or repels the water, and camot be made ducile. In the fire it grows black, and is then attrated by the loadtune.M. Kirwan thinks the term lole a word of fuch uncertain flyuification, that it oushe to he banifued from common ufe, or at lealt from every mineralogical treatife. "S me (fays he) beflow this name upon very finooth compact clays, confifting of the finetl particles: others require befides, that their colonr fhrold be red, yellow, or brown, and that they thonk comtain inon." The red generally blacken in the bre; lut, accurding to Rinman, without becoming magnetic. The yellow, when heated, become fill red; and, in a flrong neat, brown or black. What the Italians call Calamita Bianca, according to Ferber, is a white bole ftriated like afbeftos. The true figillata rubra contains calcareuns earth; and, according to Rinman, becomes magnetic after torefection. The yellow, red, and browa clays contain molt iron. Fumetimes difper. fed through their fubtance, and fomctines united to the filicenus part: in this cate they are fufible with greater dificulty. The yellow calx cifiron is more dephlogitica ed than the red, and the red than the brown. Thefe clays do not becone magnetic after calcination, uulels ihey contain 14 or is per cent. of iron.

Thite fife boles are of various colours, as red, yellow, green. grey, and bluifh grey. the red kind is that ufed in medicine uader the name of Armenian bole; an induraverkind of which afford the material for the red pencils Fommerly, when the terre figillate were efleemed in medicine, the denguilts en cavoured to have them of all different colours; for which reafon they not only fealed up ail the natmal firts of claie, but fuch as had been mix.d and coloured antificially; whence the clafs of bules was fitppofed to be mech more numerous than it veally is. Cromtledt conchides, tha: "Gince the greatelt part of thefe terro figillate contia ion, the bole mưt be a matial cluy; and as fiet ufens to le more fit for medied nfes than other clays, if aty dead carth mult be ufed inter. nallv, when there is fuch an abundance of finer fub. Rances.

The indurated bole or flate is of a reddifh brown or grey colour, and is fund in moll coalluries betwen the feams of coal. It is net with frequently in pieces like nuts of carious fizes; which, when broken, eshibit imprefioms of plants at the nodules of copper fate from I'menaus contain fith.
6. With fealy particles, the born-blente of the Swedes. This is called horn rockjpho by Wallerius, who places it anwng the apyrous flomes; but Lin meus has put it arenerg the calcareons ituncs by the name of bora-fug, tulcum corneum. It is named culcum fridtum by Rimman, and has the followin, properties: 1. Its fuecite gravity is never lefs that 2.6 fio, and frequently rifes th 0.880 . 2. It has a thenur earthy fmell, which is articularly fenfible on betathing upon it, or pouring hot water on it. 3. A touglinefs or Vol. V. Part I.

49 ] C I A
vifcidity is perciecd on pounding it in a montar, a ${ }^{\text {is }}$ the cafe with mica and hom; from which latt it derives its name. 4. When pounded it aftome a stacoiflagrey powder. 5 . It is laid to be fulable for for though Mir Kirsan informs us, that he cond miver melt this tone even by the afidance of a blow- pipue. Thas flone is frequently mixed with pyotes. In is diflingulhed from the martial shmmer or mica by the feaks bemelefo hining, thicker, and rectangndar. It is of two kinds, black, and grewith. 'The formor, when rubbed fine, affords a groen powder. It is the cortum nitens of Wallerius, and is either of a lamellated or gramular texture ; the former being fomstimes for foft as to be foraped with the mail, and its fafface frequentiy as glofly as if it had been greafid; the fpecific gravity being from 3600 to 3880 . It does not cletonate with nitre, but bucomes of a frulf-colour when beated, and then 月ighty effervefies with dibated nitrous acit; the folution alfuming a grevifh colnur. In order to difcover the principle on wheh the fmell of this ito.e depends, Mr Kirwan briled it. puraion in water ; but cund nut difcorer, cither by the tate or by any wher methon, that any thins lidd b con communicated to the filud. An handed puts of the lamellar lort contain 37 of filiccons carth, 22 of pure argillteons earth, 16 of magneia, and two of calcareous earth both in a mild ita, tugether with 23 of calx of iron not much deplorgidiated. The greemifn kind is of a granolar texture, or triated; the fpecific gravity of a focimen examed by No livwin was 2083. The common pale, qrecoin-grey whethone feems to belong to this firecies.
7. The aeotite was fill difoovered by Cronfedt, and by him reckoned a gemes dittinct frome every other ; but on a proper chemical analylis, both icirwan and Borgman have reckond thens manot the arg:llaceous cartis: and here M Magellan oh aes, that, " it is not fo mach the quantity as the i cnlity or predominancy of property that houl 1 in general direct us in the clafiffation of miaral 1, d: 2 ; not to mention, that if the mule refpectins quan: $\because$ were rigo oufly adhered to, the two primitive enthls, wegnchis and will, would not be found amorar the eners; whi h weuld doubtl is be an ablusdity, as Lo.gman has inghtiy obferved."

The properties of zechite are, 1 . It is a little hatder than the fluors, and wher calcareous fara; but is feratclsed by flacl, and does mot frike fire wish it. 2. It medts canly in the line, with an cbullition like borax, into a white fristhy hag, which camot without gheat dificuly, be bought into a folid tranfparent ftate. 3. It difolves more readily in the fire by the hap of inineral alkdi, then dat of borax or microcolmic falt. 4. It does ase ferment with the latere as lime dees, nor with the formor as thofe of whe gypfoon kind 5. It difolves very flowly, and without eflicrucfeence, in acids, as oil of vitriol and $f_{p \text { irit of }}$ n tre. With the former a great heat anifes, and the powder unites into a mafs. loy diallation with nitoons acid, fome fixed and depllogifticated airs are procured. Some forts of acolite, however, fornd in Sweden, do not melt by themferes in the lire, latare readily difforlved by the acid of nitse into a kind of jelly. 7. The fufilde kinds, in the very moment of fufion, cmit a phofphoric light.

## C I. A

Chy. Wieh regard to the eomponent parts of zeolite, M. Bayen is of opinion that it contits of equal parts of filiceous and argilaceus earths, which is alio contirmel by M. Guntard; lat accordint io Mi Berpman's andyis, the ved zonlte of Adelfores contain čo $\beta$ r rent. of filicenus carth; 9.5 of argillacevas; 6.5 of pure cakareous carth; and four of water. The white, oral, tadiated zeolite of Foroe in Iechan 1 , contans, according to i.f. Pletier, 50 of flex; 20 of argilhaseous carth ; 8 of pure calcareous carth; and 22 of water. According to Mir Maxer's anaiyis, a radiated zeolite yielded 5.33 per cen: of fils : 17.5 of argill ; 6.66 of liske; and 175 of water. In general the oryitulifed kind contain mare water than the other. At any rate, though the propertions of ingredients are various, files always feems to predominate.

In general the reolites are of a crytalline form, compoted of imperfect pyramids turncal towards a common centre ; their form is fometines glubelar, but feldann prifmatic. Neffrs Faujas and Rome de l'the mention zeolites, of a cubic and other fums, found in Iceland, the Cyclops Iflands near Etna in Sicily, the illand of Doaboa, 品e, their fpecifece ersvity is from 2.100 to 3.150 ; but this lait is very rate. Fabroni mentions a femitranfparent zeolite from Gorphyytan in Sweden, which has an clectric power. '10 the fpecies of zeolite alio belongs the lapis lazuli, from which ultramarine is made. See Lasfis Lazull, and Uletramabiae.

The fparry zeolite refembles a calcareous 〔par; hut is of a more imegular figure, as well as more britthe. It is found in Sweden of a light red or orange culour.

The crytallized zenlites are met with in greater plenty than the other kinds; and are fomd in Siweden of varions forms and colonrs. Bronieh informs us, that in the nort!, the countries of the zeolites and of the chalcedony and catholong, pieces are hown as euriofities, in which the zedite is incufel in the chaleeduny; but this is not fulficient to prose that the one was produced from the viner.
Crontledt cbferes, that the zoolites have nearly the farme qualities in the fire as the bules. The property of fwolling in the fise, like horax, is peculiar to the crytallized kisd; the others rife only in fome finall blifters, whith are of a white culour at their cel ges, and inftantly cover themflves with a white glaTy fin after which they become quite refakory. According to Bergman they have a great affity io the foborls: buat thair comporient parts are not in ferongly consec. red as to hinder the attion of acids, which ean deftecy thair combination, withot leng previouny trated with ixed athati ; this lat being a neceflary recuifite for analyige furacts. Nír Parmot is of epinion that the zeolites camot be a volcanie production, but only a feconlary one fermed by the decompolition of volcanic earthe. P'ure bafdes and volcanic lavas have indecd the fane compencot parts with the zeulites: and thefe laft have not yet been formen but among volcanic maters: but, as N. Fajias wherves, there ate mary intances of ture zeclits keing gaite buried within the budies of fold buraltes, fome being only fragment, and others complete zeolites; "which, (fays M. Maxellan), undenably proves, that the lat-
ter have been completely formed before thefe volcanic mafes were prolnced by fubterraneous fires.
8. Tripoli ufed in polithing hard fubitances. See Trıpoil.
9. The com non or thick clay, has the following propertics. 1. It acquires a red colour, nore or lefs deep, in thee fire. 2. it melts pretty eafily ints a greenifi glafs. 3. It combiths of a mixture of pure clay, filiceous and martial carth, containing altio a fnatl quantity of vitriolic ac d. It is found in a litte of purity of various colours, as red, pale-red, grey, and blue. In fome provinces of biweden a white kind is met with often in a haty forn, with fine fand between itsilrata; which when burnt is of a paler colour than any of the preceding, and does not cahe well in the fire; it is alFio more fufible than any of them. La this country alfo is found a ipecies called, by Cronftedt, fermenting cher, argila inumeficas. It is rery like the preceding as to the external appearance and other qualities : but, when both are found in the fume plact, they feem tobe different in regard to the fermenting property of this varicty. "This fermentaion (fays our author) cannot be the effect of the fand mixed with it, becaufe fand is fourad in them both: and bcides, this kind farments in the fame manner when it is mixed with gravel or ltones; and then it ferments later in the fpring than the other, fince by the Itones, perhaps, the froit is longer retained in it.

This kind of clay is alfo found mixed with calcareons earth, in which cafe it is called Marle. It is alfo found in an induraced itate, and that either pure or mixed with phlogiton and a large quantity of vitrivlic acid; in which cafe it contlitates the ores of a lum. It is afo found ia this thate mixud with calcareous carth, forming thone marle.
10. Aryithaceous forfite fonis. The molt remarkable of thefe are, 1. The fohiphs tog ularis, or common houfe-llate. It is of a blaith purfle colvar, does not ftrike fire with thecl, and may be flighty feraped with the nail. It is very brittle, of a lamellar texture, and of the fpecilic gravity $2.8 ; 6$; giving a clear found when in pieces of hadf an inch thick. It is never tranipirent, but has a moderatcly tine grain, effervefing Hightly with acids vhen puidered, but not otherwife. In the fire it lofes upwards of a per cent, of its wight: detonates hlighty with nitre, and then afo fumes a brownifh red colour; however, it is not rendered masnctic by calcination. By a vehement heat it is futible per fe, and melts into a black feoria. It melts with difunaliy in the dry way with mineral alka. li, but more tallity with borrax. and microcofmie fait, with little effervefcence; and it melts with equal eafe in chalk or elay reffels. By digeftion for two months in dephlogiticated firit of nitre, the menfluum affumes a green colour. According to Mr Kirwan, it contains 26 parts of argillaceous earth; 46 of filiceons; 8 of magnelia; 4 of caleareous earth; and $1+$ of iron. Part of the iron feeras to be phlugiticated by a mineral oil united with it ; and part dephlogiticated, or in a red cals. This laft is united to the argillaceous part as well as to the filiceous, and cannot be teparated without great dificulty. The colour of this Hate varics to the pale, to the hightly purple, and to the bluin. The lamine of the lait are thicker, their texture corfer, and they conazin more filiceous earth
and lefs iron than the foregoing. Other fones are allo made ufe of for covering lou"es; but their lamina are much thicker, their fafioe more uncen, and their texure coarfor. Ther belone chicfly to the find-anas-, or to the calcarzous kinds. 'Ithe dank bluc fibitus foripo forius contains more magnefa and hefs irum than the foregoing, and therefore cflesvifes mure billly with acids. Its fpecisc rravity is 2,01. 2. "llos perite ceous fobifas, to which alio blongs that fivm which alum is made, is of a grey, ble, hrown, or thatk cohnor; and is more or lefs decompondibby its expurnie to air, accurding to the quantity of the prrites, and the flate of the iron in it. Shen the imm is in a fomiphusiticated fate, the fohsfus will be eally deccmpoled; but nush more towly, if at all, when the culs is much dep thoridi-
 a lamellar texture, and varmas degues ent hathefs. It never gives fire with flecl, but enits a thong fincll when heated, and fometimes without $b=i n s$ heated. When foraned it does ant poxduce any white mark like the other folifus. M. Tagellan mentions a fpecimen found in Tonklite which buncd litee coal, with a ftrons fmell of bitumen.

There are varions other fuecies of amgillaceons earths, as the fiag-sone, fand or free fone, tuad. fone, \&ic. for a defcription of which fee thefe articles.

Class are of very extenfive ufe in common lise. Some varictics of the porcelain clay lecome perfectly whistein the fire; and it is not to be doubted he thete are ufd in the porcelain manufactories. The iuduratel porcelain chay, however, camot be cally heated without cracking ; and therefore we can go no great lenceth in lardenines it. The boles have almoft lout their value as medicines: but are ditl empluyed to make bricks, potter's ware, Ecc. 'T'ipoli is of indif. penfable ufe in the bufinels of polifhing, and is likewife, on many occations, wed for making noulds to cat metals in.

In agriculture, clay is indifpenfably neccinny; excepting, howerer, acoodimg to Cronledt, the white and fementing chars above mentioncd, for which no we has yet been difonered. Dy its eoherency clay retajen humidity; on which perhaps its chicf puwer of promoting veretation depends.

Dr Iatack obferves, that clay, when mixed with a large proportion of water, and kneadod a lituc, becomes a remarkable ductile adth five mals, which is not eafily difolved in more water, and to render it thin and fluid requires grat trouble. Hence it is employed for confaning larse quantities of water, as in making eanals and dykes: but the foil muft cither contain a preat quantity of elay naturliy, or fone quantity of it mull be fpread on the bottom; or the water itfelf murt depofit a quantity of clay fufficient to render it tight. Hence alfo we fee the bid cffects of allowing cattle to tread much in cl y-grounds when wet; for the clay is reduced to fuch an adhefive mafs as not to adinit the roots to penetrate the fuil, or the water to enter to the roots.

Clay is ufed in the refining of fugar; for which no other property is requifite than that it midy not dry too foon: but that fpecies ufed in fulling muft, if we were to judged fricri, befides the fincoefs of its far-
ticles, be of a dry nation, or fuch :1: whation wits; tho' thi; cality ferhapraby rat be fourlin all thofeches that are row cmployed in the bufmas. Acourdinge io Fabroni, the pure whits cha, being cakimed ia a itrons

The three parts of the e" Vindicontion, with the Bffay on Spirit, were reprintal by Mr Bonger, in one vil. ©ow, 1.50 ; with fome additimal noter, and an index of texte of ferpture illutrated or explained.

CLAYTON1A, in botany: A semens of the mon nogynia orfer, lownsing to the pantandria daf, of phans a and in the mataral method raking under the 13 th order, Srownentw. The calyx is bivalved; the cormila pentape tallus; the Atigmatnitid; the capfale tricalved, milocula, and trifpermons. There are two feeciss, natives of America. 'Ihey are very low herbacoous plants, ewheh whte fowers; and are pofleffed of no remarkible propeaty
 leirs, liany): Cheomena, ate, (Mcla); one of the twelse ancient cities of fomia. The country of Anaxaromas: fituated in the meightomhond of Colophon. The city was fmall, its port on the N. N. W. fide of the inland. Traces of the walle, Dr Chander informs us, are fond by the foa, and it a hill are veltiges of a thentre. Threce or four trees grow on it: amd by one is a cave hewn in the rock, and affording water. A vanlted room with a chimaty at one end, and a hovel or two made with tomes piled, are all the prefent Aructures; and thefe are chicfly frequented by fillermen and by perfons employed to watch and to chrive nwave birds when the grain ripens. Refervirg to this confincal fination of Clazomena, a famous fophitt, when impormaed to adorn his native city by refuling in it rather than at Smyrna, replied, The nighomgrale refufes to fint in a cage.

CLEANIHES, a fooic philompher, difciple of Zeno, flonrihed 2 to years before Chrift. He maintained himfelf in the day by working in the night: beang quefioned by the magittrates how he fublifid, he bourtht a woman for whon he kneaded bread, and a gardener for whom he drew water; and refufed a prelent from them. He compofed feveral works, of which there are non' only a few fragments remaining.

CLEAR, as a naval term, is varioufly applied to the weather, the fea-coalts, cordage, mavigation, Sic. The weather is faid to be clear when it is fair and open, as oppofed to cloudy or foggy. The fea-coalt is salled dear when the navigation is not interrupted, or rendered dangerous by rocks, fands, or breakers, \&c. It is exprefled of cordage, cables, \&c. when they are unembarraffed or difenancled, fo as to be ready for immediate fervice. It is ufually oppofed to foul in all thefe lerfes.

CLEARCHUS, a tyrant of Heradea in Pontus, who was killed by Chion and Leonidas, Plato's pupils, during the celchration of the feltivals of Bacchus. He had enjoyed the fovereign power during 12 years. A lacedremonian fent to quiet the Byzantines. He was recalled, but refufed to obey, and fled to Cyrns the younger, who made him captain of 13,000 Greck fuldiers. He obtained a victory over Astaxerxes; who was fs enraged at the defeat, that when Clearchus fell into his hands by the treachery of Tiflaphernes, he put him immediately to death.

CLEATS, in naral affairs, pieces of wood having one or two projecting ends whereby to faften the ropes: fome of them are faftened to the fhrouds below
for this purpofe, and others nailed to diferent places of the thip's deck or fides.

CLECHE, in leraldyy, a kind of crofs, charged with another crols of the fame figure, but of the colvur of the ficld.

CLEDCE, among miners, denotes the upper ftatum of fuller's carth.

CIEDONISM, Cleoonssmus, a kind of divination, in ufe among the ancients. The word is formed from enns., which lignifics two things, rumor, "a report," and amis, "a bid." In the dint fenfe, cledonifn thould demote a kind of divination drawn from words occafonally hitered. Cicero oblerves, that the Pythagoreans made wfervation not only of the words of the grods, bet of thole of men; and accordingly believed the promonncing of cerain words, v. g. incersdium, at a meal, very manipy. Thus, intead of prifon, they uled the word domicilnm; and to avoid erimeys, furies, faid cumenids. In the fecond fenfe, shedorifm foould feem a divination dram from birds; the fime with oraithomancia.

CLEEVERS. See Cemprs.
CLET, or Claff, in mult, derived from the Lain word chavis, a key; becaule by it is exprefked the fundanemat found in the diatonic fole, which rea quires a determined fuccefion of tones or femitones, whether wajor or minor, peculiar to the note froms whence we fet ont, and refulting from its polition in the feale. Hence, as it ofens a way to this fuccerfion, and difcovers it, the techuical term key is uled with great propriety. But defs rather point ont the polition of different mulical parts in the general fyfem, and the relations which they bear one to another.

A clef, fays Rouffieau, is a characker in mufic placed at the beginning of a fave, to determine the degree of elevation occuped by that thave in the genemal claviary or fyftem, and to point out the names of all the notes which it contains in the line of that clef.

Anciently the letters by which the nutas of the gamut had been fignified were called difs. Thus the let. ter $A$ was the clef of the note la, C the clef of $u t, E$ the clef of $m i, \& c$. In proportion as the fyitem was extended, the embarraffinent and fuperfluity of this multitude of clefs were felt.

Gui d'Arezzo, who had inverted them, marked a letter or clef at the beginning of each line in the fave; for as yet he had placed no notes in the fpaces. In procefs of time they marked no more than one of the feven clefs at the beginning of one of the lines only; and this was fufficient to fix the pofition of all the ref, according to their natural order: at lait, of thefe feven lines or clefs they felecled four, which were called claves fignula, or difcriminaling clefs; becanfe they fatisfied themfelves with marking one of them upon one of the lines, from which the powers of all the others might be rccognized. Prefently afterwards they even retrenched one of thefe four, viz. the gamma, of which they made ufe to mark the fol below, that is to fay, the hypoprollambanomine added to the fytem cf the Greeks.

In reality Kircher afferts, that if we underfood the characters in which ancicht nufic was written, and examined minutcly the forms of our clefs, we flould fird thateach of themreprefentsthe letter a little altered in its
form,
clof. form, by which the note was oriminally named. Thus the clef of fol was origimally a $G$, the clef of at a $C$, and the clef of for an F .

We have then three ciefs, one a fifth abore the other: the clef of $\bar{F}$, of for, which is the lowelt ; the dlef of ut, or C, which is a lifth above the former; and the clef of fut or 6 , which is a lifth above thet of wh. Thefe clets, hoth as marked hy foreigners and in Britain, moy be feen in art. 1 ,0 of Music; upon which it is accedary to remats, that by a remain of ancient practice, the def is alsorys placed upon a line, and nevar in a fpace. It deferves motice, that the def of for is maked in theee diferent nominers: one in mulic which is printed; another in mutic which is writen or engraven; and a third in the full he mony of the chorus.

By adding four lines above the clef of $j$ ol, and three lines bencath the clef of $f$ on, which sives buth above athed hetow the greatel exteni of P wament or coltablithed linns, it appars, that the wable fale of motes which can be placed upon ithe gratamon: ielative 20 thafe chforsamonts to 24 ; thit is to lay, thicu oztaves and a fourth from the $F$, or fo, which is found be neath the finft lize, to the fi, an In, which is linand above the latt, and all this torgether foms what we call the geaterd daviary; from whence we may judge, that this compafs has, for a long time, conflition the extent of the fyllem. But as at profene is in comimadly acquiring new dogrees, as well above as below, the degrees are marked by leger lines, which are added above or beluw as occafton requires.

Inflead of joining all the limes, as las been done by Rouftean in his Dictionary, (plate A, fir 5.) to mark the relation which one clef bears to another, they Separate them five by five; becaule it is pretty nearly within the degress to which the compafs of ordinary voices extends. This collection of five limes is called a fare; and in thefe they place a clef, to detemme the names of the notes, the politions of femitones, and to thow what dation the fave occuples in the claviary or general feale.

In whatever manner we take five fueceffive lines in the claviary, we thail find one clef comprehended; nay, fonnetimestwo; in which cafe one may be retrenched as ufelefs. Cuftom has even preferibed which of the two mould be setrenched, and which retained; it is this likewife which has determined the number of politions anfgned to each clef.

If Iform a tave of the finft live lines in the clavia. ry, beginning from below, I find the clef of $f a$ in the fourth line. This then is one pofition of the clef, and this polition evidently relates to the lowed note; thus likewife it is that of the bals clef.

If I wifh to gain a third in afcent, I mutt add a line above; I mut then obliterate one below, otherwife the Itave will contain more than five lines. The clef of $f a$ then is found transferred from the fourth to the third, and the clef of $u t$ is likewile found upon the fifth; but as two clefs are uelefs, they retrench here that of ut. It is evident, that the ftave of this clef is a third higher than the former.

By throwing away ftill one line below to gain another above, we have a third kind of \&ave, where the clef of $f a$ will be found upon the fecond line, and that of ut upon the fourth. Here we leave out the clef of
fie, and retain that of w. We have now gruad ano. ther the latione an 1 lad ic blow.

By continans th $f$ : alterations from line to line, we pus fuccetively though fond diferont portims of the clef of $w$. II wing dirival at that of fit, we ford it placed upon the Ressal hine, and then upon the firft. 'lons poltion includes the ive himete lise", and gives the thapett diapalon which the clefecan lignify.

The rader may [ee in RomFan's Mration D'tionary, Plate A. lig. 5. this hacufin of clets from the lowet to the highent; which in all conltiluteo eight ftaves, clefs, on difierent politions of elefs.

Whatever may be the character and genius of any voice or infloment, if is extent alouve or below does not bimefs that of the geneal claviary, in thas number may be found a llation and a clef fuitable to it; and there are, in rality, clefs detemined for all the parts in mulic, If the extent of a part is very conliderablex fo that the momber of lines neceflary to be alded above or helow may become inconvenient, the ckef is then chanset in the courfe of the matic. It may be plainly perceived by the hyare, what chef it is neceflary to chosfe, for raing or deprefing any part, under whatever chef it may be aetuatly placed.

It will likewice appear, that, in order to adjuat one clef to anutluct, buth mat be compared by the general claviry, by means of which we may determine what every note under one of the clets is with refocit to the onfer. It is by this exercife repeated that we acquire the habie of reading with eake all the parts.

Finm this manouvre it Fullows, that we may place whatever note we pleafe of the gamut upon any line or fpace whatever of the flave, lince we have the choice of cigho different poficions, which is equal to the number of mutes in the octave. Ilhus you may mark a whole tune upon the fame live, by changing the clef at each gradation. The jth fig. of the fame plate in Runfleau's Mutical Dictionary, to which we formerly refered, thows by the feries of clefs the order of the notes, re, for, la, ut, mi, fol, fi, re, rifing by thirds, althourh all placed upon the fame line. The fig. following repretents upon the order of the fame clefs the note wh, which appears to deliend by thiteds upon all the lints of the lave: and furker, which jot, by means of changing the clef, till preferves its unifon. It is upon fuch examples as this, that leh lars ought to exercife thenfelves, in order to mulertand at the firlt glance the powers of all the clefs, and their limultaneous effect.

Therc are two of their pofitions, viz. the clef of fol upon the firit line, and that of for upon the thid, which feem daily to fall more and more into defuetnde. The firlt of thefe may leem lefs neceftiry, becaufe it produces nothing but a pofition entirely fimilar to that of fou upon the fourth line, from which however it differs by two octaves. As to the clef of $f a$, it is plain, that in removing it entirely from the rhird line, we fhall no longer have any equivalent polition, and that the compolition of the claviary, which is at prefent complete, will by thefe means become defective.
'Thus much for Rouffeau's account of clefs. He proceeds to explain tlicis tranfpofition; but as this would
rendsy

CD. EPT, in a general fenfe is a 'pace made by the fepraction sf parts. Green ti:nber is very apt to Iplit and deave in iveral places, after it is verourta into form: and there cracks in it are very difarteteble to the fight. The common methed of the country carpenters is the fill up thefe vark; widh a mixture of grest and faw that ; bot the neatelt way of atl i, the liakias brel fifes well with the fot of beef.broth, aud then dippaiug pieces of fonge isto the fame trish, and blits ap all the cracks with them: they fxell ous fo as to fill the whole crack; and acco modne themflues fo wetl to it, that the deffiency is hardly feen.

Cletgts, or Crals, in farriery, appear on the bought of the palterns, and are caufed by a harpand

CLEDIA, in antiouty, a twig of the vine, which frew as a bunge of the Centurion's ofice.
Clematis, virgiv's-bover: A geam of the polygynia order, belonging to the polyaulria clafs of plans: and in the natural method ranking under the 2 fth order, AItalffitique. Thase is no callyx; the petals are furl, rarely five; the foeds have a tuain. There are twelve fpecies; all of which, except two. are fartiby clinbing phante, very hady, and achorned with quadrupetelo:s flowers of red, thue, puple, white, and greenif colours. They are very edfily propagated by layers or eutings. The vitis abba, one of the fpecies, is very acrid to the rafte, and without any fructh. It is frequently wfod as a cauttie, and for cleanting oid vilces. The root is faid to be purgative. The leaves \&f all the fypecies bruifed and applied to the fkin, burn it into cartuncles as in the plague ; and if applied to the nofrils is a foltry day inmectiately after being crepped, will caufe the fame uneafy feefation as a flane aphlied to that pait would ocrafion. Hence the title of fummulh, or "" little flame," by which this genus of plants was formerly dilitinguithed.
CLEMENCY, denotes nuch the fame with mercy; and implies a remiffion of feverity towards offenders. The term is motl generally ufed in fpeaking of the forvivenefs sxercifed by princes or perfons of high au hority. It is the reflat, indeed. of a difpofition which ought to be cultivated by all ranks, though its effects eannot be equally conficuous or extenfive. In praife of clemency foined with power, it is obferved, that it is not unly the privilege, the honour, and the duty of a prince, but it is alfo his fecurity, and better than all his garriions, forts, and guards, to prcferve himfelf and his dominions in fafety: Thiat that prince is truly royal, who mafiers himfelf; looks upon all ipuries as below him ; and governs by equity and reafon, not by paffion or caprice. $y_{n}$ illaftration of this fubject, the Collowing examples are felected out of many recorried in hiftory.
sutoon, c.g. i. Two natricians having confpired aratand Titus the Roman emperor, werc difcovered, convicted, and fentenced to death by the ferate: but the good-natured prince fent for them, and in pisate admonified then, that in vain they afpired to the empire, wlich was given by delliny; exloring them to be fatisfied with the rank in which by Providence they had beca
plarell, and offering them any thing elfe which was in his on*er to grant. At the famc time he difipateled a majee to the mother of one of them, who was theen at 1 great ilifance, and under deep eoreern about the fate of her fon, to aflure her, that her fon was not only alive, but forgyiven.
2. Licinius having raifed a numerous army, Zofimis fays 130,000 micn, endeavoured to wrett the covernment out of the hands of his brother. in law Conflastine the emperor. Bat lis army being defated, Licinus Acd with what forces he could rally to Nicomedia, whither Conlantine purfued him, and immediately invelted the place: but on the fee ond day of the liege, the emperor's fifter intreating him, with a floos of tears, by the tendernefs he had ever fhowa for her, in forgive her hufband, and grant him at leatt his life, he was prevailed upon to comply with her requeft; and the next day, Lieinius, findiag no means of making his efcape, prefented himfelf before the conqueror, and throwing limfelf at his feet, yielded to him the purple and the otherenfigns of buvereignty. Confantine received him in a very friendly manner, entertained him at his table, and afterwards fent him to Theiflonica, aftaring him, that the thould live u:molefted folong as he raticu no new dilurbances.
3. The council of thinty, eltablifhed at Athens by Lyfander, c:mmitted the mof execrable cancleics. Upon pretence of reftraning the maltitude within their cuty, and to prevent feditions, they lad cauled guards to be afigned then, had armed 3000 of the citizens for that purpore, and at the fame time difarmed all the ref. The whole city was in the utnoolt terror and difmay. Whoever oppofed their injuftice and violenee fell a victim to their refent ment. Riches were a crime that never faild of drawint a fentence upon their ownera, always followed with death and the conffication of eflates; which the thirty tyrants divided among themfulves. They put more people to death (fays Xenophon) in eight months of a peace, than their enemies had done in a war of thirty years. All the citizens of any conlideration in Athens, and who retained a love of liberty, quitted a place reduced to fo hard and thaneful a flavery, and fought citwhere an afylurn and retieat, where they might live in fafety. At the head of thefe was Thrafyhulus, a perfon of extranrdinary merit, and who beheld with the mod lively affiction the miferies of his comutry.

The Lacedemonians had the inhumanity to endeavour to deprive thofe unhappy fugitives of this laft refource. They publifhed an edigt to prohibit the cities of Greece from giving them refuge, deereed that they :hould be delivered up to the thirty tyrants, and condemned all fueh as fhould contravene the execution of this edict to pay a fine of five talents. Only two citics rejeCted with difdain fo majuft an ordinance, Megara and Thehes; the latter of which made a deeree to putinh all perfons whatfoever that fhould fee an $A$. thenian attacked by his enemies without doing his utmoft to affit him. Lyfias, an orator of Syracufe who had been banifhed by the thitty, raifed 500 fuldiers at his own expence, and fent them to the aid of the common country of Eloquence. Thrafybulus lof no time. After having taken Phyta, a fmall fort in At. tiea, he marched to the Pirens, of which he made himfelf mafter. The thinty flew thither with their troops,

## C L E

mency. troops, and a battle enfued. The tyants wete overthrown. Critias, the moll favage of then all, was killed on the foot: and as the army wis taking to flight, Thrafybulus cried out, "Wherefore do young from me as from a victor, rather than alfit me as the avenger of your liberty? We are not evemies, but fet-low-citizens; nor have we declared war agairlt the city, but againd the thinty tyrants." He continued with bidding them to remember, that they had the fame origin, country, laws, and religion: he exhorted them to compafionate their ex:led brethren, to refure their countiy to them, and teftime their own liberty. This dicourfe had the defired effect. Ihe army, upon their return to Athens, expelled the thity, and fubftionted ten perfons to govern in their room, whofe conduct proved no better than theirs: but king Panfanias, moved with compaffion for the deplorable condition to which a city, once fo flourifing, was rechuced, had the generofity to favour the Athenians in feeret, and at lengtin obtained a peace for them. It was fealed with the blood of the tyrants, who laving taken arms to rein?ate themfelves in the government, were all put to the fword, and left Athens in the full poffeftion of its liberty. All the exiles were recalled. Thrafybulus at that time propofed the celcbrated am. nelly, by which the citizens engraged upon oath, that all pait tranfactions fould be buried in oblicion. The government was re eftablithed upon its ancient foot, the laws were reftored to their prilline vigour, and magiftrates eleded with the ufual form.

This ( (ays Rollin) is one of the finett events in anc!ent hiftory, worthy the A thenian clemency and benevolence, and has ferved as a model to fuccefive ages in all gond goveroments. Niven had tyranny beenmore crutt and bloody than that the Atherians had lately thrown of: Every houfe was in mourning, every family bewalld the lofs of fome relation: it had beea a ferics of public robbery and rapine, in which licence and impunity had authoriftd all manner of crimes. The periple feemed to have a right to demand the blood of all accomplices in fuch notorious malverfations, and even the interef of the fate to authorife fuch a claim, that by exemplary feverities fuch enormous crimes might be frevented for the foture. But Thrafytulus rifing above thefe fentiments, from the fuperiority of his more extenfive geniuc, and the views of a more difcerning and profound policy, forefaw, that by giving in to the panifment of the guiley, eternal feeds of difcord and enmity would remain, to weaken the public by domeflic divifions, when it was neceflary to unite againf the common enemy, and alfo oecafion the lofs to the ftate of a great number of citizens, who might render it important fervices from the view of making amends for palt milbehaviour.
4. Such conduct, after great troubles in a flate, has always reemed, with the able!t politicians, the molt certain and ready means to reftore the public peace and trançullity. Cicero, when Rume was divided into two factions upon the occafion of Cefar's death, who had been killed by the confpirators, calling to mind this celebrated amnefy, propoled, after the example of the Athenians, to bury all that had paffed in eternal oblivion.
5. Cardinal Mazarine obferved to DonLewis de Haro, prime miniller of Spain, that this gentle and humane
conduct in France had prevented the troubies an pe- Cimemy vulls of that kingiom fiom havierg any fatal conle. quences, and c: Wat the kiner had not loft a foos of Cler ent. land by them to that daj;" whereas "the inflextbe Euverity of the Spanards was the occation that the Gubjecte of that monarchy, whenever they threw ufit the mane, never returned to their obedtence tha by die force of arms ; which fariciently appeard (fays he) ia the example of the Homanders, who are in the peaceable polletfion of many provinces, that not an age ago were the patrinony of the king of spain."
6. Lenicia; the Laceiemonian having, with 300 Herr: men only, difouted the pais of Thermopylx aramt lin. is. the whole army of Xerxes; and being killed in that c 77.? ? engagensent, Xerxes, by the advice of Mandonius one of his generals, cauted lis dead body to be hang noon a gallows, making thereby the intended dithunour of his enemy his own inmontal thame. But fons time after, Xerxes being defeated, and Niardonios hain, one of the principal citizens of Fgina came and addreffed bionfelf to Paufanias, defiring hin to avenge the indignity that Mardmins and Kerxes had fhown to Leonidas, by treating Mardonius's body after the fame manner. As a farther motive for doing fo, he added, that by thus fatisfying the mancs of thofe who were killed at Thermopyla, he would be fure to im mortalize his own name throughout all Greece, and make his menory precions to the latelt pollerity. "Cary thy bafe comints effewhere (replied Pas anias) ; ther malt have a very wrong notion of true Hoy to inagine, that the way for me to acquire it is to refemble the barbarians. If the efteem of the people if Asgina is mot to be purchaied but by fuch a procecding, I thall be content with preferving that of the Lacedemonians only, amongt whom the bafe and ungencrous pleafare of revenge is never put in compe. tition with that of flowing clemency and moderation to their enemies, efpecially after their death. As for the fouls of my departed countrymen, they are fufficiently avenged by the death of the many thoufand Perfians fain upon the fpot in the laft engagement."

CLEMENS Romanus, bithop of Rome, where be is Caid to have been born; and to lave been fellowlabuterer with St Peter and St Paul. We have mothing remaining of his works that is clearly genuine, excepting one epiftle, written to quict fome dillurbances in the chureh of Corinth; which, next to holy writ, is efteemed one of the molt valuable remains of ecclefrallical antiquity.

Cazmens Alexandrimus, fo called to diftinguifh him from the former, was an cminent tather of the church, who thousfine at the end of the fecond and beginning of the third centuits. He was the fcholar of Pain tanus, and the influctor of Origen. 'The beft edin tion of his works is that in 2 vols folio, publuhed in 1715 , by archbihop Potter.

CLEMENT V. (pope), the fufl who made a pub. lic fale of indulgences. He tranfplanted the holy fee to Avignon in France; greatly contributed to the fuppreffion of the knights templars; and was author of a compilation of the decrees of the general councils of Vienna, Ityled Clementines. He died in $131+$.

Clement VII. (Julius de Medicis), pupe, memo. rable for his refufing to divorce Catharine of Arra. gon from Henry VILI. ; and for the bull he publifhed

Clement upn the kingsmariage with Anne Bolcyn: which, been revifed and corrected by many grammarians;

Clemert XIV. (Francis Laurentins Ganganelii), the late papr, was bonn at St Angelo in the duchy of Ubbino, is OBher 1705 ; and chofea pope, thourn not yet a bithop, in 155y: at which time the fee of Rome was involved in a mall difagreabl and dangerons contell with the houfe of Bomrbon. His reign was rendered troublefome by the collifion of parties on the affins of the $J$-fuits; and it is pretended that hio later days were conbitted by the apprehenfions of poifn. Though this report was probably apocryphal, it is faid that he of ten complaind of the heavy burlen which he was oblical tw hear; an! regretten, with great fenfiblity, the lofs of that tranquillity which Lie enjoyed in his retirement when only a frmple Fran cifcan. He was, however, formate in having an opportunity, by a fingte act, to dilinguith a hort ad minittration of five yeas in fuch a manner as will cuer prevent its finking into wheurity. His death was in:mediately attributed to poifor, as if an old man of 72 , loaded with iufirmities and diforders, conld not quit the wold without vilence. His proceedings againt the Jefuits fromin da flauflde pretence for this ch rese; and the malevolence of the ir enemies embellilhed it with circomanders. It even feems as if the miniters of thofe powers who had procuted alseir diffolstion did not think it heneath them to combenance the report ; as if falfehond was neceffarr to prevent the revival of a body which had already funk, in its full ftrenoth, under the weight of real miconduct. The charge was the more ridiculous, as the pontiff lad undergone a long and painful ithers, which originally procerded from a fuppreffion of urian, to which he was fubject; yet the report was propagated with the greated indutry: and though the French and Spanith minitters were prefene at the opening of his budy, the moll horrible circemfanes were priblithed relative to that operation. It was cossenently tuld that the head foll off from the body, and that the fench poifoned and killed the operators. It availed but little that the operaturs flowed the mfelves alive and in god health, and that the furgeons and phylicizns proved the falfehool of every part of the report Clement XIV. appears to have been a man of a virtums character, and puof fred of confiderable abilitits. He died much regretted by his fuhjects.

CLEMENTINE, a term ufed among the Augnfins, who apply it to a perfon who, after having been nine years a fuperior, ceafes to be fo, and becomes a private monk, under the command of a fuperior. The word bas its rife hence, that pope Clement, by a bull, prohibited any fuperior among the Augutins from continuing above nine yeats in his olfice.

Clementines, in the canoa haw, are the conflitutions of pope Clement V. and the canons of the council of Vienne.

CLENARD (Nicholas), a celebrated grammarian in the $\mathbf{1 6 t h}$ century, was born at Dielt : and after having taught humanity at Lomvain, travelled into France, Spain, Portugal, and Africa. He wrote in Latin, 1. Letters irlating to his Travels, which are very curiors and fcarce. 2. A Greek Grammar, which has NO 82.

## and uther work. II died at Gremole in $15+2$.

CLEOBIS and BITON, two yunths, toras of Cydippe the priettefs of Jiano at Argos. When oxen could not be procored to draw thein mother's chariot to the temple of Jum, they put themstives under the yoke, and drew it +5 tadia to the temple, amidll the acchamations of the multitude, who congratulated the mother on account of the piety of her hons. Cydippe intreated the goddefs to reward the picty of her fons with the be!t gife thit could be granted to a mortal. 'They went 10 rett and aw ke no more; and by this the godeces howed that death is the only true lappy event ther call happen to a man. The Argives raifed them flatues at Duphi.

CLEOBITLUS. fonofevagras, and on? of the Grecian lages; he whedrant, a lover of leamiav. and an encony vice. Fhuribed ath ni 5 fowewabefore Chrift.

CLEONBROTUS, a king of Sparta, ton of Anaxamirndes $H e$ was deternes fore hmiln a wall achul the ithars of Corind: againt the apprach of the Perians, by an ectipe ot the fun. He died in the 75 th Olympiat, and was finceeeded by Phitachus, fon of $L$-unidas, a mimr.

Cleombrotus II. Con of Pauioni king of Sparta, atter his brosher Agefipolis I. He made war agair th the Bentians; and lat tee flonhlat be fuffrited of treacherous communications with Epaminond s, he gave that general hatle at Lenctra. in a very ditadvantereus ploce. $H$ was killed in the engag nent, and his army deftroy d, in the ywar or $R$ we 282.

Cleombrotus III. a fom-in-law of Léntridas king of Sparta, who for a while ulurped the kinodom after the expulfion of his father-in-l.w. When Lemedas was recalled, Cleombintus was banihed, and his wife Cliclonis, who had accompanied her father, now accompanied her hufband in his exile.

CLEOME in botany: A genus of the filiquofa order. belunging to the tetadynamia cl fs of plants; and in the natural method ranking under the 25 th order, Putamines. There are three rectariferns glandules, one at edch linus of the calyx except the lowell : the potals all rifing upwards; the filiqua undocular and hivalvexl. There are 15 万pecies; all of them, except two, natives of warm climates. They are her: baceus plants rifing from one to wo sect high; and ate adorned with thewers of variuus colonts, as red, yellow, fli th colour, \&c. They are propagated ty leeds, and require mo wher care than what is common to other exotics whi h are natives of warm countries.
Cl.EOMENLS, king of Sparta, conqueted the Argives and ficed Athens fom the tyranny f f the Pifittatadæ. By bribing the aracle he promounced Demaratus, his exllearnc on the throne, ilk sitimate, be caute be relufed to funifi the people of Eutas, who had daforted the Greeks. He killed himfelf in a lit of madnurs.

Clegmenes II. Cucereded !is brethen Ar fipil. IT. He reigned 3 : years in the erreatelt tia quilh: and was father to Acrotatus and Ciongomus Hewas fuccecded by Areas i. loa wf An tatus.

Cleomenes Ill. fuccui i hi father Lemnidas. He was of an cuterpriling fpirit, and reifolved to refore the amcient difipline of Lyeurgus in its fnll 2 force.

## C I E

force. He killed the Ephori, and removed by puiton his royal collearue Eurydan ides, and made hisoma brother Euclidas kint, argint the laws of the Hte, which forbald more than one of the fame fanaiiy to fit on the throne. He made war aint ha Acrecm, and attempted to deftroy the Achean leyne. Aratns the general of the Achzans, who fuppofed himftf inferior to his eneay, called Antifanus wh a mane:; and Cleomenes, when he had fiught the whinturte battle of Sellalia, retired into Egypt to the court of Proleny Evergetes, whore his wife and čillkio hul gone before him. Ptoleny received him with great cordiality; hut his fucceffor, weak atul fu!picious, twon expreffed his jealoufy of this noble itrasect, and inprifoned him. Cleomencs killed himalf, and his boly was flayed and expofed on an crofa, itu Olymp.

CLEON, the name of feveral anted mon of antiquity. I. Of an Athenian, who, thoughorigimaly a tanner, became general of the armics of the thate by his intrigues and eloquence. He took Thoron in Thrace, and was killed at Amphipulis in a lattle with Bralidas the Spartan general, Olynp. Both. 2. Ageneral of Muffenia, who diffoted with Arblodemus for the fovercignty. 3. A flatuary. 4. A poct who wrote a poem on the Argonants. 5. An orator of Halicarnaflus who compoled an oration for L, fatuder, in which he intimated the popriety of making the kiuglem of $S_{\text {paita elective. 6. A Magnetian who wrote fome com- }}$ mentaries, in which he fpeaks of portentous events, \&c.

CLEONAE (anc. geog.), a town of Argolis, abore Mycenax, on the rodi which leads from Argos to Cosimith; thanding on an eminence, on every fide occupied by houfes. In the fonell near this tuwn was fiain by Hercules the huge lion (Sil. Italicus, Seneca). Cleonaus the epithet; Cleonaum Sidus, the lion. Another Clemsis on Monat Athos in Clalcidice.

CLLOPATRA, the celcbated queco of Esypt, was dangliter of Ptoleny Auletes. By her extiandinary beaury, the fubjued the two rnowned Roman generals Juhins Cefar and Mare Antong: the later of whom, it is thought, lot the empire of Rome by his attachment to her. At lenuth, Marc Antony beinor fubdued by Oatavius Cafar, the tried the force of hor declining chams upon the corqueror, lut in vain; upon which, expleting no mercy from him, fue poifon. ed herfte, 30 years before Chiilt. Acconding to fome authors, the was the-reltorer of the Alexandrian libraEy, to which the added that of Pergamos; and it is faid, that the ftudied philofophy to confole lier for the abfence of Antony. With her death ended the family of the Ptolemies in Erypt, after it bad reigued from the death of Alexander 204 years: for Eypt, after this, was redued to a Roman province, in which dependence it remamed till it was taken from them by the Sarncens, A D. Gq1.

CLFOPATMR1s (anc. geog.), a town of Ferpt, on the Araban Culf. See Arsimot. Now faid tabe $S_{u c z}$, fituated at the bottom of the galf of the Red Sea. E. Long. $3+$ 3O. N. Lat. 30.0 .

CLEOSTRATUS, a celebsated anmomer bom in Tencios, was, according to Pliny, the firf who difcovered the figns of the Zodiac ; oflicess fay, that he only difencerad the figns Aries and Sagitamins. He alfo corrected the errors of the Grecian y car abont the 306th before Carill.

CETPSYDRA, an immomen on machine ferving Clepfy fra,
 wis.
 "water"; though the nave like wife been clapfyere made whin mercury.
The Eeryitions, by this machine, meafured the
 We of it $t$, merfore the motinn of the hass, se and 1) udley wh the fame conmance in making ath has maritime obervations. 'Al, ufe of elepfydra is yery ancient: they were invented in Eegyt mader the Pto lemis; as were alfo fun-dials. Wheir ufe was chictly in the winter; the fun-chats fored in the fummer. They had two great defects; the one, that the water ran out with a creater or lefracility, as the air was more or lefs denfe; the ofher, that the water ran more readily at the beginmeng that tuward the conchution. Ni. Amontons has invemed a clevfydra free from both thefe incoureniences; and which has thefo three grand adamtages, of ferving the erdinary purpofe of clokk, of ferving in navigation for the difonvery of the longitude, amb of nacaluing the motion of the arturies.

Curfiruation of a Czersangh. To divide any cylindric vellid into parts to be emptied in each civition of time; the time wherein the whole, and that wherein any part, is to be cracuated, being given.

Suppofe, r. g\%. a cylindric witi, whofe charge of water flows out in twelve hours, were required to be civided into parts to be evacuated cach hour. 1. As the part of time 1 is to the whole time 12 ; fo is the fame time 12 to a fourth preportional, if4. 2. Divide: the adritude of the veffer into rat equal parts: here the lall will fall to the laf homr ; the thate next above to the hatbert but one ; the five next to the tenth hour, Eici; latly, the 23 late to the fritt hour. For fince the times incruafe in the feries of the natural numbers $1,2,3,4,5$, a.c. and the altithes, it the numeration be in retrograde onder from the twelfth hour, inereaie in the feries of the unequal numbers i, 3,5,7,9, \&c. the altitude, comprated from the twelfth i:our, will be as che quares of the times $\mathrm{I}, 4,9,16$, 25 , S.e. therefore the fquare of the whole time $14+$ compuchonds all the parts of the altitude of the vefied to be cuachated. But a third proportional to 1 and 12 is the furare of 12 , and confeguently it is the number of equal parts into which the altitude is to be divided, to be dift ibuted according to the feries of the uncqual numbers, though the equal intervals of hours. Since in lieu of parts of the fame refhl, other lefs veffich equal thercto may be fubitituterd; the altitude of a vefll emptied in a given fpace of tine being giren, the alcitude of another veffel to be unptied in a given time may be found; viz. by making the altitudes as the fquares of the times. Fer a further defuiption, with afrure, fee Hyprostarios.

CLERC (Juhn le), a moit celcbrated writer and univerfal Cholur, Lorn at Geneva in 1657 . After he liad paffed through the ufuad courle of fudy at Geneva, and had loll his father in $16 ; 6$, he went to France in 16,8 ; but returning the year afur, he was urdancd with the gencral applaufe of all his examiners In 1682, le Clere vifited England witha view to learning the language. He preached feveral times in the Frenel H churches

## C I E

men of leamiter: but the fmoky air of the town not agreciug with his lungs, he returned to Holland within the year, where he at length feitled. He preached before a fyood held at Rotkerdam by the vemontrants ia $168+$; and was admatted profeffor of philofophy, polite literature, and the Hebrew tongue, in the ir fohool at Amferdam. The remander of his life afferds nothing but the hiltory of his works, and of the controverfies he was engaged in; but thefe would lead into too extenfive a detail. He continued to read regular lectures; and becaufe there was no fingle anthor full enough for his purpofe, he drew up and publifhed his Logic, Ontulogy, Pnemmatology, assd Natural Philofophy. He publifhed Ars Critica: a Conmentary on the Old 'Feflament ; a Compendium of Univerfal Hitory; an Ecclefatical Hifory of the two full Cen. ruries ; a French I'ranflation of the New Tettament, \&xe. In 1686 , he beran, jointly with M. de la Crofe, nis Bibliotheque Uuiverfalle at Hifforique, in imitation of other literary journals; which was continued to the year i 693 , inclutive, in, 26 vols. In 1703 , he began his B:bliotbeque Clenifie, and continued it to ryaz, and then commenced another work on the fame plan called Billiotbeque Ancione at Moderne, which he continued to the year 1728; all of them jully deemed excellent Hores of nefal knowledge. In i728, he was feized with a paliy and fever; and after lpending the lat fix years of his life with listle or no undertanding, died in 1736.

Clerc (John le), called Chourtier, an eminent hitosical painter, was born at Nanci in 1597 , but Itadied in Italy, where he refided for twenty years; and was a difciple of Carlo Venetiano, with whom he worked a long time, and whole ftyle he fo effectually fudiced and imitated, that feveral of the pictures which were finithed by le Clere were taken for the work of Venetiano. Fe was moit highly efeemed at Venice for his extraordinary merit; and as a token of public reSpect, he was made a knicht of Sc Mark. Fis freedom of hand was remarkable; he had a light pencil; and in his colouring he refembled his matter. He died in 1633.

Clerc (Sebaftian le), engraver and defgaer in ordinary to the French king. was born at Metz in 1637. After having learnt defigning, he applied himfelf to mathematics, and was engincer to the marfalal de la Ferté. He went to Paris in $\mathrm{I}_{6} \mathrm{G}_{5}$, where he applied himfelf to defigning and cngraving with fueh fuccefs, that M. Colbert gave him a penfion of 600 crowns. In 1672 , he was admitted into the royal academy of painting and fculpture ; and in 1680 was made profeflor of geometry and perfpective in the fame aeade. my. He publihed, befides a great number of defigns and prints, I. A Treatile on theoretical and practical Geometry: 2. A Treatile on Architecture; and other works: and died in 17 I . - He was an excellent artift, but chiefly in the petit dyle. His genius feldom esceeds the dimenfons of fix inches. TVithin thore limits he could draw up 20,000 men with great dexterity. No artift except Callot and Delia Bella could touch a fmall figure with fo much fpirit. His mott eiteemed priats are: 1. The palion of our Saviour, on 36 fmall plates, lengthwife, from his own compofitions. The beft impreffions ate without the borders. 2. The

## 58 1 C L E

minate of the ficeling five thonfunct, a micdring fized plate, lengthwite. In the tirit imprefions, which are very rare, a town appears in the back-ground; in place of which a moumtain is Cubtlituted in the common oncs. 3. The storation of ilve larege $\beta$ mes uferl in buid. ing the front of the Lowner, a large plate, lengthwife. The firt impreffons are without the date 677 , which was afterwards adcied. \& 'The actalomy of the fiencers, a middling fized plate, lengthwife. 'l he forl impers fions are before the lleleton of the itag and tortoife were added. The fecond impreftions ate before the fhadow was enlarged at the botonn, towards the right hand frde of the print. Both thefe inmethons are very faree. The firlt is rarely met with. 'This print was copid for Chambers's Dictionary. 5. The MLay of the Gobelins, a midalling-lized plate, lengthwife. 'The fiett impreflion is before the woman was introducesi, who covers the wheel of the coach. 6. The fin. cis. qui/ts, large plates. kengthwife, reprefenting the taking of Tommay, the taking of Dovay, the defeat of the conte de Marfin, and the Switzeriand allance. .. The buttles of Alixanucr, from Le Bron, tix fmall ions plates, inchedig the title, which reprefonts the picture gatlury at the Gobelins. The hitit imporlions of the tent of Darius, which plate makes part of this fet, is diftinguifaed by the fhoulder of the woman, who is feated in the front, being whour the tla bow, which was aftervards added; for which reafon they are called the prints with the haticd fromitar. B. The eatry of Alexander into Bobstan, a midding-fized plate, lengthwife. In the fint inpreffions, the face of Alexander is feen in profice; in the fecond, it is a three quarter face, and therefore called the print with the boad turmet.

Clerc (George le) count de Bufion, a ealebrated noturalift, was born at Montbard, in Murgundy, the $7^{\text {th }}$ of September 1707: his father was a counfellor of the pariament of Dijon, and the fon was dultincd to the fame office, if fcience had not drawn him away from the law. He fudicel at Dijon; and his eager activity, his acutencfs, penetration, and rebutt contitution, fitted him to purfue bulinets and pleafure with equal ardour. His carly paffion was for aluonumy, and the young Iee Clerc was nover without Euclid in his pocket. At the age of twenty, he went with an Englifh nobleman and his govenor to Italy; but he overluoked the choicell remains of art, and, anidit the ruins of an elegant and luxurious people, he firlt feit the charms of natural hifory, whofe zealous and fucecfsful admirer he afterwards proved. On his return to Franee, le fought, on fome occational quarrel, with an Englimman, whom he wounded, and was obliged to retire to Paris. IIe there tranflated Newtnn's Fluxions, from the Latin, and Hales's Staties from the Englifh, into the French language. He aftewards came to England, at the age of twenty-five; and this journey concluded his tracls: he flaid here about three months. At the age of twenty-one, he fuccceded to the etate of his mother, which was salued at about 300,000 lirres (above 12,000 pounds therling) ; and he was one of thofe whofe eafy or anluent circumftances urge on literary purfuits, and clear the path of fome of its thoms. Perliaps this was the period of his retirement to Montbard, where he fpent nueh time, and where his leifure was litede interrupted: white in the capital,

## C L E

his office of intendant of the king's garden and cabinet engaged much of hi, time. He loved much company, and was partial to the fair ; but he loved ylory more. He fpent if hours every day in Hudy; and, when we examine the extent of his knowledge, and the number of his works, we wonder at his having executed fo much even in this time. At five in the morning he retired to a pavilion in his wft gardens, and he was then inacceflible. This was, as prince LIenry of Prufia called it, the cradle of natural hitory ; but the was indifferently aecommodated. The walls were naked, an old writing-table, with pen, ink, and paper, and an elbow chair of black leather, were the miy furniture of his fludy. His manuferipts were in a cabinet in another building, and he went occationally from one to the other. The eras of Buffon's works are pretty well known. Whan each was fmithed, it was pit afide, in order that he might forget it, and he then returned to it with the feverity of a critic He was anxious to have it perficuous; and if thofe to whom he read his works hetitated imoment, he changed the paffare. The works of others he at lail read like Magliabechi, the titles, the contents, and the noth interelting parts; but lie read M. Neckar's Compte Rendu, and the Adminifration of the Finances, at length : be fpote of them alfo with no little enthufafin. His favonrite authors were Fenton, Montefquien, and Richardion.
M. de Burivn's converfation was unadomed, rarty animated, but fometimes wery cheerful. He was exact in his drefs, particularly in docflug his hair. He lat long at table, and then femed at his eafe. His converfation was, at this time, nombaraffed, and his gruets had frequently uccalion to notice fome happy turn of phrafe, on fome deep refection. His complaifance was rery confiderable: le loved prake, and even praifed himfelf; but it was with fo much franknefs, and with folitte contempt of others, that it was never difagreeable. Inded, when we confider the extent of his reputation, the credit of his worls, and the attention with which they were aloways received, we do not wonder that he was fenfible of his own value. It would perhaps lave difulayed a ftronger mind to have concealed it. His father lived to 23, and dmout adored his fon; his grandfather to 87 ; and the fubject of the prefent article exceeded only 8o. Hr died in April 1788. Fifty-fix flones were found in his blaider ; but if he had confented to the operation, he might probably have lived longer. One fon remains; who near a high tower in the gardens of Monthard has placed a low column, with the following infeription :

> Excelfx Turri
> Humilis Columna,
> Parenti fuo
> Fil. Funton.

CIERGY, a general name given to the body of ecclefatt es of the Clriblian church, in contraditinction to the laity. Sive Latry.

The datinetion of Chrilians into clergy and laity, was derived from the Jewith chach, and adopted into the Chritian ly the apotlies themfelves: whenever any number of comvelts was made, as foon as they were cupathle of bedas; formad into a congucsution or church, a biliop or prefoyter, with a deacon, were or-
dained to miniter to them. Of the bimope, priets, and dexons, the clery origimaly confated ; but in the thide contury, many infrior orders were aporimet, as fublervient to the office of deacon, fuch as dcozuthists, Readers, \&

This venerable body of men beior feparate and fotsoyp. apart fiom the relf of the peofle, in order to attend commens. the more cofely to the fervice of Almighty God, have therefore large prisileges allowed them by our manicipal laws: and had formerly much greater, which were abrideced at the time of the refommation, on accomnt of the ill ufe which the Popifn clergy had endeavoured to make of them. For, the laws having exempted them from almolt every perfonal duty, they attempted a total exmption from every fecular tie. But it is obferved by Sir LUward Coke, that as the overfowing of waters doth many times make the river to lofe its proper channel, fo, in times pall, ecclefatical perfons, fecking to extend their liburtics heyond their duc bounds, cither loft, or enjoyed not, thofe which of right belonged to thean. The perfonal exemptions do indeed for the moft part continue: a clergyman camot be compelled to ferve on a jury, nor to appear at a court-lect, or view of frank-pledre, which almot every uther perfon is obliged to do: but if a laynan is fummoned on a jury, and before the trial takes orders, he thall notwithllanding appear and be fivorn. Neither can he be chofen to any temporal ufice, as bailiff, reeve, conftable, or the like; in regard of his own continual attendance on the facred function. During his attendanceon divine fervice, he is privileged from arreft in civil fuits. In cafes alfo of felony, a clerk in orders fhall have the benefit of his clergy, without being loranded in the hand; and may likewife have it more than once: in both which particulars he is diftinguifhed from a layman. Eut, as they have their privileges, fo they have atro their difabilities, on account of their fpiritual avocations. Clorgymen are incapable of litting in the houfe of commons; and by flatute 21 Hea. VIII. c. 13. are not in general allowed to take any lands or tenements to farm, upon pain of rol por aronth, and total avoidance of the leafe; nor, upon like pain, to kecp any taploufe or brew-houfe; nor thall engage in any manner of trade, nor fell any merchandize, under forfciture of of the treble value. Which prohibition is confonant to the canon law.

Benfit of ClfRgr, is an ancient privilege whereby one in orders clamed to be delivered to his ordinary to purge himfelf of felony.

After trial and conviction* of a criminal, the judg-- Sce tise ment of the court rgulanly follows, unlefs fufpended articlea Ar. or arrefted by fome intervening circumftance; of which ratment, the principal is leiefit of clergy: a title of no fmall cu- Flea, Tria,', riofity as well as ufe; and concerning which, therefore, tion. it may not be improper to inquire, 1 . Into its original, and the varions mutations which this privilege of the clergy has fuftained. 2. 「o what perfons it is to be allowed at this day. 3. In what cafes. 4. The confequences of allowing it.

1. Cleryy, the privilugrun clivicale, or (in common blacke. (peech) the benefit of clergy, hat its origima from the Commant. pions regard paid by Chrillian princes to the church in its infunt itate, and the ill wfe which the porpith eccle. fiaftics foon made of that pious regard. The exemp-

## C 1. 1.

cire. tions whin they grated to the church were principally of two h.inls: 1. Exemptions of phace conicurated to retionous duties from criminal arretts; wheh was the foumdation of fanturatics. 2. Exemption of the peafons of cirergmen from criminal proct in fore the Fecular julse in a few purticular cafes; which was the true origiasland meaning of the privelegriun clericuil.

Pat the ciergy incrafing in wath, power, honour, number, and interett, foon bersan to fot up for themfolves; and that whith they obeqind ly the fivon of the cir? therent right, an as a right of the highet nature, indefeable, and jure domo. By their canons, there. fore, and condtutions, thoy endeavoured at, and where they met with ealy pinces, obtained, a wit extenfon if thofe cxomptions: as will in reçare to the crimes themfler, of wheh the lit became quite miverfal, as in reand to the perfons excmpted; among whon we:e it 1 neth comprehended, nut only every little fibmbate oftices belonging to the chach or dergy, but cuea many that were totally laymen.

In England, howeser, althargh the ufupations foth pope were very many and griwous, till Morny VILI. totally extominated his fupromacy, yet a total exemption of the clergy fum fecular jurifdation cond sever he thomoughy effected, thangh often endearoused by the derys: and therefoce, thourh the an cient prizilisem diericu's was in fone capital cafes, yet it was not maverfaly allowed. And in thene particular cafes, the we was for the bihop or urdinary to demand his clestss to ke remited out of the kimg's conts as foon as they were indicted: concerning the alluwance of which demand there was for many years a great uncertanty; till at length it was finely feteled in the reige of Heny VI. that the priforer thond dint be arragred; and might either than cham his benetit of cle"sy by way of duclimatory fra; or, after comviction, by way of amelt of judgment. This lattor way is munt ufually pracifod, as it is more to the datufuction of the court to have the crime presionfly afcertained by confeffon or the verdict of a jurs; and allo it is more advantageous to the prifoner himfif, who may poflibly bee acyuitted, and fo nead not the benetio of his clergy at all.

Originally the law was held that moman fhould be admitted to the benefit of clergy, but fach as had the buritum at tonfuram clericatem. Put, in procefs of time, a much wider and more comprehenfive criterion was ettablimed; every one that could read (a great mark of karning in thofe days of ignorance and her fifter fuperfition) being accounted a clerk, or chericus, and allowed the benefit of cherkfip, though neither initiated in clerkhip, nor trimmed with the holy ton!ure. But when learning, by means of the invention of printing, and ofher concurrent caufes, began to be more generally difeminated than fomerly ; ad reading was no longer a competent prool ef cleck-- thip, or being in buly urders; it was found that as inany laymen as divines were adtaitted to the privilegizm eicricule: and therfiere by Eatute \& IEnry VII.c. 13 . a dillinktion was once more dramu butween mere lay fohdars and clerks that were batly in orders. And, shough it was thought reafonable wial to mitigate the
feverity of the law with regard to the former, yct Ciergy. they were not put upon the fame footing with actoal clergy; beins fuhjected to a fizht degree of punithment, and nos alowed to clam the elerical privilege more than once. Accordingly the tatute dirests, that no perfon, once admitted to the benefit of elergy frail be admitted thereto a focond time, until be produecs his orders: and in order to ditimguih their perdons, all hamen who are aliowed this privilege, fhatl be hurnct with a hot-iron in the brawn of the hft thum?. This diatituon between lea:ned laymen and rall elerks in orders was abolithed for a time by the Bratues zidifen. VIII. c. 1 . and $3_{2}$ Hon. VIIf. c. $2 . ;$ bat is laid th have been virtually rellowd hy fatme I Follo. Sh. c. :2. wh:ch llatate allo emacts, tha fords of parlianches and peers of the calm may hove the benelit of their peetars, equivalent to that of clerey, for ticerth uleme (athough they camot read, and whlout being bernt in the had), for all offences then cleratuic to commoners, and alfo for the crimes of houc-braking, hishway-robbery, hore-lealing, and robbins of cimaches.

Afer this bumar, the laty, and before it the real dorgy, were ditharged from the ientense of the law in the liners courts, and delivered over to the ordinary, to be dealt with according to the eccletialtical canons. Whereupon the ordinary, not fatisfied with the proofs adduced in the profane fecular court, fet himelf fommly to make a purgation of the oficade: by a new eanonical trial; althongh be las been previouly convicted by his comntry, or permps by his own comiofion. This trial was held before the bifoop in perion, or his deputy; and hy a jury of twelve clerks: And there, fird, the party himielf was required to make oath of his own innecence: next, there was to be the oath of twelve compurgators, who fwore they believed he fooke the trath: then, witnufe, were to be examined upon oath, but on behale of the prifoner only: and, lattly, the jury were to bring in their verdice upoa oath, which ufually acquitid the prifoner: uthowife, if a coerk, he was destaded, or put to penance. A learned judge in the begimming of lalt century, remarks with much indignation the vall complication of perjury and fubomation of perjury ia this folemn farce of a mock trial: the witnefles, the compurgators, and the jury, being all of them partakers in the guilt: the delinquent party alfo, though convicted in the clearet manner, and confcions of his own oflence, yet was permitted, and almole compelled, to fivear himfelf not guilty; nor was the goodbifhop himfelf, under whofe countenance this feene was tranfaited, by any means exempt from a fhare of it. And yet, by this purgation, the party was rellored to his credit, his liberty, his lands, and his capacity of purchafing afrefh, and was entirely made a new and an innocent man.

This feandalous proftitution of oaths, and the forms of juitice, in the almoll contant acquittal of felonious cherks by purgation, was the occahon that, upon very heinous and notorious circumfances of guilt, tempural courts would not truat the ordinary with the trial of the olferder, but delivered over to him the convicted clerk, abfgue purgatione faciendo: in which fituation the clerk convict could not make purgation; but was to continue in prifon during life, and was in-
capable
capable of acquiring any perfoml priperty, or receiving the profits of his lim't, unkfo the king fhould pleafe to pardon him. Botas thefe eomrfos were in fome degree exceptionable; the latter perhaph being too rigid, as the former was productive of the moll atondoncd perjury. As therefore thefo mock trials took their rife from factium and wopifh tenets, tending to exempt one part of the nation from the general municipal law; it becune light tion, when the refomation was theronghy elcablita, to abolifh fo wain and impions a cemmony.
Accordiady the Patute 18 Eliz. c. 7. enacts, that, for the avoding fich perjuries and abmes, witer the afender lowe been athom his clergy, he frall not te delivered to tho sedinay as Somily; hut, upon fuch ahowene, and bund of the ham, he the lh for havith be entagred ant deliveted ont of prifon; with provifo, that the judike nay, if he thinks fit, comtinue the ofender in gand der any thene net esceding a year. And thas the law contimen unaltered for above a contury; cerept only. that the fatute 21 J ce. I. c. 6 .
 under the value of ios. flowld (not phoperly have the buctit of elergy, for they were not called upon to read; but) be buned in the laad, whippul, or thecked, or imprifoned for any time not exceeding a yar. And a fimilar induggence by the hatutes 3 and + With. and Mary C. 9. and 4 and 5 Will. and Mary c. 24. was extended to women guilty of any clergyable felony whatever; who were allowed one to clam the benefit of the fatate, in like mamer as men might clam the benefit of clergy, and to be difharged upon being burned in the hand, and imprifoned for any time not erceeding a year. All women, all peers, and all male commoners who colild read, were therefure difharged in fuch felonies abfohtely, if clerks in orders; and for the firl offence upon burning in the hand, if lay; yet all liable (except peers), if the julge faw occalion, to imprifonment not exceeding a year. And thefe men who could not reiud, if under the degree of peerage, were hanged.

Afterwards, indeed, it was confdered, that education and learning were no extemations of guilt, but quite the reverif: and that if the punifloment of death for fimple felony was too fevere for thole who had been liberaily inftructed, it was, id fortiori, too fevere for the ignorant alfo. And thereupon, by ftatute 5 Anue, $\mathrm{c}, 6$. it was cmacted that the bencfit of clergy fhould be granted to all thofe who were intitled to all it, without requiring them to read by way of conditional merit. And, experienee having fhows that io univerfal a lenity was frequently inconvenient, and an encouragement to commit the lower deģres of felony ; and that though capital punthonents were too rigorous for thefe inferior offences, yet no punithment at all (or next to none, as branding or whipping), was as much too geritle; it was enacted by the fime flatute 5 fanc, c. b. that when any perfon is convicted of any thaft or larecny, and burnt in the hand for the fame, he fhall, at the difcretion of the judge, be coramitted to the houfe of correction or puhlic work-houlf, to be there kept to hard labour for any time not lefis then fix months, and not cxceeding two years; with a power of inflicting a double confinement in cafe of the party's efvape from the firlt. And it is
alro enacted ty the fatutes 4 Geo. I. c. in and h. Cluer Go. I. c. 23. that when any perions ind liw rat...tat of ay larcen., wher grand ur atit, way ham and Atealniz or taking of money or movis and curato of
 any other mazaner, and who by the law thatly te mithet to the benerit of clergy, and liabl eniy to the paralties of burning in the hand, or whiping , the cunt, in
 whipping, may direct iuh offenaces io he tromiturtul to Ametica for feven yours; and if they rutan, waye feen at large in this kinglom within thas time, it and be felony withont bear fit of clergy.

In this frate does the henfit of dergy at jwist fitend: very confiderably diferent from its etidial in fitetion: the whom of the Entilh haletore han ving: in the confe of a loug and labominns procefs, us. eracked, by a noble alchemy, rieh medicines on on poifonous ingredient; and convertud, by gratual imatations, what was at hrtan ancafonable caemption of particular popilh coleliadlics, into a merciful mitign tion of the graceal law with refpeed to capital purilla ment:

From the whole of this detail, we may collect, that however in times of ighorance and fupertition, that. monter in true policy may fur a white fublin, of a body of men refliding in a flate, and yet independent of ths laws; yet when karning and rationd roigion have a little enlightened mens minds, fucicty can on longer endure an abfurdity fo grofs, ats muft detroy its very fundamentals. For, ly the miginal cuntract, \& goverament, the price of prometion by the mitent her of indiniduals, $i$, that of obe lience to the minted will as the commmity. 'This united will is cleclared ir the laws of the land: and that united force is esented in their dece, and univeral, execution.

1I. We are nesit to inquire, to what perfons the Lenefit of clergy is to be all.owed at this day: and this mult chiofy be collected fon what has been whero wed in the preeding artick. For, upon the whole, we may promounce, that anl clerks in onders ate, without any brandins, and of courfe withont any tranfo portation (for that is only fublituted in lei of the other), to be admitted to this privilege, and irmediately difcharged, or at moll unly conlined for one year ; and this as often as they ofiend. Again, all lorts of parliament, and peers of the realm, by the ttatute I Edw. VI. e. 12. thall be difcharged in all elergyabie and other folonies provided for by the act without any burning in the hand, in the fame manoer as reai clerks convict: but this is only for the frot oferce. Lafty. all the commons of the realn, not in orders, whether male or femate, frali, for the fint offace, be difcharged of the panifment of felunies, within the henelit of clergy, npon being burnt in the hand, and fuffering difcreticnary imprifonment; 1 , in cafe of tur. ceny, upon being tranforted for feven ywars, it the court fatl think proper.
III. The third point to be confidered is, for whit crimes the frivilegium diericatc, or bencit of clergy, is to be allowed. And it is to be obferved, that neither in high treafon, nor-in perit lanceny, for in any mere mifdemcanors, it was indulad at the common law: and therefore we may hy it down as a rupe that it was allowable only in petit tratura and capital
fulurize;

Cictey.
Choies: whed for the mult pant beame legaty intitled to this indulgume by the flatute do chao, 25 Edw. Ill. Ilat. 3.e. 4. which provides, that derks conviet for treaton or fellunics, towhing other perfons than the king himble on his royal majchy, thall hate the privilege of holy church. Dut yit it was not allowed in all cales whatfocer: for in fome it was denied even in common law, viz. infichatio viaran, or $\mathrm{l}^{-}$ing in wait for one on the highway; A.popula io agrorum, or deftoging and rasuing a cumbtry; combufio domorum, or affon, that is, hurning of houfes; all which are a kind of hotile acts, and in fome degree border upon trealon. And farther, all thefe identical crimes, together with petit tocafon, and vas many other acts of felony, are oulted of clergy by particular acts of parliament.
Upon the whole, we may obfare the following rules. I. That in all felonies, whether new created, or by common law, clergy is now allowable, unlefs taken away by act of parliament. 2. That where clergy is taken away from the principal, it is not of courfe takenaway from the acceliury, unicfós he be alfo particulanly incladed in the words of the fiatuti. 3. That when the benelit of clergy is taken away from the offence (as in cafe of murder, buggery, robbery, rape, and burghry), a prineipal in the fecond degree, being prefent, aiding and abecting the crime, is as well exchuded from his clergy as the that is a principal in the firt degree: but, + . That whee it is only taken array from the perfon committing the offence (as in the cafe of flabbing, or commiting larceny in a dwelling-houfe), his anders and abetors are not ex. cluded, through the tendernefs of the law which hath determined that fuch fatutes fhall not be taken literally.
IV. Lafly, We are to inquire what the confequences are to the party, of allowing him this benctit of clergy. We fpeak not of the landing, imprifoment, or tranfuortation; which are rather concomitant conditions, than confequences, of reciving this indulgence. The conlequences are fuh as affeet his prefent interct, and future credit and capacity: as having been once a felon, but now purged from that guilt hy the privilege of clergy : which operates as a kind of itatute pardon. And we may obferve, 1. That, by his conviction, he forfeits all his goods to the king; which, being once vefted in the crown, thall not afterwards be refloced to the offender. 2. That, after conviction, and till he receives the julgment of the law by branding or the like, or offe is pardoned ty the king, he is, to all intents and purpofes, a felon; and fubject to all the difabilities and other incidents of a felon. 3. That, after buming or parden, he is difcharged for ever of that, and ath other felmies before commited, within the benelit of clergy; but not of fuls mus frem which fuch benclit is excluded: and this hy flatutes 8 Eliz. c. f. and 88 Eliz. c 7. A. That, by the barning, or pardon of it, he is rettored to all capmatites and credits, and the poffeffion of his lams, as if he had newer beco consieted. 5. That what is faid with regand to the adrantages of commoners and layment furtequat to the bmang in the hand, is equally an tienble to all peos and ubergymen, atiturs never branded at all. For they have the fate prive
lege:, without any burnug, to which others are in. tibled after it.

CDEKR (chumes), a word fomenty uful to fignify a leamedmain, or math of letters. 'The word colets from the Greck arpest, witd for clogy; but more properly fignifying lot or hoidge, in regand the lot and pertion of cierks or cedelatics is to forse Gorl. Aceordingly ciciens was at irith ufed to dignify thofe who had a particular attachment to the fervice of God. The origin of the cxprefton is duried from the Old Thetament, where the tribe of Levi is called the lot, heritage, xans ; and God is reciprocally called their fortion; by reaton that tribe was confectated to the jervice of God, and lived on the offerings made to God, without any other fettled prowition as the reft had. Thus, Pafquier obferves, the oflicers of the counts (comites) were amiently created under the title of clerks of acompis; and fecretarics of tate wore called cieris of the fictet. So chricus domini regis, in the time of Edward 1. was Englifhed, the king's frctetary, or clerk of his council. The term was applied indifferently to all who made any profifion of learning; or who knew how to manage the pen: though oricinally it was appopriated to ecclelialtics. As the nobility and gentry were ufually brought up to the exercife of arms, there was none but the dergy. lift to culivate the fienees: hence, as it was the clergy alone who made any profeftion of lutters, a very leaned man came to be called a great clepk, and a fupid irncant man a bad chen.

Cefre is atio applied to fuch as by their courfe of life exercife their prels in any court or ollice; of which there are variuns hinds: thas,

Cuthe of the Bails, an otficer in the comrt of king's bench, whole bulinefs is to file all buil-picces taken in that court, where he aluags attend.

Clafke of the Ciback, an oflicer Lelonging to the King's cunrt; fue called, becaufe he has the check and contronhent of the yeomen that belong to the king, queen, or prince. He likewde, by himfeli or depuis, rets the watch in the comt. There is alfo an officer in the navy of the fame name, belonging to the king's yards.
tileks of the Crown, an officer in the king's bench, who frames, reads, and records all indictments againft offenders, there arraigned or indicted of any public crime. He is likewife terned clerd of the crown-office, in which capacity he exhibits information by orése of the court fur divers offences.

Clark of the Crozen, in chancery, an officer whofe bulinefs it is contantly to attend the lord chancellor in perfon or by deputy; to write and prepare for the great feal fpecial matters of tate by commition, both ordinary and extmurdinary, viz commathons of lientenancy, of juftices of alfaze, uyer and terminer, gaoldelivery, and of the peace; all general pardons, granted cither at the king's woromation, or in patiament: the wits of parlament, with thenames of the knights, citizetho, and burgefies, are alforeturased into his office. Itc ahto makes out feecial pardons and writs of execut. un wa bends of tatate-dtapie fureited
(ilation the Unimerties of the Orlmance. See Ordnanct.

Cis os of the Errors, in the cout of common pleas. an officer who tanfurbes and curtifes into the King's beach, the tenor of the reced of the action on which

the writ of error, made cut ! y the curfitor, is bruegh ther twbe deternined. In the king's bench, the cleck of the aroms tramiones and centifes the records of caufes, by bill, in that corart, into the exchequer. And the butinefori the cle k withe errors in the exchequer, is to transeribe the recorls certified thither out of the king's bench, and to prepare them fur judgment in the exchequer-chanber.

Ctzin of the Timits, in the court of common pieas, keeps the eflom roll, or chters effoins: he alfo provides parchment, cuts it into rolls, marks the number on them, delivers out all the rolls to every officer, and receives them again when writen. Sec Essots.

Chare of he Iplatets, an officer in the exchequer, who every term receives the elleats ont of the lordtreafuret's remembraricer's office, and writes them out to be hried for the cerman.

CIfNE of the Crech-toth, formerly an officer in chancery, hut wn abulined.
Cink of the Homere, or Hanaper, an officer in chancery, whele thatinets is to receme all money due to the king for the teals of charters, letters patent, commiffions, and wits; alto the fees due to the officers for enrol ing and caanining them.
 of the king's court. authorifed to allow or difallow the charges of perfuisunts, meffengers of the greencloth, Se. to minect and controul all defecto of any of the infertrof ficers; and to fit in the comating houle with the lurd-heward and other officers of the houfeholl for regulating inch matters.

Clafk (ft the King's sitzer, an officer of the common pleas, to whom every fine is brouglt, after it has pafied the office of the ciflos breniann; and who enters the etfect of writs of covenart, into a bouk kept fur that purpofe, acording to which all the fines of that term are recolded in the rolls of the coert.
Cifers of the Aharket, an officer of the king's houfe, to whom is given the charge of the king's meafures and weights, the flandards of thofe that ought to be ufed ailo over England.

Glara of the Nirbils, or Nibits, an officer of the excluequer, who makes a roll of all fuch fums as are nicinilled by the fheriffe upon their effreats of green wax, and delivers them in to the remembrancer of the treafury, to have execution done upon them for the king. See Nihil.
Clfrre of the Orduance. Sce Ordnance:
Cifark of the Outlawries, an ufficer of the common pleas, and deputy to the attorney-general, for making cut all writs of cofias utlegatum after outlawry, to which there mult be the king's attorney's name.

ClfRR of the Paper-office, an officer belonging to the king's bench, whofe bufnefs is to make up the paperbooks of fecial pleadings in that court.

Clfan of the Peace, an officer belonging to the eerfions of the peace, whofe bufinefs is to read indictenents, inrol the proceedings, and draw the procefs: lie likewife certifies into the king's berch tranferipts of indictments, outlawrics, attoinders, and convictions had before the juftices of peace, within the time limited by ftatute, muder a certain perialty. 'lhis office is in the gift of the cuflos rotulorm, and may be enceuted by deputy.

Ciars of the Palls, an wefer that blongs to the cro
Clerk. chequar, whofe bulimis is to chter every wher's bill imen a parchment-roll called polis rectomains and to muke another roll of payments collel pelius cratum.

Corki of the foty Bug, an officer of the cont of chamcery, wheof there an three, the matter of the rolls being the chief: thair butinefs is to record the return of all inquifitions out of every fhire ; to make om patents of cuftomers, gugers, comptrollics, \&ce; liberates upon extent of thatutes-dhaple; conge liclires for binops; fummons of the mobility, elergy, and burgeffis to parliament : and commifions directed to knights and others of evcry thire, for afieffug fublidies and taxes.
Chank of the Pith, an officer of the exchuquer, who lasing the accounts of all debts due to the king, deliyered ont of the remembrancors's office, charges them in a great oll folded up like a pipe. He writes out warrants to ihereffs, to levy the faid debts on the grods and chattels of the debtors; and if they have no goods, them he draws them down to the traturer's rememinamecr to white efreats againt their lands.

Cifgek of the Pleas, an officer of the exchequer, in whofe office all the officers of the court, having fyecin! privibes, ought to fue or be fued in aray attion. In this oflice alio actions at law may be profecuted by other perfons, bint the plaintiff ought to be teraant or uether to the king, or fome way accountable to him. 'Thee under clerls are attorneys in all fuis.

CIfrass of the Priay-feal, four officers that attend the lord privy feal, for writing and making ont all thinge that are fent by warrant from the fignct to the privy fial, aud tu be pafled the great feal; and liknwife to make out privy fals, upon lpecial occatious of his majeity's affare, as for loan of money, or the like.

Ctras of the Rolls, an officer of the chancery, whofe butinefs is to make fearches after, and copies of decds, officers, \& e.

CLFRE of the Sigme, an officer contimually attending upon his majeity's principal fecretary, who las the cuHody of the privy fignet, as well for fealing the king's private letters as thofe grants which pats the king's hand by bill ligned. There are fous of thafe officers who have their diet at the fecretary's table.
Six Clekis, officers in chancery nest in degree below the twelve maters, whofe bufinefs is to inrol commiffions, parduns, patents, warrants, \&ec, which pafs the great feal. 'They were anciently chrici, and forfeited their places if they married. Thefe are alfo atterncys for parties in fuits depending in the court of chancery.

CLERK of the Traafury, an officer belonging to the court of common pleas, who has the charge of keeping the records of the court, makes oat all records of nijiz prias, and likewife all exenplifications of records being in the tiealury. He has the fees due for all fearches; and has under bim an under keeper, who ahways keeps one hey of the treafury-door.

Clekr of the Wharraits, an uffeer of the common pleas, whote bulinefs is to cuter all warrants of attorney for plaintifis and defurdants in fuit; and to in. rol deeds of bargain and fale, that are acknowledged in court, or before a juige. His office is likewife to eftreat intu the exclequer all ifines, hines, eftreats, and amercements.

## C I．E

Cler＇e amorements，which grow due to the crown in that navigator，was bied up in the navy from his you：n，
and was preiont in ferer．l adions during the war of 1755．In that betwen the Bellona and Coungenx he was in great danger ；for having been Aationed in the mizen－top on board the former，the mafl was car－ ried overboard by a thot，and he fell inao the fa alomg with it：but，however，was taken up withont ha－ ving received any injary．When Commodele Byron made his frit rojare round the word，Mr Clerke for－ ved on board his fhip in quality of a midhipman；and was afterwarts on the American fation．In the year 1768 ，he fatitd round the world a fecond time in the Endeareur，on board of which he ferwed in the Aation of mafter＇s mate；but，during the voyage，fucceoded to a lieutenancy．He retumed in $\mathbf{1 7 5 5}$ ，and was fron after appointce mafter and commander．When Cap－ tain Cook undertook his laft royage，Mr Clerke was appointed Captain of the Difcovery；and incontegrence of the death of Captain Cook，naturally fncceeded to the fupreme command．He did mot，hoverer，long erjoy his new digaity．Before his departure from Engiand，he had manifert fymptoms of a con，fumption． Of this difeate lie lingered during the whole of the voy－ age；and his long refodence in the cold northern di－ mates cut off all hopes of recovery：but though fentible that the only chance le had of prolonging his life was by a．Speedy retura to a warmer climate，his attention to his duty wa fo great，that he perfocered in fearch of a paftage between the Aliatic and American continents until crery one of the officers was of opinion that it was impracticalle．He bote his difemper with great frmmefs and equanmity，retaining a good flow of $\int_{\text {pi－}}$ rits to the laft；and died on the 22.1 of Angult 177 s ， in the $3^{\text {tith }}$ yar of his age，the Thip being then within view of the coall or Kamefiatka．

Clfare＇s Ifidue＇lics on the wellem lide of the Ame－ rican continent，in N．Lat．G3．15．and E．Lons． 190．30．It was diforered bs Captain Cook in liis laft vojace，but a landing could net be efiteted．At a ditance it appeared to be of confiderable exicnt，a：id to have feveral hills conncled with the luw gromend in fuch a mamel as to makt it louk like a group of in meis． Near its eatton extremity is a lithe illand remakable for having three devated recks upon it．Both the large and imali inand are uniwhaited．

CLERONSNCX，a kind of divination peformed by the throwing of dice，or little bones；and obfer． wing the points，on marles，turbed ap．＇The word comes from \％arir，＂lut，＂and cusura，＂divination．＂ At Bura，a city of Achaia，was a templ：and ce－ lubated orncle ot Hercules；wiore fuch as conafultud the onads，after paying to the iolol，thew fond dies， the points whereof being well fammo子 by the priet， he vas fuppofed to draw an aniwer from them．

Bomething of this kind feems to have been practi－ fed with resate to Jooah．

CLERVAL，a town of France，in the Frande Comte，fented on the river Doux，blonaing to the honte of Wirtemburgh，but depends on the crowa of France．K．Long $5.57 . \mathrm{N}$. Lat．+6.35.

CLETVAUX，one of the mod celebrated and fant abous of France，in Chanparae，five mile；foom Dar－ fur－Aube，and feated in a milley furromkl with wood． and motertains．It is the ehtef of the Cibucian or－ der．Heme $i$ ，the famo：s Tun of St Demard，which will hod 800 tuns of winc．Near the abtery is a fins．l town．

CLESIDLS，a Greck painter，whont 2－6 years before Chrilt，in the reign of Aritiochas I．İe re－ benged the injuries le had reccied fiom queen Stra－ tonice by reprifoting her in the ams of a filkermano Huwever indecont the painter might reprefent the queen，fhe was drawn with fuch perfonal beatuty，that fie prefored the piece and lberally rewaded the ar tilt．

CLETHRA，in botan：A gentis of the mono－ gymia order，betoaging to the decandria eltin of plants； and in the natural method ranking under the 18 th or－ der，Dicorias．The calyx is quingupattite：the pe－ tals five：the figma trifid；the capfule trilocular and three－valuse．There is but one fpecies，riv．the Alni－ folia．This is a native of I irsinia and Corolina，where it grows in mont places，and near the fole of riwn＇．ts， rifing near eight or cen feet high．＇Ilde haves are haped bike thofe of the aker－tiec，but longer；thele anc placel aitemately upon the branches：the flowers are producted in clofe fiptes at the catremities of the banclies：they are whit，compoled of five petals，and have ten famina is each，neariy of the fame leagth with the petals．＇This is hardy enourgh to bear the open air in Butain，and is one of the molt beatiful flowering lanbe．Its feafon is commonly about the begiminr of july；and，if the dealun is not very hot， there will be part of the fipes in beaty till the mis－ de of September．This thrub will tarice bet in moit land，and requires a ineltered heuation，where it may be defonded from frong wiads，whing frequent－ ly break off the branches where they are too mueh expoicd to their volarice．It is proparated by lavers， but they are generally two years before they take ront． It may aifo be propagatud by fuckers，which are fent out from the roots：if thele are carcfully taken off with fibres in the autumn，and plantel in a mariery． bed，they will be frong enough in two years to tranf－ plant when they are to remain．

CLEVELAND，a diflriet in the nortl ridiner of Tuk－
evind Yorkhire in England, from whence the noble family of Fitzroy took the title of Duke, but which is now extinct.
Clereband (John), an Ea lim poet of forae emi nence in his time, who during the civil war under Chates I. engured as a litemary clampion in the royal caufe aganl the parliamentarians. Ho died in 165 , ant was mueh extulled by his parts. His works, which confitt of poemi, charaeters, orations, epiltes, Ec. were printed in octavo in 1677.
CLEVES, the duchy of, a prorince of the circle of Welphalia, in Germany. It is divided into two parts by the Rhine, and is about 40 miles in length from eait to weft, and 20 in breadth from north to fouth. It is a fine agrecable country, and pretty populous. The towns are, Cleves the capital, Calcar Gennet, Santen, Orfoy, Bureek, and Greit. Thefe lie on the left fide the river. On the right, Duytburgh, Wife, Rees, and Emmerick. There have ben great contefts about this duchy, but it now belongs to the king of Pruffia.

Cleves, a city of Germany, in the duchy of Cleves, of which it is the capital. It flands upon a pleafant hill, about three miles from the Rline, with which it communicates, by means of a canal which is large enough for great barges. The caftle flands upon a mountain, and, though old, is very agrecable. Calvinills Lutherans, and Roman Catholics, are all tolerated in tinis city. E. Long. 5. 36. N. Lat. 51.40 .

CLIENT, amorg the Romans, a citizen who put himfelf under the protection of fome great man, who in refpeet of that relation was called patron.

This patron afilled his elient with his protection, interelt, and goods ; and the clierit gave his vote for liis patron, when he fought any uffiee fur himfelf or his friencs. Clients owed refpect to their patrons, as thefe owed then their protection.

The right of patronage was appointed by Romulus, to unite the rich and poor together, in fuch a manner as that one might live without ematempt, and the other without envy ; but the condition of a client, in courfe of time, became little elfe but a moderate תavery.
Client is now ufed fur a party in a law-fuit, who has turned over his caufe into the hands of a comincllor or fulicitor.

CLIFFORTIA, in botany: A genus of the polyandria order, belonging to the dicecia elafs of plants; and in the natural method ranking under the 3 th order, Tricocca. The male ealyx is triplyyllous; no corolla; the llamina near 30 in number; the femake caly $x$ is triphyllous, fuperior to the receptacle of the fruit; no corolla; two flyles; with a bilocular capfillo; and a fingle feed. There are three fipecies, all of them natives of Africa; fo require to be kept in a green-houfe when cultivated in this country. Their flowers make no great appearanee; but the plants thewiflves are very ornamental evergreens. They grow to the height of four or five feet; and are propagated by cuttings, which muft be young fhoots of five or fix inches length. If thefe are planted in pots in fpring or fummer, and plunged in a hot bed, they will readily take rout. They nult Vol: V, Part I.
be watered plenifuly in furmer, but very faringly Climate io in winter.

CLIMACTERIC, among pheficians, (from climar. -ras tr, "a lader"), a crit cal yuar in a purnes's life.

Accordiag tw fome, this is every fercoth year; lute others allow orily thofe years produced by mbinlying 7 lay the odd number 3. 5, 7, and 2, to be elimacte ical. Thefe yeurs, they fay, tring with them fome remarkable change with ruficet to herlth, 1 fe , or for tune: Lhe grand climactuic is the 63d year ; but fome, making two, add to this the sitt : the when remarkillle climacierics are the 7 th, 21 星, 35 th, 4 thin, and $; 6$ th.

CLIMATE, or Climf, in seography, a part of the furface of the earth, bounded by two circles parallel to the equitor; and of fuch a breadth, as that the lonscet day in the parallel nearer the pole exceeds the longen day in that next the cquator by fome certain fpaces; viz. half an hour. The worl comes from the Greek ras, ece, "inclinamentum," an inclination.

The leginning of the climate, is a parathe circle wherein the day is the fhorteft. The end of the clinate, is that wherein the day is the longet. The climates therefore are reckoned from the cquator to the pole; and are $f$, many bands, or zones, terminated by lines parallel to the cquator: though, in Itriatnefs, there are feveral climates in the breadth of one zone. Each climate only differs from its contiguous ones, in that the longell day in fummer is longer or hoorter by half an hour in the one place than in the other. As the climates conmence from the equator, the firt climate at its beginning las its longell day precifely 12 hours long; at its end, 12 hours and an lialf: the feeond, which begins where the firt ends, viz. at 12 hours and an half, ends at 13 hours; and fo of the relt, as far as the polar circles, where, what the geographers call bou-climates terminate, and noonthclimates commence. As an hour-climate is a fpace comprifed between two parallels of the equator, in the firl of which the longell day exceeds that in the fatter by half an hour; fo the month-elimate is a fpace terminated between two circles paralled to the polar eircies, whofe longelt day is longer or fhorter than that of its contiguous one by a month or 30 days.

The ancients, who confined the cimates to what they imagined the habitable parts of the earth, only allowed of feven. The firfly they made to pafs through Meroe, the fecond through Siema, the third through Alexandria, the fourth through Rhodes, the fifth through Rome, the fixth through Pontus, and the feventh through the pmonth of the Bory Ahenes. The moderns, who have failed further townd the poles, make 30 elimates on each fide; and, in tegard the obliquity of the fphere makes a little difference in the length of the longell day, inftrad of half an hour, fone of them only make the differcuce of climates a quarter.

Vulgarly the term climate is beftowed on any comtry or region differing from another either in refput of the feafons, the guality of the foil, or cren the manncrs of the inkabitants; without any $r$ gard to the length of the longet day. Abulfeda, an Arabic author, ditinguifles the firt kind of climates by

Climax, or Gradation, in rhetoric, a figure wherein the word or expreffion which ends the firlt menber of a perica begins the fecond, and fo on; fo that every member will make a diftinct fentence, taking its rife from the next foregoing, till the argument and period be beautifully finifhed; as in the following gradation of Dr Tillotfon: "After we have practifed good actions a while, they become cafy ; and when they are eafy, we begin to take pleafure in them; and when they plafe us, we do them frequently ; and by frequency of acts, a thing grows into a habit; and confirmed habit is a kind of fecond nature; and fo far as any thing is natural, fo far it is neceffary; and we can hardly do ocherwife; nay, we do it many times when we do not think of it."

CLINCH, in the fea-language, that part of a cable which is bended about the ring of the anchor, and then feized or made falt.

CLJNCHING, in the fea-language, a kind of fight caulking ufed at fea, in a profpect of foul weather, about the pofts: it confifts in driving a little oakum into their feams, to prevent the water coming in at them.

CLINIC, a term applied by the ancint church-hinorians to thofe who received baptifm on their deathbed.

Cutntc Itcdicine, was particularly ufed for the method of vifiting and treating fick perfons in bed, for the more cxact difcovery of all the fymptoms of their difeafe.
CLINIAS, a Pythagorean philofopher, and mufician, in the 65th Olynpiad. He was wont to affuage his paffion, being very choleric, by his lyre.
CLINOPODIUM, Field-basil: A genus of the gymnofpermia order, belonging to the didynamia clafs of plants; and in the natural method ranking under the + it order, Apcrifoliax. The involucrum confitts of many finall brittles under the verticillus or whirl of Aowers. There are fix fpecies, all of them herbaceous phants, growing from one to two feet high. They are remarkable only for their flrong odour, being Somewhat between marjoran and bafil.

CLIO, in payan mythology, the firt of the mufes, daugher of Jupiter and Muemofyne. She prefided wer hiftury. She is reprefented crowned with laurcls, Luderg ta one hand a trumper, and a book in the othes. Sonstines the holds a plectrum or quill with
a lute. Her name fignifies honour and reputation, xasos, gloria; and it was her office faithfully to record the actions of brave and illuttrious heroes. She had Hyacintha by Pierius, fon of Magnes.
Cloo', in zoology, a genus of infects belonging to
Plate the order of vermes mollufca. The body is oblong and exxxvim fitted for fwimming; and it has two membranaceous wings placed oppofite to each other. The fpecies are three, principally diftinguithed by the ऑhape of their vagina, and are all natives of the ocean.
CLIPEUS, in natural hiflory, a name given to the flat depreffed centronix, from their refembling a hield. See Centronia.
CLISTHENES, a famous Athenian magiftrate, the author of the mode of banihing ambitions citizens by oftracifm, or writing their names upon a hell: the iutention was patriotic, but it was abufed like all other human inflitutions; fome of the worthieft citizens of Athens being thus exiled. He died 510 years before Chrift.
CLITOMACFIUS, the philofopher, flomrifhed about 140 years before Chift. He was born at Carthage; quitted his country at 40 years of age; and went to Athens, where he became the difciple and fucceffor of Carneades. He compofed many books, bur they are all loft.
CLITORIA, in botany: A genus of the decandria order, belonging to the diadelphia clafs of plants; and in the natural method ranking under the 32 d order, Papilionacea. The corolla is fupine, or turned down-fide up; with the vexillum or flag-petal very large, patent, and almoft covering the alx or wing-petals. There are four fpecies, all of them herbaceous perennials, or annuals, of the kidney-bean kind, growing naturally in both the Indics. The falk is climbing, flender, and of the height of a man. The leaves are winged, placed alteriately, and confift of two, three, or five pair of lobes, terminated by an odd one. The flowers, which are elegant, ftand fingly, each on its proper foot-talk. They are very large, and generally of a decp blue, but fometintes of a white colour. From the fruit of this plant is dillilled an eye-water. The beans reduced to powder, and taken in broth, to the quantity of two drachms, prove a gentle purge; and Grimmius remarks, in his Labor Ceyl. that the powder of the dried beans, being mixed with the milk of the cocoa nut, or with broth, and adminiltered is
quantity from one to three drachme, not only mitigates colic pains, but is very ufeful, and mueh ufed in Ceylon, in all diforders of the fomach and bowels. Thefe plants are propagated by feeds; and, in this country, muft be kept continually in a flove.

CLITORIS, in anatomy, is a part of the external pudenda, fituated at the angle which the nympheform with each other. Like the penis it has an erection, and it is thought to be the principal feat of venereal pleafure. 'The chitoris is of different fizes in different women; but in general it is fmall, and covered with the labia. The preternaturally enlarged clitoris is what conflitutes an hermaphrodite. When the clitoris is too large, it may be fo extirpated as to remove the unneceffary part; but this requires much care, for a farther extirpation fubjects the patient to an involumtary difcharge of urine.

CLITUMNUS, (ane. geog.), a river of Umbria, on this fide the Apennine. Aecording to Pliny, it was a fountain confifting of feveral veins, fituated between Hifpellum and Spoletium; which foon after fivelled into a very large and navigable river, running from eaft to weft into the Tinia, and both together into the Tiber. A river famous for its milkwhite flocks and herds, (Virgil.) The god of the river was called Clitumnus.

CLITUS, brother to Alexander the Great's nurfe, followed that prince in his conquelts, and faved his life by eutting off the hand of Rofaces, which held an ax lifted up to kill him at the paffage of the Granicus. Alexander, who had a great regard for him, fome time after invited lim to fupper ; when Clitus, at the end of the repaft, being heated with wine, diminifhed the exploits of that prince, in order to magnify thofe of Philip his father. This fo enraged Alexander, that he killed him with his own hand: but he was afterwards fo afflicted at it, that he attempted his own life.

CLIVE (Robert) lord, fon of Richard Clive, Efq; of Styche near Drayton in Salop, was born in 1725. Toward the clofe of the war in 174 r , he was fent as a writer in the Eaft India fervice to Madras ; but being fonder of the cainp than the compting-houfe, he foon availed himfelf of an opportunity to exchange his pen for a pair of colours. He firt diftinguifhed himfelf at the fiege of Pondicherry in $174^{8}$; acted under major Laurence at the taking of Devi Cotta in Tanjore, who wrote of his military talents in high cerms; commanded a fmall party for the taking of Areot, and afterward defended that place againft the French; and performed many other exploits, which, confidering the remotenefs of the fecne of action, would require a long detail to render fufficiently intelligible. He was, however, in brief, looked upon and acknowledged as the man who firlt ronfed his countrymen to fpirited action, and raifed their reputation in the Eaft: fo that when he eame over to England in 1753 , he was prefented, by the court of directors, with a rich fword fet with diamonds, as an acknowledgment of paft, and an incitement to future, fervices. Captain Clive returned to India in 1755, as governor of fort St David, with the rank of lieutenantcolonel in the king's troops; when as commander of the company's troops, he, in conjunction with admiral

Watfon, reduced Angria the pirate, and became maIter of Geria, his eapital, with all his accumulated treafure. On the lofs of Calcutta and the well knowr. harbarity of the foubah Surajah Dowla, they failed to Bengal; where they took fort William, in January 1757 ; and colonel Clive defeating the foubah's army foon after, accelerated a peace. Surajah Dowla's perfidy, however, foon produced frefh holtilities, which ended in his rain ; he being totally defeated by colonel Clive at the famous battle of Plafley. The next day the conqueror entered Muxadabad in triumph; and placed Jaffier Ally Cawn, one of the principal genen rals, on the throne : the depofed fouhah was foon after taken, and privately put to death by Jaffier's fon. Admiral Watfon died at Calcutta ; but colonel Clive commanded in Bengal the two fueceeding years: he was honoured by the Mogul with the dignity of an Ommah of the empire; and was rewarded by the new foubah with a grant of lands, or a jaghire, producing 27,0001. a-year. In 1760, he returned to Englanc. where he received the unanimous thanks of the company, was elected member of parliament for Shrewibury, and was raifed to an Irifh peerage by the title of Lord Clive Baron of Plaffey. In 1764 , freth ditur. bances taking place in Bengal, lord Clive was efteenncd the only man qualified to fettle them, and was accordingly again appointed to that prefideney; after being honoured with the order of the Bath, and with the rank of major-general. When he arrived in India, he exceeded the moft fanguine expectation, in reftoring tranquillity to the province without thriking a blow, and fixed the higheft ideas of the Britith power in the minds of the natives. He returned home in 1767; and, in 1772, when a parliamentary inquiry into the conduct of the Ealt India company was agitated, he entered into an able juftitication of himfelf in a mafterly fpeech in the houfe of com-1 mons. He died fudhenly towards the clofe of the year 1774

CLOACA, in antiquity, the common fewers of Rome, to carry off the dirt and foil of the city into the Tiber; juftly reckoned among the grard works of the Romans. The firlt common fewer, ealled Cloaca Maxima, was built by Tarquinius, fome fay Prifeus, others Superbus, of huge blocks of ftone joined together without any cement, in the manner of the edifices of thofe carly times; confifting of three rows of arclies one above another, which at length conjoin and unite together; meafuring in the clear is palms in height, and as many in width. Under thefe arches they rowed in boats; which made Pliay fay that the city was fufpended in air, and that they failed beneath the houfes. Under thefe arches alfo were ways through which earts loaded with hay could P afs with eafe. It began in the Forum Romanom ; meafured 300 paces in length; and empticd it lelf between the temple of Veita and the Pons Senatorius. There were as many principal fewers as there were bills. Pliny concludes their firmnefs and ftrength from their ttanding for io many ages the fhocks of earthquake, the fall of houfes, and the valt loads and weighis moved over them.
CL.OACINA, the goddefs of j kes and common fewers, among the Romans.

ClOCK.

## $\mathrm{C} 1.0 \quad\left[\begin{array}{lll}68 & ] & \mathrm{C} \\ \mathrm{L} & \mathrm{O}\end{array}\right.$

Chack. CLOCK, a machine confructed in fuch a manner, and regulated fo by the uni!orm motion of a pendulum ( A ), as to neafure tinc, and all its fubdivitions, with great exacturs.

The invention of elocks with whecls is referred to Pacificus, archacacon of Verona, who lived in the time of Lotham in of of Louis the D bommar, on the credit of an epicaph quoted by Ughelli, asd borrowed by him from lanvinius. 'iltey were at fult called nocturnal dials, to ditinguith them from fun-dials, which thowed the hour by the fun's fladow. Others afcribe the invention in Buethius, about the year 510. Mr Derham makes clock-work of a much older tandian; and ranks Acciur redes's fphere mentioned by Clasdian, and that if Pofid nirs mentioned by Cicero, among the machines of this kind: not that either their form or ufe were the fame with thofe of ours, but tha: they had their motion from fume hidden weights or fprings, with wheels, or pullies, or fome fuch clockwork principle. But be this as it will, it is certain the art of making tocks, fuch as are now in ufe, wa, either lirt invented, or at leaft retrieved, in Germany, atout 200 years ago. The water clucks, or clepfydre, and fin-dials, have both a much better claim to anliçui.j. The French annals mention one of the former kind fent by Aaron, king of Perlia, to Charlemagne, about the year 807, which feemed to bear fome tefemblance to the modern clocks: it was of brafs, and howed the hours by twelve little balls of the fame metal, which fell at the end of each hour, and in falling truck a bell and made it found. There were alfo figures of 12 cavaliers, which at the end of cach hour came forth at certain apertures or winduws in the fide of the clock, and fhut them again, \&e.

The invention of pendulum-clocks is owing to the happy indultry of the lult age : the honour of it is difputed by Huygens and Galileo. The former, who hits written a volume on the fubject, dectares it was firt put in practice in the year 1657, and the deferip. tion thered puinted in 1658 . Bucher, de Nava Temstris dimetiendi Thucria, anno 1680, contends for Galiteo; and relates, though at fecond-hand, the whole hilory of the invention; adding, that one Trefler, chock-maker to the then father of the Grand Duke of 'Iufeany, made the frit pendulum-chek at Florence, by diredrion of Galito Galilei; a pattem of which was brought into Holland 'The Acadeny de'l Cimento fay exprefoly, that the application of the pendulum to the movement of a clock was firt propoled by Galileo, and hift put in practice by his fon Vincenzu Gailei, in $16+9$. Be the inventor who he will, it is certain the invention never fourifhed zill it came into Hugens's hands, who infilts on it, that if ever Galileo thought of fuch a thines, he never brought it to any degree of perfection. The firlt pendulumclock made in England was in the ycar 1062 , by Mr Fromantil a Dutchman.

Amory the mudern clocks, thofe of Strafburg and Lyons are very eminent for the richnefs of their furniture, and the variety of their motions and heures. In the firt, a cock claps his wings, and proclaims the
hour ; the angel opens a donr, and falutes the virgin; and the Holy Spirit defeends on her. Sec. In the fecond, two horfemen encounter, and beat the hour on each other: a door opens, and there appears on the theatre the Virgin, with Jclus Chrilt in fer arms; the Magi, with their retinus, marching in order, and prelenting their gifts; two trampeters fonding all the whle to proclim the proctfon. There, however, are excelled by two lately made by En lith artids, and intended as a prefent from the Eelt India company to the Linperor of China. The clocks we \{peak of are in the form of chanints, in which are fliced, in a fine antitude, a lady, leaning har sight hand upon a part of the elariot, under wheh is a clock of emrious work. manthip, little larger than a fhiling, that trikes and repeats, and gree eight days. Upon her finger fits a bird fumely modelled, and fot with diamonds and rubies, with its wings expanded in a flying pofture, and actually fluters for a coubiderable time on touching a diamend button below it ; the budy of the bird (which contains pat of the wheds that in a monner give life to it) is not the hignefs of the toth part of an inch. The lady holds in her left hand a golel tube not much thicher than a large pin, or the top of which is a fmal! round tox, to which a cirentar ornment fer with diamonds rot larger than a ixpence is fised, which goes round near three hours in a conftant regular motion. Over the lady's head, fupported by a fmall firted pillar no bigger then a quill, is a double umbrela, under tie largett of whicha bell is fixed at a confiderable diflarece from the cluck, and feems ro have no connection with it; but from which a communication is fecretly conveyed to a hammer, thas regularly drikes the hour, and repeats the fame at pieafure, by tunching a diamoad tutton fixed to the cluck below. At the feet of the lady is a gold dos; before which from the point of the chariot are wo birds fised on fpiral fprings; the wings and feathers of which are fet with itones of various colours, and appear as if flying away with the chaniot, whikh, from another feerct motion, is contrived to ma in a flaighe, circular, or any other direction ; a boy that lay hud of the charict behind, feems alfo to puh it firwad. Above the marella are flowura and ursiament, of precinus lones; and it terminates with a flying dagon fet in the tane manner. The Whole is of gold, molt curioully execnted, and embellifhed with rubies and pearls.

Of the ganeval Mechani/m of $C_{\text {Locks, }}$ and bow they meafure Time. The firt figure of Pate CXXXIX. is a profile of a clock: $P$ is a weight that is fulpended by a rope that winds about the cylinder or barrel $C$, which is fuxed upon the axis $a$ a; the pivots $4 b$ go into holes made in the plates TS, T'S, in which they turn freely: Thefe plates are made of brals or iron, and are connceted by means of four pillars ZZ; and the whole tugether is called the frame.

The weight $P$, if not reflrained, would neceffarily surn the barel C with an uniform accterated motion, in the fame manner as if the weight was falling freely from a lieight. But the barrel is furnithed witha ratchet whed K K , the righe file of whofe teeth trikes againt the chick, which is fixed with a forew to the wheel

## C L O

Clock. wheel DD, as reprefented in fig. 2. fo that the action of the weight is commonicated to the wheet D D, the teeth of which act upon the tecth of the fmall whecl d which turns upon the pivotsec. The commanication or action of one wheel with another is catled the pitching; a fmall whed like $d$ is called a pinion, and its teeth are haves of the pinion. Several things are requibite to form a good pitching, the alvantares of which are obvious in all machinery where tecth and piniuns are employed. The teethand pinion leaves thould be of a proper thape, and perfictly equal among themertves: the lize alfo of the pinion fhomld be of a jult proportion to the whecel acting into it ; aud its place mult be at a certain diflance from the wheel, beyond or within which it will make a bad pitchine.

The wheel EE is fixed upon the axis of the pinion $d$; and the motion conmunicated to the wheel D D by the weight is tranfmitted to the pinion $d$, confequently to the wheel E E , as likenife to the pinion $e$ and wheel F F, which moves the pinion $f$, upon the axis of which the crown or balance whet G H is fixed. The pivots of the pinion $f$ play in holes of the plates L M, which are fixed horizuntally to the platez TS. In a word, the mation begun by the weight is tranimitted from the wheel G H to the palettes I K, and by means of the fonk UX rivetted on the palettes communicates motion to the penduhm A B , which is fulpended upon the hook A. The pendulum AB deleribes, round the print A , an are of a cincle alternately going amd returning. If then the pendulum be once put in motion by a puth of the hand, the weight of the pendulum at 13 will make it return upon itfelf, and it will contimue to go alternately backward and forward till the refilance of the air upon the perndalum, and the friction at the point of fuppenion at $A$, deitroys the orizinal imprefled force. But as, at every vibration of the pendulum, the teeth of the balancewheel G H act fo uoon the palettes 1 K (the pivots upon the axis of thefe patettes play in two holes of the potences $t$ ), that after one tooth $H$ has communicated motion to the palette K , that wooth cfcapes; then the oppolite tooth G adis upon tere palette 1 , dud eficapes in the fame manner; and thens each tooth of the wheel efcapes the palettes I K , after having communicated their motion to the palettes in fuch a mamer that the pendulum, inflead of being fupt, continues so move.

The wheel E E revolves in an hour; the pivot $c$ of this wheel paffes through the plate, and is contimed to $r$; upon the pivot is a wheel N N with a long focket faftened in the centre; upon the extetnity of this focket $r$ the minute-hand is fixed. The wheel $\mathrm{N} N$ acis upon the wheel O ; the pinion of which $p$ acts upon the wheel $g s$, fixed upon a focket which turns along with the wheel $N$. This wheel $g g$ makes its ricyolution in 12 hours, upon the focket of which the hour-hand is fixed.

From the above defcription it is eafy to fee, i. That th.e weight $p$ turns all the wheels, and at the fame time continues the motion of the pendulum. 2. That the quicknefs of the mation of the wheels is determined by that of the pendulum. 3. That the wheels point out the parts of time divided by the unifornm motion of the pendulum.

When the cord unon which the weight is fufpend.

691 C C
ed is entirely run down from of the barrel, it is wound
Cinck. up agam by means of a key, which grees on the fquare $\underbrace{-a}$. cod of the arbor at O, by turning it in a coneraty direction from that in which the weight defcends. For this purpofe, the inclined fide of the teeth of the whed $R$ (bir. 2.) removes the click $C$, fo that the ratchet. whed $R$ turns while the wheed I) is at relt; but as foon as the cord is wround up, the click falls in betwoen the teeth of the wheel 1), and the right lide of the teeth again act upon the end of the click, which obliges the wheel D to turn along with the barrel; and the fiping A keeps the click between the teth of the ratchet-wheel $R$.

We thall now explain how time is meafured by the motion of the pendulum; and how the wheel E, upon the axis of which the minute hand is fixed, makes but one precife revolution in an hour. The vibrations of a pendulum are performed in a thorter or longer time in proportion to the length of the pendulumstielf. A pendulum of 3 feet $8:$ French lines in length, makes 3600 vibrations in an hour: i.e. each vibration is performed in a fecond of time, and for that reafua it is called a fecond feralulum. Dut a pendalam of 9 inches $2 \frac{1}{f}$ French lines makes 7200 vibrations in an hour, or two vibrations in a fecond of time, and is called a balf fecond perdulum. Hence, in conttucting a wheed whofe revolution mult be performed in a given time, the time of the vibrations of the pendulum which regulates its motion mull be confidered. Suppoling, then, that the pendulum $A B$ makes 72 :0 vibatoons in an hour, le us confider how the whed E fhall take up an hour in making one revolution. This emtirely depends on the number of teeth in the wheels and pinions. If the balance-whecl confits of 30 teeth, it will turn oace in the time that the penduJum makes 60 vibrations: for at every turn of the wherl, the fame tooth afts once on the palette I, and once on the paletre K , which vecations iwo feparate vibations in the pendalum; and the wheel having 30 teeth, it occafons twice 30 , or 60 vihrations. Confequently, this whel mult perform 120 revolutions in an hour; becanfe 60 vibrations, which it ocenfrons at every revolution, are contained 120 times in 7200, the number of vibrations performed by the pendulun in an hour. Nuw, in arder to deternine the number of terth for the whels E F , and their pinions ef, it mult be remarked, that one revolntion of the wheel E mut turn the pirnionc as many times as the number of tecth in the pinion is contained in the number of teeth in the whet. Thas, if the whee $\mathrm{E}_{\mathrm{t}}$ contains 72 teeth, and the yinion 6 , the pinion will make 12 revolurions in the time that the wheel makes 1 ; for each tooth of the whecl drives forward a tooth of the pinion, and when che 6 teeth of the pinion are moved, a complete revolution is performed; but the wheel E has by that time only advanced 6 tecth, and has till 66 to advance before its revolution be completed, which will oceafon is more revilutions of the pinion. For the fame reafon, the whed If lyvina 60 teeth, and the piuion $f 6$, the ponion wild make 10 revolutions while the whed performs one. Now, the whed If being turned by the pimione, makes I2 revolutions for one of the whed E; and the pinion $f$ makes io revolutions for one of the whed F ; confequently, the pinion $f$ performs 10 times 12 or

## C L O [ 70 ] C L O

rixik. 120 revolutions in the time the whed E performs one. But the wheel $G$, which is turned by the pinion $f$, occations 60 vibations in the pendulum each time it turns round; confequently the wheel $G$ occations 60 times 120 or 7200 vibrations of the pendulum whiie the wheel E performs one revolution; but 7200 is the number of vibrations made by the penduhum in an hour, and confequently the wheel E performs but one revolution in an bour ; and fo of the ref.

From this reafoning, it is ealy to difeover how a clock may be made to go for any length of time without being wound $u_{p}: 1$. By increafing the ntunber of tecth in the wheels; 2. By diminihing the number of teeth in the pinions; 3. By increafing the length of the cord that fufpends the weight; 4. By increafing the length of the pendulum ; and, 5. By adding to the number of wheels and pinions. Bot, in proportion as the time is augmented, if the weight continues the fame, the foree which it comnunicates to the laft wheel GH will be diminifhed.

It only remains to take notice of the number of teeth in the wheels which turn the hour and minute hands.

The wheel E performs one revolution in an hour ; the wheel $\mathrm{N} N$, which is turned by the axis of the wheel $E$, mult likewife make only one revolution in the fame time; and the minute-hand is fixed to the focket of this wheel. The wheel $N$ has 30 teeth, and acts upon the wheel $O$, which has likewife 30 teeth, and the fame diameter; confequently the wheel $O$ takes one hour to a revolution: now the wheel $O$ carries the pinion $p$, which has 6 teeth, and which acts upon the wheel $q q$ of 72 teeth; confequently the pinion $p$ makes 12 revolutions while the wheel $q q$ makes one, and of courfe the wheel $q 7$ takes 12 hours to one revolution; and upon the focket of this wheel the hour-hand is fixed. All that has been faid here concerning the revolutions of the wheels, EJc. is equally applicable to watches as to clocks.

The ingenious Dr Franklin has contrived a elock to Show the bours, minutes, and feconds, with only three wheels and two pirions in the whole movement. The dial-plate (fig. 3.) has the hours engraven upon it in fpiral fpaces along two diameters of a circle containing tour times 60 minutes. The index A goes round in four hours, and counts the minutes from any hour by which it bas paffed to the next following hour. The time, therefore, in the pofition of the index fhown in the figure is either $32 \frac{5}{2}$ minutes patt XII. III. or VIII.; and So in every other quarter of the circle it points to the number of minutes after the hours which the index laft left in its motion. The fimall hand $B$, in the arch at top, goes round once in a minute, and flows the feconds. The wheel-work of this clock may be feen in fig. 4. A is the firt or great wheel, containing I 60 teeth, and going round in four hours with the index $A$ in fig. 3 . let down by a hole on its axis. This wheel turns a pinion $B$ of ro leaves, which therefore goes round in a quarter of an hour. On the axis of this pinion is the wheel C of 120 teetli; which goes round in the fame time, and turns a pinion $D$ of eight laves round in a minute, with the focond hand $B$ of fig. 3. fixed on its axio, and alfo the common wheel $E$ of 30 teeth for moving a pendulum (oy paletes) that vibrates feconds, as in a comamon
clock. This clock is wound up by a line going over a pulley on the axis of the great whecl, like a common thirty hour clock. Nany of the ee admirably fimple machines have been con!trucled, which meafure time exceedingly well. It is fubject, however, to the in. convenience of requiring frequent winding by drawing up the weight, and likewife to fome uncertainty as to the particular hour fhown by the index A. Mr Fer. gufou has propoled to remedy thefe inconveniences by the following conitrution. In the dial-plate of his cluck (ig. 5.) there is an opening, $a b c d$, below the centre; through which appears part of a flat plate, on which the 12 hours, with their divifions into quarters, are engraved. This plate turns round in 12 hours; and the index A points out the true hour, \&c. B is the minute-hand, which goes round the large circle of 60 minutes whilt the plate $a b c d$ hifts its place one hour under the fixed index $A$. There is another opening, efg, through which the feconds are feen on a flat moveable ring at the extremity of a fleur-de-lis engraved on the dial-plate. A in fig. 6. is the great wheel of this clock, containing iza teeth, and turning round in 12 hours. The axis of this wheel bears the plate of hours, which may be moved by a pin paffing through fmall holes drilled in the plate, without affecting the wheel-work. The great wheel A turns a pinion B of ten leaves round in an hour, and carries the minute-hand B on its axis round the dialplate in the fame time. On this axis is a wheel C of 120 teeth, turning round a pinion D of fix leaves in three minutes; on the axis of which there is a wheel E of 90 teeth, that keeps a pendulum in motion, vibrating feconds by palettes, as in a common clock, when the pendulum-wheel has only 30 teeth, and gors round in a minute. In order to thow the feconds by this cleck, a thin plate muft be divided into chree times fixty, or 180 equal parts, and numbered 10,20 , 30, 40, 50, 60, three times fuceefively; and fixed on the fame axis with the wheel of go teeth, fo as to turn round near the back of the dial-plate; and thefe divifions will thow the feconds through the opening efyh, fig. 5. This ciock will go a weck without winding, and always fhow the precie hour; but this clock, as Mr Ferguion eandidiy acknowledges, has two difadrantages of which Dr Franklin's clock is free. When the minute-hand $B$ is adjutted, the hour-plate mut alfo be fet right by means of a pin ; and the fimallnefs of the teeth in the pendulum-wheel will carfe the penculum ball to deferibe but fmall ares in its vibra. tions; and therefore the momentum of the ball will be lefs, and the times of the vibrations will be more affected by any unequal impulfe of the pendulum-wheel on the palettes. Befides, the weight of the flat ring on which the feconds are engraved will load the pivots of the axis of the pendulum-wbeel with a great deal of friction, which ought by all poflible means to be avoid. ed. To remedy this inconvenience, the feeond plate might be omitted.

A clock fimilar to Dr Franklin's was made in Lincolnthire about the end of lait century or begiming of this; and is now in London in the polfeffon of a grandfon of the perfon who made it.

A clock, howing the apparent diurnal motions of the fun and moon, the age and phafes of the moon, with the time of her coming to the meridian, and the
times

## C L O

times of high and low water, by having only two wheels and a pinion added to the common movement, was contrived hy Mr Fergufon, and deferibed in his Select Exercifcs. 'The dial-plate of this clock (fig 7.) contains all the twenty four hours of the day and night. S is the fun, which ferves as an hour index, by going round the dial-plate in twenty-four hours; and $M$ is the moon, which goes round in twenty-fourhours fifty minutes and a half, the time of her going round in the heavens from one meridian to the fane meridian again. The fun is fixed to a circular plate (fee fig. 8.), and carried round by the motion of that plate on which the twenty four hours are engraven; and within them is a circle divided into twenty-nine and a half equal paits for the days of the moon's are, reckoning from new moon to new moon; and cach day fands direetly under the time, in the twenty-four hour circle of the moon's coming to the meridian; the XII under the fun fanding for neon, and the oppofite XII for midnight. The moon M is fixed to another circular plate (fig. 6.) of the fame diameter with that which carries the fun, part of which may be feen through the opening, over which the finall wires $r$ and $b$ pafs in the moon-plate. The wire $a$ fhows the moon's age and time of her coming to the meridian, and $l$ fhows the time of high-water for that day in the fun plate. The diftance of thefe wires anfwers to the difference of time between the monn's coming to the meridian and high-water at the place for which the clock is made. At London their difference is two hours and a half. Above the moon-plate there is a fixed plate N , "fupported by a wire A , fixed to it at one end and fixed at right angles into the dial-plate at the midnight XII. This plate may reprefent the earth, and the dot L London, or the place to which the clock is adapted. Around this plate there is an elliptic faade on the moon-plate, the highetl points of which are marked high-water, and the loweft low-water. As this plate turns round below the plate N , thefe points come fucceffively even with L , and ftand over it at the times when it is high or low water at the given place; which times are pointed by the fun S on the dial-glate; and the plate H above XII at noon rifes or falls with the tide. As the fun $S$ goes round the dial-phate in twent $y$-four hours, and the moon $M$ in twenty four hours fifty minutes and a half, it is plain that the moon makes only twenty-eight revolutions and a half, whilt the fur makes twenty-nine and a half; fo that it will be twerty-nine days and a half from conjunction to conjunction. And thus the wire a fhifts over one day of the moon's age on the funplate in twenty-four hours. The phafes of the moon for every day of her age may be feen through a round hole $n$ in the moon-plate: thus, at conjunction or new moon, the whole fpace feen through $m$ is black; at oppofition or full moon this fpace is white; at either quadrature half black and half white; and at every pofition the white part refembles the vifible part of the moon for cvery day of her age. The black flazed fpace $\mathrm{N} f \mathrm{~F} l$ (fig. 8.) on the fun-plate ferves for thefe appearances. N reprefents the new moon, $F$ the full moon, and $f$ her fret ourter, and $/$ her laft guarter, \&c. The wheel-work and tide-work of this clock are repeefented in fig. 9. A and $B$ are two wheels of equal diameters: A has fifty-feven teeth, with an hollow ayis that palfes through the dial of the clock, and carries
the fun-plate with the fun S. B has frity-nine teeth, with a folid fpindle for its axis, which turns within the
-r hollow axis of A , and carries the moon-plate with the moon M : both wheelo are turned round by a pinion C of nineteen leaves, and this pinion is turned roms by the common clock-work in eight hours; and a: nineteen is the third part of fify-feven, the wheet $A$ will go round in twenty four-hours; and the whet B in twenty-four hours fifty minutes and a half: fiftyfeven being to twenty-four as fifty-nine to iwenty-four hours fifty minutes and a half very nearly. On the back of the wheel B is fixed an clliptical ring D , vericie, in its revolution, raifes and lets down a lever EF, whore centre of motion isom a pin at F; and this, by the upright bar $G$, raifes and lets down the tide-plate If twice in the time of the moon's revolving from the nicridian to the meridian again: this plate moves between four rollers R, R, K, R. A clock of this kind way adapted by Mr Fergufon to the movement of an old watch: the great wheel of a watch goes round in four hours; on the axis of this he fixed a whecl of twenty teeth, to turn a wheel of forty teeth on the axis of the pinion C; by which means that pinion was turned round in eight hours, the wheel A in twenty-four, and the wheel B in twenty-four hours fifty minutes and a half.

To this article we thall fubjoin a brief account of two curious contrivances. The firft, for giving motion to the parts of a clock by making it to defcend along an inclined plane, is the invention of Mr Maurice Wheeler; and the clock itfelf may be feen in Don Saltero's coffee-houfe at Chelfea. DE, fig. so. is the plate inclined plane on which the clock ABC defcends: CXL? this confifts externally of a hoop about an inch broad, and two fides or plates flanding out beyond the hoop about one-eighth of an inch all round, with indented edges, that the clock may not flide, but turn round whilft it moves down. One of thefe plates is infcribed with the twenty-four hours, which pafs fucceffively under the inder LP, fig. II. which is always in a pofition perpendicular to the horizon, and thows the hour on the top of the machine: for this reafon the lower part of the index, or H L, is heavieft, that it may preponderate the other H P , and always keep it pendulous, with its point to the vertical hour, as the move. ment goes on. Inftead of this index, an image may be fixed for ornament on the axis $g$, which with an erected finger performs the office of an index. In order to defcribe the internal part or mechanifm of this clock, let LETQ be the external circumference of the loop, and $f f$ the fame plate, on which is placed the train of wheel-work $\mathbf{5}, 2,3,4$, which is much the fame as in other clocks, and is governed by a balance and regulator as in them. But there is no need of a fpring and fufee in this clock; their cffects being otherwife anfwered, as we fhall fee. In this machine the great wheel of I is placed in the centre, or upon the axis of the movement, and the other wheels and parts towards one fide, which would therefore prove a bias to the body of the clock, and canfe it io move, evea on an horizontal plane, for fome fhort diftance; this makes it neceffary to fix a thin plate of lead at C, on the oppotite part of the hoop, to reftore the equilibriums of the movement. This being done, the machine will abide at reft is any pofition on the horizontal plan:
"ors Hiz: Fos if that phe be conned into the inctioned pane UE, it wil escoit it in the point D; but it cancot rett thate, beraufe the centle of gravity at M afony in the danction MI, and the point 'I' having nothing to lopport it, mate contimaily defeend, and carry the budy down the phane. But row if any weight $P$ be fised on the other fice of the machine, fuch as thath remove the e:ntre of gravity from $M$ to the point V in the line L D) which paffes through the point D, it will then red upon the inclined plane, as in the cafe of the rohing cylinder. If this weight P be fuppolal not fixed, but tufpended at the end of an arn, or wetis, which arm or lever is at the fame tince fatened to a centical wheet 1 , moving on the axis M of the machine, when whect by its teeth thall communicate with the train of whecls, Eic. on the cther fide, and the power of the weipht be juft equal to the fridton or rafitance of the train, it will remain motion. lefs as it did before when it was fixed; and confequently the clock alio will be at reft on the inclined piane. But luppoling the power of the weight P ' to be fuperior to tine refilance of the train, it will then put it into motion, and of cutre the clock likewife; which will then commence a motion down the plane; while the weight P, its wactis PM, and the wherel I, all contantly retain the fame pofition which they have at firft whan tha curek begins to move. Hence it is cafy to urderfiand, that the weight $P$ may have fuch an intrinice gravity, as fhall caufe it to act upon the train with any required force, fo as to produce a motion in the machine of any required velocity; fuch, for inflance, as fiall carry it once round in twenty four hours: than, if the diameters of the plates $A B C$ be four inches, it will defcribe the length of their circumference, viz. 12,56 inches in one natural day; and therefore, if the plane te of a fufficient bicadth, fuch a clock may go feremal days, and would furnith a perpetual motion, if the plane were infuitely extended. Let SD be drawn through M perpendiculay the theclined pane in the poine 1 ; alfo iet LD te perpeadicular to the horizontal line H H, pafiag thro' 13; then is the argle $\mathrm{HDE}=\mathrm{LDS}=\mathrm{DMT}$; whence it follows that the greater the angle of the plan:'s devation is, the greater will be the arch $D \Gamma$; and confsquently the further will the common centre of gravity be remored from M; therefure the power of $P$ will be augmeated, and of courfe the mosion of the whole macuine accelerated. Thus it appears, that by duly adjuling the intrinfic weight of $P$, at firf to proluce a motion foowing the neaa time as near as polnble, the time may be afterwards corrected, or the clock made to go fater or flower by raifing or depreflag the plane, ty means of the ferew at S. The angle to which the plane is firt railed is ahout ten degrees. The marquis of Wurcefter is alio frid to have contrived a watch that moved va a declivity. See farther Phil. Tranf. Abr. vol. I. P. $46 \pi$, Ace or $n^{2} 161$.

The other contrivance is that of M. de Gennes for making a cocks alcerid on an inclined plane. To this end let ABC (fig. 12.) be the machine on the inclined plane EDE, and let it be kept at reft uponit, or in equilibtio by the wei, li. Pat the end of the lever PM. The circular arca CF is one end of a fpring barrel in the middle of the morement, in which is inchuded a fpring as in a common watch. To this end of the bairel the am or lever PM is fxed upon the contre Mf; N' 82.
nond tha, when the clow is womel up, the fpring Clock. mures the harrel, and therefore the lever and weight $P$ in the fimation PM. In doing this, the centre of granity is confanely removed farther fron the centre of the machiane, and therefore it mof determine the clock to move upwards, which it will continue to do as long as the ipring is mbending itfelf; and thus the weight and its lever PM wit preferve the fituation they firt have, and do the office of a chain and fufe. Prii. Tranf. $11^{\circ} 140$ or Abridg. vol. i. e .467.

By fat. 9 and to W. III. cap. 28. \& 2, no perfon thall export, or endearour to export out of this king. dom, any nutward or inward bex-cafe or dial-plate, of gold, filver, brafs, or other metal, for clock or watch, without the movemert in or with every fuch box, Ecc. made up fit for ufe, with the maken's name engraven thereon; nor hall any peifon make up any cluck or watch without putting his name and place of abede or freetom, and no other name or place, on every clock or watch; on penalty of furfeiting ewery fuch box, cale, and dial-plate, clock and watch, not made up and engraven as aforcfaid; and 201. one moiety to the king, the cther to thofe that hall fue for the fame.

Clocks, porralle, or focket, commonly denominated Watcles. See the article Watch.

CLOCK-IVork, proferly fo called, is that part of the movement which frikes the hours, $\xi_{c}$ c. on a bell ; in contradiftinction to that part of the movement of a clock or watch which is defigned to meafure and exlibit the time on a dial-plate, and which is termed Watch-zwork.
I. Of the Clock-patt. The wheels compofing this part are: The great or firft wheel H ; which is moved pl. Cxus. by the weight or fpring at the barrel $G$ : in fixteen or fig. 13 . thirty-hour clocks, this has ufually pins, and is called the ein-eched; in eight-day pieces, the fecond wheel I is commonty the pin-wheel, or flriking-wheel, which is moved by the former. Nexi the Atriking-wheel is the detent-whed, or hoop-whecl K , having a hoop almoll round it, whetein is a vacancy at which the clock locks. The next is the third or fourth wheel, according to its diflance fiom the finf, called the wemm-ing-robocl L. The lafl is the flying pinion $Q$, with a fly or fan, to gather air, and fo bridle the rapidity of the clock's motion. To thefe mult be added the pinion of report; which driecs round the lockingwheel, called alio the count-zobecl; ordinarily with cleven notches in it, unequally dillant, to make the clock ftrike the hours.

Effides the wheels, to the clock pat belongs the rah or ratch; a kind of wheel with twelve large fangs, ruaning concentrical to the cial-wheel, and forving to lift up the detents every hour, and make the clock frike: the detents or Aops, which being lifted up and let fall, lock and uniock the clock in lriking; the hammer, as $s$, which ftrikes the bell R; the ham-mer-tails, as ' T ', by which the Hriking pins draw back the hammere; latches, whereby the work is lifted up and unlocked; and lifing-pieces, as P , which lift up ant malock the detents.

The method of calculating the numbers of a piece of clock werk having foncting in it very entertaining, and at the rame time very eafy and ufful, we hadl give the readers the rules relating thereto: 1. Rcgard here necds only be had to the counting. wheet, Atribing.

Ming．

## C I O

ftriking-wheel, and detent-wheel, which move round in this proportion: the count-whed commonly goes round once in 12 or 24 hours; the detent-wheel moves round every froke the clock ftrikes, or fometimes but once in two flrokes: whercfore it follows, that, 2. As many pins as are in the pin-wheel, fo many thens hath the detent-whed in one turn of the pin-wheel; or, which is the fame, the pins of the pin-wheel are the quotients of that whecl divided by the pinion of the detent-wheel. But if the detent-wheel move but once round in two ftrokes of the clock, then the faid quotient is but half the number of pins. 3. As many turns of the pin-wheel as are rcquired to perform the ftrokes of 12 hours (which are 78 ), fo many turns muft the pinion of report have to turn round the count-whed once: or thus, the quotient of 78 , divided by the number of ftriking-pins, haall be the quotient for the pinion of report and the count-wheel; and this is in eafe the pinion of report be fixed to the arbor of the pin-wheel, which is commonly done.

An example will make all plain: The loeking-wheel being $4^{8}$, the pinion of report 8 , the
8) $4^{8(6}$
6) $78(13$.
6) $60(10$.
6) $48(8$ pin-wheel 78 , the ftriking pins are 13, and fo of the reft. Note alfo, that 78 divided by 13 gives 6 , the quotient of the pinion of report. As for the warning wheel and fly-wheel, it matters little what numbers they have; their ufe being only to bridle the rapidity of the motion of the other wheels.

The following rules will be of good fervice in this calculation. 1. To find bow many, flrokes a dock frikes in one turn of the fuget or burrel: As the turns of the great whetl or fufce are to the days of the clock's continuance; fo is the number of trokes in 24 hours, viz. 156, to the ftrokes of one turn of the fufee.
2. T'o find bow many dibys a clock will go: As the ftrokes in 24 hours are to thofe in one turn of the fufec; fo are the turns of the fulee to the days of the rlack's going.

3 To find the number of turns of the fuge or Qurrel: As the flrokes in one turn of the fufee are to thofe of 24 hours; fo is the clock's continuance to the turns of the fufee or great wheel.
4. To fud the rumber of leates in the pinion of report ont the axis of the great quhcel: As the number of itrokes in the clock's continuance is to the turns of the fufee; fo are the Arokes in 12 hours, viz. 78 , to the quotient of the pinion of report fixed on the arbor of the great wheel.
5. To find the flokes in the clock's continuance: As 12 is to 78 ; fo are the hours of the clock's continuance to the number of ftrokes in that time.

By means of the following table, clocks and watch. es may be fo regulated as to meafure true equal time.

3 minutce, 56 feconds; by which quan-
tity of time every ftar comes round fooner than it did on the day before.
'lherefore if you mark the precife moment flown by a clock or wath when any ftar vanifles behind a chim. ney, or any other objeet, as fcen thro' a fmall hole in a thin plate of metal, fixed in a window-fhutter: and do this for [everal nights fuecefficely (as fuppofe twenty); if, at the end of that time, the ftar vanifhes as much fooner than it did the firft night, by the clock, as anfwers to the time denoted in the table for fo many days, the clock goes true: 22 , otherwife not. If the difference between 231 the clock and Itar be lels than the table $2+1$ fhows, the clock goes tou falt; if greater, it goes too flow ; and muft be regulated accordingly, by letting down or raifing up the ball of the pendulum, by little and littlc, by turning the fercw- 29 it nut under the ball, till you find it keeps|3ols true cqual time.

Thus, fuppoling the far fhould difappear behind a chimney, any night when it is XII. by the clock; and that, on the 20 th night afterward, the fame ftar fould difappear when the time is 41 minutes 22 feconds patt X. by the clock; which being fubtracted from 12 hours o min. ofcc. leaves remaining i hour 18 minutes $3^{8}$ feconds for the time the far is then fatler than the clock: look it the table, and againit 20 , in the left hand column, you will find the acceletation of the 1 tar to be 1 hour 18 min. 38. fec. agrecing exactly with what the difference ought to be between the clock and ftar: which hows that the clock meafures truc equal time, and agrees with the mean folar time, as it ought to do.
II. Of the Wathepart of a elock or watch. This is that part of the movement which is defigned to meafure and exhibit the time on a dial-plate; in contradiftinction to that part which contributes to the ftriking of the hour, Eit.

The feveral members of the watch-part are, 1. The balance, confifting of the rim, which is its cireular part: and the verge, which is its fpindle; to which belong two palettes or leaves, that play in the teeth of the erown-wheel. 2. The potenee, or pottance, which is the ftrong ftud in pocket-watches, whereen the low. er pivot of the verge plays, and in the middle of which one pivot of the balance-wheel plays; the bottom of the pottance is called the foot, the middle part the nofe, and the upper part the thoulder. 3. The coek, which is the piece covering the balance. 4. The regulator, or penduhum [pring, which is the fmall fpring, in the new pocket-watches, underneath the balance. 5. The pendulum (fig. 3 ) ; whole parts arc, the verge. $r$, palettes 5,5 , cocks yyy, the rod, the fork $\approx$, the flatt 2 , the bob or great ball 3, and the corrector or regula. tor 4, being a contrivance of Dr Derham for bringing the pendulum to its nice vibrations. 6. The wheels, which are the crown-wheel $F$ in pocketpicees, and iwing-wheel in pendulums; Cerving to drive the balance or pendulum. 7. The contrate-wheel $\mathbf{E}$, which is that next the crown-wheel, Eoc and whofe . teeth

## C I O

Elock. tecth and hoop lie contrary to thofe of other wheets; whace the name. 8. The great, or fift whel C; which is that the fufee B , EFic. immediately drives, by mean of the chain or itring of the fpting-ter or barrel A; afeer which are the feond wheel D, thind wheel, Re. Latly, betweee the frame and dial-phace, is the pinion of report, which is shat fixed on the arbor of the great whet; and ferves to drive the dialwhect, as that ferves to carry the hand.
For the ilhatration of this part of the work which lies concealed, let ABC (hg. 14.) reprefent the uppermon fide of the frame plate, as it apfears when detached from the dial-plate: the midde of this plate is porforated with a hole, receiving that end of the arbor of the centre whed which carries the minute hand; near the plate is fixed the pinion of teport $a b$ of to teeth; this drives a wheled of to teeth; this wheel carries a pinion ef of :2 teeth; aind dis arain drives a whed $g b$ with 36 teeth.

As in the body of the watch the wheds every where divide the pinions; here, on the contray, the pinions divide the wheels, and by that means dimimill the motion, which is here neceflary; for the hourhand, which is carried on a focket fixed on the whect $g h$, is required to move but once round, while the pinion a $b$ mues twelve times round. For this purpofe the motion of the whet $c d$ is $\frac{t}{4}$ of the pinion $a b$. Again, white the wheel cd , or the pinion eff, gocs once round, it turns the wheel $g b$ but $\frac{y}{3}$ part round; confequently the motion of $g h$ is but $\frac{1}{3}$ of $\frac{f}{\frac{T}{T}}$ of the mo-
 mores one rourd in the time tha the pinion of report, on the arbor of the centre or minate wheel, makes 12 revolutions, as requited. Hence the tirucmure of that part of a clock or wateh which thows the time may be eafly undurtood.

The cylinder A (fig.13.) put into motion by a weight or irclufed foring moes the fufee $\bar{B}$, and the great whect C , to which it is fised by the line or cord that goes round each, and milwers to the chain of a watch.

The method of calcutation is eafly menderfood by the fequel of this artiele: for, fuppofe the great wheel C gees round ouce in 12 hours, then if it be a rojal pendulum clock, winging feconds, we have $60 \times$ ó0 $\times 12$ $=43200$ feconds or beats in one thrn of the great wheel. But becaufe there are 60 fwings or fecouds in one minute, and the feconds are hown by an itdex on the end of the abor of the fwing-wheel, which in thofe clocks is in an horizontal pofition; therefere, it is neceriary that the fwing-whel F thonid have 30 tet th; whene $432=0,20$, the number to be broken into quatients fir finding the number of teeth for the other wheets and pinious.

In fpring tiocks, the difpofition of the wheets in the wath part is fich as is here reprefented in the fiGure, wher she crown-whed $F$ is in an horizontal pofition; the foconds not teing flown there by an index, as is done in the large pendulum clocks. Whence in thefe clocks the whetls are difpofed in a different manner, as reprefented in fig. 14. whitere C is the great wheel, and D the centre or minute wheel, as before: but the contrate wheel $E$ is placed on one fide, and $F$ the fwing-wheel is placed with its centre in the fane per-
pendicular line GHi with the minute-wheel, and with its plane perpendicular to the horizon, as are all the others. Thus the minute and hour hands turn on the end of the arber of the minute-whel at $a$, anl the fecoud land on the arbor of the Ewing-whetl at $b$.

Theory and calciatation of the Watch-part, as laid ducun by the Reo. Dr Derban.-1. The fame motion, it is evident, may be performed either by one wheel and one pinion, or many wheds and many pinions; provided the number of turns of all the wheels bear the proportion to all the pinions which that one wheed bears to its pinion: or, which is the fame thing, if the mamber produced by multiplying all the wheels together, be to the number produced by multiply ing all the piniors together, as that one whel to that one pinin. Thus, fuppofe you had occation for a whed of 1440 teeth, with a pinion of 28 leaves; you make it into three wheels of 36,8 , and 5 , and three pinions of 4,7 , and 1. For the three wheels, $3^{6,8} 8$, and 5 , multiplied tigether, give $14+0$ for the wheek, and the three pinions 4,7 , and 1 , muliplid tugether, give 28 for the pinicns. Add, that it matters not in what order the whetls and pinions are fet, or which pinion runs in which wheel; only, for convenience fike, the bigget numbers are commonly put to drive the rell.
2. Two wheels and pinions of different numbers may perform the lame motion. Thus, a whecl of $3^{6}$ drives a pinion of 4 ; the fame as a wheel of 45 a pinion of 5 ; or a wheel of go a finion of 10 : the turns of tach being 9 .
3. If, in braiking the train into parcels, any of the quotients fhumbd not be liked; or if any other two numbers, to be multiplied together, are defind to be varied; it may be done by this rule. Divide the two numbens by any other two numbers which will meafure them; mulliply the quotients by the alternate divifors; the product of thefe two laft numbers found will te cqual to the product of the two numbers firtt. given. Thes, if you would vary 36 times 8 , divide thefe by any two numbers which will evenly meafure them: $\int 0,{ }_{3} 6$ by 4 gives 9 ; and 8 by 1 gives 8 : now, by the rule, 9 times 1 is 9 , and 8 times 4 is 32 ; fo that for $36 \times 8$, you have $32 \times 9$; each equal to 288 . If you divide $3^{6} 6$ by 6 and 8 by 2 , and multiply as before, you have $24 \times 12=36 \times 8=288$.
4. If a wheel and piniun fall out with crofs numbers, too big to he cut in whecls, and jet not to be altered by thefe rules; in feeking for the pinien of report, find two numbers of the lame, or a near proportion, by this rule: as either of the two given numberts is to the othet, fo is 360 to a fourth. Divide that fount number, as alfo 360 , by $4,5,6,8,9$ to, 12, 15 (each of which numbers exactly meafures 36 c ), or by any of thofe numbers that bing a quotient nearelt to an integcr. As fuppofe you had 147 for the wheel, and 170 for the pinion; which are too great to be cut into fmall wheels, and yet cannot be reduced into lefs, as baving no other common meafure but unity; fay, as 170:147::360:311. Or, as 147: 170: : $360:+16$. Divide the fourth number and 360 by cne of the foregoing numbers; as 311 and 360 by 6 , it gives 52 and 60 ; divide them by 8 , you have 39 and 45 : and if you divide 360 and 416 by .

Clock. 8, you have 45 and 52 exactly. Wherefore, intead of the two numbers 1,47 and 170 , you may take 52 and 62 , or 39 and 45 , or 45 and 52 , $\varepsilon^{\prime} c$.
5. To come to pratice in calculating a pisce of watch-work: Iratt pitch on the train or beats of the batance in an loour; as, whether a fwift one of about 20,050 beats (the ufual train of a common 30 hour pocket-wateh), or a llower of allaast 10000 (hse train of the new pendulum poeket-watches), or any other train. Nest, refolve on the namber of turn; the fafee is inte.d.d to lave, and the number of hours the
 hours, of 192 hours (i.c. 昌days), Be. Iroceth now to find the beat, of the balance or pendulum in one tum of the fufee; thus in numbers; 12:16::200co: 2666\%. Wherctore, 26666 are the beats in one tun of the fale an great whech, and are equal to the quo. tients of all the wherls mato the balance multiplied together. Now this mamber is to be booke hato a convenient parcel of quatients; which is to be done thus: firt, halve the mamber of tu: 1 , $2 i z, 26605$, and you have 13333 ; then pitch on the number of the crownwhet l, fuppofe 17 : divide 13333 by 17, and you lave $7^{9}+$ for the quitient (or turns) of the redt of the whecls and pisions; which, beime too big tor one or two quotients, may lee bett broken into thee. Choofe thersfore three mambars: which, when maliphed all torguther continuaily, will core nearet 78 f : as luppole IC, $D$, and $y$, multiplied contimaliy, give tibo, which is fomewhat too much; therefore try agairother numbers, $11,2,8$ : thefe, draw! one into another concinually, froduce $79^{2}$; which is as near as can bc, and is a convenient quotient. Having thus contrived the piece from the great wheel to the balance, but the numbers not falling ont exactly, as you fint propoled, conce the work thus: fitt, multiply 792, the product of all the quotients piscled upon, by 17 (the notches of the crumb-sheel); the product is I $34^{\prime}$, , which is half the number of beats in one turn of the fufee: Then find the true number of beats in an hour. Thus, $16: 12:: 13+64: 10098$, which is half the beats in an hour. Then find what quotient is we laid upon the pinion of report (hy the rule given moder that word). Thus, $16: 12:: 12: 9$, the quotient of the pinion of report. Having thus found jour quatients, it is ealy :o determine what numbers the wheels fhall have, for choofing what numbers the pinions hall have, ard multiplying the pinions by
their quotients, the product is the num-
4) $3^{6}(9$
ber for the wheels. Thus, the number of the pinion of report is 4 , and its quotient
5) 55 (11
5) $4 i(9$
5) $40(8$ is 9 ; therffore the number for the dialwheel man be $4 \times 9$, or $3^{6}$ : fo the next finion being 5 , its quotient 11 , therefore thec ereat whet muat be $5 \times 11=55$; and 17 for of the reft.
Such is the method of calculating the numbers of a 16 hour watch. Which watch may be made to go longer by leffening the train, and altering the pinion of report. Suppofe you could conveniently facken the train to $\mathbf{1} 6000$; then fay, As $\frac{1}{2} 160 c 0$, or 8000: 13464:: 12:20; fo that this watch will go 20 hours. Then for the pinion of report, fay (by the rule given under that word), as $20: 12:: 12: 7$. So that 7
is the quoticnt of the pinion of ryort. 4) $23(7$ And as wo the numbers, the operation is
$\square$ Cl..... the fame as lefors, only the dial-whect is but 28 ; for its quotiont is alsered to 7.5 ) 5 ( 1 If you mon if you wonld give numbers tor a watch of 5) 40 ( 8 ahout: 0000 buats in an loorr, to have $: 2$ 8 turns of the fufer, to gor 1 go hours, and 17 notches in the crown-wlucl; the work is the fame, in a manmer, is in the laft example: and confequently tlats: a9 12:170: : 16000:141606, which liourth number is the beats in one turn of the fulee; its half, 70833, being divi 'ed by $1 \%$, wives 467 for the quotien' : and becaufe this number is tore big for three quotients, therefore choofe tour, as in 8, $8,6 \frac{3}{5}$; whofe procuct into 17 makes 71808 , noar. ly equal to half the true beats in one tum of the fo: fee. 'rhen fay, as $170: 12: 75008: 5 c h o$, which is half the tue train of your watch. And again, 170 : 12::12:144, the denominator of which exprefles the opinion of report, and the numerator is the mamber of the dial-wheel. But the!e numbers beines woe 1 ige to be cut in fmall wheels, they mut be buied by the fouth rule atbove. 'I'ans:

$$
\begin{aligned}
& \text { As } 1+4: 170:: 50:+25 \\
& \text { Or } 170: 14+: 360: 305
\end{aligned}
$$

Then dividing 360 , and cither of thete 24 ) $20(20$ two fourth proportionals (as dircited by the ruk), fuppole by 15; you will have 6) $60(10$ $\therefore$ or ${ }^{2} \therefore$; then the nambers of the whate movernent will fand as in the margin.
6) $48(8$

Ssea is the calabation of odinary watches, to hrow the livur of the day:
5) $40(8$
5) $33\left(6 \frac{3}{5}\right.$ in fuch as thow minutes, and fecouds, I the poncefs is thas:

1. Hang refulved on the beats in an hom: by cavicing tie defignal train by Go, fiad the beas in a minute: and accordingly, fiad poper numbers for the crosm-wheel and quotients, fo as that the minutewheet thall go round once in an hour, and the ficond Wher lonce in a minute.

Suppole, e. g. you hall choofe a pendulum of feven inches, which vibrates 142 trokes in a minute, and 8520 in an thour. Hall thefe fums are 71 , and +260. Niw, the firt work is to break this 71 into a grod proportron, which will fall into ons quotient, and the crown-uheel. Let the crown-uheel have 15 notehes; then 71, divided by 15, fives nearly 5 ; fo a crown-wheel of 15 , and a wheel and piaion whofe quotient is 5 , will go rotind ma minute to carry a hand to thow feconds. For a land to go rourd in an hour to fhew wsinutes, becanle 8) to ( 5 thete are 60 minutes in an nour, it is but breaking bio int" youd quentents (luppole 10 and $G$, or 8 and $-\frac{1}{2}, E^{\circ} \cdot$ ), and it is done. Thus, 4200 is troken as near as can be into proper numbers. But fince it
8) $64(8$ does not fall ont exacily into the above-8) $40(75$ mentioned numbers, you muft correet (as before dirceted), and ind the true number of beats in an nour, by multipiy ${ }^{+}+15$ by
5, which makes 75; and 75 by cu masen 4500 , which is half the true tain. I'r.u that the beats in one turn of the fulce; thus, $16: 192:: 4500: 5+000$; which lat is half the beats in one turn of the fufee. This

## C L O [ 70 [ $] \quad$ C L O

Ciuck, Cludia lex

54000 being divided by 4500 (the true 108 ( 12 numbers already pitched on), the quo64 ( 8 tient will be 12 ; which, not being too big 8) $60\left(7 \frac{1}{2}\right.$ for a fingle quotient, needs not be divided 8) 40 ( 5 into more; and the work will ftand as in the margin. As to the hour-hand, the I 5 great wheel, which performs onty one revolution in 12 turns of the minute-wheel, will fhow the hour; or it may be done by the minutewheel.

It is requifite for thofe who make nice altronomical obfervations, to have watches that make fome exact number of beats per fecond, without any fraction; but we feldom find a watch that does. As four beats per fecond would be a very convenient number, we thall here give the train for fuch a watch, whieh would (like mott others) go 30 hours, but is to be wound $u p$ once in 24 hours.

The fufee and firtt wheel to go round in four hours. This wheel has +8 teeth, and it turns a pinion of 12 leaves, on whofe axis is the fecond wheel, which goes round in one hour, and carries the minute hand. This wheel has 60 teeth, and turns a pinion of 10 leaves; on whofe axis is the third wheel of 60 teeth, turning a pinion of 6 leaves; on whofe axis is the fourth (or contrate) wheel, turning round in a minute, and carrying the finall hand that fhows the feconds, on a fmall circle on the dial-plate, divided into 60 parts: this contrate wheel has 48 teeth, and turns a pinion of 6 laves; on whole axis is the crown or balancewheel of 15 teeth, which makes 30 beats in each revolution.

The crown-wheel goes 480 times round in an hour, and 30 times $4^{80}$ make 14400 , the number of beats in an hour. But one hour contains 3600 feconds; and 14400 divided by 3600 quotes 4 , the required number of beats in a fecond.

The fuffe mutt have $7 \frac{1}{2}$ turns, to let the chain go fo many times round it. Then, as I turn is to + hours, fo is $7 \frac{1}{2}$ turns to 30 hours, the time the watch would go after it is wound up.

See further the articles Movement, Turn, Eic. And for the hitory and particular confruction of II'atches properly fo called, fee the artiele Wateh.

CLODIA lex, de Cypro, was enacted hy the tribune Clodius, in the year of Rome 607, to reduce C prus into a Roman province, and expofe Ptolemy king of Egypt to fale in his regal ornaments. It impowered Cato to go with the pretorian power and fee the auction of the king's goods, and commiffioned him to return the money to Rome. A nother, de Magiftratibus, 695, by Clodius the tribune. It forbad the cenfors to put a ftigma or mark of infamy upon any perfon who had not been actually acculed and condemned by both the cenfors. Another, de Re. !!gione, by the fame, G96, to deprive the priett of Cybele, a native of Peffinuns, of his office, and confer the pricthood upon Brotigonus, a Gallogrecian. Anwther, de Provinciis, 695, which nominated the provinces of Syria, Babylun, and Perfia, to the conful Gabinus, and Achaia, Theffaly, Macedon, and Greece, to his colleague Pifo, with proconfular power. It impowered them to defray the expences of their march from the public treafury. A nother, 695, which required the fame diftribution of corn among the
people gratis, as had been given them berore at nix aftes and a triens the buhth. Another, 695, by the fame, de Fudiciis. It called to an account fuch as had executed a Roman citizen without a judrment of the people and all the formalities of a trial. Another, by the fame, to pay no attention to the appearances of the hearens while any affair was before the people. Another, to malse the power of the tribunes free in makiog and propoling laws. Another, to re-eltablifh the companies of artilts which had been inftituted by Numa, but fince his time abo. limed.

CLODIUS (Publius), a Roman defeended of an iltuitrious family. He made himfelf famous for his licentioufnefs, avarice, and ambition. He committed incell with his three filters, and introduced hionfolf in women's clothes into the houfe of Juhus Cæfar whilt Pompeia Cxiar's wife, of whom he was enamoured, was celebrating the myteries of Ceres, where no man was permitted to appear. He was accufed for this violation of human and divine laws; but he made himfelf tribune, and by that means fereened himfelf from jutice. He defeended from a patrician into a ple. beian family to become a tribuac. He was fuch an enemy to Cato, that he made hin go with pretorian power, in an expedition againtt Ptolmy king of Cypans, that by the difficulty of the campaign he mighs ruin his reputation, and deltroy his interett at Rome during his abfence. Cato, however, by his uncommon fuceefs fruftrated the views of Clodius. He was alfo an inveterate enemy to Cicero, and by his influence he banifhed him from Rome, partly on pretence that he had punifhed with death and without trial the atherents of Catiline. He wreaked his vengeance noon Ci cero's houle, which he burat, and fut all his goods to fale; which, however, to his great mortification, no one offered to burg. In fpite of Clodius, Cicero was recalled and all his goods rellored to him. Clodius was fometinse after murdered by Milo, whofe defence Cicero took upon himfelf.

CLOGHER, an epifopal town of Ireland, in the county of 'Iyrone, and province of Ultter. It fend; two members to parlianent. In a very carly dge an abbey of regular canons, dedicated to the Virgin Mary, was founded here. St Patrick is faid to hate prefided over the church of Clogher; and havinis appointed St Iiertenn to be his fucceftor, he refigued this goverument, and went to Armagh, where he founded his celebrated aboej: On the 2ceh of April 1396, a dreadful fire burat to the ground the church, the two chapels, the abbey, the court of the bilhops, and thinty-two other buildings, with all the facerdotal vefments, utenfils, sc. belonging to the bihop's chapter and church. In the year iGio, on the 2 qth of July, whilt George Montgomery was bithop of Clogher, king James unnexed this albey and its revenues to that fee. The fee (valited in the king's books at 3501 . per annum by extent returned 15 th James I.) is reputed to be worth L. +000 amsually. W. Long. 7. 30. N. Lat. 54. 16.

CLOISCER (Chatzoam), a habitation furrounced with walls, and inhabited by canons or religious, \&se. In a more general fenfe, cloitter is ufed for a munaftery of religious of tither fcx. In a nore reflrain ed fenfe, cluiter is ufed for the orimeipal part of a re-

Clonmacll, gular monaftery, confifing of a fquare built around; ordinarily between the church, the chaptes-huofe, and
the refectory; and over which is the durmitory. The cloifters ferved for feveral purpofes in the ancient monateries. Petrus Blefenifis obferses, that it was here the monks held their lectures: the lecture of morality at the north fide, next the church; the fchool on the welt, and the chapter on the ealt; fpiritual meditation, \&ec. being referved for the church. Lantane obferves, that thie proper ufe of the cloiter was fur the monks to meet in, and converfe together, at certain hours of the day.

The form of the cloitcr was fquare; and it had its name cluuffoum, from claudo, "I hut or clufe;" as being inclofed on its four fides with buildings. Hence, in architecture, a building is flill faid to be in form of a cloiler, when there are buildings on each of the four fides of the court.
CLONMELL, the afme town of the county of Tipperary in Ircland, is fituated on the river Suir, hath a barrack for iwo troops of horfe, and is governed by a mayor, reeoder, bailifs, and town-clerk. The river is navigable from this town to Carrick and Waterford; and there is fome trade carried on hore in the woullen branch, particularly ly the quaker, who are very numervas in this acighberthood. There is at fang here of Spa water, that itiocs out of the filde of a rining ground, that is, nctwithtadiag, orerkoked by a pretty fteep hill, on that fide of the river Suir which is in the county of Waterford. The cures performed by drinking of this water in the feursy, and other chronic diftempers, dew thither, fome years ago, a great refort of peoplo; but faftion, which reigns with an abfolute authority, has brought other waters of late into ligher credit. It was in this town that the celebrated and Rev. Laurence Sterne was born, on the 24th of November :713. The town confits of four crofs ftreets, and has a fpacions bridge of 20 arehes over the river Suir ; the markct houfe is ftrong and well built; and there is a charter fchoul here fur forty children, to which the late John Dawfon, Efq; and Sir Charks Moore, Bart. were conliderable benefactors. A Dominican friary was founded at Clonmell, in 1269 , and dedicated to St Dominick. In the fame year Otho de Grandifon erected a Francifcan friary, the church of which was efteemed one of the molt magnificent in Ireland; in it was kept an image of St Francis, refpecting the miraeles wrought by which many marvelious ftories are circulated. This town is very ancient, being built before the invafion of the Danes: it was formerly defended by a fquare wall. Oliver Cromwell, who found more refiftance from this place than any other of his conquefls in the kingdom, demolifhed the cafles and fortifications, of which nos only the ruins remain : the chief Guthic chuch here is fill kept in good repair.

CLOSE, in heraldry. When any bird is drawn in a coat of arms with its wings clofe down about it, (i. e. not difplayed), and in a tlanding polture, they blazon it by this word chgie; but if it be flying, they call it volant. See Volant.

Close, in mufic. See Cadence.
Close-Haulet, in navigation, the gencral arrangement or trim of a hhip's fails when fhe endeavours to make a progrefs in the nearcit dircsion poflible to.

## 77 ] C L O

wards that point of the compafs from which the wind bluws. In this mamer of fating, the keel commonly makes an angle of lix puints with the line of the wind; but lloups and fume cother findt rethels are faid to fail almoft a pint nearer. All velfels, however, are fuppufed to make nearly a point of leeway when elofehanded, even when they have the advanate of a grood failing breeze and favoth water. The angle of leeway, however, incrates in proportion th the incratis of the wind and fea. In this difpontion of the fails, they are at catenced fideways on the fhip, fo that the wind, as it croifes the thip obliquely toward the ftern from forwards, may fill their carities. But as the current of sinds alfo enters the fails in an oblique direction, the cffort of it to make the thip advance is confiderably diminithed: the will therefore make the leat progrefs when failing in this manner. The thip is faid to be clufe-hauled, becaufe at this time leer taks, or luwer corners of the principal fails, are drawn clofe down to her bede to wiedward, the fhects hatuled chote-aft, and all the bow-lines drawn to their greatelt extention to kecp the fails fteady.

Close-Guartris, eertain Arong barriers of wood, ftetehing acrofs a merchant-mhip in feveral places. 'lhey are ufed as places of retreat when a hhip is buardad be her adverfary, and are therefore fitted with feveral findllloop-heles thruagh which to fire the frnall anms, and thereby amoy the enemy and defend themilves. 'They are likewife fumithed with fereral caifons calted posidreclefls, which ate fixed upon the dock, and filled with purder, oldoails, \&e. and may be fired at any time from the clofe-quarters upon the boarders.

We have known an Englifh merchant-hip of 16 Faluoners guns, and propurly fittel with clofe-çarters, defat Dia. of the the united cifiorts of three Freach privateers who Murine. boarded her in the lad war, after haring engaged at fome dillance nearly a day and a half, with very few intervals of reth. 'l'wo of the erwifers were equipped with twelve ganseach, and the other witheight. The French failors were, after boarding, fo much expofed to continued fine of mufquetiy and cochorns charged with grenadoes, that a dreadful feene of earmage enfued, in which the decke were foon covered with the dead budies of the enemy, feveral of which the buarders, in: their hurry to efoape, had loft behind.

Cloterird : a lpecies of Fringalla
CLOT'H, in commerce, a manufacture made of wool, wove in the loom.

Cluths are of divers qualities, fine or cuarfe. The gooduefs of cloth, according to fome, confits in the following particulars: 1. That the wool be of a good quality, and well drefed. 2. It mutl be equally fpun, carefully obferving that the thread of the warp be finer a:d better twifeci than that of the woof. 3. The cloth mult be well wrought, and bcaten on the loom, fo as to be every where equally compact. 4. The wool muft not be finer at one end of the piece than ia the refl. 5. The lifis muit be fufficiently ftrong, of the fame length with the ftuff, and muit conlat of good wool, hair, or uftrich-feathers; or, what is ftill better, of Danilh dog's hair. 6. The eloth mull be free from knots and other imperfections. 7. It mult be well fooured with fuller's earth, well fulled with the bett white foap, and afterwards wathed in cloar
 with the thasel, withont luing too mach opente. ध It mut he: Prom chofe withont makiag it thatadb"e. 10. łt nutut buell dried. If. It inut not be tencer-ftuluded, to force it to its junt dimenfionio. 12. It raut be prefled cold, not hat peried, the latio: keine tery injurious to wooblen cloth.
 fives. The tut wool for the manufact rring of cloths are thate of Enghad and Eptin, efpecially thote of Jimeshatire and Segovia. To ufe thofe wouls to the beft adwatage, they ruft be koured, by putting then into a lignor fumcnhat more than lukewam, compoled et theee parts frir water and one of eriac. After the woul has continned loner enourth in the lignor to bok, ond diffle the greafe, it in datand and well wahed in rumnine water. When it feels dry, and has no fonell tut the natural one of the theep, it is faid to be cully feorred.

After this, it is homp they ia the fale; the heat of the fon moking it hamh and indenible: when dry, it is beat win wods ufon hardles wi wood, or on cords, on cleanfe it from dath and the grolfer fith ; the more it is thus beat and deanfed, the fufte: it becomes, and the better fur fpinaing. After beating, it mut be wedl picked, to free it from the relt of the filth that had cfeaped the rods.

It is now in a proper condition to be oiled, and carkd on large iron cards phaced llopewife. Olive oil is efleemal the bell for this purpofe: wne fifth of which theuld be ufed for the wool intended for the woof, and a minth for that befirmed for the warp. After the wool has been well oiked, it is given to the finmers, who firt card it on the knce with fmall fine cares, and then finit on the whelel, obferving to make the thecud of the warp fmaller by one third than that of the wouf, and much compacter twitted.

The thread thus fipu, is reeled, and made into Akeins. That detsyned for the woof is wound on little tubers pieces of 1 aper, or ruhes, for difpofed ats that triney may be calily put in the eye of the thutte. That for the warp is wound un a kind of large wooden bebbins, to difpufe it for wapping. When warped, it is ftifered witia fire; the beft of which is that made of threds of parchment; and when dry, is given to the weavers, who monnt it ou the loom.

The wap thus mometed, the weavers, who are two to eack loom, we sil tach fide, tread altermately on the tredidle, firlt on the right thep, and then on the Ieft, which raifes and lowers the threads of the warp equally: between which they throw tramerfely the frutte from the one to the other: and every time that the foutle is thus thrown, and a thread of the wof inferted within the warp, they Arike it conjunct. ly with the fane frame, wherein is faltued the comb or reed, between whare teeth the theads of the warp are pafied, repeating the froke as often as is neceffary.
'The weavers having contimued their work till the Whole warp is filled with the woof, the cloth is fenuthed: it is then taken of the loom by urrolling it from the beam whereon it had been rolled in proportion as it was wove; and now given to be cleanfed of the knots, ends of threads, fraws, and other filth, which is done with iron nippers.

In this condition it is carried to the futlery, to be fo rured with usine, or a kind of potter's clay, well Accped in water, put along with the cloth in the trough wheren it is fulted. Tbe cloth being again cleered from the earth or wrine, is returned to the former hands to have the lefier fith, fmall fraws, \&c. taken off as before: then it is returned to the fuller to be beat and fulled with hot water, wherein a iuitahle quantity of roap has been difolved ; after fullines, it is taken cut to be fmoothed or pulled by the liftis leng thwife, to take out the wrinkles, crevices, 8 e.

The fmoothing is repeated every two hours, till the falling be fininhed, and the cloth brought to its proper breadth: after which it is wathed in clear water, to purge it of the fodp, and given wet to the carders to raife the hair or nap on the right dide with the thate or weed. After this preparation the clothworker takes the cloth, and gives it its finit cut or flacange then the carders refume it, and after wetthing give it as many more courfes with the teazle, as the quality of the Atuf requires, always obferving to begin againt the grain of the hair, and to end with it; as allo tu begin with a fmouther thitle, proveedins flitl with one fharper and tharper, as far as the fixth degree.

After thefe aperations, the cloth being dried, is retumed to the cluth-worker, who theers it a fecond time, and returns it to the carders, who repeat their operation as before, till the nop be well ranged on the furface of tise cleth, from one end of the picee to the other.

Thee cloth thus wove, fooured, napped, and form, is fent to the dyer; when dyed, it is wahed in fair water, and the worker takes it again wet as it is, lys the nap with a bruth on the table, and hangs it on the tenters, where it is Itretehed both in length and breadeh fuffeciently to fmooth it, fer it fuare, and bring it to its proper dimenfons, without ftaming it too much; obferving to brufh it afreth, the way of the nap, while a little moill, on the tenters.

When quite dry, the cluth is taken off the tenters, and bruthed again on the table, to fimin the laying of the nap: after which it is folded, and laid cold under a preft, to make it perfectly fmooth and even, and give it a gions.

Lafly, the cloth being taken out of the prefs, and the papers, Ac. for glofing it removed, it is in a condition for fate or whe. With regard to the manufacture of mix. cluths, or thofe wherein the wools are firf dyed, and then mixt, fpan, and wove of the colours intended, the procefs, except what relates to the colou:, is molly the fame with that jult reprefented.

Cioth mads from Fegetable Filaments. See Bark and Pilamenfs.

Incomiturile Clota. See Asbestos.
CLOTHO, the youngelt of the three Parca, daughters of Jupiter and Themis. She was fuppofed to prenice over the moment that we are bora. She held the diftafi in her liand and fpun the thread of life, whence her name xowtov, to join. She wats reprefented weang a coown with feven fars, and covered with a variegated robe.

CLOOUD, a collection of vapours fufpended in the atmoiphere.

## C L O

[79] C 1,0
Cloud. That the clouds are formed from the aqueas wapours which before were fo clofly united wiet the atmerphere as to be insidille, is univertaly allowed: but it is no eaty matter to account for the ham montnuance of fone very g peque chouls without difolvint; or to give a reafon why the vapours, when they have once begun to condente, do not contime to do fo till they at lait fall to the ground in the form of rain or frow, Sc. Under the article Baroneter, n' 23 . we have hinted at the general canfe of the formation of clonds; namely, a feparation of the latent heat from the water whereof the vapour is compoled. The confequence of this Repration, as is undenially proved Ey Dr Black, mult lee the condenfation of that ypow, in fome degree at lealt: in fuch cafe, it will firl appear as a fmoke, mitt, or log; which if interpofed betwist the fun and earth, will form a choud; and the fame caufes continuing to act, the cloud will protuce main or faow. But though the feparation of this lat int heat in a certain degree is the immediate caufe of the formation of clunds, the remote caufe, or the changes produced in the atmofyhtre, whertby fuch a Eeparation may be induced, are much mure dififalt to be difcovered. In commen obferation, we fee that vapour is molt powerfuily condenfed by cold fulftances, fuch as metals, water, Sce. But cold alone cannot in all cafes caute the condenfation of the atmofpherical vapours, otherwife the nights behoved to be always foggy or cloudy, owing to the vapours, raifed throughout the day by the beat of the fin, being condented by the fupaior coldneis of the night. Great mains will bappen in very warm weather, when the union of the vapours with the atmofphere ought rathor to le promoted than ciffolved, if culd was the only acent in their condenfation. The ferenity of the stmofplicre, alfo, in the mon fevere frolts, abundatly thows that fome other caufe befides mere hat or cold is concerned in the formation of clouds, and cordenfation of the atmofpherical vapours.

The electric fluid in now io gencrally admitted as an agent in all the great operations of nuture, that it is no wonder to find the formation of donds attributed to it. This hatly accordingly been given by S . Beccaria as the caule of the formation of all clouls whatfoever, whelher of thunder, rain, hail, or finow. The fint, he thinks, are produced by a vory great pown of electricity, and the others by one more muduate. But though it is certain that all clouds, or even fogs and rain, are electrified in fome degree, it ftit remains a queftion, whether the clonds are formed in coniquence of the vapuur whereof they are compoted beirg fint electificd, or whether they bucome electrified in confequence of its being frift feparated from the atroofplere, and in fome meafure condented. This hath not yet, as far as we know, been afcertained by the expeiments of Beccaria, or any other perfon; and indeed, notwithtanding the multitude of electrical difcoveries that have latcly been made, there feems to be little or no foundation for afcertaining it. Electricity is known to be in many cafes a promoter of evaporation; but no experiments have yet been brought to prove, that electrified air parts with its moifure more readily than fuch as is not electrified; fo that, till the properties of electrified air are father inveligated, it is
impolibie t, lay down any rational theory of the formation of cho:ds upon this princirle.
but whether the chouds ate produced, i. © . the insighe varoms Howtuy in the anm dabere corde: od

 it is cotan dont they do contan the chechio aluji in 'cotafed. prodigionsand is:conceisable quantitics, and may very tersibie and dethoctive phenomona have been occen-
 traurdinaty indance of this laind pellapas on record hapened in the illand of dava in the Lath fudies in A) urbat 1772. On the tith of that nomth, at mid-Torthe night, a laight cond was wherval coverincis a mount in delthetho

 who dwelt upon the upper panta of the monatum nut being able to sif falt cono: h, a great part of the clowd. almoft three leasucs in circuaference, detached itledf
 like the waves of the fea, and conitting globes of ite foluminows, that the nighe become as clent as day. The effects of it were atoniming: every thing wasde. floyud for feven layues romd, the houfes were denolihed; plantatims were buied in the eath : and 21.90 people l.an their lives, belde's 1500 head of cattle, arid a vatt nember of horfes, goats, sce.

Arother inllance of a very deflexactive cloud, the blec- $B_{y}$ an tha thic quahties of which will at prefont farcely be doutt-inthe noms ch, is mated by Mr Brydone, in his Tour thongh of Muta. Malta. It appeared on the 2tht of October 195\%. About thee quarters of an hour after midnight, there wous feen to the forthewed of the caty of Melita, a grat black: clowd, whith, as it aproachod, chaged its culuar, till at hat it became like a flame of fare mixed with black fonolo. A drandful noife wes leatad on its approach, which alamud the whole city. It palfed over the port, and came dirt on an Engtifin mip, which in an indant was torn in piece:, and nothing left but the hulk; part of the malt:, fail, ant cordage, were carried to a confiderable dittance akonr with the cloud. The fanall boats and follogues that fell in its way were all broken to pieces and fink. The nife increat: 1 and became more frightful. A centinel ternited at its approach ran into his box; but both he and it were lifed up and carsied into the fea, where he periflucd. It then traverfed a confiderable part on the city, and lad in ruins almolt every thing that lond in its way. Several houfes were had level with the ground, and it did not leave one deeple in its paffige. The bells of fome of thom, together with the fipes, reve carzita tu a contidnable dilance; the roofs of the churches demolifled and beat down, Sec. It went of it the northealt point of the city, and domolffing the light-houre, is faid to lave mounted up into the air with a frightful noife; and palled over the fea to Sicily, where it tore up fome trees, and did other da. mage; but nothing conderable, as its fury had been molliy pent at lifalta. 'The number of killed and wounded amounted to near 200 ; and the lols of thip. ping, Eec. was very confiderable.

The effects of thunder-horms, and the valt guantity of clectricity collected in the clouds which produce thefe Rorms, are fo well lnown, that it is fuperiluous to mention them. It appears, however, that even.

Chud. theíc clouds are not fo hight dectrificd as to produce their fatal effects on thole who are immerfed in them. It is only the difcharge of part of their electricity upon fuch hodies as are either not electritied at all, or

7
Infance of two people involved in s thund.
cloud. not fo highly electrified as the doud, that does all the mifchief. We lave, however, ouly the following inftance on record, of any perfon's leeing immerid in the body of a thunder-cloud. Profeffor Saulliute, and young Mr Jalabert, when travelling over one of the high Alps, were caught among donds of this kind; and to their aftonithment found their bodies fo full of electrical firc, that frontanenus flafles darted from their fingers with a crackling noife, and the fanc kind of fenfation as when ftrongly electrificd by art.

8
Heisht of the clouls.

The height of clouds in general is nut great ; the fummits of ve:y ligh mountains being comenonly quite free from them, as Mr Brydon experienced in his journey up mount Ætua: but thofe which are inolt highly electrified defeend lowett, their height being often not above feven or cight hundred yards above the ground; nay, fometimes thunder-clonds appear actu-- See Thun-ally to touch the ground with one of their edges *:
but the generaity of clunds are fupended at the lieng:t however, have imagimed than to arife to a mont incredible and extravagant height. Maignars of 'Thonloufe, in his Treatife of Perfpective, F -92, gives an account of an exceeding briglit little elond that appeared at midnight in the month of Augult, which fpread itfelf almoll as far as the renith. He fays that the fame thing was alfo ubferved at Rone: ; and from thence roncludes, that the clond was a collction of rapours raifed beyond the projection of the carth's hhadow, and of confequence illuminated by the beams of the fun. This, bowever, can by no means be credited; and it is much more probable that this choud owed its fplendor to eluecricity, than to the reflcction of the folar beams.
9 . In the evenings after fun-fet, and mornings before Their vari- fun-rife, we often obferve the clouds tinged with beauaccounted tiful colours. They are mofly red; fometimes orange, for. yellow, or purple; more ratcly bluifh; and fldiom or ever green. The reafon of this variety of colunrs, according to Sir Ilaac Newton, is the diffient fize of the globules into which the vapours are condenfod. This is controverted by Mr Melville, who thinks that the clouds refect the fun's light precifely as it is tranfmitted to them through the atmofphere. This reflects the mot refrangible rays in the greatelt quantity; and therefore ought to tranfinit the lealt refrangible ones, red, orange, and yellow, to the clouds, which acenoringly appear mott ufually of thole cotours. In this opinion lie was greatly confirmed by olfieving, when he was in Switzerland, that the foowy fummits of the Alps turned more and more reddifh after fun-fet, in the fame manner as the rlonds; and lie imagines, that the femitranfparency of the clouls, and the obliynity of their fituation, tend to, make the colours in them minch more rich and copions than thofe on the tops of faow mountains.

The mutions of the clouds, though fonctines directed by the wind, are not always fo, efpec:ally when thunder is about to enfue. In this cafe they feem to move very fowly, and oftea to be abfulutely thationary
$\mathrm{N}^{2} 32$.
fur fome time. The reafon of this mof probably is, that they are impelled by two oppofite llyeans of air nearly of equal itrength; by which means their velocity is freatly retarded. In fuch cafes both the aerial currents foen to afeend to a very condedable height; for Mefil. Charles and Ruberts, when endeavouring to avoid a thumicr-clond in one of their acrial soyares, cond find no alteration in the courfe of the cmrrent, though they afcended to the height of 4000 feet from the furface of the earth. In fome cafes the motions of the clonds evidently depend on their electricity, independent of any current of air whatever. Thus, in a calm and warm day, we often fee fmall clouds mecting each other in oppolite directions, and fetting out from fuch thort diftances, that we cannot fuppofe any oppofite winds to be the caufe. Thefe clunds, when they meet, inftead of forming a larger one, become much lefs, and fometimes vanill adtogether; a circumftance undoubtedly owing to the difcarge of oppofite dectricities into each other. This ferves alio to throw fome light on the true caufe of the formation of clouds; for if two clouds electritied, the one politively and the other negatively, deftroy tach other on contact ; it follows, that any quantity of vapour furpended in the atmofphere, while it retains its uatural quantity of electricity, remains invifible, but becomes a clund when electrified either shas or minus. A difficulty, however, fill occurs; viz. in what manner a fmall quantity of vapour furrounded by an immenfe ocean of the fame kind of matter, can acquire cither more or lefs electricity than that which furrounds it : and this indeed we feem not as yet to lave any data to folve in a fatisfactory manner.

The fhapes of the clonds are likewife undoultedty Theit owing to theis eleetricity; for in thofe feafous in which thayeso a great commotion has been excited in the atmofpherieal clectricity, we thall perceive the clouds affuming Atrange and whimfical flapes, which vary almof every moment. This, as well as the mecting of fmall cloads in the air, and vanithing upon contact, is an almolt iafallible figr of thonder.

Wehdes the plenomera of thunder, rain, \&e. the Connecclouds are intimately connected with thofe of wind, tion of the and alvarys antiune a particular thape when a Itrong winds with continued wind is about to enfue; though it is remarkalble, that in the itrongeft winds we fhall often oblerve them ftationary. Sometimes alfo, on the approach of a clow, we hall find a fudden and violent guit of wind arife; and at others, the wind, though vivent before, thall ceale on the approach of a cloud, and recover its flrength as foon as the cloud is paft. This connection of the clonds with wind is moft remarkable in moun tainms comerves, when the peaks are fufficiently high to have their tops involved in clonds. A very remarkable momenan of this kipd is met with at the Cape of Goud Hope, from the clowds on whofe tup, accordEng to the relations of travellers, the winds iffue forth at it they had been contined in a bag; and fomething similu has been oufreved of mountans in other parts of the warld.

The rifs of the douds are evidut, as fom them 13 moceeds the rain which refrelhes the carthes and with. out which, aceording to the prefent fytem of nature, the whole furface of the eartla mult be a merc defart.

They

C hut They are likewife of great ufe as a foreen interpofed between the earth and the forching rays of the fun, which are often fo powerfuk as to dciltroy the grafs and other tender vegetables. In the more feeret operations of nature alfo, where the electrical fluid is concerned, the clouds bear a principal fhare; and ferve efpecially as a modium for conveying that fluid from the atmofiphere into the carth, and from the earth into the atmofphere: in doing which, when electrified to a great degree, they fometimes produce very terrible effecis; of which inftances have been already given.

Clove-tree, in botany. See Caryophylius.
Clove, a term ufed in weights of wool. Seven pounds make a clove. In Efex, eight pounds of cheefe and butter go to the clove.

Clotra fuly-fower. See Dianthus.
clover-grass, in botany. See Trifolium; and Agriculture, $1^{\circ}$ 177, 179.

CLOUGH, or Draught, in commerce, an allowance of two pounds in every hundred weight for the turn of the feale, that the commodity may hold out weight when fold out by retail.

CLOVIO (Giorgio Giulio), hifory and portrait painter, was born in Sclavonia in 1498. Having in the early part of his youth applied himfelf to literature, his genius prompted him to purfue the art of painting for a profeffion; and at 18 ycars of age he went to 'Rome, where he fpent three years to perfect his hand in drawing, and devoted himfelf cntirely to painting in miniature. His knowledge of colouring was eftablifhed by the inltructions of Julio Romano, and his talte of compofition and defign was founded on the obfervations he made on the works of Michael Angelo Buonaroti. By thofe affilances he proceeded to fuch a degree of excellenee in portrait as well as in hittory, that in the former he was accounted cqual to Titian, and in the latter not inferior to Buonaroti. He died in 1578. His works are exceedingly valuable, and are at this day numbered among the curiofities of Rome. Vafari, who had feen the wonderful performances of Clovio with inexpreffible aftonifhment, enumerates many of his portraits and hiftorical compofitions, and fecms to be almolt at a lofs for language fulficiently expreflive of their merit. He mentions two or three pitures on which the artilt had beflowed the labour of nine years: but the principal pi\&ture reprefented Nimrod building the Tower of Babel; which was fo exquifitely finifhed, and fo perfect in all its parts, that it feemed quite inconceivable how the eye or the pencil could execute it. He fays it is impoffible to imagine any thing fo admirably eurious; whether one confiders the elegance of the attitudes, the richnefs of the compofition, the delicacy of the naked figures, the perfpective proportion of the objeets, the tender diItances, the feenery, the builsings, or other ornaments; for every part is beartiful and inimitable. He allo takes notice of a fingle ant introduced in one of the pictures of this mafter; which, though exceedingly and incredibly fnall, is yet fo perfect, that even the mont minute member was as diftinct as if it had been painted of the natural fizc.

CLOVIS I. was the real founder of the Frencli monarehy; for he was the firl conqueror of the feveral provinces of Gaul, poffeffed before his time by the Ro. mans, Germans, and Guths. Thefe he united to the Voc. V. Part I.
then feanty dominions of France, removed the feat of government from Sciffons to Paris, and made this the capital of his new kingdom. He died in 515 , in the 46th year of his age and 3 it of his reign. Sce (Hyl. of) France.

CLOUT'S, in gunnery, are thin plates of iron mailed on that part of the axle-trec of a gun-carriage which comes through the nave, and through which the linfpin goes.

CLOYNE, a town of Ireland, in the county of Cork and province of Munter. W. Long. 8. ©. N Lat. 51.40. It is but a finall place, though an epifcopal refidence. A church was built, and a billiopric erected here, by St Colnan, who died on the 4 th of November 604 ; and in 707 an abley was alfo founded here. In $1+30$, the bifhopric was united to that of Cork; and the union continued till the ith of November 1638 , when Dr George Synge was confecrated bifhop of Cloyne; fince which time this fee has been governed ly its own prelates, one of whom was the celebrated berkeley. - This fec is not taxed in the king's bouks; but is now reputed to be worth L.. 500 a-year. - The chapter of Cloyne is compoied of a lean, elhanter, chancellor, treafurer, an archdeacon, and fourteen prebendaries. The diocefc is divided into four rural deaneries, and the collegiate chureh of St Mary of Youghal is united to the bifhopric. The cathedral is a decent Gothic building. The nave is about 120 fert long; having lateral ailles, befides the crofs aifles, divided by Gothic arches, five on each fide. In the choir there is an excellent organ. The bilhop's palace, which was rebuilt at the beginning of the prefent century, is large and convenient. To the rorth-weft of Cloyne is a reputed holy well, dedicated to St Colman, whieh is much frequented on the 2 qh of November, being the patron-day.

CLUE of a sail, the lower corner; and hence
CluE-Garmets, are a fort of tackles falluncd to the clues, or lower corners of the main-fail or fore-fail, to trufs them up to the yard as occafion requires, which is ufually termed clueing up the fails.

Clue-Lines are for the fame purpofe as clue-garnets; only that the latter ate confined to the courfes, whereas the former are common to all the fquare fails. See thefe ropes as reprefented in the artiele Smip.
CLUNIA (anc. geog.), a principal town of the Hither Spain, a Roman colony, with a conventus juridicus, on the Durias, to the weft of Numantia. Now Corunna did Conde.

CLUNIUM (anc. geog.), a town of Corfica, near Battia. Now St Catharine.

CLUNY, or Clugny, a celebrated abbey of Benedictine monks, in a city of that name; being the head or chief of a congregation denominated from them.

It is fituated in the Mafonnois, a little province of France, on the river Gróne; and was founded by William Duke of Berry and Aquitain; or, as other, fay, by the Abbot Bernon, fupported by that Duke, in the year 910.
This abbey was anciently fo very facious and magnificent, that in 1245 , after the holding of the firit conncil of Lyons, Pope Innocent IV. went to Chury accompanied with the 2 patriarchs of Antioch and Conftantinople, 12 Cardinals, 3 archbifhops, 15 hihops, and a great number of abbuts; who were all enterI. tained,
C.O..6
!!uny.
mined, withont one of the monks being put ont of their place: tho's. Louis, Q. Blanche his mother, the Duke of Artais his brotken, and his fider, the Limperor of Condtantinoples the fons of the kinge of Arragon and Catile, th: Duke of Hurgundy, 6 comnts, and a great number of londs, with all their retinnes, were there at the fame time.

Cluny, at its fret erection, was put under the immediate protection of the apollolic fee; with exprefs prohibition to all fecular and ecclefiatic powers, to diftrab the monks in the poftrinom of their effecte, or the election of their abbot. 13y this they pretended to be exempted from the juriflictiva of hifiops; which at lengei gave the hint to other abbeys to infit on the fame.

Cluny is the head of a very numeros and extenfive conervesation: in ffocz, it was the futp congrecation of disers menalteries suited under one chaf, fo as only to confitute me budy, or, as they call it, one ordar, that ever anole.

This order of monks was bronght into Eincrund by Wribian Earl of Wamell, fon-in-law to Wialam the Conguerer, who buit a houfe for them at I cowe in Sufiex about the year 1077. There were 27 friorics and cel!s of this orderin Lingland, which wer governed hy forturners, aficuwards nade derizens.

Cievielia, or Herrints, in inholyulogy, a gemus welonging to the orrier of abdominales. The upper jaw is curnihed with aferated mytathe; the branchiallege nembrane has eight rays; af foly ferrated line runs slong the belly from the had to the tail; and the bethefins have frequently nine rays. There are is fectes, ris.
8. The hovengus, or common heming, has no foote, adid lie mader jaw is lunger than the upper nne. A herring dits immediatily after it is taken out of the ovater; wheme the goverh arifes, A's dotat as a berring. The meat is revy where in ereatefeem, bemg Sat, foft, and delicate; efpecielly it it is drefied as foon do cought, for then it is incomparably better than on the acxt day.
'The herring was unknown to the ancients. Notwithtanding the words, $\chi^{* x} \times$ wh and uais are by tranfLators rendered bolec, the charaiters given to thote fifh are enmmon to fuch rimbers of diffirent feeies as render it impoffible to fay which they intendicd. tules, yet known as low as the northern coafts of Prance; and excerpt one intance, brought by Dod, of a few being once taken in the bay of langier, none are cuer found more fonthery. They are met with in valt thoals on the coatt of Ancrica, as low as Carolin\%. In Chefapeak-bay is an annual inundation of thafe fifh, which cover the Gore in fuch puantitios as to becone a nuifance. We find them again in the feus of K amptiftinka, and probably they rearh fapan ; for Eemper memions, in his account of the fith of that country, forme that are congenerous The great winter rendezvous of the heminr is within the arelic circle: there they continue for many montlis in order to reemit themt. lves after the fatigue of Poming: the teas within that fance fwamer with infed fow in a fas
for the word berring comes from the German beer, "an army," to exprefs their numbers. They begin to appear off the Shetland ifles in April and May : thefe are only the forerumers of the grand thoal which comes in June: and their appearance is marked by certain figns, by the numbers of birds, fach as gannets end others, which follow to prey on them; but when the main body approaches, its breadth and depth is fuch as to alter the appearance of the very ncean. It is divided into dillinet columns of five or fix miles in length, and three or four in breadth, and they drive the water before them with a kind of ripering: fometimes they fink for the fpace of ten or fifteen mintites, and then rife again to the furface; and in tine wean ther reflect a variety of fleadid colours like a field of the mott precious gems : in which, or rather in a much more valuable, linhe thould this thupendoun gift of Pioviounce be confudered by the inhabitante of the Britila ince.

The firf cleck this army meets in its march fouthwad is from the Shetland iflos, which divide it into tro parts; one wing takes to the eaf. the other to the welern fhores of Great Dritain, and fill every bay and creck with their numbers; athers pals on tow wards Yarmouth, the great and ancient haart of herrings: they then pafs through the Britifn Channel, and after that, in a manner difappear. Thofe which take towards the weft, after oficring themelves to the Hebrices, where the great ftationary fithery is, proceed to the north of Ireland, where they neet with a fecond interraption, and are obliged to make a fecond divition: the one takes to the wetern fide, and is farec perceived, being foon loft in the immenfity of the Atlantic ; but the otber, that paffes into the lrim fea, rejoices and feeds the inhabitants of noof of the coals that border on it. Thefe brigades, as we may cill them, which are thus feparated from the greater columns, are often capricious in their motiuns, and do uot fhow an invariable attachment to their haunts.

Were we inciized to confider this partial migration Wonderfis in a moral light, we might refted with veneration and inftinct of awe on the mighty power which orginally impreffed thefe creaun this moft ufefu] budy of his creatures the inftinct that directs and points out the courfe, that bleffes and enriches thefe iflands, which caufes them, at certain and invariable times, to quit the vaft polar deeps, and offer themfelves to our expecting fleets. 'Ihat benevolent Peing has never been known, from the earlieit account of time, once to withdraw this blefling from the whole; though he often thinks proper to deny it to particulars, yet this partial failme (for which we fee no natural reafon) Should fill us with the moft exalted and gratefnl fenfe of his Providence for imprefling fuch an invariable and general inftinct on thefe frh towareds a fouthward migration when the whole is to be bencfited, and to withdraw it when only a minute part is to fufier
'This intinet was given then, that they might remove for the fake of depofiting their fown in warmer feas that would mature and vivify it more affuredly than thone of the frozen arme. It is not from defect of fond that they fet themedes in motion; fur they conce to us full of fat, and un thein return are almof univerfl'y obferved to be lean and mitwatle. What their food is near the Eule we are not yet informed;

## C L U

Chpea．Lut in our feas they feed nuch on the onifius narinus， a cruftaceous infect，and fometimes on their own fry．

Tloy are full of roe in the end of June，and conti－ nue in perection till the beyinning of winter，when they depolit their fpawn．The young herrings begin to approach the fhows in July and Augull，and we then from half on inch to two inches long：there in ouncones Yonkthire are called berring fole．＇thourh we have no aribablv et：re with heir pa－ cnes． particular authority for it，yet as very tew young her－ rings are found in our feas during winter，it feems mof certain that they mull return to their parental hames beneath the icc，to sepair the valt detruction of their race during fummer by men，forl，and fith．Some of the old herrings continue on onr coat the whole year： the Soarbowoth hithermen never put down their nets but they catch a few：but the numbers that remainare not worth comparifon with thefe that retura．See Merringolishera．

The Dutch are mof extravagantly fond of this faf when it is piekled．A premium is given to the firft bufs that antives in Holland with a lading of this their ambroia，and a valt price given for edel keg．＇There is as much joy anomy the inhabutants on its arival，as the Egyptians thow on the firl overflowing of the ickling of Nile．Flanders had the honow of inventing the art of pickling lamings．One William Banklen of Bi－ verlet，noar Shas，hit on this uleful expedient：from him was derived the name picke，which we bomow from the Dutch and Carnan．Banklendied in 1397．The emperor Charles 1 ＇．held his memory in fuch venera－ tion for the fervice he did to manliind，as to do his tuonb the honour of a vilit．It is rery fingular that moft nations give the mame of their farsurite dih to the facetions attendant on every mountebank．Thaus the Dutch call him ficke beriag ；the Italians，macu－ roni；the Firench，form porterg：；the Getmath，butis

2．The forotus has ： 3 mys in the back fin．It is a native of the European ken，and has a great retem－ blance to the hening，only it is of a lefs fare．They come into the sifer Thames below bridge in the begin－ ning of Nowember，and Jeaye it in March；and are，du－ sing that हafon，a gatat relief to the poor of the capi－ tal．At Cravefend and at Yamomh，they are cured hike red－horings：they are fometimes pichled，and are litele inferior in ildvour to the anchory，but the bones will not diffuive like thofe of the lattur．
3．The alofe，or foat，has a forked frout，and black fpots on the lides．According to Belonius and Haf－ fulquift，this is a fifh of paftige in the Nile．The lat fays，it is forame in lla Mediterranean near Smyma， and on the coatt of Egypt near Refetto ：and that in the months of leeconber and fanuary it afeenls the Nile as high as Cuiro，where the people thui it with 8 pot marjoram：and when dreffed in that manner，it The fineat will wry mealy intosicate the eater．In Great briw nhabir the tain the Serem affords this filh in ligghet perfection
ievern． is vern．
than any other river．It makes its firf appearance there in May，but in very warm fearons in Apria；for its arrival fomer or latter depends much on the exm－ per of the air．It continues in the river abont two months，and then is fucceeded by a variety which we hall have occafion to mention bereafter．

The Severn forat is efleetned a very doliente fob about the time of its firlt appearance，cfpecially ias that part of the river that 月ows by Crloneelter，where they are taken ia nets，and ufuadly fell dearo than lamon fome are font ts Lonslun，where the bith－mongets dif－ thinguith them from thofe of the Thancs by the lienth name ofefe．Whether they fpawn in this river and the Wye is mot determinel，for their fiy liab suat jet been affertained．The old fofle come from the fer inter de： siver in full roe．In the months of fuly and Angut， multitades of bleak frequent the river near Cloucthes． fonce of them are as big a；a fath bumines，and thed the bithermen caroneoully fuppofe to the the fiy of the thad．Numbers of thefe are talea near Cloucelter，in thote months onjz，lut none of the emaciated latad are ever caught in their a ctum．

The Thames fhad docs not frequent that river till the latter end of May or begiming of June，and is efleemed a very courfe and infipid fort of fifh．The Severn fhad is fometimes caught in the Thanes，though rarely，and called allis（no doultt abof，the French name）by the fifhermen in that river．About the fame time，and rather carlier，the valiety called，near Glon－ cefter，the trazit，makests appeatance；an it taken ronte de． in great numbers in the Scrern，and is held in asfribed． great difrepute as the fhad of the Thames．＇The dif． ferences hetweca each variciy are ai follows：the trae fhad weighs fonctimes cight pourals；but their ge－ neral fize is from four to five．The tow rite，on the contrary，weighs fiom half a pound to two poundis， which it never cxceeds．The foritp diflers from a fhad omf in having one or more round blatk fpots on the findes：if only one，it is always near the gill；Int conmonly there are threc or four，placed one mader IJe other．

4．The eqsaficotus，or atolozy，has iss upper jaw Andow longer that the under one，and is about three inches defrimed． leng．＂1hluy are taken in vath quantities in the Nedi－ teranean，and ate bronght over here pickled．＇I＇he great finuey is at Georgia a dimall ille weft of Lecg－ horn．Sus Aublay Itsheser．

The other fecies are，5．The ancrimodes has a fhiming line on cach fide，and fmall belly－fins．It is a native uf mimam．G．The thriffa has 20 mas ia the fin at the anns．It is found in the Indian occern．7．The fima has rellous fins，thofe of the belly buing very limali．＇line mouth is that ；the upper jaw is very Gort；the body is of a hining fitrer colous；and the fins are yellow．It is a native of Afin．8．The fermi－ cla has no belly－fins，and the bouly is broad．It is a native of Surinam．9．The myfus is Chaped like a fivord，and the fors at the ants are mitect．It is found in the Indian occan．10．The tropica has a wedge－like tail，and a white，broad，comprefed borly． It is Cound at Afcenfon iflame．In，the finemfor is very like the common herrige，bul broader．It has no tecth， aris is a mative of China．

CRUSLA，the balsam－tree：A genas of the momogynia orecr，belunging to the polygamia clate of plants：ard in the natural method manking umeler thofe plants the order of which is doubttul．Whe calyx is tctraphyllous or hexaphyllous，with its lcaf－ Ints oppolite and imbricated ；the corolla tetrapetalous， or besibpetaluas；the Ramina numerous．The caly $x$ and cosolla of tire female as in the male；the nota－ L．

rium of antherx or glandules coalited, including the germen. The capfule is quinquelocular, quinquevalved, and full of pulp. There are four fpecies, all natives of America.- The mof remarkable is the flava. This is pretty commos in the Britifh American ifands, where the tuees grow to the height of 20 feet, and thoot out many branches on every fide, furnithed with thick, round, fucculent laves placed oppofite. The flowers are produced at the ends of the branches, each laving a thick fucelent cover. After the flowers are paft, they are fucceeded by oval fruit. From every part of thefe trees there exudes a kind of turpentine, which is called in the Wrat Indies bug-rum; beenufe they fay, that when any of the wild hogs are wounded, they repair to the fe trees, and rub their wounded parts againet the flent till they have anointed themfelves with this turpentine, whielh heals their wounds. Thefe plants are very tender, and in this country mult be kept conitantly in a flove; and fparingly watered, efpecinly in winter; for they naturally grow in thofe parts of the illands where it feldom rains, and confequently cannot bear much moillure. They may be propagared from cuttings, which mutt be laid to dry for a fortnight or three weeks, that the wounded parts may be healed over, otherwife they will rot. The bell time for planting thefe cuttings is in July, that they may be well rooted before the cold weather comes on in autuma.

CLUSINA falus, (anc. geog.) a lake of Tufcany, extending north-weft between Clufium and Arretium, and communicating with the Arnus and Clanis. Now Cbiawa Palude.

CLUSINI rontes, (Horace), baths in Tufcany, in the territory of Clufium, between this lait to the north, and Acula to the fouth, at the difance of eight miles from each. Now Bagni di S. Cafciana.

CLUSIUM, anciently called Camars, (Virgil, Livy) ; a town of Tufcany, at the fouth end of the Palus Clufina, where it forms the Clanis; the royal refidence of Porfena, three days journey from Rome to the north, (Polybius). Clufinus the epithet. Clufini $V$ cteres the people. Now Chiufi. E. Long. 13. Lat. 43.-Clufum Novim, was a town of Tufcany, near the fprings of the Tiber, in the territory of Arretiun ; where liss the Ager Clufinus; now called Cafentino. Clufini Nozi, the people, (Pliny).

CLUTIA, in butany: 'A genus of the gynandria order, belonging to the dieccia clafs of plants; and in the ratural method ranking under the 38 th order, Tricocca. The male calyx is pentaplyyllons, the corolla yentapetalous: the calyx and corolla of the female as in the inale; the Ityles are three, and the capfule is talocular with a finglefeed. There are three fpecies, all of them natives of warm climates. They are evergreen hrubby plants, rifing fix or eight feet ligh, gernithed with limple leaves, and greenilh-white quinquepetalous howers. They arc propagated by cuttings in fpring or fummer, planting them in pots of light darth, plunged in a hot-bed. The plants mult always be kept in a ftove.

1) Wright, in his aecount of the medicinal plants of Jamaica, fays that the cluffe elutheria is the fame as the calcarilla and eleatheria of the thops. Other medical writers have fuppofed them to be diftinct balks, and they are fold in the fhops as different pro-
ductions. Liunreus's croton cafcarilla, Dr Wight ousferves, is the wild rofemary fhrub of Jamacia, the bark of which has none of the fenfible qualities of the caf. carilla.
CLUVIER (Philip), in Latin Cheverius, a celebrated grographer, born at Dantzic in 1580 . He travelted into Poland, Germany, aud the Netherlands, in order to ftudy law; but, being at Leyden, Jofeph Scaliger perfuaded him to give way to his genius for geograply. Cluvier followed his advice, and for this purpofe rifited the greater part of the European fates. He was well verfed in many languages; and whereever he went, obtained illilitious fricnds and protectors. At his return to Leyden, he taught there with great applaufe; and died in 1623 , aged 43 . He wrote, 1. De tribus Rheai alveis. 2. Germania antiqua. 3. Sicilia antiqui. 4. Italia antiqua. 5. Introduatis in univerfom Gecgrabibien. All juitly efteemed.

CLYDE, a river in Scotland, which, arifing in Annandale, falls into the fea over againtt the ifle of Bute. Next to the Tay, it is the largeft iiver in Scotland; and is navigable for fmall craft up to Glafgow. The canal, which joins the Forth, falls into it a little below that city. The cataract called the Fritb of the Clyde, oppolite to Lanark, is a great natural cuniolity, and the firft fcene of the kind in Great Britain. This tremendous fleet of water for about a mile falis from rock to rock. At Stone-byers, the firlt fall is about 60 feet ; the laft, at Cory-Lynn, is aver foild rock, not lefs than 100 feet high. At both thele places this great body of water exhibits a grander and more interefting fpectacle than imagination can poffibly conceive.

At Cory-Lynn, the falls are feen to mof advantage from a ruinous pavilion in a garden, placed in a lofty fituation. The cataract is full in view, feen over the tops of trees and bufhes, precipitating itfelf, for an amazing way, from rock to rock, with fhort interruptions, forming a rude flope of furious foam. The fides are bounded by valt rocks, clothed on their tops with trees: on the fummit and very verge of one is a ruined tower, and in front a wood over-topt by a verdant hill. A path conducts the traveller down to the beginning of the fall, into whiels projects a high rock, in floods infulated by the water; and from the top is a tremendous view of the furious fream. In the cliffs of this favage retreat the brave Wallace is faid to have concealed himfelf, meditating revenge for his injured country.

On regaining the top, the walk is formed near the verge of the rocks; which on both fides are perfectly mural and equiditant, except where they overhang: the river is pent up between them at a diftance far beneath; not rumning, but rather fliding along a floney bottom tloping the whole way. The fummits of the rock are wooded; the fides fmooth and nalsed; the ftrata narrow and regular, forming a flupendous natural mafonry. After a walk of above half a mile on the edge of this great clafin, on a fudden appears the great and bold fall of Boniton, in a foaning-heet, farprojecting into a hollow, in which the water flows a violent agitation, and a wide extending mitt arifes fror the furface. Above that is a fecond great fall ; two leffer fucceed: beyond them the river winds, grows more tranquil, and is feen for a conkderable way,
bounded

[^4]
## 

Clymene bounded on one fide by wooded banks, on the other by II rich and fwelling fields.

The great fall of Stone-byers, firt mentioned, has more of the horrible in it than any of the others, and is feen with more difficulty : it confilis of two precipitous cataracts falling one above the other into a valt chafm, bounded by lofty rocks, forming an amazing theatre to the riew of thofe who take the pains to defeend to the bottom. Betwen this and Cory-Lynn there is another fall called Dundoffin.

CLYMENE, in fubulous hitory, the danghter of Oceanus : who, being beloved by Apollo, he had by her Phaciton, Lampatia, Eght, and Phebe. See Phaeton.

Clypeola, treacle-muspard: A gemus of the filiculofa order, belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 39th order, Siliquofe. The filicula is emarginated, orbiculated, comprefled plane, and decidnons. There are two fpecies, both natives of Fiance, Italy, and the warn parts of Europe, but hardy enough to bear the winters in this country. One of them is an annual, and the other a perennial plant; both are low and herbaceous, bearing fpikes of white flowers. They are propagated by feeds, which fhould be fown in autumn where they are to remain.

CLYSSUS, an extiact prepared, not from one, but feveral bodies mixed together: and, mong the moderns, the term is applied to feveral extracts prepared from the lame bouly, and then mixed together.

CLYSLER, is a liquid remedy, to be injected chiefly at the anns into the larger inteflines. It is ufually adminilkered by the bladder of a hog, theep, or ox, perforated at each end, and having at one of the apertures an ivory pipe faftened with pack-chread. But the French, and fometimes the Dutch, ufe a pewter fyringe, by whieh the liquor may be drawn in with more eale and expedition than in the bladder, and likewife more forcibly expelled into the large inteftines. This remedy honld never be adminitered either too hot or too cold, but tepid; for either of the former will be injurious to the bowels.

Clyters are fonetimes uled to nourifh and fupport a patient who can fwallow little or no aliment, by reafon of fome impedinent in the organs of deglutition; in which cale they may be made of broth, milk, ale, and decoctions of balley and oats with wine. The Englifh introduced a new kind of clyiter, made of the fmoke of tobaceo, whiel has been uled by feveral other nations, and appears to be of confderable efticacy when other clyfters prove ineffectual, and particularly in the iliae paftion, in the berniz incarcorata, and for the recovery of drowned perfons.

CLYTEMNESTRA, in fabulous hilory, the daughter of Jupiter and Leeda. She married Agamemnon ; but while that prince was at the fiege of 'lroy, fhe had an amorous intrigue with Agilthus, whom the engaged to murder Agamemon at his return oo his dominions. Her fon Oreltes, however, revenged the death of his father by killing Etrilthus, with his mother Clytemnellra; but was afterwards haunted by the Furies as long as he lived.

CLyTiA, or Clytie, daughter of Oceanus and Tethys, beloved by ipolio. She was deferted by her
lover, who paid his addrefies to Leucothoe; and this fo irritated her, that the difcovered the whole intrigue to her rival's father. Apollo defpifed her the nore for this; and the pined away, and was changed into a llower, conmonly ealled a fom-fower, which yill turns its head towards the fun in his courfe in token of her love.

CNEORUM, widow-wall: A ganus of the monogynia order, belonging to the triandria clafs of plauts; ant in the natural method raking under the 3 ith order, Tricocca. 'The calys is tridentated; there are three equal petal3, and a tricoccous berry. There is but one (ijeecies, a little evergreen and very ornamental fhrub, adorm. ed with fimple leaves, and tripetalous flowers of a pale ycllow colour. It is propargated from feeds, and requires no wther care than to be kept free from weeds.

CNICUS, blessed-thistee: A genus of the polygamia zecualis order, belonging 20 the fyugenefia elafs of plants ; and in the natura! method ranking under the 49 th order, Compofice. The calyx is ovate, imbricated with fpinous-bianched fcales, and encircled with bractex. The florets are equal. There are fe . ven Species, of which the only remarkable one is that uled in medicine under the nane of carduas beneditus. This is an annual plant cultivated in gardens: it flowers in June and July, and perfects it leeds in antumn. Fur medical purpoles the plant fhould be gathered when in flower, dried in the thade, and kept in a very dry airy place, to prevent is sotting or growing mouldy, which it is very apt to do. The leaves have a penetrating bitter talte, not very ftrong or durable, accompanied with an ungrateful flavour, which they are in a great meafure freed from by kteping. Water extracts in a little time, even without heat, the lighter and more grateful parts of this plant ; if the digeltion is continued for fome hours, the difagreeable parts are taken up; a flrong decoction is very naufeous and of fenfive to the flomach. Rectified fpirit gains a very pleafant bitter tafte, which remains uninjured in the extract. The virtues of this plant are little known in the prefent practice. The naufeous decoction is fometimes ufed to provoke vomiting; and a trong infufion to promote the operation of other emetics. But this elegant bitter, when freed from the offenfive parts of the herb, may be advantageounly applied to other purpofes. Dr Lewis informs us, that he has experienced excellent effects from a light infufion of cardaus in lofs of appetite, where the itomach was injured by irregulavities. A ftronger infufion made in cold or warm water, if drunk freely, and the patient kept warm, occafions a plentifnl fweat, and promotes all the fecretions in general. The feeds of the plant are alfo confiderably bitter, and lave fometimes been ufed with the fame intention as the leaves.

CNJDUS, (anc. geog.) a Greek town of Caria: fituated on a horn or promontory of a peninfula. It lad in front a double port, and an ifland lying before it in form of a theatre, which being joined to the continent by moles or caufeways, made Cundus a Dipolis or double town, (Strabo), becaufe a great number of Cnidians inhabited the illand. Paufanias mentions a hridge which joined the ifland to the continent.Cnidii, the peopl:- Cuitius, the epither. - Cnidia Vea nas, a principal divinity of the Cnidians, (Horace!. 1

Enefine, Fer fatue was exccuted by Praxiteles; and fo exquifitcly done, and to much admired, that people came from all parts to view it, (Pliny). Of this place was Fudonus, the famous altronomer and geometrician, who had here an oblervatory, (Strabo).

CNOSSUS, or CNosus, anciently called Cerator, from a comnominal river rumuing by it ; a city of Cicte, 23 miles to the eaft of Gortind, (Patinger). Here itood the fepulchre of Jupiour, the famons latyysinth, and the palace of Minos a very ancient king; bere happened the adventure of Ariadue his danghtur with 'lluelens, called Grofos, (Ovid). Its port-town was Weraclean, on the eat lide of the ifand.

COACFI, a vehicte for commodous iravelling, fafpended ou leathers, and mored on whecls. In Birtain, and throughont Europe, the conches are dramn on horfes, except in Spain, where they ule males. In a part of the ealt, efpecially the domianons of the ereat Mogul, their codches are drawn by nxen. In i)enmark ther fornetimes yoke rein-deer in their conches; though rather for curiofity than ufe. 'The coachman is codinarily placed on a leat raifed before the body of the coach. Wat the Spanifin policy has difplaced him in that country by a royal ordonnance; on occalion of the Duke d'Ohvares, whe foued that a very important fectet, whereon he had conferred in his coach, fad been overheard and revealed bv his conchman: fince that time the place of the Spanith coachman is the fane with that of the French ftage-coachman and ons poltifion, viz. on the frlt horfe on the left.

The invention of coaches is owing to the French: vet coaches are not of any great andiquity, even in France, fearee reaching beyond the reign of their Prancis I. Their ufe, at their firtl rife, was only for the country: and anthors wblerve, as a thing very firigular, that there were at firf no more than two coaches in Paris; the one that of the quetn, and the other that of Diana natural daughter of Henry II. The firit courtier who had one was Jan de Laval de Bois Dauphin; whofe enormous bulk difabled him from tavelling on horleback. One nay hence judge how much variety, luxury, and islenels, have grown upon onjr hands in later days; dree being nowemputed in that tame city ro lefs than $15, \mathrm{coo}$ coacles.

Coaches have had the fate of ail other inventions, to be bought by degrees to their perfoction; at prefent they feem to want mothing, either with regard to cafe or magnificence. Louis XIV. of France made feveral fumptuary laws for sethraning the excefine richnets of eoaches, prohibiting the whe of gold, hlver, \&ec. therein; but they have hat the fate to be neglected.

By the act 25 Geo. Ill. c. 47 . former daties on coaches, 太ic. are repealed, and the following charged in lieu tho reof, mamely: For every coach, berlin, landau, chariot, calah, with fun wheels, chaile masine, chaile with four wheels, and caravan, or by whatever name fuch earriages may be called, kept by any perfon for his nwn ufe, or to be let out to hire (Except hackney coaches), thall be paid the yearly fum of L. 7 . And for exery calath, chaife, chair, gig, or whifkey, or by whatever name they are known or called, having iwo or three wheels, to be drawn by orse or more horSes, that hall be kept by any perfon for lis own ufe, or to belet out to hire, the yearly fum of L. 3, 10 .

Every maker of coaches, chaife, chariots, ǐc muk,
from and after the fifth day of July 1785 , take out at the excle office in London, or of their argents in the conotry, a licence to be rencued admally at lealt ten days before the expiracion of the former, for which they nuit pay 20s. They muft ahr pay 203 duty ferevery four-wheeled carriage newly beilt for fale, and los, for every two wheel carringe. Thefe duties are aloo payable to the commifioners of the excife in town, or their agents in the country.

Coach-makers in seotland are to take out their licences and paty the duties to the commiffoners of $6:-$ cife in Edinburgh, or their ageuts in the country of that part of Great Britain.

Lesery coach-maker neglecting to take out a lieence, and resewing the fune annally, forfeits L. 10 ; and negrecting or tefuliog to fettle every fix weeks, in the manmer paticularly directed by the act, is a torfeiture of $1, z 0$.
llackney-Coseras, thole expoled to hire, in the ftects of Londos, and fome other gleat cities, at rates fixed by authority.

One thmufand hackney-coaches are allowed in London and Wetminter; which are to be heenied by commithoners, and to pay a duty to the crowa. They are all mombered, having their numbers emeraved on tis plates fixed on the conch-doors. Their fares or rates are fixed by act or parliament ; and by a late act have been increaled in confequence of a new weckly tax.

Stare-Conches, are thate appointed for the conveyance of travellers from coecity or town to another. The satters of ftare-coaches are not liable to an acion for things loll by their coachmen. Who have morney given them to canty the goods, bulels where facin matler takes a price for the came.

Perfona keeping any cuach, herlin, landan, or other carriage with four wheds, or any caldh, waife, clair, or other earridge wih two whede, to be cmployed as public llage coaches or carriages, for the purpofe of conveying paffengers for lure to and from different places, fhall pay annally 5 s. for a licener : and no perion fo liended Mall by vinue of one licence keep roore than one cariage, under the penaley of L. 10.

Nail-Costhss, are flage-coaches of a particular confruction to prevent overtains; and for a celtain condideration carry his Majelty's male, which are protected by a gurd, and fubjeit to the regulations of the pott-ofice. They are puinted as to their time of arnival and departhet, are reltricted to four intide pafeners, and from experionce have proved wey beneficial to the commerce and correfpondence of this country. Juhn Palner, Efq; whe has the merit of the invention, and been indefatigable in bringing the ellablihment to a permanert footing, has been gieatly patronifed by givernment ; and fot, as the reward of his ievice, a handfome appointment in the general pult-office London.

Coach, or Conen, is alfo a fort of chamber or apartment in a large this of war near the hern. The floor of it is formed by the altmolk part of the quarter-deck, and the roof of it by the poop: it is generally the habitstion of the captain.

COADUNA' ${ }^{\prime} E$, in botany, an order of plants in the frasmenta metbodi natoralis of Linureus, in which he has thefe genera, viz. annona, liriodendrum, magnotia, uvaria, michelia, thea.

COAGULATION, in chemitry, is performed by

## $\mathrm{C} O$ A $[87] \quad \mathrm{C} O \mathrm{~A}$

coagulum fix different agents; and by each of thefe in feveral III different manners. I. It is performed with water, by eongealing, cryftalliping, and precipitating, as in the mercurius vita and fome other preparations. 2. With oil, which, by the force of fre, unites with fulphar, falis, and metals. 3. With alcohol, upon the fpirit of fal ammoniac, the white of exgs, the ferno of the blood, \&ec. 4. With acid ard alkali growine folid together, as in the tartarum vitriclatum. 5. With lixed alkali, as in milk. And, 6 . With acid falts; as in milk, 「erum, and the whites of eggi.

COAGULUM, is the fame with what in Englim we call runnet, or rather the curd formed thereby.

COAKS. Fur the exciting of intenfe heats, as for the fretting of irot ore, and for operations where the acid and oily particles would be detrimental, as the drying of malt, fofil-coals are previouny chanes, or reduced to oolos; that is, they are made to undergo an operation fimilar to that by which charcoal is made. Pey this nperation coals are deppived of their phategm, their acid liquan, sad part of their Enid oil. Coalks, therefore, con'ing of the two mond fixed conflituent parts, the heavy oil and the earth, turether with the acid roncuete falt, which, chough wolatik, is difiolued by the oil and the earth.

COAL, among chemifts, fyonifies any fulntance enntainine cill, which has been expofed to the fire in clofe veffels, fo that all its volatile principles are ix. pelled, and that it can fuftain a red heat withont further decompolition. Coal is commonly frulid, black, very dry, and confiderably hard. The ip eific elaaratter of perfect ciol is its camcity of buming with accefs of air, while it beenmes red-lint and fptrbles, fometimes with a fenfrtle fame which gives little light, with no fmoke or foot capable of blackening white bodies.

Coal is capable of communicating its inflummable prineiple, either to the vitriolie acil with which it forms fulphur ; or to the nitroue acid contained in nitre, which it inflames : or to metallie earths, which it reduces into metals. But the phlogitun cannot pafs from coal to form thefe new combinations without the affiltance of red-heat. Coal feems to he an unalterable compound in every inflance but thofe mentioned, of burning in the open air, and of commuricating its phlogition to other bodies: for it may be expofed in clofe veffls to the moll violent and long continued fire without fuffering the laft decomp fition. No difpofition to fufe, nor any diminution of weight, can be per-ceiv-d It is a fabtance exceedingly fixed, and perhaps the mole refactory in nature. It refills the action of the moll powefful mitnfleua, liver of fulphur alone excepted. Coal is cvidently a refult of the deempofition of the compornd bodies from which it is ubtained. It confits of the greatert part of the earthy principle of thefe compound loodies, with which a part of the faline principles, and fome of the phlogiton of the decompord oil, are fixd and combined very intimately. Cual can never te formed bar by the fhlogifion of a body which haw been in an oily flate: hance it cannot be formed ly fulphur, phoifhorus, metals, nor by anyother fubflance the phlogiflua of which is wot in an oily flate. Alfo every oily matter treated with fire in ciofe veffels, furnithes true conal; for that mhenever a charry refiduan is left, we may be certain
that the fubtance employed in the operation contained oil. Lally, the inflimmable principle of eval, alcho' it proceeds from oul, certainly is not cil: but pare phlogiton: lince cond added to vitriolic acid can form fulphur, to phofphosic acid can form phofphorus, Sic. and fince oil ean produce none of thefe cffects till it has been decompoled and reduced to the itate of cual. B-ides, the phenomena accompany ine the burnug of coal are different from thone which hipport when ally fubtances ale burnt. The fime of charcoal is not fo binght as that of oil, and produces no flane or foot.

All the phlagition of coal is not burnt in the apen air, particulaty when the comburion is aso. One part of it eshales without decompofition, and forms a vapour, or an invifible and infeutible gas. This vapour (which is, or at leaft contains a great dical ofo fixed air.) is found to be very pernicions, and to affect the animal fyhem in fuch a nanuce 2.5 to oceafion death in a very fuort hine. For thio reafon it is dangerous to remain in a cl fe place, where chareoal or any other fort of coal is bumt. Perfons fruck by this vapour are fturned, faint, fuffer a violent headachs and fall down fenielefs and motionefs. The bell methat of recoveling them is by expofure to the open air, and by making them fwallow vinegar, and breathe its fleam.

Amongt conls, fume diferences are oblervable, which proceed from the difetence of the bodies from which they are made: fome coals, pirticularly, are more combnatible than others. This combulibility feems to depend on the greater or lefs quantity of faline principle they contain; that is, the more of the Faline prineiple it contains, tha more eafity it decompofes and burns. Tor example, coals made of plants and wood contaning much faline matter capable of fixing it, the aflyes of which contain much alkaline falt, burn vigoronfly and produce mueh leat; whereas the cozls of animal matters, the falise principles of which are volatile, and cannot be fixed but in fmall quantity, and the zhes of which cuntaia little or no falt, are fearcely at all combuntible. For they not onlj do rot lindle fo ealily as clarcoal does, nor ever burn alone, but they cannot be reduced to aftes, withont very great trouble, even when the moft effectual methods are ufed to facilitate the combuftion. The coal of bulloeks blood has been kept for fix hours very red in a flallow erucible, farrounded with burning charccal, and conilantly thirred all the time, that it might be totally expofed to the air; yet could it not be reduced to white, or even grey, athes: It fill temained very black, and full of phlogiton. The coals of pure oils, or of concrute oily fublances and foot, which is a kind of coal raifed during inlammation, are as difficultly reduced to athes as animal conls. Thefe couls contain very listle fuline mater; and their athes yield no alkali. The coals which are fo diffentel) burnt, are alforefors capable of infaming with nicre than others more combuntible: and fome of them even in a great meafure refilt the action of nitre.
COAL, in mincraosy, a kird of folid inflammable fubfance, fuppofed to be of a bituminous nature, and commonly ufed for fucl. Of this fablance there are varions fpecies.
I. I'ti-coal (Lithanthax), is a black, foild, eompact,

## C O A

Cont. pact, brittle mas, of moderate harduefs, lamellated fructure, more or lefs hining, but feldom capable of a good polim: and does not melt when heated. According to Kirwan, it confilts of petrol or afphaltum, intimately mixed with a fmall portion of earth chiefly argillaceous; feldom calcareous; and frequeutly mixed with pyrites. A red tincture is extracted from it by flinit of wine, but cauftic alkali attacks the bituminous part. From fome forts of it a varnilh may be made by means of fat oils. Fixed alkali has never been found in any kind of it, nor fulphur, unlefs when it happeas to be mixed with pyrites.-None of the vasious linds are found to be electrics per fe (A).

The wariet ies of lithanthrax, enumerated by Crontedt, are, I. With a fmall quantity of argillaceous earth and vitriolicacid. It is of a black colons, and hining texture: it lums, and is moftly confumed in the fire, but leaves, however, ? fmall quantity of afhes. 2. Slaty coal.
2. Cum roal, called hoom, by the Swedes, has a greater portion of argillaccous earth and vitriolic acid, with a moderate proportion of petrol. It has the fame appearance with the foregoing, though its texture is more dull: it burns with a flame, without being confumed, but leaves behind it a fars of the fame bulk with the original volume of the coal. The following is Mr Lirwan's defcription of it from the memoirs of the Stockholm academy. "Its fracture has a rougher fection than the camel coal; its fpecific gravity from 1300 to 1370 . The beft kind affords by diftillation, at frit fixed air, then an acid liquor, afterwards intlammable air, and a light oil of the nature of petrol; then a volatile alkali; and lattly pitchoil. The reliduum is nearly three quarters of the whole; and being flowly burnt, affords 13 per cent. of athes, which confift moftly of argillaceous earth; and about three hundredth parts of them are magnetic. It is found in England, and among fome aluminous ores in Sweden."
3. Shatecoal contains fuch a quantity of argillaceous earth, that it looks like common flate: bowever, it Durns by itfelf with a flame. M. Magellan is of opriuion that this is the bituminous fublance already defrribed (fce Clay, p. 51.) This fchiftus is of a dark bluith rufty colour ; when thrown on the fire it hurns with a lively flame, and almott as readily as the oily wood of dry olive tree, or lignom vita; emitting the very difagreeable fmell of petrol. Such large quarries $\mathrm{N}^{\mathrm{j}} 83$.
of it are fonisd near Ptirbeck in Dorfethire, that the poorer part of the inhabitants are thence fupplied with fucl. From the appearance of this laty coal, CronAtedt has been induced to fuppofe that the earth of all kinds of coal is argillaceous, though it is not fo eafy to diflinguifh it after being burnt. The pit-coals, he fays, contain more or lefs of the vitriolic aciel; for which reafon the fmoke arifing from them atacks filver in the hame manner as fulphor does, let the coals be ever fo free from marcafite, which, howerer, is often imbedded or mixed with them.
4. Cannd coal (Ampelites), is of a dull black colour; breaks ealiy in all directions; and, if broken tranfverfely, prefents a fmooth conchoidal furface. It bums with a bright lively flame, but is very apt to Hy in pieces in the fire; howerer it is faid to be entirely deprived of this property by immerlion in water for fome hours previous to its being ufed. It contains a confiderable quantity of petrol inna lefs condenfed tate than other coals. Its fpecific gravity is about 1.270 . This kind of coal, being of an uniform hard texture, is eafily turned on a lath, and takes a good polifh. Hence it is ufed for making various toys, which appear almot as well as if made of the finett jet.
5. Kilkenny coal is the lightent of any ; its fpecific. gravity being only about 1400 . It contains the larfreft quantity of afphaltum ; burns with lefs fnoke and tlame, and more intenfely, though more flowly, than the cannel-coal. The quantity of earth it contains does not exceed one twentieth past of its weight; but this kind of coal is frequently mixed with pyrites. It is found in the county of Kilkenny, belunging to the province of Leinfter in Ircland. The qualis $y$ of it as burning without fmoke, is proverbially ufed as an encomium on the county.
6. Sulphureaus coal confifts of the former kinds mixed with a very confiderable portion of pyrites; whence it is apt to moulder and break when expofed to the air, after which water will act upon it. It contains yellow fpots that look like metal; burns with a fulphureous finell, leaving behind it either flag or fulphureous allues, or both. Its fpecific gravity is 1500 or more.
7. Duray coal (Nylmonthas), is of a brown or brownifh black colour, and of a yellow laminar texture. lts lamine are frequently flexible when fint dug, though they generally liarden when expofed to
(A) "The varieties of this conl (fays Mr Magellan) are very numerous according to the different fubflances with which it is mised; but in regard to their ceonomical ufer, only two kinds are taken nutice of by the Britifh legifature, viz. culm and caking coals. The caking coals, in burning, fhow an incipient fufion, fo that their fmalletl pieces unite in the fire into one mafs; by which means the fmallet pieces, and cren the mere duft of this kind, are almon equally valuable with the larget pieces. The other fort called culn, does not fufe or unite in the fiercelt fire ; fo that the fmall coal, being unfit for domeftic pur pofes, can only, pe ufed in burning limeftone.
" It hould be an eafy matter for any perfon to dittinguifh culn from fmall caking coal, either by trying to make fire with it in a common grate, without iuterpofing any other fuel between it; when it kindles, it is a caking coal; if not, it is culm: Or by putting fome of thefe fmall fragments of coal on an ignited iron thowe ; if they melt and sun torether, they belong to the caking kinds; if not, they are culm. But it feems that coal merchants are now in the cuflom of calling culm the powdery parts of pitcoal, of whatfoever kind they may happen to be. The reafon of this is, that there is a difference in the duty payable by culn and by caking coals. There never was any difficulty, however, on the fubject; nor would there be any difficulty in collecting the tax, werc it not for the infufferable ignorance and love of defpotic oppreflou whith gentrally pervece the undeling oflicers of the revenue."

## $C O A$

Coul. the air. It confits of wool fenetrated with petrol or bitumen, and frequently contains pyrites, alum, and sitriol. According to the German clemitts its athes contain a little fixed alkali ; but Mr Mills dificrs from them on this fubect. By difillation it yields a fetid liquor mixed with a volatile alkali and oil ; part of which is coluble in fpirit of wine, and part of a mineral nature, and infoluble. It is found in almolt all the countries of Europe.
Thefe are the molt confiderable varicties of coals commonly krown; but we mult not imagine that each of them is to te met humogeneous in thofe phaces where they are found. On the contrary, the difierent qualities and proportions of their ingredients make a walt number of other varieties, lit for different purpofes, according to the quality and quantioy of thofe ther contain. Thus, rarious kinds of coals are often foom wised with one another under ground; and fome of the finer forts foratimes run like veias hetween chofe of a cearer kind. Thus, M. Magellan obferved in the fine coals employed in a curious manulectory at Birmingham, that they produced a much clearcr flame than he had ever obferved from common coal: yet, on inguiry, be found that thefe were picked ont from the common coals of the countri, through which they ran in reins, and were ealily diftinguifhed by the mandacturers, though they did not afford fuffecient indications of a lpecific difference. The parpofe to which they were applied was the moulding rods of tranfparent and coloured glafs into the fhapes proper for common buttons; which they performed with attonithing expedition.
loureroy remarks, that this fulfil bitumen, when heated in contact with a body in combution, and having a fre: accefs of air, kindles the more fowly and with the greater difficulty in proportion as it is more wighty and compact. When once kindled, it eraits altrong and durable heat, and burns for a long time lefore it is confuncd. The matter that is burncel, and produces the tlame, appears very denfe, and feems united to fome othor fubitance which retanis its deItruction. On burning, it cunito a particular itrong fmell, which is not at all fulphureous when the coal contains no pyrites. When the combutible, oily, and other volatike parts of the coal are difipated, if the combution be then Aoppd, the remainder is found to be reduced to a true charred flate, and is called cook. This fubltance is capatle of exciting the moll intenfe heat, for which purpofe it is nfed in metallurgic works all over Mritain.
" It is well known (Gays M. Magellun), that the Enclith method of burning pit-coat int a conk has leen a moll profitable and happy acquiftion for the fimelting on ores, and for many other metallurgical and chemical proedes in this ifland. But the ingenions and arlvantageons undertaking of lord Dundonald, by which he twons to a very conflerable profte the mines of coals in his and other eflates, building ovens of a proper conflruction for burning pit-roal into coak, and at the fame time for collectiod, in feparate receptacks, the valutile alkali, cil, tar, and pitch, which were erencrally loit by the ufual mathod, delerves to be noticet, as it alfords a very demarkable inlence of the great loffes to mankind, for want of carefully attending to every refult from great proceffes of ant - Vol. V. Pari L.
whea made on a large feale. Thefe ovens are fo contrived, as to admit an mater fupply of air: amb the coals, after becing kimater, deromphe thenfelven by a
 Atroy the ingredients. The reflam left in the wen proves to be moft cacellent cinders on combs: whilt the volatike parts, which othowite would be diflipated in the air, are feparated and comdenfed in refersens, or receptacles of capacions fi\%e, placed at proper diftances beyond the reach of frice. Monf. Faujatio St Fond, who vifical thefe works in a tuip he made to Scotland, undertook to erect a frmilar liind of oren in France: and it is rather fingular, that he cndeaverns to ettablith a clain of having difcovered the fame procefles before he faw them in Scotland; as if it did not reflect a greater honour on his induftry, to carry back to his conntry fome ufeful knowiedge, than to retarn as ignorant as our Englifh traveliers," \&c.

On fubjecting pit-coal of any kiad to dilillation in clofe vefels, it firit yields a phlerm or watery liquor: then an cthereal or volatile oil; afterwards a volatile alk:lif ; and lafty, a thick and greafy oil: but it is remarkable, that, by rectitying this tut oil, a tranfparent thin and light ofl of a fraw colour is produced, which being expoied to the air becomes black tike animal oils. From this and other obfervations, the general opinion is, that all coals, bitumens, and other oily fubtances found in the mineral hinguom, derive their origin from vegutables buricd in the carth; fince it is weil known that uny organifed bodies have the power of protucing oily and fat mbllances. "The amzing irregulanitics, gaps, and breaks (ays AI Na.chtri) of the flrata of coals, and of other foffice fulinanees, evince that this globe has andergone the mol? vilent convulfons, by which its parts have been broken, detached and overturned in different ways. buryiag large trakts of their upper furfaces, with all the animal and regetable productions there exiling, at the time of thofe horrible cataftrophes, whofe epoch far precedes all haman records. And it is ealy to be conceived, that the various heaps and congerics of thefe regetable and animal fubitances, remaininy for ages and ages in the bowts of the earth, have obitained yarions condiftencies, and itill produce thofe oily and bituminous juices, which find way to guh out, leaving behind their thickett parts on the fara places where they' are found, and in many others where the indutry of mankind never will be able to penetrate."

Coul-Minz See Coalery. - Malianafly fetting fire to coal-mines is flony, by llat. ro. Geo. II. c. 3 z. $\$ 6$.

Small Coit, a fort of charcoal prepared from the fpray and bruthwood flripped of from the brauches of coppice wood, fonetimes bound in bairns for that purpufe, and fonetimes charred without binding, in which cafe it is called " coming it together:"

COALERT, Comaiery, of Collery; a coal- fory of work, or place where Coals are dug.

It is gencrally agreed, that our cangel-orna * is the " See Atmo lapis ann lites of the Romans: though it foms to dows. have been ufed by them only for makiag tors, tracelets, B.c. The extentive bed＇s of fut ，therefore，with which the kingdom of England and the precincts of Mancheter are fo liappily fored，were tirft noticed by the lkill， and tirtt opened by the lebour of the Britons；and fume time before the arrival of the Romans among us． And the nearer quarries in the conines of Lradford， Newton，and Manchefter，would natumally attract the notice，and invite the inquiries，of the britons，before any others．The curent of the Medluck，which withes the Sdes of them，would brine down Specimens of the riches within，ludge many of them about the Calletide，and allure the Batons fucereffely io a cel－ Letion of the one aad a fearch after the other．

Bu：，even for agestifer the difovery，wood continu－ ed to compofe the general nume of the nation．In 852 ， a grant as mide of rome la：doty the abbey of Pcier－ turongh，under the reforvation of certain buons and parmates in kird to the morallery；as，one night＇s entertaitment；io veffelo of Welfh and two of com－ mon ale；（o cart－le alle of wod；and 12 of pit－coal ； where ac fee the cuan：ity of coal was enly one cart－ load to bive of word The latier maturally continued the princtple aiticle of our fue as long as the forths and thichets pretertat thensties fo ready to the larel：and foch it contisutd tili a very hate period． The firt public notice of the former is monstioned by

Mr Iume to have been in the time of Henry III．who
Coalery in the year 1272 ，granted a charter to the town of Neweatle，giving the inliabitants a licence to dig coals： ard the firil fatute relating to chis article was the 9 Ifory $\mathrm{V}^{\circ}$ ．c． 10 ．ordaining all kets in the port of Neweafle to be meatured by commifioners，before carriage of coals，on pain of forf iture．＇They were not brought into common afe till the reign of Comes $I$ ． and were then fold for about 17s．a clialdron．In Camplell fome $y$ ears after the rellotation，there were about loifical 200,0 coc clakdrons burnt in London；in 1670 ，about ${ }^{\text {Surveg．}}$ 270，00 clabdrons；and at the revolution，upwads of 300,200 chadoms；and at prefent，full Gov，000 are annuall＇confumed there．＇There is，befides，an im－ menle confumption in other parts of Britain，and in Iftand．In Sentland，they fupply their own confump－ tion，and alfo export．In Irtland，though they have cuai，yet they take annually to the value of 30,0001 ． from Ergland，and 12，0001．fiom Scotlend．

The moft remarkable cualery，or roal work，that we have ever had in this inand，was that wrought at Bur－ ruwfonnotis，under the fa．＇Ihe veins of coal were found to continue under the bed of the fra in this place， and the colliers had the courage to work the vein near half way over；there being a mote half a mile from the fhore，where there was an entiy that went down ints the coal－pit，under the jea．This was made into a kind of round key or more，as they call it，built fo as to keep ont the lea，which flowed llene twelve feet．Here the coals were laid，and a hip，of that draught of wa－ ter，could ley her fide to the mote，and take in the coul．－This bamous colliery belonged to the earl of Kincardine＇s fami Is．＇The frefl waier which fprung from the boitom and fodes of the coal pit，was always dawn us upow the fare by an engine mowed by wa． ter，hat cirew it forty fathom．＇This cual－pit continued tw he wought many years to the great profit of the owners，and lase womler uf all that faw it；kut，at latt，an unexpected high tide drowned tie whole at once：the labouters had not time to efcape，bnt perifh－ ed in it．
＇There atc feveral other countries in Europe which poffefo confiderable cona－mines；as Fiance，Liege， Germany，and Sweden．Aito on the other fude of the Atlantic ucean，there lias been coal dilcovered，and wrught ；in New roundland，Cape－Breton，Canada，and fome tf the Now－England prowinces．But in all thefe Excelitec countries，the cral is of a quality much inferior to the of the Br． Brici便，addenthely unft to be ufed in mary manu－tifa coals factures；fo that they are obliged to import great g．antities from Bitain for the ufe of their manufac－ tures of iron，\＆c．

Our inland coa！trade，that is，carrying coals from importar Newcaltle，Sunduland，Blith，and other adjacent of the co places ia the nort！of Ergland，as alfo from the frith trade． of Edinburgh in Scotland，and other places thereabouts， to the city of London，and to the port－towns on the coalt all the way，as well on this fide of Newcalle， north，as up the channel as high as Purtmouth weft， is a prodigious article，and employs abundance of thip－ ping and feamen；in fo wuch that，in a time of ur－ gent neceffity，the coalery navigation alone has been able to fupply the government with a body of feamen for the roysl navy，able to man a contiderable fleet at a very fours wanning，and that without diffenly，when
no other branch of trade would do the like. Likewife wonld ane been advanced by this tim: to very great Coilerv. the Whitehaven coalerics in Cumlerland, belonging to Sir James Lowther, furnifh fewerd countics in Ir land with coale, and e.snltantly employ uperards of 2000 feamen; which alio is a noble nurlery fs the navy of this kingdom. And not only da the pit-cuals fuffieiently fopply all the parts, but, by Imcans of thofe ports and the navioble rivers, all the adjacent counties vety far imand.

In id rt, coals, though not an exchuive, yot may, with pr pricty, be Ayled a prouliar lile forso to Bitaid from their areat plenty, their acknowledesed excetlence, and their bebus fonad in fuch plases as are convenimty litnated for expontation. Nor is there any canger of the export-tade heing leffened evan by the feveral datics that have been lid up ot then: for the foreipn confumpt being fonnded in teceffity with regand to manufatures, and in aconomy uhere they are ufed for convenience (wod and turt being dearer than coals with the duty), we noed be in no lear of the narkets declinine. There is as biste ruam to be alamed from an mpphention of their beins witanted, as the prefent works are capable of fupplyine us for a long feries of years, and there are namy usher mines rady to be opened when thene mall ting Belikes, there ara known to be coals in many fants of the three singfoms, which hitherth they have had ro encouracement to wolk.

Betides the val:e of this eomemotity as a conser ieney of life, as an artide of commere, and to giving rife to a murfery of leamen for the increate of the marine; "ther impoptont adrmitares deforve t, be moticed. Coals are in many rofpects, and in a very bigh degree, uffal to the landed interell not only by raifing exceedingly the real value, and of courf the purchafe, of thole lands in which they are found, and thofe Thefeare throngh which it is necerary to pals from the wouks phatial-to the plates where they are enibaket, bur fuan the fiyled seneral improvenurets they have occaloned ; fo that
$y y-l a y$ es ifarc'er very few comncies are now better cultivated than Noras hah thumberland, and the fame effetts they have lad in a uts as any greater or lefs degree in other places. Thoufands of lided pre- laborious people are employed in a ad about the mines; thoufands more in eonveying them to the porte, and on board the thips; to fay nothing of thofe that draw their fubfitenee from the earriage of them by land to fupply families, \& that live in a funerior fation: as flewands. clitectors, fickors, agents, brok-keep-rs, \&e. To thefe we may add the extraordinary encouragement given to ingeninus artits who have invented, and the mumerous workmen continually empley about thofe feveral curions and coftly machines which, for a valiety of purpofes in this bufinefs, are in continual ufe, and of courfe in eontinual wear: we may join to thele the multitudes that obtain their living from the many manufactures in which they are employed, and which could not be carried on but by the hilp and cheapnefs of coals. Latly, the produce of coals exported, which amounts to a very confiderable fum, befides being profrable to the owners, merchants, and mariners, is fo much clear gain to the nation.

It might be expected, that a trade fo beneficial to individuals, and to the nation in general, and which las been gradually increafing forfeveral centuries paft,
prode an, and reduced to a leprular fyhem. But, in -a-d one very pfiential refpect, it is found to be guite otherwic. 'l'he art of working corb-mines in the now profitable manere is inded bighly improved : but the firiduncmal of the ast, that of forebing for and difen$\checkmark$ ringe calal in any ditriat of country where it has not yet been found, has newer, that we know of, been theated in a fyon atic matincr. 'The rea'se, there. fure, will not be difpleafed to hind theis defect tapplied in the courfe of the prefent artich, tencels. with a detail of all the wher openaions in the bufinds of coialerics.

The fernefrial mateces which compore the folid situmon of pats of the eath are difpolitl in fata, bedo, or lat-the I'satu. era, the under farface of whe bearing agamin (1. lying upon the uppat furface of thet below it, which lat beats of liss on the next buow in alec fame manaer.

Thefe thata confitl of very dificerent kinds of matter, fuch ay frec lone, lime-stons, metat-flenz ou whitntone, cual, de. as will be particulaby fpecifies in the fequel.

Sume of thefe data are of a coufurable thetanefs, teiner often funad frow 100 t. 200 fect or upwarde, rearly of the fame himd of matter from the fuperin. so the inferive finface: and sthers are found of the leat thickuefs imagindble, we iach or lifs.

All thefe trata are divided ot pancod from cacia other laterally, either by their cren, Emooth, poliffed fuffoes, att very thin lamima of foft or dutty matere betwint :'1zm, callud the forfors, which renders them eafy weparit: : or die only by de fundaoes clotely corjoined to ench other, wichout any vificle matior in. turpofed betwixt them; stt the diftirent fubltance of cach flratum is not in the loat internixud, though fometioes they afhere fo thronsly wather, that it is very dfacult in part or disjoin thom : in this laft cate they are faid so have a lad pombing.

Belides this priacipal divition er parting laterally, thereare, in fome lata, feconlary divilions or partincs aldo laterelly, feparating or approaching towands a feparation, of the fame tratum, ia:o parts of difo ferent thickneffes, nearly paralli! to each uth=r, in the fame manaer as the principal partings divide the dif. feent frata from each other: but thefe focondaty ones are mot fo itrong or vifible, nor mak: fo effectual a parting, as the principal enes do; and are only met with in fuelifrata, as are not of an unform hardoefs, texture, or coluar, from the upper to the under lurface.

There are other divifons er partingn, called factos, in almust every itratum, which erofs the former latebal ones longitulimally, and cut the whole thatum through its two furfaces into long rhumbuidal figures. Thefe again are crefled by others called cuthers, running either in an oblique or perpendicular direttom to the laf mentioncd backs, and alto cut the itratum throush its two tufares. Buth theie ta lis and chittels generally extend from the upper or fatewior flatum d un through feveral of the lowe ones: fo that the fe backs and custers, togstieer with the lateral patings before mentored. diche everr flatum into innumprble cubic, prim: tic, and rhomboidal figures, aecordine to the thicknels of the ftratum, and the posfition and number of the backs and custurs. J"hey Áz
dometimes

Couiery. fometimes have a hind of thin partition of $\mathrm{d} \cdot \mathrm{t}$ ty or foft matter in then, and fometimes none, like the firl mentioned fartings ; but the fufter kind of frata generally have mose backs and cuters than the harder kind, and they do not extend or penetraie though the otizers.

To rxplain this a litile ferther, let $\lambda, \mathrm{B}, \mathrm{C}, \mathrm{D}, \mathrm{E}$, F, (b, (dis. 1.) repetent the principhal partings before mentioned, or the upper and moder finfaces of any Aratum: then $a, l, c, d, f, f$, will reprefent the lecondary lateral patings nearly parallu to the principal ones: $\quad$ o $, h, i, k, l, m$, the lonsitudinal partings calked baks; $n, o, p, a, r, s$, the crols partinges eatled cuitios, crehing the idd mentiened oneseither oblique. ly or perpunciculi.r.

In a!l places where che arata lie regular, they are divided and fubtiviged in the manner above men. tioned; and fometimes in this manner extend through a preity lange dianict of country: though it is often otherwife; for their regulasity is frequenty iaternuptcd, and the frata breken and difondered, by fuadys cheme, bucaclues, or fifferes, which are diferently de. nominated accodine to their vanous dimentons, and the mathers with wheh they are flled, vis. dikis,
hithes, and troutles, which flall be explained in order,
Dibes are the largelt kind of filunco. Tincy feem to be nothing but a crack or breach of the folid itrata, necafroned by one part of them being broken awry and fallenf from the other. They terterally run in a Araight line for a confiderable length, and penetrate from the furface to the greatell depth ever yet tried, in a direction fometimes perpendicular to the horizon, and fometimes obliquely: the lame kind of Arata are found lying upon each other in the fame order, but the whole of them greatly elevated or depreffed, on the one fide of the dilse as on the otber. Thefe fiffures are fometimes two or three feet wide, and fumetimes many fathoms. If the fiture or dike be of any confiderable width, it is generally filled with heterogentous matter, different from that of the Solid ftrata on each fide of it. It is fometimes found filled with clay, gravel, or fand; fometimes with a confufed mafo of different kinds of tone lying edgeways; and at other times with a folid body of free-flone, or even whin-Itone. When the fifure is of no great width, as fuppofe two or three"fcet only, it is then ufually found filled with a confuled mixture of the different matters which compofe the adjoining ftrata, confolidated into one maff. If the dike runs or Aretches north and fouth, and the fame kind of Arata are found on the eaft fide of the dike, in a fituation with refpect to the horizon 10 or 20 fathoms lower than on the other fide, it is then faid to be a dip-dike or downaft-dike of 10 or 20 fathoms to the eaftward;-or counting from the eaft fide, it is then faid to be a rifedike or upcaf of fo many fathoms weltward. If the itrata on one fide are not much higher or lower with relpect to the horizontal line, than thofe on the other, but only broken off and removed to a certain diftance, it is then faid to be a dike of fo many fathoms thick; and from the matter contained between the two fules of the fiffure 6 or dike, it is denominated a clay-dike, jlone-dike, \&e.
thon. Thele hitches are denominated in the fame Coalery. manncr as dikes, according to the nurnber of feet they elevate or deprefs the ftrats.

There are dikes (though they are not often met with in the coal-countrics) whofe cavities are filled with farr, the ores of iron, iead, vitriol, or other metallic or minerai matlers; and it is pretiy well known. that all metallic vins ar? nothing elle than what in the coal cotentries arc calked dikes.

The itiuta are generally found lying apon each other in ale fame order on one fide of the dike as on the ocher, as mentioned above, and nearly of the fame thickneffes, appaaing to have been orisinally a continuation of the lame regula flata, and the dike only a breach by fome later accident, parpendicularly or obliquely down through them, by which one part is removed to a imali ditance, and depreffed to a lower fituation tian the uther. Bat this is not the only alteration made in the Ruta by dakes; for generally to a conflerable dilance on cach fide of the dike, all the Rata are in a kind of fhateced condition, very tersder, eafly pervious to water, and debaled greatly in their quality, and their iacination th the horizon ofen altered.

Troullow may be denominated dikes of the fmalleft degree; for taty are not a teal breach, but only an approdeh tuwards it which has witaken a full effect. The firata are senctally altesed by a trouble from their regalar fite to a different potition. When the regular comfe of the ifrata is neanly level, a trouble wil. canfe a tudden and confiderable afeent or dsfeent: where they have, in their regular lituation, a certain degice of afcent or defcent, a trouble tither increafeth it or alters it to a contiary pofition: and a trouble has thefe effects upon the flrata in eommon with dikes, that it greatly debafeth them from their original quality; the partings are leparated; the backs and cutters disjoined, and their regularity difordered; the original cubic and primatic figures, of which the itma were compoled, are broken, and the dillueation filled with heterogeneous matter; and the whole Itrata are reduced to a fofter and more fidable fate.

The Itrata are feldom or never found to lie in a true horizontal fituation; but generally have an inelination or defeent, called the dip, to fome particular Dip and part of the horizon. If this inclination be to the ealt- life of the ward, it is called an eaff dip, and a wepf rife; and ac- ftrata. cording to the point of the compais to which the dip inclines, it is denominated, and the afeent or rife is to the contrary point. This inclination or dip of the Arata is found to hold every where. In fome places, it varies very little from the level; in others, very confiderably; and in fome fo much, as to be nearly in a perpendicular direction: but whatever degree of inclination the flrata have to the horizon, if not interrupted by dikes, hitehes, or troubles, they are always found to lie in the firft regular manner mentioned. They generally continue upan' one uniform dip until. they are broken or difordered by a dike, hiteh, or trouble, by which the dip is often altered, fometimes to a different part of the hoizon, and often to an oppofite point; fo that on one lide of a dike, hitch, or trouble, if the ftrata have an eaft dip, on the other fide they may have an eaft rife, which is a weft dip; and in general, any confiderable alteration in the dip is never.

Coalery. met with, but what is occafonedby the circumitances lall mentioned.

To illuftrate what has been Caid, fee fig. 2. wheme $a b \in d, \xi^{\circ} c$. teprefents a courfe of frata lying upon each other, having a certain inclination to the horizon. $A-B$, is a downcalt-dike, which deprefleth the flrata obliquely to $\mathrm{ofg} k$, Gc . lying upon each other in the fame order, but altered in their inclination to the horizon. CD reprefuts a clay or frec-itone dike, where the Itrata are neither elevated nor depreffed, but only broken off and removed to a certain diflance. EF, reprefents a hitch, which braks off and depreffeth the Arata only a litile, but alters their inclination to the horizon. GH , ruprefents a tronble, where the fleata on one fide are not entirely brusen off from thofe os the other, but only in a cruhted and irregulan lituation.

As fome particular llata are found at fone times to increate, and at onher times to diminith, in their thickweffes, whits others romain the fame, confequenty they canmot be all parallel; yet this increate and dimination in their chackulfes comes on very gradually.

Tlee etrata are nof: t. kind dipufed in the canth accordins to their fpectice grawites: for we often find Itrata of wery denfe mater near the furface; and perlaps at 50 of cuen 100 fathoms beneath, we mect with itrata of not half the fpecilic gravity of the firft. A lratum of iron cre is very often fonad above one of coal, though the former has twice the gravity of the latter; and, in finurt, there is fuch an ablolute uncortainty in forming any judgment of the difousision of the ithata from cheir fpecitic gravities, thas it cannot in the lealk be relied upon.

It has been imarimed by many, that hills and val. lies are ocealioned by thofe breaches in the ftrata before mentioned called dikes: but this is contradieted by experience. If it was fo, we thould meet with dikes at the firirts of the hills, and by the fides of valleys, and the Cea-fhore; but intlead of that, we genorally find the frata lying as uniormly regular under hills and valleys, and beneath the bottom of the fea (as far as has been yet tied), as in the moft cham paign countries. It may lappen, indeed, that a dilse is met with in fome of thefe places; but that being only a cafual circumitarce, can never be admitted as a general caufe. Whatever irregularities are oceafioned in the folid ftata by dikes, or other breaches, are commonly covered over and evened by thofe beds of gravel, clay, fand, or Coil, which lie uppermolt, and form the outward furface of the earth. Whereever thefe fofter matters have been carried off, or removed by accident, as on the tops of hills and the fides of valleys, there the folid ftrata are expofed, and the dip and rife and other circumftances of them may be examined; but no certain conclufions can be drawn, merely from the unevennefs and inequaliaies of the outward furface.

The preceding obfervations, upon the general difpofition of the folid Arata, are equally applicable to the flrata of coal as to thofe of flone or other matter.

We fhall next give an account of the feveral ftrata of coal, and of done and other matters, which are ufually connected with coal, and are found to have a parcicular affinity with it : and, for the fake of dillinction, faill arrange them into fix principal claffes,
which will include all the varicties of flata that have Coalery. been fonnd th occur in all thofe dillricks of conntry bath in Scotland and England where cond abounds.

1. Of Whimgone ] 'The flata of what is demo ninatce "hin-llone are the hardelt of all othere: the angunar pieces of it will eat grals; it is of a very comrfe texture, and when broke acrofs the grain extubits the apperance of large gians of hand half vierificd; it can leanedy be wromsht, or broke in pieces, by common tools withon the affilance of enn-powder; cach ftratum is commonly lomongeneons in fubtance and colonr, and cracked in the rock to a great demels. 'The moft common colours of thefe flata are black or dark blue, yet there are others of it ath-coloured and light brown. 'Their thicknefs in all the coal commtise is but inconfiderable, from fix or five feet down to a fers inches; and it is only in a fewp places they are met with of the fe thicknoffes. In the air it decays a little, lavinge a brown powder: and in the firc it cracks, and thans roddifh brown. Limellone, and what is called laftad limglane, is fometimes, though rarely, met with in conleries. It is a well known ftone; bat from ita refemblance in hadnefs and colour is often miltaken for a lind of whin. Sometimes, particularly in hilly commites, the fulid mater next the furface is found to be a kind of foft or rotten whin;-but it may be noted, that this is only a mafs of heterogeneous matter ailpuled upon the segular ltrata; and that beneach this, all the Arata are generally found in as regular an order as where this heterogencous matter does not of. cur.
2. Of Puf-fone.] This is a free flone of the hardeft kind, and next to the limeftone with refpect to hardnefs and folidity. It is of a very fine texture; and when broken appears as if compofed of the fineft fand. It is commonly fund in a homgeneous mafs, though variegated in colour; and, from its hardaefs, is not liable to injury from being expofed to the wather. Of this kind of fone there are four varieties, which may be ditlinguilhed by their colaur: the mof common is white polt, which in appearance is like Portland tone, but confiderably harder ; it is fometimesvariegated with itreaks or fpots of brown, red, or black.

Grey poft is alfo very e mmon; it appears like a misture of tine black and white fal: it is often variegated with brown and block forako; the lalk mentioned appear like fmall clouds compoicd of particles of cosl.

Brown or yellow pof is often met with of differm ent degrees of colour ; mont commonly of the colour of lisht ochre or yellow fand: it is as hard as the reft, and fometimes variegated with white and black ftreaks.

Red pote is generally of a dull red colour: this is but rartly met wi.h; it is often Ateaked with white or black.

All thefe lie in ftrata of different thickneffes; but comnonly thicker than any other Itraia whatever: they are feparated from each other, and from other kinds of frata, by partings of coal, fand, or foft matier of different colours which are very diftinguiflable.
3. Of Sant-fonere] This is a free fone of a coarder texture than joll, and not fo hard; is fo lax as to be eafily pervious to water; when broke, is apparently of a coarfe fandy fubtance; is friable and moulders to.

Cul.
 fomall ltones inclufed in ito mafs. Of this, there are two kinds commonly met with, ditinguifud by their coneurs, grey and brown, which are of difeernt thates, lifter or daker in propontion th the mixture of white in them. It is molt generaly found in frata of confiderable thicknefs, without many feconlary partings: and fometimes, though rarely, it is Cebdivided into hyers as thin as the common grey tate. It has generally fandy or foft patings.
4. Of $A H_{e t a x}$ /ftome.] This is a toleralle bard Aratem, being in paint of hardnefs nest to fand Aore; generally follt, compar, of corfiderable weight, and of an argilliceovs fublance, containing many ucules or balls of ironore, and y llow or white pyrites: its part.
 fmonth as glafs. When broke, it tas a dull delliv appealance (though of a fine texture), like hard dried clay mixed with particles of ecal. Thoush had ia the mine or guarty, when expefed to the fieflair it falls into very frall pieces. The moll ufual colour of this ftone is black; but there are fiveral other lighter co. lours, down to a light brown or erey. It is cally ciAnguifhed from free-fone bo its texthe and colour, as well as by its other eharacteriticic. It lies in Arata of variows thiekneffes, thonith feldom fo thick as the two hat mentioned kinds of thone.
5. Of Shiver.] This Aratum is more frequently met with in cualerit, than any ulter. There are many varieties of it, both in hardnefo and colour; Lut they all agece in one general characterillic. The thack colour is mof comm $n$; it is called by the miners that? River, Wack mettit, or bleas. It is fufter than matal-ftone, and in the mine is rather a tough than a had fub. Aance, is not of a fuld or compact ratter, bcing eafily feparable, by the multude of its partings, $\& \mathrm{c}$. into very f nall parts, and readily abforbing water. The fubitance of this hatum is an induated bole, commonly divided into this lamina of uregus 1 hickreffes, which break into low frall pieces when fruck with fores; and, on cxamination, they appear to ke fmall irrecular leumb ides: each of the fe fmill picees has a polithed glafly fursace; and, when brotee evols the grain, anpears of a dry, leafy, or laminated texture, like excerding fine elay: it is very fitahe: feels to the twoh like an unctmos fubitance: and diffolves in air or water to a fine piumid hack clay. There are almof confantly foum incefod in its ftrata lumps or nodules of iron ore; often real beds of the fame.

There are cther chlours of ihis Aratum befides black. The brown or dun hiver is very trequently met with; it agrees with the ahove defeription in every thing but chome Grey fliver is alfo very common: it fems to be only a misture of the blacs and dun; and be the different deveres of mixture of thete col was others are porluced. It lies in ttrata fometimes of confiderable thicknefs, at other times not exiectins a few feet: they are commerly parted from each other ly lamina of fpar, coal, or foft matter.
6. Of Eonh.] R ferring the reader, for the feientific fivifion of enals, to Ampelites, Lithanthrax, and the preceding articles, we fhall bere confider them as
diltinguiflable into three kinds, according to their degrees of ind mmability.

1. The latt inflmmable kinds are thofe known by the name of $W^{\prime}$ 'lb coal, which is found in Wales ; Kilkenny conl, which is fund near Kilkenny in Ireland; and blind or danf coal, which is found in many parts of Soutland and Enyland. This coal takes a confiderable digree of heat to kindle it, but when once thoroughly ignited wall burn a long time; it remains in the fire in feparate pieces without ticking together or caking; is pruduceth neither flame nor fmoke, and makes no cincer, but burns to a waite fony flagg; ir makes a hot glowing fire like charcoal or cinders ; and emits epluvia of a furfocating nature which renders it unfit for burning is dwelling-houfes, its, chicf ufe being amonget maltiters, dyers, \&e. for drying their commodities. 2. Oter barning coal, foon kindles, making a Lot pleafant fire, but is foon conlumed: it produceth bush imuke and flame in abundance: but lies open in the fire, and does not cake together fo asto furm cin. ders, its furface being barnt to ahes before it is thoroughly eakeined in the midt; from this it has its rame of an ofen ly honing coul'; it burns to white or brown athes very light. Of this kind is cannel-coal, jtte, parrot, fplint, and molt of the coals in Scotland. 3. Cidafe lumning coul, kindles very quickly, makes a very ho: fre, melts and runs together like bitunen, the very finallet culm making the that cinders, which being thoroughly bernt are prous and light as a pumice Alone, and when broke are of a thining lead colun; it rakes a more durable fire then any other coal, and hially burns to bown or reddith coloured heavy athes. Of this kind are the Newealle and feseral other of the Englifl coals, and the finithy coals of Scotldul. The open burning and the cloie burning coal mixul together, make a more profitable fire for dometitic ufes that cither of them feparate.

In all thofe dithiets of country where coal is fonnd, there are generally leveral frata of it; perlaps all the different kiuds above mentioned will be found in fome, and only one of the kiads in others; yet this one kind Hay be divided into many differeat leams or thata, hy beds of thiver of other kinds of mater interpofing, fo as to give it the appearance of fo many feparate flreta.
All thefe Arata above defuribed, with their feveral The order varict:es, do not lie or bear upon each other in the: in which order in which they are deferibed, nor in any certain they lie. or invariable order. Though thare be found the fame kinds of itrata in one coalery or dillnict as in another, yet they may be of very different thickneffes. In Tome places thete are moll of the hard kinds, in others mott of the fofter ; and in any one diltrict it rarely happers that a! the various kinds are found; for fome kinds, pethaps, occur only anee or twice, whilit others occur 10 or 20 times before we reach the principal Atratum of coal.

In order to explai:a this, fuppofe the frata in the fit at A (hy. 3.) he in the order $a, b, c, d$, Ef. . they

## Place

 CXLII. may te fo much altered in their thickneffes, by reafon of fome of them increaling and others diminith. ing, at the diance of B, that they may be found there of very different thickneffes; or if they are examined in a pit at D , by reafon of its lower fituation, and the
## C O A [ 2; ] C O A

Coalerg. frata there not being a continuation of thofe in the other places, they may be wery diferent both in their order and thicknefts, and yet of the fame kinds.
Though they be thus found very diferent in one coalery or dillict from what they are found to he in ancther, wish uefuct to their thicknefes, and the order in which they lie upon each other, yet we never meet with a ftratum of any kind of matter but what belongs to fome of thofe above defented.
To ilhutrate how the varions thrata lie in fome placis, and how often the fame thatum may nocur betwist the furface ard the coal, we thall rive the following example. The numbers in the lif hand colann refer to the deftes of flata before deferithel, to whin each belonge. The fecond column contains the names of the Itrata; and the four numeral columns to the right hand, exprefs the thicknefs of each tratum, in fathons, yarls, feet, and inches.

In this iuflance the fpecies of fand-flone only occurs twice, poff five times, whilf the fiver occuis no lefs than nine times.

To apply the foregoing obfervations to practice.
Suppofe it was required to examine whether there was coal in a piece of ground adjoining $t o$, or in the 11 neighbourhood of, other coaleries.
Hethods of in the firt place, it is proper to be informed, at of Arata; the order in which they lie upon each other; to what pint of the hotizon, and in what quantity, they dip; if any dikes, hitches, or trcubles, and the
Rule an, courfe ihey fletch. Having learnt thefe circumitances, fearch in the ground under examination where the flrata are expofed to view, and compare thefe with the other. If they be of the fame kinds, and nearly correfond in order and thicknef, and be lying in a regular manner, and agree by computation with the dip and rife, it may fafely be concluded the coal is there; and the depth of it may be juiged from the depth of the coal in the other coalery, beluw any partieular ftratum which is vifible in this.

If the fulil arata a e not expofed to view, neitier in the hills nor valleys of the ground ander examination, then fearch in the adjoming gromms; and if the: Gome kind of thata are found thent as in the admacont colkery, and there is reafon, foum the dip ind what circumbanes, to believe that they flretel thomal the ground to be examincd; it may then be conduded that the coal is there, as well as the fe onleer frat a

Suppofe a codhy is m the fide of a hill at $A$, lige. 2. and yon would fearch for a coat at B , on the ether file of the hill, but in a mach lower lituatiea a toy ob hemes the feveral fleata lying abone the cond at $A$, and the Fuint to which di.ty did, whech is directly towand 13 (if dur of dikes), yous may expect to find the tarne kind of trata on the other fite of the hill, but much 1wer down. Aecordingly, if fone of the thata are vilible in the face of the precipice $C$, thay mat b cunpared with fome of thofe in the pit at $A$. On, is thoy are not to be feen there, by fearehnes in the op. pofite hill, they moy perthaps be diffovered at the place F; where, it they be found in the mamer befort mentioned, and there be rcafon to belicie they extend rerolarly from the firt piace to this, it is more than proBinde the coat, as well as thefe Arata, will be foend in the intennediate ground.

If the ground to be csamined lie more to the rife Rule ito of the coral, as at E, which being fippofed to be on a fint, perhaps the folid thata there may te wholly covered by the gravel, clay, sca. of the cutward fueface lying apon them: In this cafe, by mealuing the borizontal cifance and the defcent of ground from $A$ to E, and computing the quantity of aicent or rife of the eoal in that difance: by comparing thefe toge. ther, it may be julded at what depth the coal whill be found there, allosings that it lie regular. Thus, fuppofe the coid at A so yards deep, the dillance from A to E 500 yards, ond that the coal tiles 1 yard in IO yards of herizontal diftance :

Then, frem the depth of the pit 80
Deduet the difcent of ground fiom $A$ to
E, fuppofe - - - $2_{4}^{4}$

But as the coal rifes in in feet, then deduct what it rifis in 500 yarde, which is 50

And the remainder is the depth of that cual ai E

6 Yarủs.
Or fuppofe that the place at $B$ is 500 yards the Rute for
contrary way. or to the full dip ot the coal at A ; if a view of the folid thata cannot be obtained, then by proceeding in the fame manner as before, the depth of the coal at that place may be computed. Thus,

To the depth of the coat at the pit is 80
Ade the defeent or inclination of the coal
in 500 yards, which, as before, is 50
This fum would be the depth, if the gromed was level
But as the ground defeends towards B , deduct the quantity of that, which fup. pofe
Remains the denth of the coal at $\mathrm{B} \quad 50$ Yurds.

P-ic
(x)dín nor full ilie, but in tome propantion towata athor, the fame ancthod may be puitued, computing how much the coal rifes or dips in a certain dillance in that direction.

If these is known to be a dike in the workings of the pit at $A$, which devates or de:refleth the dirata towards the place under eximination, then the quantity of the elevation or depreffion mult he accordingly added to ot deducted liom the computed depth of the coal at that place. Smppole there is an upealt dike of 10 fathoms or 20 yards towards $B$, rhen deduct 20 from 50 , the depth before computed, there will remain 30 yards or 15 lathoms for the depth of the coal at 13 .

But it often lappers that coal is to be learched for, in a part of the country, at fuch a confiderable diAance from all other conal ries, that by reafon of the intervencion of tills, valleys, unknown dikes, Ece. the connection or relation of the Itrata with thofe of any other coalery cannot be traced by the inctloos laft mentioned; in which cafe a more extentive view nult be taken of all circumilances than was neeffary in the former ; and a few general rabes founded on the fore groing obfervations, and on e nelufions drawn from them, will greatly affit in determining fometimes with a great degrec of probability, and fomerimes with abfolute ceriainty, whether cual be in any particular dobidet of connery or not.
Inule stio. The firt proper ftep to be taken in fuch a eafe. is to take a general view of that difict of country intended to be fearched, in order tojudge, from the outward appearance or lace of the country, which particular part cut of the whole is the mof likely to contain thofe kind of flata favourable to the production of coal; and confequently fuch particular part being found, is the moft advifable to be begun with in the examination.

Though the appearance of the outward fulface gives no crrain or infallitle rule to judge of the kinds of ftratalying heneatl, yet it rives a purbable one; for it is हुerall: found, that a chain of moustans or hills nimg to agteat height, and very Ateep on the fides, are commonly eumpofed of thata much harder and of different kinds from thofe before deferibed wherin eonl is fond to lie, and therefore unfavourable to the production of coal; and thefe monutainous fiteations are allo more fubject to dikes and truables than the lower gromnds: fo that if the folid Arata comroing them qave even farourable fyr ptoms of coal, ytt the hafl circumflance would render the quality bad, and the quantiry precarions. Aand, on the whole, it may be ubferved, that mountainous lituations are foud more favourable to the prodiction of metals than of ccal. It is likewife generally fomat that thote dincicisabouading with valleys, moderately iting hills, and intesfyerfed with plains, fometimes of coldiderable cecut, io more commonly contain coal, and thofe kinds of Rrata favourable to ito produciun, than either the monutairsus or chanpaign countrics; and a country fo fituaid as this lat defcribed, tipecianty if at fome condiderale ditlazce from tie muntains, oughe to be the hilt part appointed for fatticular ex- genetally ficuated $k y$ the fids of rivers, or betwixt
NO 8.
fuch moderate rifing grounds as hat deferibed, are aifo very favourable to the production of coat, if the folid thata, and other circumitances in the higher gromids adjoining, be conformable; for it will farce$J_{y}$ be foond, in luch a fituation, that the Hrata are favourable in the rifing grounds, on buth lides of the plain, and not fo in the fpace betwixt them. Though plans be for favourable, in luch circumflances, to the pioduction of coal, yet it is often wore difficule to be difcuvered in fuch a fituation, than in that before dedefcribed; becaufe the clay, fon, and otber lax matter, brought off the higher grounds by tains and other accidents, tave generally covered the iurfaces of luch plains to a conticerable depth, which pievents the exploration of the fold llrata there, untefs they be (xpofed to view by dicging, quarrying, or fome fuch operation.

That part of the diltrict being fixed upon which abouids with moderate luths and valleys as pooperelt to begne the examination at, the firft tap to be taken is to examine all place where the $10 l$ d wata are expoled to vicw (which ale culled the crops of the fltata), as in precipices, hollows, \&e. hawh them as accurately and grdeally as the ciccumances will ailow, foom the uppromolt ifretum or thylith part of the ground to the sery underncit: and is they appear :o be of the kuads urture decertoed, at mill be freper to note in a mem sandum buok their dafe cne thekafles; the orden tu wath they he upun each , dire, the peint of the horizon to which they dp or inaline, and the quantity of that inclination; anc whether they lie in a regular fitate. This thould be done in every patt of the ground where they can be leen: obierving at the fame time, that if a tratam can be found in one prace, which liave a comnection wrib tume othen in a ncond place, and if this other has a comectoun wita anuther ma third place, Sc; tisen, from thete feparate connections, the joint corrcipondence of the whule may be traced, and the Arata, whech in tome places ane covered, may te known by then collelpondence with thofe whach are expuled to view.

If by this means the crops of all the flata cannot be leen (which is utten the caie), and if nu coal be difcovered by its chop appearing at the lurlace; yet if the Itrata that thave been viened conlift of thofe kinds before deferibed, and are funad lying in a regular order, it is fuffictently probable that coal may be iin that part of the diflrita, although it be concealed from light by the forface of earth or other matter. Therefore, at the lame time that the crops of the flrata are under examination, it will be proper to take notice of all fuch tprings of water as kem to be of a mineral nature, particulaty thofe known by the name of iron water, which bear a mud or feument of the colour of wull of irun, having a thong aftingtiot talte. Springs of this kind Froeced uriginally from thote terata wheh curtain beds or balls of iron-ore; but by teaton of the tenacity of the matter of thote thata, the water cmly difengages itflf flowly from than, difending into fome rave ponous or open flratum below, wheres, gathering in a body, it runs ont to the lurface in tmall itreans or rills. The ftratum of cual is the molt general refervoir of this water; for the inoatlone being lodged in different linds of thiver, and the coal com-
monly

## C O A

walery.
monly connected with fome of them, it therefore defeends into the coal, where it finds a ready paffage throngh the open backs and cutters. Sometimes, indeed, it finds fome other flratum than coal to collect and tranfmit it to the furface; but the difference is cafily diftinguinhable; for the ochrey matter in the water, when it comes from a ftratum of coal, is of a darker rulty colour than when it proceeds from any other, and ofteu brings with it particles and fmall pieces of coal; therefore, whercter thefe two circumftances concur in a number of thefe kind of fprings, fituated in a direction from each other anfwerable to the fretch or to the inclination of the flrata, it may be certain the water comes off coal, and that the coal lies in a fomewhat higher fituation than the apertures of the fprings.

There are other fprings allo which eome off coal, and are not dillinguifhable from common water, otherwife than by their aftringency, and their having a blue fcum of an oily or glutinons nature fiwimming upon the furface of the water. Thefe, in common with the others, bring ont particles of coal, more efpecially in rainy feafons when the !prings How with rapidity. When a number of thefe kinds are lituated from tach other in the direction of the ilrata, as above defcribed; or if the water does not run forth as in fprings, but only forms a twamp, or an extertion of flagmant water beneath the turf; in either cafe, it may be depended upon that this water proceeds from a thratum of coal.

If the fratum of coal is not expofed to view, or cannot be difoovered by the firl method of fearching for the crop, athough the appearance of the other flrata be very favourable, and afford a ftrong probability of coal being there; and if the lat-mentioned method of judging of the particular place where the crop of the coal may lie, by the fprings of water iffining from it, fhould, from the deficiency of thofe fprings or other circumftances, be thought equivocal, and not give a fatisfactory indieation of the coal; then a further fearch may be made in all places where the outward furface, or the flratum of clay or earth, is turned up by ploughing, ditching, or digging, particularly in the lower grounds, in hollows, and by the fides of freams. Thefe places fhould be flrictly examined, to fee if any pieces of coal be internixed with the fubttance of the fuperior lax ftrata; if any fuch be found, and if they be pretty numerous and in detached picces, of a firm fubftance, the angles perfect or not much worn, and the texture of the coal ditinguilh. able, it may be concluded, that the flratum of coal to which they originally did belong is at no great diftance, but in a fituation higher with refpect to the horizon; and if there be allo found along will the pieces of coal other mineral matter, fuch ats pieces of fhiver or fieetone, this is a concurrent proof, that it has come only from a fmall ditance. Though the two fore-mentioned methods hould only have produced a ftrong probability, yet if thio latl mentioned place, where the piecea of coal, 2 c . are found in thic clay, be in a fituation lower than the iprings; when this circumftence is joined to the other two, it amounts to little lefs than a moral certainy of the flratum of coal being a very litule above the level of the fprings. But if, on the contrary, thefe pieces of coal are found more Noz. V. Part I.
fparingly inienfperfed in the fuperior ilratum, and if Covery. the angles are much fretted or worn ofl, and very lietle of other kinds of mineral matter conneted with thern; it may then be concluded, that they have come from a flratum of coal fituated at a greater difance than in the former cafe; and by a drife fearch and an aceurate comparifon of other circumilances, that particular place may be difcovered with as much certainty as the other.

After the place is thus difeovered, where the Arwtum of coal is expected to lie concealed, the next pro. per ltep to be taken, is to begin digging a pit or hale there perpendicularly down to find the coal. If the coal has no folid frata above and beneath it, but be found only embodied in the clay or other lax matter, it will not be there of its full thicknefs, nor fo hard and pure as in its perfect llate when cnclofed betwixt two folid ftrata, the uppermof called the ronf, and the undermoll called the pavement, of the coal: in fuch fituation therefore it becomes neceflary, either to dig a new pit, or to work a mine forward until the Atratum of coal be found included betwist a folid roof and pavement, after which it need not be expected to increafe much in its thicknefs: yet as it goes deeper or farther to the dip, it mof likely will intprove in its quality; for that part of the ftratum of coal which lies near the furface, or only at a finall depth, is often debafed by a mixture of earth and fundry other impunities, walled down from the firface, through the backs and cutters, by the rains; whilat the other patt of the ftratum which lics at a greater depth is preferved pure, by the other folid thrata above it intercepting all the mad wafhed from the farface.

The ahove methods of invertigation admit of many different eafes, according to the greater or lefo number of favourable circumflances attending each of the morles of inquiry; and the refult accordingly admits every degree of probability, from the mott dittant, even ap to abfolute certainty. In fome f:uations, the coal will be difcovered by one method alone; in others, hy a comparifon of certain circumfances attending each method; whill in fome others, all the circomitances that can be collected only lead to a certain degrec of probability.

In the laft cafe, where the evidence is ouly probable, it will be more advifable to proceed in the fearch by boring a hole through the folid ftrata (in the manner hereafter defcribed), than by digging or finking a pit, it being both cheaper and more expeditions; and in every cate, which does not amount to an abfolute certainty, this operation is neceffary, to afcertain the real exittence of the coal in that place.

We flatl now tuppofe, that having examined a certain dittrict, fituated within a few miles of the fea or fome navigable river, that all the circumftances which offer only amount to a probability of the coal being there, and that boring is neceffary to afcertain it; we thall therefore defcribe the operation of boring to the coal; then the method of clearing it from water, commonly called weinnins it; and all the fubfequent operations of working the coal and raifing it to the furface, leading it to the river or harbour, and finally putting it on board the Mips.

Suppofe that the ground, $A, B, C, D$, fig. 4. has of boring been cxamined, and from the appearance of the ilrata for the
witere that are vifible（as at the precipice $D$ ），and fe－ weral othe phaces），they are found to be of thole linds nom！？consected with coal，and that the point to which they rite is diectly well howards $A$ ，but the frotind being flat and covered to a confuderable depth wih carth，efo the dhata cannot be ricwed in the low ryounds；thorefore，in this and all hmilar henations， the firt hole that is bored for a trial for conal mould be on the weat fide of the ground，or to the full rife of the drata as at $A$ ，where，brinco down though the Arata 1，2， 3 ，fuppofe 10 futhome，and not findimg real，it will be better to bore a now hole than to pro－ ceed to a great deptla in that：thererore，proceeding fo for to the callward as B，where the dratinn 1 ，of the Fifl holc，is computch to be 10 or 12 fathoms decp，a fecond hole may tebered，where borng dewn through the fuata $4,5,6,7,8$ ，the travom 1 is met with，hat rocoth；it wall the of no ufe to bore father in this hole，as the seme thrata would he fund which were in the hole $A$ ：theresoce，proceeding again to far to the eafoward，as it may be computed the itratum of the fecond hale will be met with at the depih of 10 or 12 fathoms，a nows lule may be bored at $C$ ；where， borines through the lliatad $9,10,11,12$ ，the conl is met with ar－ s ？，hefore the home jroceed fo doep as the dratum 4 of the former．li is cridut，that，by this methud of procedure，scither the coal nor any o－ ther of the drata can be paffed over，as the lat hote is alwave boved down to that fretum which was neareft the furface in the fomer hole．

The purpoies for which boring is ufad are nume－ sous，and foine of them of the ntmot importance in coakries．In coaleries of great exteat，although the coal be known to extend throng the whole gromends， yot ascidental tums，and uther alterations in the dip， to which the coal is liable，reader the bariag of three or more holes acecfiar，to Jetermine exactly to what $\xi$ int of the burizon it dips or incliase，hefore any ca－ gital operation for the winnaty of it can be undertaken； becaufe a wery forall error in this may oceation the lufs of a great part of the coak，or at leaft incur a double expence in recovering it．

Suppote $A, 13, C, 1)$ ，lig． 5 to be part of an exten－ fue feld of coal，intunded to be won or laid dry by a fire－engine；accordiag to the coufe of the dip in adjoming coaleries，the point $C$ is the place at which the engine thould be erected，becaufe the coal dips in direction of the line $A C$ ，confequently the level line would be in the direction CD ；but this ought not to be trufterl to．Almit two holes，1，2，be bored to the coal in the direetion of the fuppofed dip，at 200 yards dilance from cach other，and a third hole 3 at 200 yarc＇s diftance from each of them：fuppofe the coal is found，at the hole 1 ，to be 20 fathoms deep；at the hole 2，io fathoms decper；but at the hole 3，only 8 fathoms deeper than at 1 ．＇Then io find the true level line and dip of the coal，fay，$\lambda$ s． 10 fathoms the dip from 1 to 2 ，is $t 0200$ yards the diflance，fo is 8 fathoms，the dip from 1 to 3 ，to 160 yarde，the dif－ tance from one on the line $1_{2}$ ，to $a$ ，the point upon a level with the hole 3．Agrain fay，As 8 fithoms，the dip from 1 to 3 ，is to 200 yards the diftance；fo is Jo fathoms，the dip from 1 to 2 ，to 250 yards，the diftance from 1 ，in Jirection of the line $\mathbf{1}, 3$ ，to $l$ ，the puint upon a level with the hole 2．Ituris let fall the
perpendicular $1, c$ ，which will be the true direction of
Coalery， the dip of the coal，inttead of the fupporied line A C； and by drawing ED，and DF，parallel to the other lines，the angle 1 ），and no other place，is the deepent part of the coal，and the place where the engine thonid be erected．If it had been erected at the angle $C$ ，the level line would have gone in the direction $c b$ ， by which means about one third part of the field of coal would have been below the level of the engine， and perhaps lolk，without another engine was erected at D．

Boring not only mows the depth at which the coal lies，but is exact thicioncis；its hurdnefs；its oualits， whether elofe burning or open burning，and whether any fun！mistu：e in it or not；alio the thicknefs，hard－ nefs，and other circumftances of all the itrata bored throush；and from the ganaty of water met with in the boring．fone jadronent my be formed of the fire of an engine canable of chawing it，whea an engine is meseflary．Whea holes are to be bored for thefe purpofes，they may be fixed（as neat as can be guter－ led）in fuch a tination from each other，as to fuit the places where pits are afterwards to be funk ；he which means molt of the expence may be laved，as the fe pits wowld otherwife require to be bored，when link－ ing，to difeharge bikir water into the mine below． There are many other ufts to which buring is applied， as will be explained hereafter．

For thefe reafons，boring is greatly prastifed in Eng－ land，and is brought to great perfection；and as the operation is generally entrnfed to a man of integrity， who makes it his profelfon．the accounts given by him of the thicknefs and onder circumitances of the firata， are the mole accurate imarinable，and are trutted to with the great ft confidence；for as very few gente－ men choofe to take a lcale of a new coalery which has not been fufficiently explored by boring，it is ne－ etfary the accounts thould be faithful，being the only rule to guide the landlond in leting lis coal，and the tenant in taking it．In Scotland it is not fo generally practifed；nor are there any men of charncter who are profefed borers，that operation being commonly lef：to any common wolkman；whence it happens that it never lias been in any elteem，the accounts given by them being fo imperfect and equivecal as not to merit any confidence．

The tools or inftruments ufed in boring are very fimple．The boring rods are made of iron from 3 to 4 feet long，and about one inch and a half fquare，with a forew at each end，by which they are forewed toge－ ther，and other rods added as the lole increafes in depth．The chiffel is ahout 18 inches long，and two and a half broad at the end，which being fcrewed on at the lower end of the rods，and a piece timber put through an eye at the upper end，they are prepa－ red for work．The operation is performed by lifting them up a little，and letting them fall again，at the fame time turning them a little round ；by a conti－ nuance of which motions，a round hole is fretted or worn through the hardelt trata．When the chiflel is blunt，it is taken out，and a fcouped inftrument call－ ed a arimble put on in its ftead；by which the duft or pulverifed matter which was worn off the fratum in the latt operation is brought up．By this fubftance， the borcra bnow exadly the nature of the fratum

## C. $O A$

Comlery.
they are boring in; and by any alteration in the working of the rods (which they are fenfible of by handing them), they perceive the leall variation of the Irata. The principal part of the art depends apon kecping the hole clean, aud obleming every variation of the Hrata with eare and attention.

Ihe ctalhifhed price of boring in England is 5 s . fer fathom for the firll dive fathoms, los. per lathom for the nest live fathoms, and 15 sfer fathom for the next live fathoms; and fo continually inerealing 5 s . por fathom at the cond of every dise fathoms; the borer fondiag all kinds of boring intioments, and taking his chance of the hardacfs of the flrata, except above one foot in thickuefs of whin occur, when the former price ceafes, and le is prid for day.
of is exceedingly uncommon to mect with a flatum of coal which is naturally dyy, or whofe febterrancan fprings or fecters of water are for very finall as to require no other means than the kbout of men to draw off or conduet then anay; fur it molt commonly happens, that the fratum of ceal, and the other Mrata adpacent, abound formich in feeders of water, that, before access can be had to the coal, forme other metheds munt be parived to dran or conduct away thefe feeders: thercfoac, after the deepeft pant of the coal is difcoverd, the next confideration is of the bedt method of duaning it, or, in the miner's language, of swimuary he cont.

If the coal lies in fuch an elevated fruation, that a part of it can be drained by a level brought up from the lower grounds, then that will be the molt antural method; but wacther it be the mont proper or wot, depends upon ceitain circumflances. If the fitnation of the ground be fuch, that the level would be of a geat length, or have to come through very hard hrata, and the quantity of coal it would drain, or the profits expected to be produced by that coal, flould be iradequate to the expence of imprying it up; in fuch cafe fome other method of winning might be more proper Or fuppuic, in another cafe, it be found, that a level can be lad to a conlery, which will cot L. 2000, and require fire years to bring it up to the coal, and that it will dram 30 acres of coal when completed; yet if it be found that a fire chgine, of fonde other machine, can be ereated on that coalery, for the fane fum of moncy, in une year, "lluch will draia 50 acres of the fame coal, then this lat would be a mone proper method than the level; beculfe four years profit would be received by this methed before any would come in by the other: and after the $3^{\circ}$ acres drained by the level is all wrought, a machine of fone hind would nevertheleis be necoltary to thain the remaining 20 actes: fo that ereting a machine at firlt would be on all accounts the mult adufable.
Whete a locel can le drove, in a reafonable time, and at an adequate expence, to drain a fufficient tiact of coal, it is hiten the moit clagble method of wiuring; becaufe the charge of upholding it is generaty lefs tham that of upholding fire-engines or other machines:

If a level is pulyed properefl after conlideration of every neceflary circumilance, it may be begun at the place appoinced in the manner of an open ditch, about three feet wide, and carried forward wotil it be about fix or fesen feet detp from the furface, taking care to fecure the bottom and fides by timber-work or build-
ing; after which it may be commancl in the manner of at mine about thace feet wide, and there fiet and a half high, through the folid ftrata, taking care all along to keep the botom unn a lewd, and to fecure the roof, fides, and bottom, loy timber or buikdins in ali places where the drata are ust $\$ 1$ romy enough to fur)pont the incumbent weight, or where they are lidun to de ay by their expofure to the frefl air. If the mine las to go a very long way before it ration coal, it mar be necollaty to fink a limall pit, for the convenicnee of taking out the flones and subbith pros. dued in working the mine, as well as to fuplly frem air to the workmen; and if the air hoold atherams tum damp, then fquare wooden pipes mate of dales clofely jointed (commonly called cir-bowes), may be fixed in the upper part of the mine, from the pit-bottom all the way to the con? of the mine, which wiol caufe a fufficient circulation of freth air for the workmen; perhaps in a great length it will le found proper to fiak another or more piss won the mine, and by proceeding in this manner it may be carried forward until it arnve at the coal; and after diving a mine in the coal a few yards to one fide, the hirt coal. pit mas be funk.

If a level is found impracticable, or for particuhar reafons madifable; then a lire-cngme *, or rome o- "See s. ther machine, will be necefiary, which thould be fixed nece stoment upon the decepelt part of the coal, or at leat foraromine. towards the dip as will drain a fulficient extent of coal, to continue for the lime intended to work the coalery; and whether a lire-engine, or any other machine, is wied, it will be of grat advantage to have a partial ievel brought up to the engine-pit, if the fi. thation of the ground will admit it at a lmall charge, in order to bacive and consey away the water without drawing it fo high as to the furface: for if the pit was 30 futhoms deep to the codl, and if there vas a partial level, which received the water five fathons only boluw the furface, the engine by this means would be erabled to diaw 1 -fth part more water than winhout it; and if there were any feeders of water in the pit above this level, they might be conveyed into it, where they would be dicharged without being diawn by the engine.
'The engine-pit may be from feven to nine fect wide; and whether it be cincalar, oval, or of any other form, is not very material, provided it be fulficiently trong, though a circular form is molt gene. rally approved. If any feeders of water are met with a licw fathoms from the furface, it will be proper to make a circular or fpiral cutting about one foot deep, and a little hollowed in the bottom, round the circumference of the pit, in order to receive and conduct the water down, whhout flying orer the pit and incommoning the workmen. If the itrata are of fo tender or frialde a nature as not to bear this operation, or if ilue water leaks though them, then it will be neceflary to infost in the formentioned chetting a circular piece of timber called a crib, hollowed in the fame manner to colleck the water; and a ferond may be inferted two or three yards below the firit, with a noping nitela down the wall or fide of the pit, to conwey the water from the former into it ; proceeding by fome of the fe meihods until the pit is fouk 15 or 20 firthoms; at which place it would be proper to fi: a N 2 citerm

## $\mathrm{C} O$ A $\quad 100] \quad \mathrm{C}$ O A

Combery. ciftem or referwir, for the fift or upper fet of pumps Com to fand in; for if the pit be 30 fathoms as fuppofed, it would be too gieat a length for the pumps to be all in one fet from buttom to top, therefore, if any extraordinary feeders are met with, betwist I 5 and 20 fathoms deep, it woukd be belt to fix the ciftem where it may receive them, and prevent their defcending to the bottom; obferving that the upper fet of pamps be fo much larger than the lower one, as the additional feeders may require; or if there are no additional feeders, it ought then to be a little fimaller.

After the upper eiftern is lixed, the operation may be purfued by the other fet of pumps in mach the fame manner as has been deferibed, nutil the pit is funk to the coal; which being done, it would be proper to link it fix or eight fect deeper, and to work Come coal out from the dip fide of the pit, to make room for a harge quantity of water to collect, without incommoding the coal-pits when the engine is not working.

It wond excesd the proper bounds of this article, to enumerate all the accidents to which engine-pits are liatle in fonking; we thall therefore only recite a few which feem impoitant.

If a quickfand happen to lie above the folid Atrata, next the furface, it may be got through by digging the pit of fuch a widenefs at the top (allowing for the natural flope or romning of the fand) as to have the proper fize of the pit on the uppermolt folid ftratum; where fixing a wooden frame or tube as the timberwork of the pit, and covering it round on the ontfide with wrought clay up to the top, the fand may again be thrown into the excavation round the tube, and levelled with the furface.

If the quickfand fould happen to lie at a confiderable depth betwixt the clay and folid ftrata, then a Arong tube of timber clofely jointed and fhod with iron, of fuch a diameter as the pit will admit, may be let down into it ; and by fixing a great weight upon the top, and by working out the fand, it may be made to fink gradually, until it come to the rock or other folid fratum below; and when all the fand is got out, if it be lightly calked and feeured it will be fufficient.

It fometimes happens, that a ftratum of foft matter, lying betwixt two hard fulid ones, produces fo large a quantity of water as greatly to incommode the operations. In fuch a cafe, a frame work of plank, ftrengthened with cibs and clofely calked, will Rop back the whole or the greateft part of it, provided the two ftrata which include it are of a clofe texture; or let an excavation of abont two fcet be made in the foft ftratum, quite round the circumference of the pit ; and let that be filled clofe up hetwixt the hard Itrata, with pieces of dry fir-timber abous ten inehes fquare infented endwife, and afterwards as many wonden wedges driven in to them as they can be made to receive; if this be well finifhed, little or no water will fund a paffage through it.

It rareiy happens that any fuffocating damp or foul air is met with in an engine-pit; the falling of water, and the working of the pumps, gemerally caufing a fufficient circulation of frefh air. Lut that kind of combutible vapour, or inflammable air, which will catch she at a candle is often met with. It proceeds from :le partings, backs, and cutters, of the folid fitata,
exhaling from fome in an infenfibie manner, whilt from others it blows with as great impetuonty as a pair of bellows. When this inflammable air is permitted to accumulate, it becomiss dangerous by taking fire, and burning or datroying the workmen, and fometimes by its explolian will blow the timber out of the pit, and do confiderable damage. If a confiderable fupply of fieth air is forced down the pit by airboxes and a ventilator, or by dividing the pit into two by a clufe parcition of deals from top to button, or by any other means, it will be driven ut, or fo weakened, that it will be of no dangerous conlequence: or when the intamnable air is vory thong, it may be falely carried off by making a cole fluathing of lining of thin deals quite round the circomference of the pit, from the top of the folid trata to the botom, and lengthening it as the pit is funk, leaving a imali vacancy behind the fneathing; when the combultibie matter, which exhates from the itrata, being continod behnd thefe deals, may be vended by one or two limall leaden pipes carried from the theathing to the furface; fo that vely little of it can tranfpire into the arca of the pit. If a candle be applied to the oritice of the pige at the furface, the inflammable air will inltantly tuse fure, and continue buraing like an oil tamp until it be cxtinguifted by fome external canic. Uper tio whole, every method chould be uled to make the pit as foro: in every past, and to keep it as dry ato putible; and whenever any accident happens, ic ihould be as expeditioufly and thoroughly reparred as poffible, befure any other operation be proceeded in, leat an additional one follow, which would more than double the difficulty of repairing it.

The firt operations, after finking the engine-pit, are the working or driving a mine in the conl, and linking the firft coal pit. The fituation of the firlt coalpit foould be a lictle to the rifc of the engine-pit, that the water which collects there may not obilluct the working of the coals every time the engine dops: and it thould not exceed the dilance of 20,30 , or 40 yards; becanfe when the fint mine las to be driven a long way, it becomes both difficult and expenfive. If there be nut a fufficione cireulation of trefh air in the mine, it may be fupplied by the before deferibed airboxes and a ventilator, until it arrive below the intended coal pit, when the pit may be bored and funk to the coal, in the manner before mentioned.

After the pit is thus gat down to the coal, the ne:at confideration hould be of the bett method of working it. The moft general practice in Scotland is to excavate and take away a part only of the thatum of coal in the firft working of the pit, leaving the other part as pillars for fupporting the roof; and after the coal is wrought in this manner to fuch a diftance from the pit as intended, then thefe pillars, or fo many of them as can be got, are taken unt by a fecond work ing, and the roof and other follid frata abouc permitted to fall down and fill up the excavation. The quartity of coal wought away, and the fize of the pillars left in the firl working, is proportioned to the hardnefs and Itreng th of the coal and other Atrata adjacent, compared with the incumbent weight of the fuperior flrata.

The fame mode of working is puriued in moft parts of England, difering only as the circumatances of the
conlery may require : for the Englifh coal, particularly in the nouthem out tish beme of a tine tender texture, and of the choferorning kind, and alto the row and parement of the e al in greneral not fo throns as in Scoutand, they are obliged to leave a larger propurtion of coal in the piltars for fupporting the roof, during the firft tine of working; ats, in the fecond work ing, as many of thefe pillars are wrought away as can be got with fafety.

The Scots coal in general being very hard, and of the open-burning kind, it is necelary to wurk it in fuch a manner as to produce as many groat conls as poffitle, which is beft effected by taking away as high a proportion of the coal as circumitances will allow in the fitf working; on the contraty, the Englifh coal being very tender cannot poflibly be wrought large, nor is it of much importance how fmall they are, being of fo rich a quaity; fo that a larger proportion may be left in pillars in this coal than could with proFriety be done in the other; and, when all circumitances are conlidered, each method feems well adapted to the different purpofes intended.

The ancient method of working was, to work away as much of the conal as could be got with fafety at one working only: by which means the pillars were left fo furall as to be ciufhed by the weight of the fuperfor firata, and entirely lufl. As great quantities of coals wese loll by this method, it is now generally ex. floded, and the former adopted in its place; by which a much larger quantity of coal is obtaned from the fame extent of ground, and at a much lefs expence in the end.

The exact proportion of coal proper to be wrought away, and to be left in pillars at the firl working, may be julged of by a comparifon of the circumilan. ees before mentioned. If the roof and pavement are both Rrong, as well as the coal, and the pit about 30 fathoms deep, then two-thirds, or probably threefourths, may be taken away at the firlt working, and one-third or one fourth left in pillars. If both roof and patement be loft or tender, then a larger pioportion mult be left in pillars, probably one-thid or near one-half; and in all cales the harduefs or ftrength of the coal muft be confidered. If tender, it will require a larger pillar than lard coal; becaufe, by being expofed to the air after the firt working, a part of it will moukder and fall off, by which it will lofe much of its iolidity and refiftance.

The proportion to be wrought away and left in pillars being determined, the next proper llep is to fix upon fuch dimenfions of the pillars to be left, and of the excavations from which the coal is to be taken away, as may produce that proportion. In order to form a jult idea of which, fee a plan of part of a pit's fathoms, and the coal having a moderate rile. A, seprefents the engine-pit; $B$, the coal-pit; $A_{a} B$, the mine from the former to the latter; BC , the fint working or excavation made from the coal-pit, commonly called the wimiag mine or winning beadzay, nine feet wide; $666 b$, \&ce. the workings called rooms, turned off at right angles from the others, of the width of 12 feet ; $c i c c$, \&c. the workings called throughers or thirlings, 9 feet wide, wrought through at right angles from one room to another; $d d d$, \&ce, the fil-
lars of coallift at the firl working for fupporting the Coalery rowf, 18 feet long and 12 feet broad; DD, two large pillars of cual near the pit boitom, 15 or 20 yards long, and so or 15 broad, wefupert the pit, and present its being damaged ly the rour falling in ; ce, the lead mine wronght in the coal from the engine pit botom, 4 or five fect wide $; f f$, \&ec. larye pillars of coal left next the level, to fecure it from any damage by the roof falling in ; $\xi g$, a dike which deprefeth the colal, 1 lathom; $b l$, cice large pillars and barriers of eoal left unwrought, ajjoining to the dike where the roof is tender, to prevent its falling down. The coal taken out by the firt working in this pit is fuppoded to be one-third of the whole, and allowing the rooms 12 feet wide, and the thinhngs $y$ teet wide, then the pillars will requite to be 12 fect wide and 18 feet kmg; for if one pillar le in a certain propertion to ite ad. joining room and thirling, the whole number of pillars will be in the fame proportion to the whole number of rooms and thirlings in the pit. Supp fe ABCD, (fig. 7.), to be a pillar of coal is feet long and 12 leet broad, its area will be 216 fquare fet ; ACHE, the adjoining thirliug, iz feet by y feet, and its area 108 fquare fuet; BAEFG, the adjuining room, 27 fect long and 12 feet broad, and its area $3^{2}+$ fquare feet; which added to 108 gives 432 Iquare feet, ir two thisds wrourht, and 216 fquare feet left, or one-third of the whole area FGHD.

It is proper to obferve, that in the profecution of the workings, the roons to the right of the winning headway thould be oppofite to the pillars on the lift; and the firf, thind, and fifth pillar, or the fecond, fousth, and fixth, adjoining to the faid headway, fhould be of fuch a length as to overlay the adjoining thirlings; as, in the plan, the pillar 2 overlays the thirlitgs 1 and 3 ; and the pillar 4, overlays the thirlines 3 and 5 ; this will effectually fupport the roof of the main road BC, and will bring the other pillars into their regular order, by which means each pillar will be oppofite to two thidings. Allo a latger propostion of coal than common fhould be left in all places which are intended to be kept open after the fecond working ; fuch as the pit-bottoms, air courles, roads, and water-courics, or where the roof is tender, as it generally is near dikes, hitches, and troubles; and if the rof thould continue teuder for a confiderable fpace, it will perhaps be found proper to leave a few inches of coal adhering to the roof, which, together witl a few props of timber lixed moder it, may fupport it effectually for a long time. 'The level mine $e e^{\text {e, and the winning headway BC, fhould be wrought }}$ formatd a conliderable length before the other rooms, in order to be drove through any dikes that mioht interpofe; otherwife the progrels of the workings mingt probably be fopped a contiderable time, wationg untib a counfe of new rooms wert procured on the other lide of the dike. Suppofe the dike $g g$, lig. 6. to deprefs the coal lix feet or one fathom, and that it rifes in the fame manner on the under fide of the dike as it does on the upper fide; in fuch a cafe, the only remedy would be to work or drive a level mine through the Atrata of flone from the engine-level at $c$, over the dike, until it interfect the coai at i; and from thence to drive a now level mine in the coal at $i i$, and a new winning headway ih. In order to gain a new fet ố
fotary ronne, and son fupply freftair to this new operation, a Conll mine might Ledrue from the romm $b$, and a hole funk down upun the lewd romm $i f$; therefore, if the level mine ee was not drose fofar formarl as to have all thefe operations compluted before the rooms and other mokings were iutercepted by the dike, the working of the pit might coafe until thene new places were rady.

If there be two or thare flrata or feams of coal in the fame pit (as there offen are) hasibe only a dratur of a Ben feet chick lying botwist then, it is then material to oblerw, that evory pillar in the fecond feam the phocet immodiately below one in the fint, amd every pallar in the thind feam below one in the fecond; and in fuchat fuation the upper Iratum of cond ought to the fird wrought, or cile all the three toigether: for it would be undale to wat the lower one frit, leil the roof thould break, and damage thofe lying above.

It fometinses becomes neceflary to work the coal lying to the dip of the thime or the level ; which coal is confoquently drowned with water, and moth therefor be draine. liny fome means hefore it can be wrought. If the quantity of water proceeding from it be inconfiderahle, it may then be drained by fnall pumes laid upon the pavement of the coal, and wrousht by men or horfes, to raite the water up to the level of the en-rime-pit botton: or if the feeders of water be more confiderable, and the fituation be fuitalle, the working rod of thefe pumps might be connected with thofe in the engine-pit: by which means the water would be raifed up to the level: but if the quantity of water be vely gitat ; or if, from other cilcumflances, thefe methods may not be applicable; then the engine-pit may be funk as deep below the coal as may be neceffary, and a leve! \&one mine drove from its bottom to the dip of the itrata, until it interfect the Atratum of coal, from whenee a new level mine might be worked, which would efiectually drain it. Suppofe A B, fig. 8. to be a fection of the engine-pit ; $B C$, the coal drained by the engine; BD , the coal to the dip of the ensine iniended to be drained; then if the engine-pit be funk deeper to E, altone mine may be wrouglit in the direction E. D, until it interfeet the coal at D , by which the water will have a free paffage to the engine, and the conal will be draint.

If there be another Aritum of coal lying at fuch a depth below the lint as the engine-pit is intended to he funk to, the upper feam may in fone fituations be conveniently drained, by driving a mine in the lower feam of coal from E to F , and another in the upper one from B to D ; and hy boing a hole from D to F , the water will defeend to F, and, filling the mine EF, rife up to the engine-pit bottom at E, which is upon a level with D.

Whenever it is judged neceffaty to work the pillars, eegard mun be had to the nature of the roof. If the roof is tender, a fantow room may he wrought through the pillar from one end to the other, leaving only a thell of eoal on cach fide for fupporting the roof the time of workine. Suppore ABCD, fig. 7. tu be a pillar of conl is feet long and 12 feet broad: if the roof is not thorg, the room $1,2,3,4$, of eight feet wide, may be wrought up through that pillar, leaving a heel of two leet thick on each fide ; and if it can be
fafoiy clone, a part of thefe The!!s may alfo be wonceht asay, by vorking two places throuph them an at 5 and 6. By this entans very litule of the coal with te lat ; for two thands of the whole being obtaineci by the firit working, and alove two-thends of the pillar by the fecond working, the loffe upon the whole would not ex. eced one-tenth: but it may be cobiened, that fome mile lars will nut produce fo great a proportion, and peshaps whers cannot be wought at all; fo that, uren the whole, there may be abuat one eirhth, one-fevasth, or in fome fituations one-lixch part of the cual loft. If the root be hard and frong, then as mbsh coal may be wrought of exch fode and each end of the pillar as can be done with fafety, leavisg only a fmall piece 1 andias in the midtle; and when the roof is veny llong, fomelimes tersral pillars may be taken entirely out, withont any lots of ccal: and in general this lat meaboud is attesuded with lefs lofs, and produces lamer coals, than the furner. It all cales it is proper to begin workng, thole pillars firll which lie tarthe!t from the pit bettors, and to proced working them regularly analy towards the pit; but if there be a great namber of pillars to the dip of the pit, it is the faidt a eihod to work thete out before thofe to the rife of the pit are begun with.

There is no mreat diference in the weirrht of diferent kirds of coals, the lighetelt betmerg aboit it pourds aveirdupois, and the leaviet about 79 pounds the cabie fort ; tur the moth ufual weight is 75 pounds the foot, whinh is 18 hundred weight and 9 gounds the cubic yard. The ीlatute cladder is 53 hunded weigh: or when meafored is as follows: 258.8 cubie inches to the Wirchetter galhon; $t^{\frac{2}{5}}$ gallons to the coal puck, ahout 3 pounds weight; 8 coal pecks to the boll, about $247 \frac{1}{3}$ peunds; and 24 bulls to the chalder. of 53 hundred weight. If une coal meafuring exactly a cubic yad (nomly equal to s bolls) be hroken intu pirees of a :nue devate fize, it will meafure feven coal bolls and a half. If bruken very finall, it will meafure 9 bolls; which fhows, that the proportion of the weight to the meafure depends upun the lize of the coals ; therefore accunnang by weight is the moft rational method.

A Table of lie weight and quancity of ccal contained in ont acre Scots meature, allowing un= fixih patet to be loll beluw ground, in leams of the following thickneifes.

We Mall next mention fome of the various methods of bringing the coals from the roons and sther workings to the pit bottom. Where the \&tratum of coal is of a fifficient thicknefs, and has a moderate rife and dip, the coals are mon advantareoufly brouertit out by horfes, who draw out the coals in a tub or bafket plam

Coslery. ced upon a fledge: a borfe by this means will bring out from four to eight hundred weight of coals at once, according to the quantity of the afcent or defcent. In fome coaleries they have accefs to the workings by a mine made for them, floping down from the furface of the earth to the coal; and where that convenience is wanting, they are bound into a met, and l wowed down the pit. If the coal be not of fuch a height as to admit horfes, and has a moderate rife like the lant, then men are employed to bring out the coals: they ufually draw a baket of four or tive hundred weight of coals, fixed upon a fonall forr-wheeled carriage. There are fome futuations in which neither horfes nor men can be properly ufed; particularly where the cual has a great degree of defeent, or where many dikes occur: in fuch a cafe the coals are beft brought out by women called Bearere, whon cary them in a kind of bathet upoo their backs, wfrally a hundred, or a hundred reight and a half. at once.

THisen the coals are brought to the pit bottom, the batkets are then !ooked on to a chain, and drawn up the pil by a rope to the finface. Which is bett effected by a machine called a gin, wrought by horles. 'There are ctlee kinds of gins for drawing coals, fome wrought Dy water, whers by the vibrating lever of a fire-engine; but ether of thefe lall is only convenient in fome particular fituations, thofe wrought by horfes being in mod general ufe. After the coald are got to the furface, they are drawn a fmall ditance from the pit, and laid in feparate heaps: the largell coals in one heap, the finaller pieces called dorous in another, and the cirm ur pnn-coal in a Reparate place.

There is an accident of a very dangerous mature to which all coalcries are liake, and which has been the ruia of feveral: it is called a cruß or a fitt. When the piblars of coal are left fo fmail as to lail, or yield under the weight of the fuperior flrata; or when the pavement of the coal is fo foft as io permit the pillars to fink into it, which fometimes happens by the great weight that lies upon them; in ciller cate the Tolid fratum above the coral breaks and falls in, cruftes the pillar to pieces, and eluteth up a great extent of the workings, or probably the whole coalery. As fuch an accident feldom comes on fuddenly, if it be perceived in the beginning, it may fometimes he fopped by build. ing large pillars of tone amongt the coal pillars: but if it has already made fome progrefs, then the beft methed is to work away as many of the coal pillars adjoining to the cruth as may be fufficient to let the roof fall frecly down a and if it makes a breach of the folid Arata from the coal up to the furface, it will very probably prevent the cuth from procedding any farther in that part of the coalery. If the crufh begins in the rife part of the coalery, it is more dificult io ftop it from proceeding to the dip, than it is to kop it from going to the rife when it begins in a contrary part.

Ancther circumfance proper to be taken notice of is the foul or adulterated air fo often troublefome in coaleries. Of this there are two kinds: the black damp or ftyth, which is of a fuffocating nature; and the inflammable or combullible damp. Without Aayirg to inquire, in this place, into the origin and effects of thefe damps, it may be fufficient to obferve, that, in whatever part of any coalery a conftant fupply or a circulation of frefh air is wanting, there fome of
theit dumps exil, accumulate in a body, and become noxious or fatal: and whenever there is a good cinculation of fiehair, they cannot accumulate, being mixed with and carrid away by the Almam of air as faft as they generate or exhate from the lirata. Upon thefe priaciples are founded the feveral inethods of ventilating a coalery. Suppofe the workings of the pits $A$ and $B$ (fig. 6.) to be aboxions to the inllammable damps; if the commumeation was open betwixt the two pits, the air which went duwn the pit A wonkl proced inmediately along the mine $o$, and afeend uns of the pit B; fur it naturally tikes the neareld direction: fo that the air in all the womingry would be Rar. nant ; and they would be menty inace flible foom the accumatation of the combultible darap. In order to expel this, the air muft be mode to circnlate through all the different rooms by means of colldteral aircourfes made in thi manmer: The paffage or mine a muk be chufd up or fappod by a patition of deals, or by a wall built with bicksor ltones, to prevent the air palfing that way. This building is called a fopping. There muf alfo ber luppinges made in the thirlings I It, Sic betwixt the pillars ff, \&cc. which will direct the air up the mine $c c$, tath it arrive at the innemolt thinlug 2 , which is to be left open for its pals fage. There mant allo be thoppisse mate at the fide of the mine aat min, and on both fides of the main headway BC at $b b$, , 2 then retuming to the insermof thirliug 2, procced to the third row of pillars, and butd up the thirlings 22,82 leaving open the thating 3 for a paffage for the air; and procecding on to the fith row of pillars, build un in the farse manner the fuppings 3 3, \&c. leaving open 4 for an air courfe: and by puceeding in this manner to Hop up the thirlings or pafiages in cuely other row of fillars, the current of fieh air will circulate through and venciate the whole workings, in the direction pointed to by the lmall. arrows in the plan, cloaring away all the danps and noxious vapous that may generate. When it is arrived at C , it is condu hed acrof the main headway, and carried through the other part of the pit's wortings in the fane manner, until it return through $n n$ to the pit $B$, where it afcends; and as the rooms advatice father, other loppings are regularly made.
In lome of thofe foppings, on the fides of the main headway, there mult be doors to admic a palage for the bringing out of the coals from the rooms to the pit, as at 5 5: thefe doors muil be condantly ihut, except as the time of paflog through them.

There are other methods of difpolng the foppings fo as to ventilate the pit; but none which will fo ef fectually diperie the damps as that deferibed above If the damps are not very abundant, then the conric of ioppings ! 11 , \&ce. in the level mine, and the others at 1.6 h , \&c. in the main headway, without auy other, may perhaps be fufficient to keep the pit clear. If at any time the circulation of the frem air is not brilk enough, then a large lamp of fere may be placed at the hottum of the pit E , which, by rarefying the ato thete, will make a quicker circulation.

Moft of the larger coaleries fend their coals in the of 18 hips for the coafling trade or exportation; and, as the and $\mathrm{A}_{\mathrm{i}} \mathrm{i}_{2}$ quantity is generally very large, it would take a greater rinar i.: number of carts than coald conveniently be obtained at ${ }^{\text {wis.. }}$ all times to carry them; beldez the confiderable enjenc?
$\mathrm{Pl} \cdot$ C.s.es

Coulery, of that manner of carridge: the therefore generally Coullier. ufe waggons, for carrying them along waggon-ways, laid with timber; by which means one horle will draw from two to three tuns at a time, when in a cart not above half a tun conld be dawn.

The firft thing to be done in making a waggon-way is to level the ground in fuch a manner as to take off all fudden afcents and lefeents: to effect which, it is fometimes neceffary to cut through hills, and to raile an embankment to carry the road through hollows. The road thould be formed about 12 feet wide; and no part fhould have a greater defient than of one yard perpendicular in 10 of a horizontal line, nor a greater afcent than one yard in 30 . After the road is formed, pieces of timber, about fix feet long and lix inches diameter, called fechurs, are laid acrof it, being i 8 or $2+$ inches diftant from cach other. Upon thefe flecpers other pieces of timber, called rails, of four or five inches fquare, are laid in a lateral direction, four feet diftant from each other, for the waggon wheels to run upon; which being firmly pinned to the feepers, the road may then be filled with gravel and hinifhed.

The wagyons have four wheels, either made of folid wood or of calt iron. The body of the camiage is longer and wider at the top than at the bottom; and ufually has a kind of trap door at the bottom, which, being loofed, permits the coals to run out without any tronble. The fize of a waggon to cary 50 hundred weight of coals is as follows:

$$
\begin{array}{lccc} 
& & \text { Fect. } & \text { Inches. } \\
\text { Length of the top, } & - & 7 & 9 \\
\text { Breadth of the top, } & - & 5 & 0 \\
\text { Length of the bottom, } & - & 5 & 0 \\
\text { Breadth of the bottom, } & - & 2 & 6 \\
\text { Perpendicular heiyht, } & - & 4 & 3
\end{array}
$$

Where the pits are fituated at fome confiderable diflance from the harbour, it becomes neceflary to have a fore-houfe near the mipping place, where the coals may be lodged, until the liglters or thips are ready to take them in. 'The wargon-way fhouk be made into the ftore-houfe, at fuch a height from the ground, as to permit the coals to run from the waggons down a fpout into the veffels; or die to fall down into the ftore-houfe, as oceation may require.

This kind of ftore-houfe is well adapted to difpatch and faving expence : for a waggon-luad of coals may be delivered either into the forchoufe ar veffels inftantly with very little tromble: and if the coals were expofed to the effects of the fun and rain, they would be greatly injured in their quality; but being lodged under cover of the flore-houfe, they are preferved.

COALESCENCE, the union or growing together of two bodies before feparatc. It is principally applied to fome bones in the body, which are feparate during infancy, but afterwards grow tugether ; or to fome morbid umion of parte, which fhould naturally be difinct from each other. 'Thus there is a coalefcence of the fides of the vulva, anus, and nares; of the eye-lids, fingers, toss, and many others parts.

COALIIER, a vefle cmpluyed to carry coals from one port to another: chicfly from the northern parts of England to the capital, and innere foutherly parts, as well as to foreign markets. This trade is known to be an excellent nurfery for foamen; although they $\mathrm{N}^{2} 8$.
are often found, from the condtitution of their climate, Coamings, not $1 s$ be fo well calculated for fouthern navigation.

COAM1NCS, in hipobulding, are thofe planks, or that frame, fomming a border round the hatches, which raife them uphigher than the reft of the deek. Loop-holes for mulkets to thoot out at, are often made in the coamings, in order to clear the deck of the enemy when the thip is boarded.

COANE, among the Grecks, a name given to a peculiar fipecies of tutio or tutty, which was always found in a tubular form. It had its name from avo, a word ufed to explefs a fort of cylindric tube, into which the melted brals was received from the furnace, and in which it was fuffered to cool. In cooling, it always depolited a fort of recrement on the fides of the veflel or tube, and this was the tutty called coane.

COAST, a fea-hore, or the country adjoining to the edge of the fea. Dr Campbell, in his political furvey of Great Britain, contiders an extentive feacoall as of great advantage to any kingdom; and confequently that this illand hath many conveniences refulting from the extent of its coafts, fuperior to other kingdoms which are much larger. The chief advantages ariling from an extenfive feacoalt are, that thus there is a convenient opportunity for exportation and importation to or from all parts of the kingdom. Thus, a number of cities are formed on the coatts; by this meano the internal parts are improved, \&e. The extent of the fea-coalts of Arabia, he looks upon as the gemuine fource of wealth and fplendour to the ancient inhabitants of that peninfula; the fame was the indrument of the greatnefs of ancient Egypt, of Jhenicia, 己e. In thort, acco:ding to him, no comtry or city can for any length of time be Rourifhing unlefs it hath a comfiderable comnection with the fea. " It is indeed true (fays he) that the widdom and indutiry of man, tuking hold of fome peculiar circumfances, may have rendered a few iniand citics and countries very fair and flomifhing. In ancient hiftory we read of Pdmyra, and the diftict round it, becoming a luxariant paradife in the midat of inhofpitabledefats. But this was no more than temporary grandeur ; and it has now lain for fome ages in ruins. The city and principality of Kandahar was in like manner rendered rich and famous, in confequence of its being made the centre of the Indian commerce; but, long ago declining, it s'deltraction has been completed, in our days, from that dreadful defolation which Thamas Kouli Khan fpread though Perfia and
 ties in Germany, which for a time made a great hgure from the freedom and induftry of the inhabitants, and diffufed eafe, plenty, and profperity, through the ditriets dependent on them, which of courfe rendered them populous, are now fo much funk, through inevitable accidents, as to be but hadows of what they wore; and though they ftill continue to fubtitt, fubtif ouly as the melancholy monuments of their own miffortunes. We may therefore, from hence, with great certainty, difuern, that all the pains and labour that can be behowed in fupplying the defect of fituation in this refpect, proves, upon the whole, but a tedious, difficult, and precarious expedient. but, however, we mult at the fame time admit, that it is not barely the
ape.Coart the poffeffion cren of an extended coaft that can produce all thefe defirable effects. That coalt mutt likewife be diftinguifhed by other natural advantages; fuch as capes and promontories, favourably difpofed to break the fury of the winds; decp bays, fafe roads, and convenient harbours. For, without thefe, an extended coaft is no more than a maritime barrier againlt the maritime force of other nations; as is the cafe in many parts of Europe: and is one of the principal reafons why Africa derives fo little benefit from a fituation which has fo promiling an appearance; therc being many confiderable tracts upon its coafts, cqually void of havens and inhabitants, and which afford not the fmallet encouragement to the attempting any thing that might alter their prefent defolate condition. It is, however, a lefs inconvenience, and in fome cafes no inconvenience at all, if, in the compafs of a very extended coaft, there hoould be fome parts difficult or dangerous of accefs, provided they are not altogether inacceffible. - The fea coalt of Britain, from the figure, in fome meafure, of the ifland, but chiefly from the inlets of thic fea, and the very irregular indented line which forms its fhore, comprelends, allowing for thofe frnuofities, at leaft 800 marine leagues: we may, from hence, thercfore, with fafety affirm, that in this refpect it is fuperior to France, thouglt that be a much larger country; and equal to Spain and Portugal in this circumftance, though Britain is not half the fize of that noble peninfula, which is alfo fingularly happy in this very particular."

Cape-Coast, the name of the chief Britifh fettlement on the coatt of Guinea in Africa. The name is thought to be a corruption of Cabo Corfo, the ancient Portuguefe appellation. This cape is formed by an angular point, wafhed on the fouth and calt by the fea, on' which flands the Englifh fort. Here the Portuguefe fettled in $\mathbf{1} 610$, and built the citadel of Cape Coaft upon a large rock that projects into the fea. A few years afterwards they were diflodged by the Dutch, to whom this place is principally indebted for its Atrength. In $166+$ it was demolifhed by Admiral Holmes, and in 1665 the famous Duteh Admiral De Ruyter was ordered by the States to revenge the infults of the Englith. With a fquadron of 13 men of war, he attacked all the Englifh fettlements along the coaft; ruined the faetories; and took, burnt, and funk all the fhipping of the Englin Company: however, after all his efforts, he was bafted in his attempts on Cape Coaft. By the treaty of Breda it was confirmed io the Englifh, and the king granted a new charter in 1672 ; on which the Company applied all their attention to the fortifying and rendering it commodious.

COASTING, in mavigation, the act of making a progrefs along the fea-coalt of any country. The principal articles relating to this part of navigation are, the oblerving the time and direstion of the tide: knowledge of the reigning winds; of the roads and havens; of the different depths of the water, and qualities of the ground.

Consting-Pilot, a pilot who by long experienee has become fufficiently acquainted with the nature of any particular coalt, and of the requifites mentioned in the preceding article, to conduct a hip or fleet from one part of it to another.
Vol. V. Part I.

## 105 C C O 13

coa'l', or coat of arms, in heraldry, a habit worn' by the ancient kuights over their arms both in war and tournaments, and ftill borne by herald; at arms. It was a kind of fur-coat, reaching as $10 \times y$ as the navel, open at the fides, with thort feeves, fometimes furred with ermine and hair, upon which were applicd the armories of the lenights embroidered in gold and film ver, and enamclled with beatea tin coloured black, grecin, red, and blue; whence the rule never to apply culuar on colour, nor metal on metal. The coats ot arms were frequently open, and diverffied with bands and fillets of feveral colours, alternately placed, as we ftill fee cloths fcarleted, watered, \&ce. Hence they were called devifes, as being divided and compofed of feveral pieces fewed together; whence the words falfe, pale, clewron, bend, crofs, faltier, lozenze, à c. which have fince become honourable picces, or ordinaries of the fheld. See Cross, Blad, Chevron, \&c.
Coats of arms and banmers were never allowed to be worn by any but knights and ancient nobles.
Coat, in anatomy. See Tunic and Eye.
Coat of Musil, a kind of arnour made in form of a thirt; confiling of iron rings wove together netwite. Sec Mail.
COATI, in zoology, a fynonime of a fpecies of $\mathrm{V}_{1}$. verra, and Ursus.
COATIMUNDI, a varicty of the abore.
COATING, amoug Chemifs. Sce Chemistry, no 580.

Coating of Vials, Panes of Glufs, \&ce. among electricians, is ufually performed by covering the outfide of the vial with tinfoil, brafs or gold-leaf, \&c. and filling its infide with loofe pieces of brafs-leaf, by which means it becomes capable of being charged. See Ilectricity.

COATZONTECOXOCHITL, or Flozer wihb the vifer's bent, in botany, a Mexican flower of iucomparalle beauty. It is compofed of hive petals or leaves, purple in the innermoft part, white in the middle, the relt red but elegantly fained with yellow and white fpots. The plant which bears it las leaves refembling thofe of the iris, but longer and larger ; its trunk is finall and fim; this flower was one o. the mof eftemed amongt the Mexicans. The Lincean academicians of Rome, who commented on and pullifhed the Hiftory of Hernandez in $1 \sigma_{j} \mathrm{I}$, and faw the paintings of this flower, with its colours, executed in Mexico, conceived fuch an idea of its heauty, that they adopted it as the emblem of their very learnell academy, denuminating it Fior di Lince. See llate CXEIII.

COBALT, one of the feminetals, according to Cronftedt, of a whitinh-grey colour, nearly, refermbing fime hardened ftecl, and of the fpecilic gravity of 6.000 ; but according to vethers, of a Elnith grey, or reddih white colour, and of the ipecific gravity of 7.700 . It is as difficult of fufion as copper, or even gold ; and when well puriled, farcely yiclos to inon itifelf in this refpect. When flowly ccoled, it cryflalizes, furining on its furface fmall bundes of needles, or aeedte-forined prims, laid on one another, and united into bundes : greatly refembling, according to Mongen, a mats of Thaken bafaltes. In order to fucceed in this cryltallization, it is fufficient to melt the cabalt in a crucible till it fufiers a kind of ebullition; and, after haviug

Cust
II
Cubale.

Fobst. thken it from the fire, to incline the veft white the furface of the fomimetal is conaealing. By this incliwation the portion of netal hall fufed is poured out, and that which adheres to this kind of gende formed be the couling of the furfaces of the cobalt is found coneral with the cryfals furght for. When meterd with Lurax it afforia a lhe glafs, which is the mot obrious methed of dilinguiling if ores amongte all cthers. It cannot be calcined without confiderable dificulty; and the calk. though black in appearance, is in reality of a deep blue. This cals melted with lorax, or potalle and filiceous fand, affords the blue flafs called jom $h$, wey much nled in cnamel painting and tinging of other glats, being the mot fixed of all whoms in the live.

Cchalt, when calciner ahong with the calk of arfenic in arentl licat, affurnes a red colomr. The fame is natmally proluced by way of efforefence, and is then callud the blom or faterers of cobalt. When cuhalt and arienic are metteit in a Arong fre, they bum with a bive dame. It dors nat mix either with mer-- an by by means hithurto known, nor will it fow any union with bimuth without the aldition of fome medun. It is eatily foluble in firit of nitre, and the folution cither in th's or any other acid is of a red colour: and it is obferrable that the colour of the acid fout:ons of this fenmetal, infead of fading by dilution with wate:, becomes more vivid. It is precipitated of a pale red colour from its Sulations by aGid of fuast, wilich bas the greatcit attraction for it ; though acid of forrel likewife precipiates it.

Cromatat, in fpuakinz of this femirintal, makes mention of native cubalt ; but other mineralogits affure us that it has never been found perfoctly pure in the bowels of tie earth. What paffes for fuch, is faid by Kirwan to be mincralized by arfenic. That called the grey cubalt ore comes nearef to the purity of the native feminutal, but alwass holds fome quantity of arfenic aud iron. It is found in Sweden, Saxony, Norvay, and England, particularly at Mendip hills in Sumerfethire, and in Cornwall, where Dr Lewis fays it has lately been dug up in large quantitics. Here it is fometimes found in conjunction with bifmuth, and fometimes withoat it, refombling very much in appearance the Saxun ores from Schnuberg in Mifnia, and produces the finett blue colours by proper management. An arfenicated grey cobalt ore has alfo been found at Chatclaudren in France.

This kind of ore is folid, heavy, and compact, fometimes dull and fometimes of a bright appearance, cryflallized frequentiy in a teffular and fometimes in a dendritical form; being generally hard enough to Atrike fire with teel, when an arfenical fmell is perceived. It grows black in the fire, is foluble with effervefence in the nitrous acid, from which it may be precipitated by the marine, and affords the Sympathetic INK mentioned under the article Chemistry, $\mathrm{n}^{2} \$ 22$. This and the blue colour communicated by it to glafs are indced the two characterillics by which the ores of cubalt are diftinguibed from other arfenical ores.

The moft common ore of cobalt is that called the black or vitreous cre, and Kobalt Mulm or Scblaken Kolalt by the Germans. It is found in a loofe powdery form, fonetimes refembling lamp-black, fumetines of a grey colour, in which flate it is called cobult
ochere; but when in fcoriform half vitrified maffes, it ol tains the name of virreous or glafis cre. When this lind of ore contains any fulphur or arfenic, they are ouly mechanically nixed with it. A fmall portion of cupper, however, is fometimes found in it. It is frequently embodied in thones or fands of a black colour; fometimes it is contained in argilluceous earths of a blue or greea colour. Tah, chatik, and gypfum, impreguated with it, are called by the fame name; and by fome fikigel cobalt:
3. Cobalt mincraiifed by the arfinical acil, is found either loofe and pure, or mixed with chnt or gypfum, or indurated and certallized in tetahedral crytals. It is alfo found in a dtalact:tical form. It melts calily, and then becomes blic. It frequently invelts other cobaltic ores; and is found fomectimes in fone and fand. From the experinents of Bergman it appears, that the arfenical acid, and nor the cals of arfenic, enters into this combination ; for cobilt is never red but when united to an acid. Mowers of cobalt, mineralized by arfonic withut any filer, and intermised with gralena, have alfo been difcotersed in France.
The fowers or efflorefence of cobalt are often found of a recicolour, liheuther earths, ¢pread very thin on the cubill ores; and is, when of a pae colour, erroveouly called flowers of bimuth. A white cobalt earth or ochere is fud to have been found, and examined by a clibrated mineralogit, who found it to refemble the cobalt flowers in every refpect except the colour ; and indecd it is poffible thar in thefe fowers the colour might by length of time, or fome other accident, have lof their colour. The indarated flowers of cobalt are commuly cryfallized in form of deep red femitranfparent rays or radiations. It is found at Schubbers in Sasony.

Cobalt, mineralifed by fulphurated iron, is of a colour nearly refembling tin or flifer. It is fometimes found in large mafles, functimes in grains crytallized of a dull white colour, and frequently has the appearance of mifpickle. It has no mixture of arfenic. By calcination it becomes black and not red, which ditinguithes it from the pyrites; and it contains fo hitile fulphur, that none can be extracted from it. When diffolved in aqua regia the folation is yellow, but becomes green when bolling hot: which afternation, fays Kirwan, is peculiar to marine cobalt. A coarfe grained kind of this ore, found in Sweden, becomes fimy in the fire, and fticks to the iron rods employed in thirring it while calcining. The flaggy kind contains a large quantity of iron, and affords a very beautiful colour as well as the fornier.

Cobalt maineralized by fulpbur, arfenic, and iron, has a great refemblance to the harder kinds of grey cobalt ore, formerly mentioned; but it is never hard enough to arike fire with fteel, and fometimes may even be fcraped with a knife. The molt fhining kinds of this and the former fpecies are called cobult glants.

The great confumption of cobalt is for the permanent blue culour which it communicates to glafies and enamels, either upon metals, porcelains, or earthen wares of any kind. It is the fame blue prepared in a very cheap way by the Dutch, chiefly from the coarie glafs or blue glafs of cobalt, and called azir de Hollavide by the French, and which is employed by laun-
dreffes.

Culvit drefles. Lut although cobale is applied to few or no coblentz other purpefes, the quantities confumed in this way afford fufficient profit to thofe who have cobale mines
in their pofledion.

Ores of cobatt, ais has aiready been faid, are met with in many parts of Europe. The greatelt quantitics are found near Schnmerg in the diftrict of Mifnia in Saxony ; alfo at St Andreafoerg in the UTpper Hartz, where large quantities have been met with for upwards of 30 years paft. Formenty an iron ore only was fond in this place; but about the begiming of the rath century, on finking deeper, it was linceeded by a wey rich ore of fitior; which alfo being in kength of time exlanted, gave place to cobalt ores. Some pieces, howewer, are ftill found in thefe mines, that contain hiver and gold.

The general method of preparing ex halt ores in the large way feems contind to Saxony alone; from whence all other parts of the world, eren the Eatt l dies, are coutantly fupplitd. It is fuppoled that the Chinefe, and nore paticulaly the tayanefe, had fornerly mines of excellent cobalt, with which the tine blues of their ancient porchains were painted; but it appears that the fe mines are now exhaulled, and that the inferior blues of thein prefent wares are painted with the Saxon zaffe imported to them by the Duteh. For the management of the ore in fimh a mancr as to fit it for giving the defired colour, fee the article Zaffre.

When cobalt is united to bifmuth, by means of nickel , the compound, is called fpid/s. This name is alfo griven to a misture of cobalt, nickel, bifmuth, fulphur, and arfenic.

In Germany and Saxony, the word cobalt is applied to the damps, arfenical vapeurs, and their effects on the miners; which has induced the vulgar eo apply it to an cvil fyirit whom they luppofe to dwell in the mines.

Regulus of Corate, a kind of Cemimetal prepased from" c balt, of a whith colour inclining ta red. See Zaffre, and Chemistry, 12129 . Sc.

COBBINC, a pumithment fometimes inflicted at fea. It is performed by friking the offender a certain number of times on the brecch with a flat piece of wood called the colling-bourd. It is chiefly ufud as a punifhment to thofe who quit their flation during the period of the night-wateh.

COBLTIS, the luabe, in ichthyology, a gemus of fifmes belonging to the order of abduminates. The eyes are in the upper part of the head; the branchioftege membrame has from four to five ayss; and the body is nearly of an equal thieknefs houghout. The fipecies are five; three of which are natives of Europe. The loache is found in feveral of our fmall rivers, keeping at the bottom on the gravel; and is, on that account, in fome places called the gromulting: It is frequent in the frean near Amebury me Wiltfhire, where the fortfonen, through foolic, finallow it down ative in a glafs of white-wine.

COBLE, a boat ufed in the turbot finery, twenty feet fix iaches lung, and five feet broad. It is abour one ton burthen, rosed with three pair of oars, and admirably conitructed for enconntening a momatanons fea.

COBLENTZ, an ancient, handfome, and Mrong
town of Cermany, in the clectomate of larews ar Treves, feated at the combleme of the rivers khine and Mrefle, in a forik conatry, whomontan; avercid with rincymes. It is the whal riturace of the theetor of 'licues, to whom it bed figs. Over the Rhane is a bridge of twetre arches, Luift for the convmicnce of the mbabitants of Coblenty and the arjment places. A ferry machme is condantly groing from the city to the other fide of the Rnine, where there is a little town and sery frong callle buile on an emínence named the rock of lonowr. 'This machine is ercited on two boats, in the form of a large lipate gallesy, (11compafial with balluthades; and camies a tall Ilagfafl; on which are diflayed the arms of the clectorate of 'I'reves. It is pui in motion by the ferry-man's pulling a rope, which is lixed to a dandard un cach fide the diver. The calle appears to to almole inacceffible to an enemy, and enticls commands the city of Coblenze. The archbithop's patace flauds at the foot of this rock, and the artenal at a little chifance. L. Long. 7. 18. N. Lat. 50. 24.

COBOB, the name of a difinamong the Aours. It is made of feecral picese of mutton wrapt of in the cawl, and aftrwards mated in it; the proner pople, inflead of the meat, whe the hart, liver, and wher parts of the contrails, and make a good dulh, thuegh not equal to the former.

COBOOSL, in lea-lagguage, is derived from the Dutch kimblus, and demetes a lont of box, retabling a lentry-lox, whed to cover the chimneys of fime meechant hips. If generally thands agrint the banieade, on the finc-part of the quarter decks. It is called in the Wexl hadies cabre wega.

COBURG, a town of Germany in the circle of Franconia, and capital of a territury of the fame name, with a famous college, a fort, and a calle. This tom, with its prineipality, belongs to the houte of Saxony, and the inhabitants are Protedants. It is fated on the river ltch, in E. Long. 11. 5. N. Lat. 50. 20.

COBWEB, in phy fology, the fire net-inork whehe fpiders fpin out of their own bowels, in onder to) (atich there prey. Sec Aranea.

COCCEIUS (John), rolefior of theolugy at Bremen, was founder of a fect called Corcouns: they had, anongit other liugula opinions, that of a whale refg of Chrit in this world, after a gencral comvertion of the Jows and all other people to the true Chrithian futh, as laid down in the vommana works of Cocceius. He died in soy, aged 66 .

COCCINEL, $\therefore$, in zoology, a genusofinfects of the flate order of colcoptera; the characters of winch are thele: Cxhat The antenne are fiberlavated: the pabpime longer than the antenne, the haf articulation hewt-hajes ; the body is hemifplenic; the thorax and elgtra are margined; the abolomen is hat. This genus is divided into fections, from the colour of the elytra, and of the foots with which they are adomed. 'The fomales, impregnated by the maks, depoft theiregigs, which than to franl burex, fluw in their progres, anl ate enmios is the ghan-loufe. Thote larso are ficequmby romd upoa leaves of trecs cove ed with ghan-lice. On the point of being motamorphofat, they tettle on a lat by the hindur art of their body, tinen bend and firch themfolce, forming a kind of hovis. The kin extends, grows hard ; and in a formight's time the chry falis

Eurcorbbo opens along the back. The infect in its perfect flate receives the impreffions of the air, that gives its clytra a greater degree of confiftence. It fellom flies, and cannot keep long on the wing. Of all the different larve of the coccindla, the molt curious is the white hedgehog, a name given it by M. de Reaumur on account of the fingularity of its figure, and the tufts of hair which render it remarkable. It feeks its food on the leaves of trees. After a fortnight, it fettles on one $F_{F}$ ot, and without parting with its fur, turns to a chryfalis; three weeks after which, it becomes a coecincla. The fourg appears nowife impaired by its transformation. M. de Reaumur has obferved it on a plum-tice. It is likewife found upon the rofetree.

When the coccinclle firt arrive at the flate of perfeetion, the colours of their elytua are very pale, nearly bortering upon white or crean colour ; and the elytra are very foft and tender, but foon grow hard, and change to very lively brilliant colours. Their egres are of an oblong form, and of the colour of amber.

COCCOLOBO, in botany: A genus of the trigynia order, Lelonging to the octandria clafs of plants; and in the matural method ranking under the 12 th order, Holoracce. The calyx is quinquepartite and colourcd; there is no corolla; the berry is fommed of the c.lly x , and is monofpermous. The fpecies called unifira, or fac-jde arate, grows upon the fandy floores of mof of the Weft India iflands, where it fends up many woody flems, eight or ten feet ligh, covered with a brown fmouth batk, and furnifhed with thick, veined, thinitng, orbicular leaves, five or fix inches diameter, ftanding upon thort font-flalks. The fowers come out at the wings of the ftalks, in racemi of five or fix inches long; they are whitifh, have no petals, but each is compufed of a monophyllous calyx, cut at the brim into five oblong obtufe fegments, which fpread open, continue, and furround feven or eight awi-fhaped ftamina, and three thori fyles, crowned with fimple tigmata. The germen is oval, and becomes a fefly fruit, wrapped romind by the calyx, and includes an oval nut or fone. Thefe plums are about the fize of goofeberries, of a purple red colour, and a tolerable good flavour. There are fome other fpecies of this genus whofe finits are caten by the inhabitants where they grow, but they are fonaller and not fo well tafted.

COCCOTHRAUSTES, in ornithology, the trivial pame of a frecies of Loxia.

COCCULUS Indicus, the name of a poifonous tery, too frequently mixch with malt-liquors in orcir to make them intoxicating; but this practice is exprefsly forbidden by act of parliament. It is the fruit of the Mfentafersuas Cucculus. Fifhermen have a way If mixing it with pafte: this the fifh fwallow greedily, and we thereby rendered lifelefs for a time and foat on the water. The good women ufe it with flavefacre, for delfroying vermin in childrens heads.

COCCUS, in zorlogy, a genus of infects belonging th the coder of fremiptera. The roflrum proceels from the breaft the belty is brittly behind; the wings of the male are erect; and the female has no pinisc. The fpecics are 22 , denominated principally form the plants they frequent. The molt remarkable favicsor:
s. The coccus he fperidum, or orcen-boufe bug, which
is oval, oblong, of a brown colour, covered with a kind of varnifh: it has fix legs; with a notch and four briftcs at the tail. It infelts orange trees and other funilar plants in green-houfes. When young, it runs upon the trees; but afterwards fixes on fome leaf, where it hatches an infinity of eggs, and dies. The male is a very fmall fly.
2. The coccus phalaridis. The male of this fpecies is finall. Its antenne are long for its fize. 'the feet and body are of a reddilh colour, nearly pink, and frinkled with a little white pawder. Its two wiags, and the four threads of its tail, are fnow white, and of thofe threads two are longer than the rell. It is to be found upon the fpecies of gramen which Linnarns calls phalaris. The female contrives, along the lalk; of that dog-grafs, little nefts, of a white cottony fubftance, in which the depolits her eggs. The finall threads of her tail are fearce perceptible.
3. The coceus cacti, a mative of the warmer parts of America, is the famous cochineal animal, fo lighly valued in every part of the world for the incomparable beauty of its red colour, which it readily communicates to wool and filk, but with mach more difficulty to linen and cotton. This infect, like all others, is of two fexes, but exceedingly diffemilar in their appearance. The female, which alone is valuable for its colour, is ill-flaped, tardy, and Ilupid: its eyes, mouth, and antenne, are fixed fo decp, and are fo concealed in the folds of the finin, that it is impoffible to diftinguith them without a microfcope. 'Ithe male is very fcaree, and is fufficient for 300 females or more; it is active, fmall, and fender, in comparifon with the female; its neck is narrower than the head, and till narrower than the refl of the body. Its thorax is of an elliptic form, a little longer than the neck and head put together, and flattened below; its antennæ are jointed, and out of each joint iffuc long fender hairs that are difpofed in pairs on each fide. It has fix feet, each formed of diftinct parts. From the pofterior extremity of its body two large hairs or brifles are extended, which are four or five times the length of the infect. It bears two wings that are fixed to the upper part of the thorax, which falls like the wings of common flies when it walks or refts. Thefe wings, which are of an oblong form, are fuddenly diminithed in breadth where they are connected to the body. They are ftrengthened by two oblong mufcles, one of which extends itfelf on the outfide all round the wing; and the other, which is internal and parallel to the former, feems interrupted towards the fummit of the wings. The male is of a bright red; the female of a decper colour. They are bred on a plant known in Oaxaca in New Spain, and all thofe parts where it abounds, hy the name of nopal, or nopalleca, the Indian fig-tree, Sec Cactus.

The cochineal was formerly inagined to be a fruit or feed of fome particular plant ; an error which probably arofe from an ignorance of the manner in which it is propagated; but at prefent eyery one is convinced of its being an infect, agreeably to its name, fignifying a wood-loufe, which generally breeds in damp. places, efpecially in gardens. Thefe infeets, by rolling themfelves up, form a little ball fomething lefs than a pea: and in fome places are known by the name of baquilas de San Sinton, i. e. St Anthony's

## 

ciceus. little cows: and fuch is the figure of the cochincal, except that it has not the faculty of rolling itfelf up; and its magnitude, when at its full growth, does not excced that of a tick common in dogs and other animals.

The juice of the plant on which thefe infeets breed, is their fole nourifhment, and becomes converted into their fuhftance; when, inftead of being thin and waterifh, and to all outward appearance of little or no ufe, it is rendercel of a moft beautiful crimfon colour. The plant is in May or Jme in its mont vigorous fate, and at this moft favourable feafon the eggs are depolited among the leaves. In the fhort face of two months, from an animalcule, the infert grows up to the fize above mentioned : but its infant flate is exprofed to a variety of dangers; the violent blafts of the north wind fweep away the eggs from the foliage of the plant ; and, what is equally fatal to their tender conllitutions, Showers, fogs, and frells, often attack them, and deftroy the leaves, lcaving the careful cultivator this only refource, namely, that of making fires at certain diflances, and filling the air with fmoke, which frequently preferves them from the fatal effects of the inclemency of the weather.

The breeding of cochineal is alfo greatly obftructed by birds of different kinds, which are very fond of thefe infects: and the fame danger is to be apprehended from the worne, \&e. which are found among the plantations of nepals: fo that unlefs conflant care be taken to fright the birds away from the platatation, and to elear the gromd of thofe various kinds of ver$\min$ which multiply fo faft in it, the owner will be greatly difappointed in his expectations.

When the infects are at their full growth, they are gathered and put into pots of earthen ware ; but much attention is requifite to prevent them from sctting out, as in that cafe great numbers of them would be loft; though there is no danger of it, where they are at liberty on the nopal laves, thofe being their natural habitation, and where they eajoy a plenty of delicions faod: for though they often remove from one leaf to another, they never quit the plant; nor is it unconmon to fee the leaves entircly covered with them, efpecially when they are arrived at maturity. When they have been confined fome time in thefe pots, they are killed and put in bags. The Indians have three different methods of killing thefe infecis; one by hot water, another by fire, and a third by the rays of the fun: and to thetc are owing the feveral gradations of the colour, which in fome is dark, and in others bright ; but all require a certain degree of heat. Thofe therefore who ufe hot water are very careful to give it the requifite heat, and that the quantity of water be proportioned to the number of infects. The method of killing the creatures by fire is to put them on flovels into an oven moderatidy leated for that intention; the fine quality of the cochineal depending on its not being over dried at the time of killing the infects: and it mult be owned, that aroong the feveral ways made ufe of to deftroy this valuable creature, that of the rays of the fun feems to bid fairett for performing it in the moft perfect manner.

Belides the precaution requilite in killing the cochineal, in order to preferve its quality, it is equally neceflary to know when it is in a proper fate for being
removed from the leaves of the nopal; but as cape. rience only can teach the cultivator this neceflary criterion, no fixed rule can be laid down. Accordingly, in thofe provinces where the cultivation of thefe infeets is chiefly carried on, thole gathered by Indians of one village differ from thofe gathered in anuther; and even thofe gathered by one perfon in the fame village, are often different from thofe gathered by anutiner; every individual adhering to his uwn mothod.

The cochineal-infect may, in fome circumfances, be compared to the filk-worn, particularly in the manner of depofiting its eygs. The infects dedtined for this purpofe are taken at a proper time of their gruxth, and put into a box well clufid, and lined with a coarte cloth that none of them be loft: and in this cominuement they lay their eges and dic. The box i, kept clofe fhut till the time of placing the eggs on the nopal, when, if any motion is perceived, it is a fuflicient indication that the animalcule has life, though the eyry is fo minute as hardly to be perceived; and this is the feed placed on the foliage of the nupal, and the quantity contained in the thell of a len's egg is fufficient for covering a whole plant. It is remarkable that this infect does not, or at lead in any vibible mamer, injure the plant, but extracts its nourifhment from the molt fucculent juice, which it fucks by means of its probofcis through the fine teguments of the leave.

The principal countries where the coclineal infects are bred, are Oaxaca, Tlafcala, Chulula, Nueva Gallicia, and Chispa, in the kindom of New Spain; and Hambato, Loja, and Tucuman in Peru: but it is only in Oaxaca that they are gathered in large quantities, and form a branch of commerce, the cultivation of thefe little creatures being there the clicef employment of the Indians.

Though the cochineal belongs to the animal kingdm, of all others the moll hable to corruption, yet it never fpoils. Without any other care than merely that of keeping in a box, it has been preferved for ares. In diying, it lofes about two thirds of its weight. When dried, it is forted into large entire grains, and finall or broken ones: the firt are called by the Spaniards grana, the later granilla. In trade, four forts are diltinguihned, Moflique, Gampefchane, 'Tetrafcbale, and folvefter ; of which, the firll is accounted the bell, and the lint the wort. The three fint are named from the places where they are produced; the latter from its being found wild without any culture.

In medicine, cochimeal has been flrongly recommended as a fudorific, cardiac, and alexipharmac; but practitioncrs have never obferved any coufiderable effeets from it. Its priacipal confumption is among dyers. Sce the article Dreing.
4. The coccus ilicis, or that forming the kermes grains, inhabis the quercus coccifera of the fouthern parts of Europe. Mr Hellot of the French Academy of Science:, in his Art of Dyeing, c'lap. 12. fays it is foumb in the woods of Vauvert, Vendeman, and Narbonne; bat more abundantly in Spain, tovards Alicaat and Valencia. It not only abounds in Valencia, but alio in Murcia, Jatn, Cordova, Seville, Ellremadura, la Manelia, Serranias de Cutnca, and other places.

## $\mathrm{C} O \mathrm{C}$

In Xixoma and Tierra de Relien, there is a dilmiez
called $D_{e}$ la Grana, where the people of Valsncia firt began to gather it, whofe exanaple was followed all over Spain. It has fome yars produced 30,000 dollars ( 5000 l .) to the intabicants of Xixona.

Buth ancients and moderns feem to have had very confufed notions concerning the origin and nature of the kermes; fome confidering it as a fruit, without a juft knowledge of the tree which produced it ; others taking it for an excrefcence formed by the puncture of a particular fy, the fame as the common gall obferved upon oaks. Tound fort was of this number. Count Marligli, and Dr Nifole a phyfician of Montpelitr, made experments and obfervations, with a view of further difcovenies; but did not perfectly fucceed. Two other phyficians at Aix in Prorence, Dr Emeric and Dr Garidel, applied themfelves about the fanse time, and with greater fuccefs; having finatly difiovered that the kermes is in reality nothing elfe but the body of au infect transformed into a grain, berry, or hufk, according to the courfe of nature.

The progrefs of this transformation nuft be confidered at three different feafons. In the firf fage, at the beginning of March, an animalcule, no larper than a grain of millet, farte able to crawl, is petceived flicking to the branches of the tree, where it !ixes itfelf, and foon becomes inmoveahle; at the period it grows the moll, appears to fwell and thrive with the fuftenance it draws in by degrees. This fate of relt feems to have deceired the curious obferver, it then refembling an excefeence of the bark; during this period of its growth, it appears to be covered with a down, extending over its whole frame like a net, and adhering to the baiks its figure is convex, not unlike a fimall floe: in fuch parts as are not quite hidden by this foft gament, many bright fpecks are perceived of a gold colout, as well as ftripos running aerofs the body from one fpace to another. At the fecond fage, in April, its growth is completed; its fhape is thea round, ald about the fize of a pea: it has then acquired more thength, and its down is changed into dutt, and feems to he nothing but a huik or a capfule, full of a reddifa juice not unlike difcoloured blond. Its third fiate is towards the end of May, a litte fooner or later accoding to the warmon of the climate. The hulk appaars replete with fmall eggs, lefs than the feed of a poppy. Thefe are properly ranged under the belly of the infect, progreflively placed in the net of down that covers its body, which it withdraws in proportion to the number of exgs: after this work is performed, it foon dies, thongh it fill adhores to its pofition, rendering a furcher fervice to its progeny, and hiclding them from che inclemency of the weather, or the boilile atiacks of an enemy. In a grod feafun they multiply exceedingly, having from 1800 to 2000 ergs, which produce the fame number of animalcules. When obf tred with the microfape in July or Augut, we find, that what appeared as dutt, are to many eges or opon caplules, as white as frow, out of cach of which iflues a gold-coloured animatule, of the fhape of a cockroach, with two horns, fix fect, and a forked tail. In Languedoce and Puvence the poor are employed to gather the kermes, the women letting theil nails grow for that purpofe, in order to pick them off widh greater facility.

The cutton of lopping of the bougins is very injudicious, as hy this means they deftroy the next jear's harvell. Some women will gather two or three pounds a-day : the great point being to linow the places where they are mol likely to be found in any quantity, and to gather them early with the norning-dew, as the leares are more pliable and tender at that time than after they have been dried and parched by the rays of the fun: Arong dews will occationally make them fall from the trees fooner than wfual: when the proper feafon paffes, they fall off of themfelves, and become food for birds, particularly doves. Sometimes there will be a fecond production, which is commonly of a lefs fize with a fanter tinge. The firt is generally found adhering to the bark, as well as on the branches and Italks; the fecond is principatly on the leaves, as the worms choofe that part where the nutritions juice preferves itflf the longeft, is mot abundant, and can be moll eadily devoured in the fhort time that remains of their exiftence, the bark being then drier and hard. er than the leaves.

Thofe who buy the kermes to fend to foreign parts, fperad it on linen; taking care to fprinkle it with vinesar, oo kill the worms that are within, which produces a red dult, which in Spain is leparated from the huks. Then they let it dry, pafing it through a farce, and make it up into bags In the middle of each, its proportion of rod duft, put in a little leather bag, allo belongs to the buyer; and then it is ready for exportation, being always in demand on the Alrican coatl. The people of Hinojos, Bonares, Villabba, and other parts of the kingdom of Seville, dry it on mats in the fun, Airring it about, and feparatiog the red dult, which is the finelt part, and being mixed with vinegar goes by the name of paflic. The fume is done with the hulis; but there have but hatf the valut of the dult. The kermes of Spain is preferred on the coath of Barbary, onaccount of its goodncis. The people of Tunis mix it with that of Ttuan, for dyeing thwle farlet caps to much ufed in the Levant. The Thuifians export every year abuve 150,000 dozen of thefe caps, which yields to the D:y a revenue of 156,000 hand dullars (3.3,7501) fer annam for dutios; to that, exclufive of the ules and adiantages of kermes in medicine, it appears to be a very valuable branch of commence in Spain.
5. The coccus lacea, or gum-lac animal, is a native of the Eat Indies. The head and iruak form one uniform, oval, compreffed, red body, of the fhape and magnitude of a very fmall loufe, conititing of twelve tranlverfe rings. 'The back is carinite ; the belly fat; the antenne half the length of the body, tilitorm, truncated, and diverging, fendiug of two, often chree, delicate, diverging hairs, longer than the antenax: the moth and eyes conld not be feen with the naked cye. The tail is a little whate point, fendug off two horizontal hairs as loag as the body. It has three pair of limbs, half the densth of the iniect.

This is its defcription in thet date in which it fallies forth fiom the womb of the parent in the months of November and December. They traverfe the branches of the trees upon which they were produced for fome time, and then fix themetelves upon tis fucculent extremities of the youns branches $B y$ the middle of January they are all fixed in their proper 2

Coccus. fituations; they appear as plump as before, but fhow no other marks of life. The limbs, anteme, and fetre of the tail are no longer to be feen. Around their edges they are environed with a Spiflid fubpellucid liquid, which feems to glue them to the branch: it is the gradual accumatation of this liquid, swhich forms a complete cell for each infect, and is what is ealled gum licco. Ahout the middle of March the celis are completely formed, and the iffect is in appearanee an oval, finooth, red-bag, without life, about the lize of a fimall cuchancal infect, emarginated at the obtule end, full of a beattitil red liquid. In Octobr and Nosember we find ahom 20 or 30 oval eces, or rather young erube, witam the red Auid of the mother. When this fluid is ail expended, the young infects fiace a hole chrough the baek of their mother, and walk of one by one, leaving their exuvire behind, Which is that white membrnous fubtance found in the empty cells of the Itick lar.

The infess are the inhabiants of four trees: I. Ficus religisfa, Limmi; 2. Fieus indica, Limma; 3. Platu, Horties Alolulerici ; aud 4. Khamnes jujuba, Limmai.

The infecto generally fix themelves for clofe together, and in foch numbers, that farcely one in fix can have room to complete her cell: the uthers die, and are eat up by varions infects. 'Tlte extreme tranches appeat as if they were covered with a red sult, and their fap is fo mach exhaufted, that they whither and procuce no font, the leaves drop off, or turn to a dirty black colour. Thefe infeets are tranplanted by birds: if they perch upon thefe branches, they mall carry of a number of the infects upor their feet to the next tree they reft upon. It is worth oblerving, that thefe figtrees when wounded drop a milky juice, which inkantly coogulates into a vifcid ropey mbitance, which, hardencd in the open ain, is fir ilar to the cell of the coe. cus lacca. The natives boil this milk with oils into a bird-lime, which will catch peacocks or the largeft birds.

A red medieinal gum is proeured ty ineifion from the plafo tree, fo fimilar to the gum lacea, that it may readily be taken for the fane fublance. Hence it is probable, that thofe infects have little trouble in animalizing the fap of thefe trees in the formation of their cells. The gum lacea is rarely feen upon the rham. nus jujuba; and it is inferior to what is found upon the other trees. The gum lacea of this country is prineipally found upon the uncultivated mountains on both fides the Ganges, where bountiful nature has produced it in fuch abundance, that was the confumption ten times greater the markets might be fupphied by this minute infect. The only trouble in proeuring the lae is in breaking down the branches, and carrying them to maket. The prefent price in Dacea is about twelve flillings the hundred pounds weight, although it is brought from the diftant country of Affam. The beft lac is of a deep red colour. If it is pale, and pierced at top, the value diminithes, becaufe the infects have left their cells, and confequently they can be of no ule as a dye or colonr, but probably they are better for varnifhes.

This infect and its cell has gone under the various names of gum lacea, lack, loe tree. In Bengal, la; and by the Englifa it is diftinguifhed into four kinds,
differently demominated: for which, and their feveral wes, fee the article Lacca.

In the figure, a reprefents the infect at its birth; $b$ ditto, bige with young; both the natural fize. $\gamma$ 'The embyro before birth inclufed in its membrane; o The coecus, with two hairs from each antema; \& Ditto, with three latirs from each antema; thefe three ligures are magnified.
6. Cuecus Polonicus, an infect which may properly enongth be called the cochineal of the northern part of the world. As the cochineal loves only the hot climates, this ereature affects only the cold ones. It is collected for the ufe of dyers: but the crops of it are much finaller, more difficultly made, and the drug itfelt greatly inferior to the true cochineal. It is commonly known by the name of coccus Polonicus, or the farlet grain of Polumd. That conantry is indeed the place where it is gathered in the greatelt abundance; but it is not che only one where it is found. It is to be met with in many of the nothtern countries; and pullibly may be fuund in fome of the more temperate ous, where it is not yet known; as it is very much hid by natuc from the eyes of common obfervers. It is foond aflixed to the root of a plant, and ufually to plaws of that fpecies from thence called polyoonuns cocerferan: though authors have informed us of the fame bery, as it is offen called, being found at the roots of the moule ear, rupture-wort, pimpernel, and pellicory of the wall; and that it is in no other than fandy places that it is found at the roots of thofe plants. Breyuius, in I 73 I , printed at Dantzick a very euious account of this pruduction, which proves it inconteflably to bc an animal. Towards the end of June the coceus is in a fit ftate for being gathered. Every one of the creatuies is then nearly of a Sherical form, and of a tine violet cslour. Some of them, however, are not larger than poppy fetd, and others of the lize of a pepper eom; and each of them is lodged, either in part or entirely, in a fort of cup like that of an aeorn. IIURe than half the funface of the body of the animal is covered by this cup. The outfide of the covering is rough, and of a blackilh brown; but the infide is fmoorh, polified, and thining. On fome plants they find only one or two of thefe, and on others more than forty; and they are fonctimes placed near the origin of the talks of the plants.

Breynius began his obfervations on the animals in this ftate, feveral of them being put into veffis of glals; and by the $24^{\text {th }}$ of July, there was produecd from every one of them a hexapod, or fix-legged worm, with two anternz on its head. Several of thefe were kept a fortnight, and fhowed no inclimation to eat any thing. They runabout, however, very fwiftly for fome time; but then began to be more quiet, drew up their bodies fhorter, and ecafed to run about any longer. They were now of a purple colour ; but in this fate, though they did not walk about, they were fubject to various contortions. At length, when they were become wholly mationlefs, their bodies became covered with a fine down: this was white, and formed them a perfect covering, which was fometimes of a fpherical, and fometimes of an irregular figure: it was always. however, very elegant; and the downy matter plain. ly enough tranfpired out of the animal's body. 'The creasulez

## C O C

Cricus.
creatures remained in this thate of reft, and cosered with this down, for five or fix days; but at the end of that time, every one of them laid more than 150 eggs. Thefe eggs were depofited upon the paper on which the animals were placed, and were enveloped in fome meafure by a downy matter. When the creatures had laid all their eggs, they died; and ahout the 24 th of Augult there came from every egr a fmall infect, which to the eye fcarce feemed any other than a red point ; it might, however, be obferved very plainly to move about. Thefe young animals lived about a month, wholly without fuitenance. Mr Breynius was induced at firlt to believe, that thefe animals came to be in a Itate to produce perfect eggs, without any congrefs with the male; but farther obiervations convinced him of the error of this opinion. He faso afterwards a fort of very fmall flies with two white winss bordered with red, produced from feveral of the cocci. Thefe fies are plainly of the fame kind with the male gall-infects.

It has before been obferved, that thefe cucci differ ia fize. The flies are produced by the fimall ones not tigger than a poppy feed; the others produce the worms before defcribed: and one obfervation of Mr Breynius's affords a plain proof that thefe flies are the male infeets of the fpecies; fince all thofe of the females, which had been a day or two accompanied by thofe flies, quickly covered themfelves with down and began to lay their eggs; whereas thofe which had not this comnerce with the flies remained in the fame Hate, or elfe got only a very thin and flight covering of down, and never laid any eggs. The manner of this creature's life, however, from its being hatched, to its being found in the hape of a berry at the roots of the plants, is yei unknown : and how they aflume the fhape of a ball lodged in a cup, mont require a nice obfervation to difcover.

The proper time for gathering this inlect, as we have already obferved, is about the end of June, when it is quite full of of purple juice. Thofe who gather it have a hollow fade with a fhort handle; then, taking hold of the plant with one hand, they raife it out of the ground with the tool held in the other; after which they very quick!, and dexterounly detach the infeets, and replace tne plant in the ground, where it again iakes root. The cenceus is then reparated from the earth by means of a fieve; and in order to prevent them foom turning into worms, they fneinkle them with very cold water or "inegar. Laitly, they are killed by expofure to the fun, or kecping them for fome time in a varm place; but this nuft be done with caution, as too hafty drying would fpoid the colonr. Sometimes they feparate the infers from the velicles with their fingers, and form them into balls; but by this operation the price is greatly increafed.

We are informed by Bernard de Bemith, from whom this account is taken, that the harvelt of coccus was farmed out to the Jews by fome Polifh lords, who had poffeffions in the Ukraine; that it was ufed ty them, as well as the Turks and Armenians, for dyeing not only wool and filk, bat the tails and manes of their horfes; that by" its means the Markifh women dyed the tips of their fagers of a beautiful carnation: and that it was formerly ufed by the Dutch along with an equal quantity of cochistai, the coccus beinis pur$\mathrm{N}^{2} 3$.

## II 2

C O C
chafed at a very dear rate ; that beautiful paints may Coccygeu be prepared from this infeet and pounded chalk, \&e. All this, however, M. Macquer fupporits to have been Cochin. exaggerated, as he never conld ploduce with it any other than lilach, flefl-colour, or crimfon; and he found it, morever, vaftly more expentive than cochineal, as not yielding one-fifth part of the colomr. Hence this drug is atmolt entirely fallen into difufe, being farce known in any of the European cities remaskable for having good dyers.

COCCYX, or Coccygrs os. See Anatomy, n 35 .

COCHIN, a Dutch fettlement on the coalt of Malabar in N. Lat. 9 . 58. E. Long. 75. 58.-The tawn is not unpleafant, though it falls far fhort of their fettlement at Columbo in the illand of Ceylon. The furtification is irregular, but ftrong enough to refift any of the Indian powers, and has 40 or 50 cannon facing the fea. The people in this town and the country adiacent are fubject to a ftrange diforder of the legs called Cochin or elephant legs, in which the fivelled limb is fometimes of fuch an enormous bulk as to have greatly the appearance both in fhape and dize of the leg of an elephant. According to Mr Ives, this diforder feems to be merely an œedematous fwelling, occafioned by an impoverified fate of the blood and juices. The perione aflicted, with this diftemper very feldom apply to European furgeons, and thus are rarely, if ever curci. Indecd, our anthor obferves, that their application would probably be of little avail, as the only thing that could be preferibed would be an alteration from the pooreit to the moft cordial and nutritious diet; and the Indians are fo invincibly wedded to their own cultoms, that they would fooner die than break through them. Of this he fays there were feveral intances in their long paflage to Kengal, duing which fome of the Sepoys perimed for want of food, rather than fave themflves by partaning of the mip's provifions after their own had been expended. Molt of thofe afticked with the diforder we fpeak of, are unable to call any affifance, being the very pooreft of the people, who live entirely upon a kind of hith called Sardinias, without beines able to purchafe evea the fmallefl quantity of rice to eat along with it ; their drink is alfo mere water, unlefs they fometines procure a drauglit of the fimple unfermented jnice called toddy. Cuchin is the principal place from whence the Dutch import their pepper into Europe.

Cochin-China, a kingiom of Ala, hounded on the north by Tonquin ; on the eaf, by the fia of China; on the fouth, by the Indian ocean; and on the weit, by Cambodia, and a ridge of mountains inhabited by a favage people called Kemois, who live independent of any govermment. Little of the hiftory of this kingdom is known. M. le Poivre, a French traveller, intorns us, that about half a century before the French firft arrived in thefe diftant regions, a prince of Tonquin, as be fled from his fovereign, by whom he was purfued as a rebel, had with his foldiers and actherents crofed the river, which ferves as a barrier hetween Tonquin and Cochin-China. The fugitives, who were wrlike and civilized men, foon expelled the fcatteral inhabitante, who wandered about without any fo-
ciet-

## $\mathrm{C} O$ C $[113] \quad \mathrm{C} 0 \mathrm{C}$

shino cicty or form of government, ani founced a new king-
the reigus of the firil fix kings, ra nation could be happier than the Cochin-Chinfe. Their monarchs governed them as a fatlocr che's his family, cttablifhing no laws but thofe of nature, to which they themfelves were the firft to pay ohedience. They honoured and encourated agriculture, as the moll ufful employment of mankind; and required from their fubjects only a fanall amual frecegift to defray the expence of their defenfive war againt the Tonquinef, who were their enemics. This impolition was regulated, by way of poll-tax, with the greatell equity. Every man, able to till the ground, paid into the prince as frall fum proportioned to the flrength of his eonflitution, and the virour of his am; and nothing more.

Cochin-China contimed happy under thefe princes for more than a century; but the difcovery of goldmines fut a llop to the abore mild regulations. Luxury inmediately took place. The prince began to defpile the fumple habitation of his aneeflors, and carficd a fuperb palace to be built a league in circumference, furronded with a wall of brick in the model of that of Pekin, and defended by 10 óco pieces of camon. Not content with this, he would needs have a winter palace, an autumn palace, and a fumaer palace. The old taxes were by mo moans fuffecieat to defray thefe expences; new ones were devifed; and apprefion and tyranny every where took place. His ciurtiers, to flatter their prince, gave him the title of the Ling of beaven, which be till conthues to affime. When fpeaking of his fubjects, he flykes them his chichren, but by no meants beliaves as if he was their father: for our author informs $u$;, that he has feen whole villages newly abandoned loy their inhabitants, who were harafled with toil and infupportable exactions: the neccflay $y$ confequence of which was, that their lands returned to ther former unculivated flate.
M. le Poivre reprefents the Cochin-Chinefe as gentle, hofpitable, frugal, and induftrions. There is not a beggar in the country; and robbery and murder are abfolutely unknown. A ftranger may wander over the kingdom from one end to the other (the capital excepted) without meeting with the flightelt infult. He will be every where received with the molt eager curiufity, but at the fame time with the greateft benevolence. A Cochin-Chinefe traveller, who has not moncy fufficient to defray his expences at an inn, enters the firt houfe of the town or village he arrives at, and waiting the hour of dinner, takes part with the family, and goes away when he thinks proper, without fpeaking a word, or any perfon's putting to him a fingle queltion.

The country of Cochin-China is mich of the fame temperdture with that of Tunquin; though rather milder, as lying nearer the fea. Like Tonquin, it is annually overfowed, and confequently fruitful in rice, which requires no other manuee than the mad left by the inundations. They have fugar-eanes, and the fame kinds of fruits common to other parts of India. The country produces no grapes, and therefore they drink a liquor brewed from rice. They have walt woods of mulberry-trees, which run up as fath as our Bemp. Their filk is Aronger than that of Chima, but

Vol. V. Part I.
not fo fine. They have the belt timber in the worth, farticulaty a fort which abounds in the mountans, and is called the incormathle trie; lecaufe it never rots under carth or water, and is fo folid that it ferves for anclurs. There are two kinds, black and ral. The trees are very tall, ftraight, and fol big that tivo men can tarce fathen them. They bave alfo on the monntans of the Kemois a trec of the moll fragrant feent, which is fuppuled to be the fane with lignom aloes. This, being reekoned the bett product of the country, is engrofled by the king, and is fold from five to 1 G dueats fer pound. It is highly valued buth in China and Japan, where the legs of it are fold for 200 ducats a pound, to make pil lows for the kine and robility; and among thofe Indians which continue to burn the ir dead, great quatities of it are ufed in the funcral piles. The young tress called aquila, or eathtewood, we cuery one's property, which makes the wh ones called calambid fo farce and duat. They have oak, and large pincs, for the building of thips fo that this country is of the fame ufe to China that Norway is to latitan. In gencrat, they have the fame kind of trees and plants that are to be met with in 'Tonquin. Thee have mines of gold, as well as dimonds; but the latt they do not value fo highly as pearl. They alfo efteem their coral and amber very much. In all the provinces there are great granaries filled with riec, ia fome of which that grain is kept upwardo of 30 years. One of the greatelt raritics in thefe parts, efpecially in grand contertainments, is a ragout made of the ciatable birds nelts, which fone fay are found only in Cochin-China, and others in four inands that lie fouth of its coat. See Birds-Nests.

The merchants of Canibodia, Tunquin, Clina, Macao, Manila, Japan, and Malacca, trade to CochinChina wiht plate, which they exchange for the commodities of the country. The Purtagricfe are the molt favoured here of any Europeans. The Cochin. Chinete themflees, not being inclined to travel, feldum fail out of fight of their own thore, but purchafe many trizhes from foreigners at great rates, particularly combs. needles, bracelets, ghtis pendants, EBi. They are very fond of our hats, caps, girdles, fifirts, and othir clothes; and, above all, fet a great waine on coral. The conntry is faid to have 700 miles of coall, with many large inlets of the fea, and above 60 convenient landing phaces; which, however, according to Captair Hamilton, are but fellom rifted by Arangirs..

The poople of this comentry have a great affinity with thofe of Tonyuin, with whom they have a common origin, and from whom they differ very little in their manner of living, as well as their mannes and culloms, all of which thev have in a great meafure borrowed from the Chinefe. The priacipal exports of the country are lilk, Fugar, cbeny, and calambawood; gold in duft or in barso which is fold for only ten tinaes its weight in filver; and copper and porcelain brought from Clima and Japan. Trom this countigy alfo are expored the birds-nefts efteemed fuch a delicacy at the table. They are found in four iflands lituated near the coats of Cochin-China, to the caltward of which are live other fmaller ones, where are found prodigious numbers of turtes, the ficth of which is fo delieate that the 'ronquind fe and perple of Cochin-China frequently fight itf ferate battks, 1

Corlan:Chiia.

## 

Pund in onder to take them from one another. - The com(her)a. modities which felmolt readily in this country are,
falt-petre, fulphar, lead, fine cloths, and barred or flowered chintz. Pearls, amber, and coral, were formerly in great requell, but at prefent only the two latt are faleable; and even thefe will not anfwer molefs the beads of coral be round, well polifhed, and of a beantiful red colour ; the amber mult allo be ex. tromely clear, the beads of an equal lize, and not larger than an hazel nut.

The onty money current in Cochin-China is that of Japan, which is paid and received by weight. The money of the country is of copper, and as large as our counters ; of a round forvore, and having an hole in the middle by which the pieces may be tirung like beads. Threc hundred of thefe are put on one fide, and as many on the other, which in Cochin China पafs for a thoufand; becaufe in 600 are found ten times 60, which make a century among almoft all the people of the eaft. There is, however, fearce any country in which merchants are more apt to be deseived with regard to the value of moncy than Co-chin-China; owing to the pieces heing unequal in tifare and quality, and the difficulty of determinins their valuc, which is regulated only by a few characters t amped upon them. The dealers mutt therefore be at pains to have honelt and dkillul people to afcertain the value of the pieces they receive; otherwife they run a sreat rilk of being deceived in their value, as the Cochin-Chinefe make a great merit of $\mathrm{b}=-$ ing able to cheat an European.

Etropean merchants complain, according to M . Crobier, unjuftly of the demands made in CochinChina for entrance, clearance, and anchorage. 'The duties indeed are very trilling, amounting only, even thofe of the cuftomboufe, to + per cent. : but nothing can be removed from a thip which arrises there antil the has firlt been infpected, when the cultomhoufe officers unload her, weigh and count the finalleft pieces, and generally take what they look'upon to be moll valuable, in order to fend it to the king. The monarch :akes what he thinks proper, and returns the value; but the grandees are faid to keep part of the goods alfo, withont paying any thing for them. Thus the ordisary goods, which, had they been accompanied with the more valuable part of the cargo, would have found a ready market, can now farcely be difpoled of; though our author is of opinion, that the matter is not altogether without remedy. When the Dutch fent to this country, veffels loaded with cloths, lead, and faltpetre, their cargoes were fuffered to remain entire, becaule they had taken the precantion to pay every year a certain fum for each velfel that entered. Other nations, by endeavouring to avoid the payment of this duty, entirely detroyed their commerce: the people of Cochin-China, however, for fome years pait, have been much more moderate in their demands; and whatever their exactions may be, they are far lefs exorbitant than thofe of the Tonnminefe.
M. Grofier oblerves, that a faifer report has gained sround in Europe, that when a trading veffel happens to run a-ground in Cochin-Clima, or to be driven into any of its harbours by ftrefs of weather, the king feizes the cargo if the rudder be broken. He afiures us, fowever, that, fa far from this bung the cafe: a vef-
fol in difucts is much fufer on the coafis of Cocim. Cochines?, China than almoll any where elle. Barks are imme. Cocblea. diately fent to the relief of the crew, and prople emHoyed to drag the fea with nets in order to ecover the groods that are lolt ; and, in fhort, neither litbour nor expences are fared to put the haip in the belt coudition polfible. Only two things can hart the trade of foreigners at Cochin-China, one of which may be cadily avoided. This regards the ckaring out of veflels. 'Thus, white the matter is waiting on the evening hefore his departure, or on the day fixed for failing, in order to reccive his difpatchen, it of ien happenz that he lofes his voyage, which may prove the yuin of a trader. For this reafon, cate mut be taken to fulecit a elearance a mon:h befone; by wheh means one is always certain of obtaining it, and departing on the day appointed. 'The other ditusuly is occerfoned by the neceffity of felling eromls on credit, which are fellom paid at the ditpulited time. This, however, is contrary to the inclination of the prince; for every merchant who can convey to him an decourit of thete unjult delays, is fure to be paid, and fonetimes even with interelt.

COCHINEAL, or COCHEwEL, at drus ufel by the dyers, EOc. for giving red colous, efpecially vinsfons and featets, and for making cumine; and likewife in madicine as a cardide, cordial, fudurife, alesiphamac, and febrifuse.

The cochineal, in the ftate in which it is brought to us, is in fmall bodies of an irregular figure, whally convex, and ridged and furrowed on one fide, and concave on the other. The colour of the bett is a purplith grey, powdered over with a fort of white dutl. All that the world knew of it for a long time was, that it was gathered frum certain plants in Mexico; and therefore it was naturally freppofed to be a feced, tith. in the year 1 Gg2 Father Plumier gave Pomet an account of its being an animal. And this, thongh then difregarded, has been confirmed by fubfequent ublervations. Indeed, to determine the point, we have now the means in our own hands, even in this pait of the world.-We need only moiken and foak in water, or in vinegar, a number of cochincals till they are fwelled and dittended, to know that every one is the more or lefs perfect body of an infect; the muft inperfect and mutilated fpecimens always fhow the ring's of the body ; and from obfersing others, it will be eafy to fund the number and difpolition of the lergs; parts, or even whole ones, being left on feveral, and often complete pairs. In this way the legs, antennæ, and probofcis, may be difcovered. See Coceus above.
M. Macquer obferves, that the cochincal of Sylveftre is gathered in the woods of Old and New Mexico. The infect lives, grows, and multiplies on the uncultivated opuntias, which grow there in great abundance. It is there expoled to the inclemencies of the weather, and dics naturally. The colour is more durable than that of the common coctaneal, but lefs bright : but there is no advantage in uing it; for, though cheaper, a greater quantity is recuifite.

COCHLLA, the hell-fnail, in zoology. See He118.

Cochlea, in Aratomy. See Anatomy, p. 765. col. 1 .
cochlearia, scuryy-grass: A genus of the filiculofa order, belonging to the letradynamia clafs of plants; and in the natural method ranking under the 39 th order, Siligaofs. The flicula is emarginated, turgid, and fealmus; with the valves gitobous and obtufe. There are fix fpecies; the moft remarkable of which are, 1. The angelica, or garden feurvy-grafs, grows maturally on the fea-hore, in the north of Eagland and in Holland; but is cultivated for ufe in the gardens near London. It hath a fibrous root, from which arife many round fucculent leaves, which are hollowed like a fpoon; the thalks rife from fix inches to a foot high : thefe are brittle, and garnifhed with leares which are oblong and linuated. The flowers are produced in clufters at the end of the branches, comfifting of four finall white petals which are plaeed in the form of a crofs; and are fueceeded by hort, roundifh, fwelling, feed-veffels, having two cells divided by a thin partition. In each of thefe are lodged four or five roundifh feeds. 2. The armoracia, or liorfe-radifh, is fo well known as to need no defeription.

The firft is propagated by Seeds, which are to be fown in July, in a moift fpot of ground; and when the plants are come up, they fhould be thinned, fo as to be left at about lix inches diftance each way. The plants that are taken out may be tranfplanted into other borders. In the fpring thefe plants will be fit for ufe; thute that are left will run up to feed in May, and perfect their feeds in June. If the feeds are fown in the fpring, they feldom grow well. The horie-radih is propagated by cuttings or buds from the fides of the old roots. 'The bett feafon for this work is in October or February; the former for dry lands, the latter for moit.

Ujies. Scurvy-grafs is a pungent flimulating medicine; capable of diffolving vifcid juices, opening obfiructions of the vifeera and the more diftant glands, and promoting the more fluid fecretions. It is particularly celebrated in feurvies, and is the principal herb employed in thele diforders in the nerthern countrics. Horferadifh root has a quick pungent fmell, and a penetrating acrid tate; it neverthelefs contains in certain veffels a fwett juice, which fometimes exfudes on the furface. By drying it lofes all its acrimony, becoming firft fwectilh, and then almof infipid: if kept in a cool place in fand, it retains its qualities for a confiderable time. The medical effects of it are to ftimulate the folids, attenuate the juices, and promote the fluid fecretions: if feems to extend its action through the whole habit, and to affect the minutert glands. It has frequently done fervice in fome kinds of fcurvies, and other chronic diforders proceeding from a vifcidity of the juices or ubltructions of the excretory ducts. Sydenham recommends it likewife in droplies, particularly thofe which follow intermittent fevers. Both water and rectified fpirit extract the virtues of this root by infufion, and elevate them ia diflillatiuns: along with the aqueous fluid an effential vil rifes, polfefling the whole tatte and pungency of the lorie-radilh.

CUCHLI'l'Es, in natural hiftory, an appellation given to the petrified thells of the cochlex or fuails.

COCINTUM (ance gone), a promentery of the Biatni, reekoned the longelt in Italy: and which

Holthenius and Voffus have refored to Ovid, reading Cocimtia for Centania, Metam. XV.v. 704.-Cocinhum, alfo a tuwn, 22 milcs to the fouth of Scylaceum, almoft on the fpot where now Sitlo Itands; from which the oppolite promontory Cocintum is cummonly called Capo de Stito.

COCK, in roology, the Englith name of the males of gallinaceous hirds, but more efpecially wifed for the common dunghill cock. See Phasianus.

Black Cock.
Cock of the Wool. $\}$ See Tetrao.
Cock-Chaffer. See Scarabaus.
Cock-Paddl, Lump-filh, or Sea-oul. See Cyclurterus.

Cock-Pit, a fort of theare upon which game-eocks fight.

It muft appear aftonifhing to every reflecting mind, that a mode of diverfion fo cruel and inhuman as that of cock-fighting fhould fo generally prevail, that not only the ancients, baıbarians, Greeks, and Romans, thould have adopted it; but that a practice fo favage and heathenifh fhould be continued by Cluitians of d! forts, and even purfued in thefe better and more enlightened times.

The ancient Grecks and Romans, as is well known, were wont to call all the nations in the world barbarians; yet certainly, if we confider the many inflances of eruelty practifed among them, there was very little reafon for the diftinction. Human faerifices were coms mon both to them and the barbarians; and with them the expoling of infants, the combats of men with wild beaft:, and of men with men in the gladidtorial fentes. were fpectacles of delight and fellivity.

The iflanders of Delos, it feems, were great lovere of eock-fighting; and Tanagra a city in Boeotia, the ille of Rhodes, Chalcis in Euboa, and the coumty of Media, were famous for their gencrous and magranimous race of chickens. The kingdom of Perdia wis probably included in the latt, fion whence this kird of poultry was hift brought into Greece; and it one may judge of the rett from the fowls of Rhodes and Media, the exccllency of the broods at that time confilled in their weight and largenefs (as the forls of thofe countries were hears and bulky), and of the nature of what our fportfinen eall flakelags or turnpokes. The Greeks, moreover, had fome method of preparing the birds for battle, by feeding; as may be collected from Columella.

It fhould feem, that at firt eoek-fighting was partly a religious and partly a political indtitution at Athens; and was there continued for the purpofe of improving the feeds of valour in the minds of their youth ; but was alterwards abufed and perverted both here and in the other parts of Greece to a common paftime, without any moral, political, or religious intention, and as it is now followed and practifed among us.

At Rome, as the Romans were prone to imitate the Grecks, we may expeet to find them following their example in this mode of divertion, and in the worf way, viz. without any good or laudable motives; fince, when they took and brought it to Rome, the Greeks had firgoiten every thing that was commendable in it, and had ulready perverted it to a low and unmeaning fport. Signii، Hyam thinks the Romans borrowed the paline from Dardanus in Afia; but there is !itite:

Cots dis reafon for rading thengo fo fur from it, wen it was $\xrightarrow[\sim]{\text { - fo generally followed in Greece, whofe culloms the Ro- }}$ mans were addicted to borrow and imitate. However, it is probatle. they did not adopt this opinion very eariy. It may be gathered from Columella, that the Rumans did net ute the fort in his time. This anthor Ityles cock lighting a Gracion diverfion; and fpeaks of it in terms of ignominy, as an expenfive amuffment, unbecomins the frugal houlchoder, and often attended with the ruin of the partics that followed it. The words are remarkable. "Nos enion cenfemus inflituere vectigal indulaii patris familias, non rixofaum avium lantix, cujus plerumque totum patrimo. nium pignus alex, vitur grallinactuy pectes abltalit:" Where he deferibes, as we think, the manner, not of the Romans, but of the Greeks, who had in his time converted the diverfon of cock-tighting into a fecies of gaming, and even to the total ruin of their families, as Liappens but tou often in Dingland at this day. The Romans, however, at latt gave intu the entom, tho' not till the decline of the empire. The fint caufe of contention between the two brothers Baffands and Geta, fons of the emperor Septimus Severus, happened, according to Herodian, in their youth, about the fygtang of their cocks; and if the battling be. tween thefe two princes was the birf inttance of it, probably they had feen and learned it in Greece, whither they had olten accompanied the cmperor their fa. ther.

It is obfervable, that cocks and quails pitted for the purpofe of engagin one another, woutrance, or to the lat galp, for diverlion, are frequently compart, and with much propricty, to gladiators. Hence Pliny's exprefion, Gallorum-- caisladiatoram ; and that of Columelia, rixojurum awium lanila: lonipa being the proper term for the matter of the gladiators. Coniequencly one would expect, that when the bloody feenes of the amphisheatre were difcarded, as they were foon after the Chrillian religion became the eftablilisment of the empire, the wanton fhedding of mens blood in fport, being of too cruel and favage a nature to be patronifed and encouraged in an inllitution fo harmlefs and innocent as the Chritian was, one might jultly expect that the optupouvis and the arennovoparva would have ceafed of courfe. The fathers of the church are continually inveighing againtt the fpectacles of the arena, and upbraiding their adverfasies with them. Thele indeed were more unatural and fhocking then a main of cocks; but this, however, had a tendency towards infufing the like ferocity and implacability in the breafts and difpofitions uf men.

Befides, this mode of diverfon has been in fact the bane and deftuexion of thoufands here, as well as thefe of hani/luavism, "cock-feeders," mentioned by Columel13, whofe patrimonial fortunes were totally difipated and deitroyed by it.

The cock is not only an ufeful animal, but flately in His figure, and magnificent in his plumage. " Imperitart fuo generi, fays Pliny, et regnum, in quacunque funt domo, excretn:" Aritophanes compares him to the king of Perfia; molt anthors alio take notice of the " ipectatifumim infigne, ferratum, quod eonm vertisem regis coronc mosio cxornat." His tendernefs towards his brood is fuch, that, contrary to the cuifom
of many wher males, he will feratch and provide for Coch Piti. them with an alidnity almoll equal to that of the hen; and his generofity is fo great, that, on finding a hoard of meat, he wiil chucl:le the hens together, and with. out touching one bit himelf will relinquifh the whole of it to thin. He was called the lird, axe tenonn, by many of the anosents; he was highly efleemed in fome countries, and in others was even held facred, info. math that one cannot but regret that a creature fo utoful and noble, thould, by a ftrange fatality, be fo enormoully abufed by us. It is true, our $\alpha_{\text {aferpuncaliz, or }}$. the maffacre of Shrove Twelday, is now in a declining way; and, in a few years, it is to be hoped will be totally difufed: but the cock-pit itill continues a reproach to the humanity of Englithmen, and to their ieligien; the pureft, the tenderell, and molt compaffonate, of a!! others, not exeepting even the Brachmannic.

It is unknown when the pitched battle firt entered England; but it was probably brought thithes by the Roman:. 'The bird was here before Celar's arrival, but no notice of his figlating occurs earlicr than the time of William Fitz-Stephen, who wrote the life of archbifhop Beeket, fome time in the reign of IHenty II. and defcribes the cocking as a fport of ichool-boys on Shrove Tuefday. From this time at leat the diverfon, howeverabfurd, and even impious, was continued amonglas. It was followed, though difapproved and prohibited 39 Edward III.: alfo in the reign of Henry VIII; and A. D. 1569. It has by lome been called a robal hiverfin; and, as every one knows, the cock-pit at Whithall was erected by a crowned head, for the more maguificent celebration of it. There wras another pit in Dery-lane, and awother in Javia Areet. It was prohibited, however, by ane of Oliver's acts, March $3 \% 166$. What aggravates the reproach and difgrace upon Englifimen, are thofe fpecies of fighting which are called the battle-royal and the Wel/ $\mathrm{h}-\mathrm{man} \mathrm{m}_{3}$ known no where in the world but there; neither in Clina, nor in Perfin, nor in Malacea, nor among the favage tribes in America. Thefo are fcenes fo bloody as almoll to be too hocking to relate; and yet, as many may not he acquainted with the horrible nature of them, it may he proper for the excitement of our averfion and deteltation to defcribe them in a few words. In the former, an unlimited number of fowls are pitted, and when they have naughtered one another for the diverfion (Dii boni!) of the otherwife generous and humane Englifhman, the fingle furviving bird is to be etteemed the victor, and carries away the prize. The Whh-main confilts, we will fuppole of 16 pair of cocks ; of thefe, the 16 conquerors are pitted a fecond time; the 8 conquerors of thefe are pitted a third time; the 4 conquerurs the fourth time; and laftly, the two conquerois of thefe are pitted the fiftle time; fo that (incredible barbarity!) 3 ! cocks are fure to be molt inhumanely murdered for the fport and, pleafure, the noife and nonfenfe, the profane curfing and fiwearing, of thofe who have the effrontery to call themfelves, with all thefe bloody doings, and with alf this impiety about them, Cloifiuns; nay, what with many is a luperior and dittinet characker, men of benevolence and morality. But let the morality and benevolence of fuch be appretiated from the following inflance reconded as authentic in the obituary of the

Gentleman's

Exck. Fit, Gentleman's Magazine for April 158. "Died, bouks to his fuir defundrefs. Phitofophy fojourns in Corburre, socklunce, April +. at Tottenham, John Ardefuif, Efl; a young man of large fortune, and in the fplendor of his carriages and horfes rivaled by few country genticmen. His table was that of hofpitality, where it may be faid he facrificed too much to conviviality; but if he had lis fuibles, he had his merits alfo that far outweighed them. Mr Ardefoif was very fond of cockfighting; and had a favourite cotk upon which he had won many profitable matchec. The lit het he laid upon this cock he lott ; which fo enraged him, that he lad the bird tied to a fpit and ronted alive befone a large fire. The forems of the miferable animal were fo affering, that fome gentemen who were prefent aittempted to interfere; which fo enraged MI Ardefoif, that he feised a poker, and with the mofl furi nis vehemence declared, that he would kill the lirft man who interpered; but, in the midft of his paffionate dfieverations, he fell down dead upon the fpot. Such, we are afiured, were the circumllances which attended the death of this great pillar of hemanity."

Cock-pit, of a hip of war, the apartment of the furgeon and his mates; being the place white the wounded men are deffed in time of battle, or otherwife. It is fitulted under the lower deck.

COCKBURNE. (Mrs Catharine), a moft accomplifhed lady and celebrated writer, was the daughter of Captain David Trotter, a native of Scotland, and a feacommander in the reign of King Charles II. She was born in London, Augut 16. 1679, and baptized in the Proteftant church, according to whieh the was bred up in her infancy a Proteltant; but being a Pprightly, ingenious, and beautiful chitd, the was particularly carefied by fome confiderable families among the l'apills. This favour natural!' $y$ wrought a good opinion of fuch fricnds; and enteri:g irto an iutinacy with them as the grew up, the became an eafy congueft to their taith, in which the continued many years. In the mean time her genius ripened apace, and thot forth proofs of her talents for puetty, even before the had paffed her child. hood. In her 17 th year the produced a tragedy called Agtes de Cafiro, which was atted in 10.95. This performance, and fome verfes addreffed to Mr Congreve upon his Mourning byide in 1697, brought Ler into the acquaintance of that gentleman. Thusien. couraged in her fift attempt, her Mufe broughe upon the flage three plays more, before the death of Mr Dryden in 1701 , to whofe memory fhe joined with feveral other ladies in paying a tribute of verfe. However, poetry and dramatic witing was not the moft dillinguifhed of Mifs Trotter's talents; the had a remarkable philofophic turn, and equal to fuch refearches. Mr Locke's Effay on Human Underitanding came out during this interval: that famous philofopher lad dreffed out logic and metaphyfics in fuch a new mode as was very agrecable to the talle of the fex in general, and particularly engared the attention and admiration of our young authorefs. She had begun to project a defence of the Effay againft fome remarks of Dr Burnet of the Charter-houfe, which was fininhed fo early as the beginning of December 1701. She had but lately paflid the 22d year of her age; and the maflerly way in which the piece was drawn, mult needs have given fingular pleafure to her great champion, who zecordingly expreffed his fatisfaction by a prefent of
the neighbourthond of religion; thete phitotophic revelies would maturally lead a thougntme mind t , that Cockermouth. fubject: and taking into her conlideration the tencts of lher preient fuith, the began to diconer thes indefenlible grouds: the therefore atolvad to remome it, and publathed a vindication of her change in 170\%; and returning to the chablithed churcin of $S$ :oiland, the changed her condition likewife the uat jear, 1758: and was narried to Mr Cuekbunne, a learnect divine of that chatech. The daties of a wife and mon. ther called Mrs Cockbune from her books and pen many years; and domeftic cares eng dging her attention, we hear nothints of her as a wher dill $102 \%$, when her zeal for Mi'lucke's opinions drew her aran into public light. She exercited he: pen altenands as occation offered; and in 1739 fle entered intu the controverfy concernitig the fondation of moral duty and obligation. In that concroverly the vrote two treatifes, the find of which the trationited in nann feript to Mr attenwardo Dr Warbaton, the late vithop of Clouceler, who publihed it, with a preface of his own, in $17+7$. Mro Cockburne furvied this publication two years only. Sbe died in 1749, and was intered at Loug Hondy, near her hutodnd, who died the year before her, wich this fhort fentence upon the tomb, "Let their works praife the: in the gates." Prov, xxx. 31. Her works were collected and pub. lifhed in 1751 , in two volumes 8 vo , with an account of her life prefixed.-This collection is an incontelable proof of the author's genius. Wut her abilities as a writer will not be feen without attending to the pees!iar circumftances in which her writings were produced: her early youth, for inflance, when he wrote fome; her very advanced age, and ill fate of health, when fre drew up otkers; the unaly fituation of her fortune during the whole courfe of her life; and an interval of near 30 years, in the vigour of it, ! pent in the cares of a family, without the lealt leifure for reading or contemplation; after which, with a mind fo lone divertel and encumbered, refuming her thudies, the inAantly recovered its entire powers; and, in the hours of relaxation from domentic employments, purfued to the utmoll limits fome of the deepeft retearches the liuman undertanding is capable of. Fier character is that of a moft unconimon lady, no lefs celebrated for her beauty in her younger years, than for her genius and accomplifhments. She was fmall of Itature, but had a remarkable livelinefo in her eyes, and a delicacy of complesion which continued to her death.
COCKERMOUTH, a town of Cumberland in Enyland, lituated in W. Long. 3. 12. N. Lat. $54 \cdot 35$, It is a large town irregularly built, with broad itreers. It is wathed by the Deswent on the weftern tide; divided in two by the Cocker; and the parts are connected by a itone-bridge of one fingle arch. The number of inlabitants is between thace and four thoufand: the manufactures are fhalloons, worlttd itockings, and hats; the latt exported from Glatgow to the Wett Indies. It is a borough-town, and the right of voting is velled by burges tenure in certain houfes: this is alfo the town where the county elections are made. -Here is a cafle teated on an artificial mount on a bank above the Derwent. It has a fquare building, and frengthened with feveral fquare towers: on rach

## C O C <br> [18] C O C

Eocket, fide of the inner gate are two diep dungeons capable Cockle of holding 50 perfons in either; they are vaulted at top, and have only a fmall opening in order to lower through it the unhappy prifoners into this dire prifon; and on the outfide of each is a narrow fit with a fope from it, down which were fhot the provifions alloticd for the wretched inhabitants. This calle was founded by Waldof, firft lord of Allerdale, and fon of Gofpatrick earl of Northumberland, cotemporary with William the Conqueror. Waldof relided firt at Papcaftle, which he afterwards domolihed; and with the materials built that at Cockermouth, where lie and his family long refided; but feveral amms over the gateway, which Cambden fays are thole of the Minlons, Humfranvilles, Lucies, and Piercios, evince it to have belonged in latter times to thofe families. It appears that it was firlt granted by Edward II. to Anthony de Lucie, fon of Thomas de Multon, who had aflumed that pame, becaufe his mother was daughter and co-heirefs to Richard de Lucie ; and afterwards, by marriages, this caftle and its honours defiended to the Humfranvilles, and finally to the Percies. In $15 ; \%$, it was garrifoned for the king; and being befieged and taken by the rebels, was burnt, and never afterwards repaired.- Cockermonth is now in the poffeffion of the Lowther family, who have here a great property in coal-works. The town fends two members to parliament.

COCKE'T', is a feal belorging to the king's cuftemboufe, or rather a feroll of parchment fualed and delivered by the officers of the cuftoms to merchants, as a warrant that their merchandifes are ctitomed.

It is alfo ufid for the office where goods tranfported were firft entered, and paid their cuftom, and had a cocket or certificate of difcharge.

COCKLE, in iehthyology. See Cardiung.
Cockif,ot Shirli, in mineralogy, a fpeciesuf fones of the garnet kind, br longing to the filiceous clats. It is called Schocolus by Burgman, Lapis cornets coyfalizzatus by Wrallerius, and Siannum cryphlifs columinaribus by Limaxus. It is hard and heavy, honting into cryftals of a prifratic figure, principally of a black or gruen colour. The name cackle for thefe kinds of ftones is an old Cornith word; but is fometimes alfo applied to very different fubtances. The term Jin! is adopted from the Germans. The Englih mineral name of call has alfo been uled by fome authors as $f y$ nonimous with cockle, and thefe are even confounded together at the mines; but the call, definitively fpeaking, is the fame with the fublance called woifrom by the Germans.

The fpecific grasity of thefe flones is between 3cco and 3400 , though always in preportion to their different Poliditics. They crack in the fire, and are very diffe ult to be fufed: retaling both microcofmic falt and mineral alkali. 'They cannot totally be diffolved in aqua fortis; but the diflulved part is precipitated in a gelatinous form on the addition of an alkali. On a chemical analyfis they are fund to contain diliceons cath, argil, calcareous earth, and iron; which laft is found in a much greater quantity when they are o. paque than when tranfarent. According to Bersman, fome contain 55 putts of filiceous earth, 39 of aikillaceous, and fix of fute calcareous euth: but fome comain ten or twelve of magnelia. In Britain they
are chiedy found in Cornwall, abour the tinmines, and Cockle. fonse fine crytalized kinds have been brought from Scudand. The sarteices are,

1. 'The fhoertus martialis, or cockle mixed with iton. It is of a green colour, and found in moft of the Swedila inom mines. It is coale, and without any determinate gigure. $^{\text {der }}$
2. 'The foutojus, or fparry cockle, is found in fome places of a detp green colour; whence authors have called it the mother of emeralds. It fpecific character is, that it always breaks in a cubic or rhomboidal form. In fome parts of isweden it is found of a pale green, white, or black colour, and of a brown colour in Weftmoreland in Eugland. It frequently oceurs in the fealy lime-ftones, and its coiour changes from a deep green to whise, in proportion as it contains more or lefs iron.
3. Fibrous cockle refembles threads of glafs. Thefe are either parallel, or like rays from a centre, in whioh laft cafe it is called farret cochle. Its colours are black, green, white, blackith green, and light green; all which are to be met with in Sweden. In Weltmanland it is found along with a fteel-grained lead ore; and here the whole is called aran-ris-malm, or pint-ore, from its refemblance to the branclies of that tree. Cronfledt obferves, that the Atructure of this fubftance has caufed it to be fometimes confounded with the albetur, and that to this fpecies belong moft of the fublances called imperfect afocpi. The thriated cockle, compared with the abeiti, is of a fhining and angular furface, though this fonctimes requires the aid of a magnifying glafs to difcuver it; always fomewhat tranfparent; and is pletty ealily vitrified before the blowPipe, without being confumed as the pure abelti feem to he.
4. Cryftallifed cockle is found of tlack, deep-green, lightegren, and reddith-brown in Sweden, and fome other Europenn countries. Near Bafil in Switzenland is found, thongly very rarely, a tone called taufflizin, belonging to this variety. It is of a reddifh-brown culour, and confte of two hexagonal cryitals of cockle grown torgther in the furm of a crofs, which is worn by the Roman Catholics as an amulet, and called by them lapis cruiffer, or the erofs-ftone. This form, however, is not peculiar to the cockle, for both Werner and Bergman mention cryftals of mountain-cryftal joined together in the fame manner.

This variety was lately found by M. Fichtel on the Carpathian mountains, cryftallifed in prifms, and embodied in limeftone. It effervefees flightly with acids, and contains 61.6 of filex, 216 of calcareous earth, 6.6 of augil, 5 of magnefia, 1.6 of iron, and three of water. The reddith brown prifnatic fhirl from Vefurius contains 48 of biles, to of argil, five of cals, one of magnefra, and the of tron. Other kinds, however, have afforded 50 fer com of filiceons earth, 30 of argillaceous, one or tho of magnetia, and 18 or 20 of iron. The white fort probably comain lefs iron, but all become reddifh by calcination. Cronftedt informs us that he has heard of lead being melted out of a kind of cockle from Rodbeck's Eng at Umea in Laphand: and he alto thinks it very probatle, that fome of the cockies fonno in the Englifh tin mines may contain tin. Some erytuly of cockle are more fufble than any fort of flune whatever ; thefe are always glafly and te-

Cockney mitranfparent. The precife fryure ct the cockle, thu' alswys primatical, is uncertain: that from Yoin, at Cocos Nya Kupparbery, is quadrangular; the French kind has mine fide er planes, and the tanftem is hexamnat.

COCKNEX, a vers ancient mitkame for a citizen of London. R.y fays, an interpetation of it is, A young perton en dxici or cocquered, made a waston, on nickle.cock, delicately bied and brought up, fo as when arrived at man's ettate to be unable to bear the lealt kardhip. Another, A perfon ignorant of the terms of country ceconomy, fuch as a young citizen, who having been ridiculd for calling the neighing of a horfe laughing, and told that it was called neighing, nust morning, ow hearing the cock crow, to thow inftruation was unt thrown away upor him, cxuaimed to his furmer inilrakher, Huw that cock neigh ! whence the citizers of Lundon have ever fince been called cockreighs, or cockneys. Whatever may be the ofigin of this um, we at leaf learn from the folluwing verfes, attribated to Hugh Bayrot earl of Norfolk, that it was in ufe in the time of king Henry 11 .

> Was I in my catte at Bumat,
> Yaf by the river Warency,
> I wo ld not che fir the ing of cockney. (i.c the king of Lamdm.)

The king of the cocknty occurs among the regulathans for the fyorts and thows formerly held in the Middle Temple, on Childermas day, where he hai his atheers, a marhal, conftable, buter, \&c.-Sec $\mathrm{Du}_{\mathrm{b}}{ }^{-}$ dale's Origines Fariticiules. p. ${ }^{2}+7$.

COCKROACH. See Blatta. In Captain Conk's hat woyage, the fhips, while at Huahcine, were infelted with incredible numbers of thefe creatures, whom St was found impoffible by any means to dellroy. E. very kiad of foud, when expofed only for a few misutes, was covered with thefe noxious infects, and pierced fof full of hules, that it refembled an honey comb. They were particularly detruciive to birds which had been Rufied for cariolities, and were fo fond of iok, that they ate our the writing on labels. Books, however, were fecured from their ravages by the clofeneis of the binding, which prevented them foung getting in between the leaves. They were of two kinds, the Blatta Orientalis, and Germanioz.

COCKSWAIN, or Cocksos, an officer on board a man of war, who hath the care of the boat, or flon , and all things belonging to it. He is to be always ready with his boat's gang or crew, and to inan the boat on all occafions. He fits in the ftern of the buat, and fleers; and hath a whittle to c:ill and encourage his men.

COCLES, (Pub. Horat.) a edebrated Roman, who alone oppofed the whole army of Porfenna at the lead of a bridre, while his companions behind him were cutting of the communication with the other fhore. When the bridge was deftroyed, Cocles, tho' wounded by the darts of the enemy, leapt into the Tiber, and fwam acrofs it with his arms. A brazen fatue was raifed to him in the temple of Vulcan, by the conful Publicola, for his eminent fervices.

COCOA, in botany. Sce Cocos.
COCONATO, a town of Piedmont in Ytaly, famous for being the birth-place of Columbus, who firt difcovered America: E. Long. 8. O. N. Lat. ++50.
$\operatorname{COCOS}$, in butany: A genus belonging to the :atural order of Palme. The calys of the male is trigat.
tire ; the corolla tripetakos, with fis damima. The caly: of the female guinquepartite; the combla trimtaluos; the llighata three, and the plum conaccunt. Thare is only on fpecies known, which is coltivatal in booth the ladion, and is of the eraated ule to the inhatsiants. It is fupmbed to be a mative of the Naldive and fome defert ifland: in the Eatt lndies; and from thence to have been tranformed to all the warm parts of America: for $1 t$ is not fund in :uny of the inland parts, nor any where far diltant from feulements. The tree frequently rifes 60 foet high. The budy of the trunk, whech gencrally leans to one fide, occafioned, as is fuppuled, by the great weight of auts it fuftains when yourer, is the exact hapee of an apothecary's large iron pettle, being of an tquad thicknefs at top and at bottom, but fomowhat fualler in the middle; its colour is of a pale brown through. out, and the bark fnooth. The leaves or branches are wten $1+$ or 15 feet long, about 28 in number, winged of a yellow colour, flraight and tapering. The pime or partial ? des erre green, ofter threefeet long next the trunk. bat dimininherin leng th toward the extremity of the b, erhes. The branelices are fallemed at tup by browe tringy theads that grow ont of them, of the fize of ordmary pack-thread, and are intersonven like a web. The nuts lang at the top of the tumbe in clutere of a d zen in cach. Einh nut, next the iteny, has three i.oles clofely itopped; one of them being wider, and more ealily penctrated than the reth. When the kerael begins to grow, it incruth the inlide of the nut in a bluith, jelly like fubfance; an this grone larder, the inctufed liquid, ditalled inio the nut from the ruots, becomes fomewhat acid; and the bermel, as the nut ripens, becomes teill more folid; and at length linses the whole infice of the nut for above a quarter of an incl: thick, being as white as fnow, and of the Havour of an almond. The quantity of liquor in a full grown nut is frequently a pint and upwards. The hufky tegument of the net contits of trong, tough, fringy flaments, which, wha removed from the fruit, refemble coarfe oakham, and may perhaps be converniently enough ufed as fuct. The thetl; of the fe nuts, being tipped with filver, are froquently ufed for drinking bowls. 'The bark of the tree may be waught into cordage, and the leaves ato baknets, trooms, himemocks in form of nets, mate, fucks, and other wheful utedifils. The ligere contained in the theth is a mot cooling wholefome beverage in thofe fultry climaties, and the white kernel a molt agreable food. 'The Nialdive cocoa-nut is cikemed, by the inlabitants withere iflands, as a powerful antidote againt the bites of ferm pents and other poifons. The cocoa-nut tree is propagated by planting the muts; which, in lix weet... or two months time, will come up, provided they are trefz and thoroughly ripe; but this is what few of them are when brought into this country ; for they always gather them beriure they are ripe, that they may keep during their pallage. The bett way, the tetore, would be to gather luch nuts as are thoroughly ripe in their native country, and plant them in a tub of dry fend, in order to keep them from the vermin during their paffage. Here they will frequently iprout, which will be an adrantage, as they may then be im-. meinately planted in pots of tarth, and pluaged in the bark-fuve.

## C O C

Coter $\quad \operatorname{COCTION}$, a genemal term for all alterations made in bodies by the application of lire or heat.

COCY'licts, one of the rivers of hell, according to the theology of the poets. It has its name are to nonvar, fiom groaning and lamenting. Hence Mifon, Eircytus ran'd of lamentati in luud, Il ard on the tu fur fircam.
It was a branclz of the siver Styx ; and flowed, according to Horace, with a dull and languid theam.

COD, in ichthyology. Se Gadus and Fishery.
Con is who a term ufed, in fome parts of the kingdum, for a pod. See Pud.

Cod-Cape, a promontory on the coalt of New Englank, near the eatrance of Button harbour. W. Long. 62.50. N. 1.at. +2.0 .

CODDY-mODDr, the Engiig name of a fpecies of Iarus.

COIDE (ools $x$ ), a collection of the laws and conftitutions of the Roman emperors, made by order of Jutinian. 'The word comes from the Latin codex, "a paper took;" fo cailid is codicibus, or caudicilns arlowizn, "the trunks of tiess;" the bark whereof being hripped off, ferved the ancients to write their buoks on.

The cude is accounted the fecond rulume of the civil law, and contains twelve books; the matter of which is rearly the fame with that of the digetts, efpecially the firt eight bouks: but the fyle is mether fo pare, nor the method fo accurate, as that of the dirells; and it detcrmines matters of daity uie, whereas the digetts difcufs the more abftrufe and fubtle guettions of the law, giving the various opinions of the ancient lawyers. Athough Jullinian's code is didinguiflied by the appellation of cok, by way of eminonec, yet there were codes before his time; fuch were, I. The Gregorian code, and Hemogentan code; collections of the Ronan laws, made by two famous lawyers, Gregorius and Hermogenes, which included the contitutions of the emperors from Adrian to Dio-- hefan and Maximinus. 2. The Theodotian code, comprifed in 16 books, formed ont of the contitutions of the emperors from Conflantine the Great to Theodofius the Younger: this was obferved almolt ore all the welt, till it was ahograted by the Jutinian code. There arc alfo feveral later codes, particulally the encient Gothic, and thofe of the French kings; as the code of Euridic, code-Lewis, code-Herry, code-Marchande, code dics Eaux, Sec; and the prefent hing of Pruffa has lately publifoed a code, which comprifes the laws of has kiugdom in a very imall volume.

CODEX, in autiquity, denotes a book or tablet on which the ancients wrote Sice Codex.

Cobex alfodenoted a kind of punifhment by means of a clog or block if wood, to which dlaves who had oficmded were ticd falt, and obliged to drag it along with them; and fometimes they fat on it clofely bound.

CODIA, among botanits, fignifies the head of any flat, but more paticularly a poppy head; whence its tyrup is called diucotium.

Conta, in butany: A genus of the cigynia order, telonging to the octandria chafs of plants. The caly: is tetraphyllous, with imall oblong horizontal leaves; the corolla contifs of four very fmall linear petals; the ftamina are eight filaments twice as long as the calyx; the anthere are roundith.
$\mathrm{N}^{\top} 83$.

CODICRL, is a writing, by way of fupplement to a will, when any thing is omited that the teltator would have added, or wants to be explaised, alterect, ur recalled.

COLDIIN, an apple ufeful in the kitchen, being the mott proper for baking.

COLLING, an appellation given to the cod-fin when young. See Ganus.

CODON ( $k=0 \cdot 1$ ), in antiquity, a cymbal, or rather little brals bell, refembling the head of a poppy. They were fattened to the trappings and bridles of horfes.

Codon, in butany: A genus of the monogynia order, bolonging the decandnia clafo of plants. 'Ihe calys is decempartite, with the fegments alternately long and hort; the corolla campanulated, with the limb decempartite and equal; the necturium decemlocular, of ten feales inferted into the heels of the flamina; the feed-cale bilocular; the feeds hairy, roundifla, in a dry coloured pulp.

CODRINGTON (Claitopher), a brave Englifh officer, and not lefs diftinguifhed for his kearning and benevolence; was born at Darbadoes in the year 1663 , and educated at Oxford; alter which he betook himfelf to the army; and, by his merit and conage, foon recommending himfelf to the favour of king William, was made a cajptain in the firit reginent of foot-guards. He was at the diege of Namur in 1695 ; and, upon the conclufion of the peace of Ryfuict, was made captaingeneral and governor in chief of the Leeward and Caribbee iflands. However, in 1701 , feveral articles were cahibited againt him to the honfe of commons in England ; to which lee publifhed a ditinet and particular anfwer, and was honourably acquitted of al imputations. In $1 / 03$, he fhowed great bravery at the attack of Gaudaloupe: but at latt he regroned his govermment, and lived a fludious retired life; for a few years before his death, he chiefly applied himfelf to chureh-hintory and metaphyfics. He died at Barbadoes, on the 7 th of April 1710 , and was buried there the day following; hut his body was afterwards brourlat ever to England, and interred, on the igth of June 1716, in the chepel of All-Souls College, Onford. By his laft will, he bequeathed his plantations in Barbadoes, and part of tize illand of Barbuda, to the fociety for propagating the gofpel in foreign parts; and left a noble legace to All-Souls College, of which he had been a felluw. 'This legacy confifted of his library, which was valued at $6000 \%$; and $10,000 \%$ to be laid out, 6000 in building a library, and 4000 in furnilhing it with bools. He wrote fome of the poems in the Niuje Aluglicane, printed at London in $17+1$.

COLRUS, the 17 th and laft king of A thens, fon of Melanthus. When the Heraclide made war againit Athens, the oracle fairl that the victory woukl be granted to that nation whofe king was killed in battle. The İeraclide upon this gave ftriet orders to fare the life of Codrus; but the patriotic king diffuifed himferf and attucked one of the enemy, by whom he vas killed. 'The Athenians obtained the victory, and Codrus was defervedly called the father of his country. He reigned 21 years, about 2153 years before the Chritiun era. 'I'o pay more honour to his memory, the Athenians made a refolution that no man alter Codrus thould reign in Athens under the name of king.

COECUM,

## C O E [ 121] C O

COECEM, or bund-gur. Sec Anatomy, 103. Ior Muferave gives us an accomat, in the Phitotophical Tranfactions, of the coecum of a dog leme cut out without any prejuatice to the animal. Ase Giles gives us another of the cocom of a lady lexing tillended, fo as to form at tumor that held almoth three chapins of a thin, greyifh, almot liquid fubtance, of which the died. And Mr knowler a third, "f a lay"s cưcum being valily extended and tatled with cherry-fomes, which likewife proved mortal.

COETIICIENTS, in algeha, are fuch numbers or bnown quantitisa as are put before letters or quantities, whether known or mbnown, and into which they are fuppoted to be multiplied. 'Ilhos, in $3 x, a x$, or $b x ; 3, a$ and $l$, are the cocticients of $x:$ and in $6 a$, $26 ; 6$, and $y$, are the coefficisuts of 4 and $b$. Sice Algerra.

CORLESTIAL, or Celestisl, in gemeral, denotes my then beloneing to the hearens: the we fay,

COEL[AC artery, in amomy, that artery hach iflacs fiom the aonta, jutt belon the diapharam. Sice Andiom:, 1123 .

Corban ${ }^{\prime}$ cin, in anatomy, that roning through the inteltinum rectum, ahong with the calhe atery.

COELIMONTANA Porta (Pliny), we of the gates of Rome, fituated at the foot of mont Cevhius; and hence its name: thought to bethe ancicat elfimatio by fome: but this uthers doubt. Liy this gate Nlaric with his Goths is faid to have entered and plamered Kome.

COELIOBRIGA (anc. geog.), a lown of the Bracari in the Ither Spain, to the lumth of Bracara Augutla, he north of the Durius, and not far from the Atlantic; a municinim (Com). Now thought to be Batriclus, a town of Entri Minho y Dinero. IV. Long. 9. 55. Latt. 41.20 .

COLLHLB : Ons one of the ferta hilh of Rome; fo called from (othe, a Tufan captain, who carme wo the affatace of Romulus agamet the sabines, ( 1)om-

 by 'Thberins (Tactuss. Suctonine). T'e the vath it had the city walis, on the woth the Corkinhe, to the wett the Palatia, and on the wath the Eleuilac.

COEDTOJASA, a part of momat Couns to lie
 walls on the eath, the A vastine tuthe fouth, on the well and merth the valley throngh winch the rivalet of the Appiat runs.

COBIOMA, ameng phyticians, a hollow uleer, feated in the minica consea of the ove.

COLLOB fortus (anc. geog.), a town of the Cherfurtos of Thrace, wo the fouth sf Selues; where the fithenians erecter! a trophy, affer a fa siciony uver the Limedenomians (Diodurns Sicullis).
(OLLO SHMIA, in the larger fonfe of the wort, was the mane of the whole conntry lying fou ? wad of Selencia, and extemeling as far as Etyyt an? Arabia: but this wod is priacipally appliced to the salley lying butween libams and Antibanas. This wod ocenrs only in the apocryphal writings of the Oid 'lettabinent.

COELUS (Heaven), in Pagan mythokgy, the fon of Fither and Dies or Air and Day. Acconding to Vow, V. YartI.
 begat Aurea or the Mountains, the ()ecan, äe. but having at length impritomed the Cyedob, who were Cofico atho his chidren, his wife, heing offented, inctice her fon Saturn to revenge the imany done or his batolats : and, by her affillance, be tomed athed cadratud Calos, when the blood that flowed from the womat pordecal the three furics, the giants, and the wond-ay mph; and the genital parts being thrown into the ica, inpreguated the waters, and formed the woddel; Vinns.

## COEMETLRY. Sice Crmatery.

CODMIJIONALES, ammor the Romans, an anpellation given to ohl flaves, which were bedd in a hos with others, becanfe they could not be fold akne.

COENODI'IE, a rehgions who lives in a convent. or in community, under a certain rule; in oppolition to anachoret, or hemit, who lives in folituct. The word comes from the Greck pancor, con ,wanis; and suls, zitd, " life". Cuffan makes this diference lictween a convent and a monafory, that the laticr may be applied to the refodence of a fingle religious or rachate; whereas the convent implics carblikes, of inambers of religious living in common. Flcury loeats of three kinds of monks in Eaypt ; ahatamots, who live in folitude; anabites, riau contime to live in conmus nity : and fercublias, whu are a lind of monks-cratat, that itroll from place to place. He efors the iraltitation of conobitcos to the tines of the aporles, and makes it a kind of imitation of the ordinary lises of the faithful at jerufalem. Thourh st lachomius is ondinaly owned the infitutor of the cernotite life; as beins the dirt who gave a male to any community

COENODIUM, \% w a bove the hate of living in a focity, or commanty, where all things are common. Pgrhargas is thought to be the abifur or tirl inkituten of this hind of life; his difciples, thume fome handats in mamber, bein obliged to give up a! their pricate ellat. $:$, in order io les anmexed to the iwint 1tock of the whole. The Efowims anomg the juas and Platoni is are fad to tare lived in the fane manner. Many of the Chatians ablo have thaght this the mut perfect kind of fincicty, as leing that in which Chrit and hes apolles chofe io live.

COBRCELD'I, a town of Gommary, in IT, Itphalia, and in the tersitories of the himop of Dimother, where he often refich. It is ncar the river Burkeds E. Long. 54 . 2. N. $1 . a t .5: 5$ ?

COEVORDEN, one of the fronget towns in the United Provinces, in Owryitel, furtilied by the famous Cohem. It was taken by the bithop of Numter, 1673; and the Dutch retook it the fame ) car. It is furromed by a morafs. E. Lomg. G. ir. N. Lat. 52. 40.

COFFEA, the Cofree tret: A genus of the monogymia wrder, betoming to the pentambia ciafs of Fhits: and in the natural mothod raking mater the 4,th corder. Sicllute. 'ithe corolla is funmelthapud; the famina ahowe the tube; the bery infenor, difpermous ; the feeds anllated, or baving a proper caterion cubcring sropping of of its awn accord. 'There is but one, faccies, fuppofed to be a mative of Ambia Fidic. It feldom rifes more than 16 or is fect in height; the main ftem greows upright, and is cowered what a light brown bark; the lamehes are prodnced

## C O i $\left[\begin{array}{lll}122] & \mathrm{COH}\end{array}\right.$

Coffea, horizontally and oppofite, croffing each other at every joint; fo that crery hide of the tree is fully gamithed with them, and they form a fort of pyramid. The leaves alfo fand oppofite; and when fully grown are abuut four or five inehes long, and two broad in the middle, decrealing toward each end; the borders are waved, and the furface is of a lucid green. The flowers are produced in clufters at the root of the leaves, fitting clofe to the branches; they are tubulous, and fpread open at the top, where they are divided into five parts; they are of a pure white, and have a very gratefal odour, but are of hort duration. The fruit, which is the only ufeful part, refembles a cherry. It grows in clufters, and is ranged along the branches under the axilla of the leaves, of the fame green as the laurel, but fomething longer. When it comes to be of a deep red, it is gathered for the mill, in urder to be manulactured into thofe coffee-bens now fo generally known. 'The mill is compofed of two wooden rollers furnihed with iron plates is inches long, and io or 12 in diameter. Thufe moveable rollers are made to approach a third which is fixed, and which they eall the chops. Above the rollers is a hopper, in which they put the colfe, from whence it fills between the rolless and the chops, where it is Aripped of its firle Ikin, and divided into two parts, as may be feen by the form of it after it has undergone this uperation; being Hat on the one lide and round on the other. From this machine it fall's into a brafs fieve, where the fin drops between the wires, while the front flides over them into bafkets placed ready to receive it: it is then thrown iuto a veflel full of water, where it foaks for one night, and is afterwards thuroughly watherl. When the whole is fimithed, and well dricd, it is put into another machine called the peeling-mill 'This is a wood. en grinder, turned vertically upon its trendle by a mule or horfe. In paffing over the coffer it takes off the parchment, which is nothing but a thin Rin that detaches itfelf from the berry in proportion as it grows dhy. The parchment being removed, it is taken out of this mill to be put into another, which is called the simnowimg-mit". 'This machine is provided with four pieces of tin fised npon an axle, which is turned by a thave with confacrable force; and the wind that is made by the motion of thefe plates clears the coffee of all the pellicles that are mixed with it. $1 t$ is after. wards put upon a table, where the broken berries, and any filh that maty romain among then, are feparated by nugroes, afuer which the collice is fit for fale.

The cofee-tree is cuitivated in Arabin, Perfa, the Eaft Indies, the 1 ge of Rourbon, and feveral parts of America. It is alfo raifed in botanic gardens in feveral parts of Europe. Prince Eugene's garden at Vierna pronluced mure coffer, than was futiacient for his own confumption. It delighes particularly in hials and mombains, where its root is alnont always dry, and is head frequently watered with gentle flowers. It prefers a wetem afpeet, and phonghed gromed withcot any appearance of grafs. The plants hould be ploced at digh fiet ditance from each other, and in bules twelve or fifeen inches deep. If lift to themsferses, the $y$ would rife to the heicht of its or 18 feet, as already obferved; but they are genctally finted so five, for the conveniasy of gathering baci fruit
with the greater cafe. Thus dwiffi, they extend Coffa. their branches fo, that they cover the whole foot round about them. They beginto yield fruit the third year, but are not in fullbearing till the Gifth. With the fame infmities that mot other trees are fubject to, thefe are likewife in danger of being deftroged by a worm or by the fcorching rays of the fuas. 'Ithe hills where the coffee-trees are found have generally a gravelly or chalky bottom. In the latt, it limguines for fome time and then dies: in the former, its roots, which feldon fail of friking between flones, obtain nourifhment, and keep the trec alive and fruitful for 30 years. This is nearly the period for plants of the coffee-tree. The proprietor, at the end of this period, not only finds himfelf without trees, but has his land reduced, that it is not fit for any kind of culture; and unlef he is fo fituated, that he can break up a foot of virgin land, to make himieif anends for that ulich is totally exhaufted by the cofice-trees, his lofs is irreparable.

The coffee produced in Arabia is found fo greatly to excel that raifed in the American plantations or elfewhere, that the cultivation of the tree is now but kldom practifed in any of the Britifh colonies. Large plantations of this kind were formerly male in fome of them: and it was propofed to the parliament to give a proper encouragement for cultivating this commodity there, fo as to enable the planters to. underfell the importers from Arabia. Accordingly, there was an abatement of the duty payable on all coffee imported from our colonies in America, which at that time was fuppofed to be fufficient encomagement for this kind of conmerce; but the inferiority of the $A$ merican coffec to the Arabian hath almolt ruined the project. Mr Miller propofes fome improvements in the muthod of cultivation. Aceording to him, the trecs ane planted in too moift a foil, and the berries are gathered too foon. They ought, he fays, to be permitted to remain on the trees till their hins are thrivclled, and they fall from the trees when faken. This will indeed greatly diminith their weight, but the walue of the commodity will thereby be increafed to more than double of that which is gathered fooner. In Arabia, they always thake the berrics of the trees, fpreadine cloths to receive them, and only take fuch as readily fall at each time. Another caufe may be the method of drying the berries. They are, he obferves, very apt to imbibe moiture, or the flavour of any thing placed near them. A buttle of rum placed in a clofet, in which a canilter of coffee-herries clofely flopped was tanding on a thelf at a contiderable difance, in a few days fo impregnated the bervies as to render them very difacreable: the fame hath alfo happened by a bottle of fprit of wime ftanding in the fame clofet with coffee and tea, both which were in a few days fpoikd by it. Some years ago, a coffece thip from ludia had a few bags of pepper put on boart, the Hasour of which was imbibed by the coffee, and the whole cargo fpiled. For thefe reafons, Mr Miller directs that coffee-berrics thould never be brought over in thips freighted with rum, nor laid to dry in the houles where fugars are builed or rum dittilled. When they are fully ripe, they thould be thaken off when the trees are perfectly diy, and fpread upon cloths in the fun to dry, carrying thens every evening 1
under

## C O F

under cover, to prevent the dews or rain from falling on them. When perfeetly dry, they thould have their outcr kins beaten off, and then be carefully packed up in cluthe or bags thice or four times double.

The coffee-tree, as we have already obferved, is fometimes cultivated in European gardens; but for this it requires the affiftance of a fore. It makes a fine appearance at all feafons of the year (being an evergreen), but efpecially when in flower, and when the berries are red, which is generally in the wimer, fo that they continue a long time in that flate. It is propagated from the berrics; lout they muft be planted inmediately when gathered from the tree, for they lofe their vegetative quality in a very fhort time: when fent abroad by the poft, they have contantly Falled in thofe that have been a fortnight on their journey; fo that where thefe trees are delired, the young plants mult be fent, if it be at any ditance from the place where they grow. The frefh berries may be plauted in fmall pots, and plunged into a loot-bed of tanmers bark. If the bed be of a proper temperature, the young plants will appear in a month or dive wecks time; and in fix weeks more, will be ready for tranfplanting into feveral pots. During fummer, iley muft be frequently watered; but not in too great plenty, otherwife the roots will be apt to rot. The firle fign of the plants being difordered is their leaves fiveating out a clammy juice; after which they are over-rum with infects, that canot be detroyed till the plants have recovered their health; fo that on the firt appearance of thefe infects, the trees thould be removed into frefh earth, and all polfible care taken to recover them. The diforders incident to them, generally proceed either from their having been put into large pots, or from the cartil about them being too ftiff or overwatered. The moit proper foil for them is that of a kitchen-garden, which is naturally loofe, and not fubject to bind, efpecially if it has conftantly been well wrought and dunged.

Coffee alfo denotes a kind of drink, prepared from thofe berries; very familiar in Europe for thefe 100 years, and among the Turks for 170 .

Its original is not well known. Some afcribe it to the pior of a monaftery; who being informed by a goat-herd, that his cattle fometimes browzing on the tree would wake and caper all night, became curious to prove its virtue : accordingly, he firft tried it on his monks, to prevent their fleeping at matins. Others, from Sehchabeddin, refer the invention of coffee to the Perfians: from whom it was learned in the $15^{\text {th }}$ century by Gemaieddin, mufti of Aden, a city near the mouth of the red fea; and who haviog tried its virtues himfelf, and found that it diffpated the fumes which oppreffed the bed, infpired joy, opened the bowels, and prevented lleep, without being in. commoded by it, recommerided it fult to his dervifes, with whom lie ufed to fpend the night in prayer. Their example brought colter into wogue at Aden; the profeffors of the law for fudy, atifans to work, travellers to walk in the night, in line every body at Aden, drank coffee. Hence it paffed to Mecca; where firf the devotees, then the reft of the people, took it. From Arabia Felix it paffed to Cairo. In 1511, Kahie Begprohibited it, from a perfuation that it inebriated, and inclined to things forbidden. But

Sultan Caufou inmediately after took off the prohibi- Coffec. tion; and coffee advanced from Egype to Syria and Confantinople. The denvifes declamed againg it from the Alcoran, which declares, that coal is not of the number of things created by God for frod. Accordingly, the mufti ondered the coffee-houfes to be fhut ; but his fucceffor deciaring coffee not to be coal, they were again opened. During the war in Candia, the affemblies of news-mongers making ton free with Rate aftive, the gram! vilir Cuproli fuppreffed the coffer-houfts at Conitantinople: which lapprefion, though thill on foot, does not prevent the pubtic ufe of the liguc there. Thevenot, the traveller, was the tirft who! rought it into Framee ; and a Greck fervant, named Pelima, brought into Encrland by Mr Dan. Edwards, a Thmy merchant, in 1652 , to make his coffee, fill fe: tup the profeffien ot coffee-man, and introduct the darnle into this intand.
'The word caftio orgginally Arabic: the Tuks pronounce it caleuh, and the Arabians cothat? which fome anthors maintuin to be a general name for any thing that takes away the appetite, ot liters for any thing that promote appetite, and cthers arain for any thing that gives Atrength and vigour. The Mahoinctans, it is obferred, diflinguith three kinos of calowah. The firt is wine, or any liquor that incbriates: the fecond is made of the pods that contain the coffee-berry; this they call the Sultan's coffee, from their having firit introduced it on account of its heating lefs than the berry, as well as its keeping the bovels open: the third is that made with che berry itferf, which alone is ufid in Europe, the pods being found improper for tranfportation. Some Europeans who imported the pods called them the flower of the coffeetree. The deep brown colour of the liquor occafioned its being called fyrup of the Indian mulberry, under which fipecions name it firtl gained ground in Europe.

The preparation of coffee confints in roalting, or ario ving it a juit degree of torrefaction on an carthen or metalline plate, till it have acquired a brownith hue equally deep on all fides. It is then ground in a mill, as much as ferves the prefent occalion. A proper quantity of water is next boiled, and the ground coffee put into it. After it has juft boiled, it is taken from the fire, and the decoction having fond a while to fettle and fine, they pour or decant it into difhes. The of dinary method of roafting coffee amonglt $u_{3}$ is in a tin cylindical box fu!] of holes, through the middle whereof suns a fpit: under this is a femicircular hearth, whereon is a large charcoal-fire: by help of a jack the fpit turns wifit, and fo ronts the berry ; being now and then taken up to be haken. When the oil rifes, and it is grown of a dark brown col ur, it is emptied into two receivers made with latge hoops, whofe bottoms are iron plates: there the coflice is thaken, and left till almoll cold ; and if it louk bright and oily, it is a lign it is well done.

Very different accounts lave been given of the medicinal qualities of this ber"y. To determine its real effects en the human body, Dr Percival has made feveral experiments, the refolt of which tee gives in the following words: "From thefe obfer vations we anty EF Fer infer, that coffee is fichtly allingert, ard antiepoc; Vitu. that it moderates alimentary fermentation, ana isp. $2=$." powerfully fedative. Its action on the not fuls fyltem
prubably depends on the oil it comains; which recsives its gavour, and is rendered mildly empyreumatic, by the procefs of roatine. Nemman obtained be didilation fom ane poum of colfe, five ounces fred drachms and at half of water, ix ounces and hali a drachm of thick fetid vil, and four cimees and two dochus of a caput mortoum. And it is well known, that ige, torrefied with a few almonds, which rumeth the necelary proporion of oil, is now tremently emphoyd as a fubititute for chere benico.
$\therefore$ The medemal qualities of cufere frem to te derived from the cretcful fonfation which it froduces in the thomtch, and form the fedative powers it exeris on the tes wion Heace it affots diction, and relieves the headach; and is taken in hare cumtines, with pecular propricty, by the Turka and dortans; beraufe it counterabs the nacotic efincts of ornan, to the uhe of wrich thole notions are mach abdeted.
"In deliente habits, it often oceabions werteblular fs, tremors, äd many of the formains whertate de. nominatad nervom:. It has been even fulfueted of producing paties; ats from my own obfervation, I Poonl apothen, not entirely is ill ut foun iatort. Stare affime, that he beane pualsat by the ton liweral we of enfece, and that his diforder was renowal by dillineme fion that lighoo.
"The following curious and important offerva?"on is estrdetad from a letter with whith I was hofuntenl b; Bir Jon Eriagle, in April 1773: "On conders your tuction concerning cotree. abe quatioy osemed to me which I bad offorut of that liquor, ronfaning what you have [aid of its it dative vitues. It is the bent arbater of the paroxyfas of the feniodie athon? that I hase feen. The contereught to be of the bea Mown, newly burnt, and inade very trong immediately after grioung ic. I have commonly coeertil an ounce for one dith; which is to be repeatul frethafter the interval of a quatcor of haff an berti ; and whim! I decet to be taken without mili or fugat. The madnone in peneral is mentionci by Naforave,
 of it from a pheyfician in this place, who having ones praktifed it in Litelsche, had been informed tiy the cha poople of that place, that Sir fohn Fhever, during the latter year of his lise, kept free from, or at leath lived ealy under, his abmma, frum the ufe of very ftrong coffee. This difovery, it feems, he made af. ter the publication of his bouk upon that difeafe." Since the receipt of that letter, I have frequently disedted coffee in the allhma with great fuccolo."

COFFER, in architcture, a fquare deprefture or frking in each interval between the modilimen of the Corinthan cornice; ordinarily tilled up with a rofe; fonetimes with a pomegranate, or other enrichment.

Corfer, in fortification, denotes a hollow lodirement, athwatt a dry moat, from 6 to 7 fect deep, and from Ih to is broad; the upper part made of pieces of timber raifed two feet above the level of tite moat; which little elevation has hurdtes laden with earth for is covering, and lertes as a parapet with ernbrafures: the cufter is neatly the fame with the caponiere, excepting that this lat is fometines sace btyond the counterfarp on the ulacis; and the coffer aiways in the mont taking up its whole breadeth, which the caponiere dues mut. It differs from the
traverie and gallery, in that thele latter are made by Cofferer, $\therefore$ le betiegers, and the coffer by the belieged. The befieged generally make ute of coffers to repulf: the beltageas when they endeavour to palis the ditch. To Gave themfelves from the fire of thele cofers, the befievers throw up the earth on that lide towards the cofic:

COFFERER of the King's norsehond, a principal officer in the court, next under the comptroller. He was likewife a white-fati offeer, and always a member of the privy council. He lad a fpecial charge and overfyht of the other officers of the houlchold. He paid the wages of the king's fervants below itairs, and for provifions na diresed by the board of green chth. This office is now fuppreffed, and the butineis of it is tranfacted by the lom iteward, and paymaler of the honfthad. FIe had 工. 100 a-year mages, and L. 100 a-vear buds-wases.

COMPIN, the chedt in wioh dead bodies are put intu the \&rounc.

The fepulderal honour' paid to the manes of de. parted frime's in ancient times, demand ationtion, and are extrembly culans. 'Their being tut into a chate his been particulaly confudered as amak of the hiskelt dithation. W.th us the poorelt people h.we their costins. If the relations canot afford them, the pailh is at the expence. On the contrary, in the cat they are not at all made ufe of ia our tines; Turis aml Cmilians, as Thevenot allures us, agree is thic. 'The ancient Jews feem to have buricid their dead in the fome mamer: neiner was the body of onr loord, it thend feem, put into a coffa; nor that of Whha, 2 Kingssiii. 21. whole tones ivere tonched by the corpfe that was let down a lithe afier iato his fepuldare. However, that they were arciently made ufe of in Egypt, all agree, and antuque cofins of fone, and fivomoriauoal, are fthl to be feen in that country; nut io mention thofe faid to be made of a kind of patheboand; formed hy folding or glaeing cloth to. gtther a ereat many rimes, curioufy platerd, and then painted with hieroglyphies. Its being an ancient ligritian cuitom, and not practiled in the neighbournin conntries, were, doubtefs, the caufe that the facred hiturian exprefsly ablerves of Jofeph, that he was not only eminalmed, hut put into a coffin too *; "Gen.l. both being manacements peculiar to the Egyptians.

Bifhop Patrick, in his commentaly on this paffare, takes notice of thefe Ergptian coffins of tycamore wood, and of patteboard; but he doth not mention the contraty ufage in the neighburing countries, which was requifite, one might fuppofe, in order fully to illuftrate the place: but even this perhaps would not have conveyed the whole idea of the facred anthor. Maillet apprehends that ali were not inclofed in cofins who were laid in the Egyptian repofitories of the dead; but that it was an honour agpropriated to perions of figure: for after having given an account of feveral niches found in thofe chambers of death, he adds $\dagger$, "But it mult not be imagined that + Let. vi! the buclies deputited in thefe glony apartments were p. 28r. all inchoed in chafle, and piaced in niches. The greatel part were limply embalmed and fwathed after that manner which every one hath fome notion of; after which they laid them one by the lide of another without any ceremony. Sume ware evan laid

## C O G [ 125 ] C O II

Cofin in thefe tombs without any embalming at ail; or fuch a light one, that there remains nothing of them in the linen in which they were wrapped, but the bones, and thofe half roten. It is probable, that each confiderable family had one of thefe burial-places to themfelves; that the niches were deligned for the bodies of the heads of the families; and that thofe of their domeflics or flaves had no other care taken of them than the laying them on the ground, after having been embalmed, or even without that; which, without doubt, was alfo all that was done even to the heads of families of lefo diltinction." After this he gives an account of a way of hurial, practifed anciently in that country, which had becu but latcly difcovered; and which confiled in placing the bodies, af. ter they were fwathed, upon a layer of charcinal, and covering then with a mat, under a depth of fand of fever or cioht feet.

That action then were not miverflly ufed in E. gept, is undombed from the fencuants; and mobably they were only pardo. of cilliuction who were baided in them. It is afion vafonable to belicye, that in times formete as that of Joreph, diey might be muchiofecommon than afiermeres: and confequently, that Jreph's being puc in a colfin is Emypt migh be mentioned with a defgen to exprefsele great honows which the Egyptians did him at his death, as wedl as in life, being interred after the moll fumptaous manrier of the Esyptians, emlaturd, and pat into a coffin. Asreeably to this, the Septuagint cerfom, which was made for Egyptians, feems to reprefent coffus as a mark of grandeur. Jub xxi. 3 ?.

It is noobjection to this account, that the widow of Nain's fon is reprefented as carrical forth to be buricel in a $\operatorname{\sigma og}(\xi$, or ". on a bier:" for the prefent inhabitants of the Levant, who are well known to lay their dead bodies in the carth uninclofed, carry them frequentiy ont to burial in a kind of eoflin. Sio Dr Runt, in particular, defribes the bier ufed fur the 'lurks at Aleppo, as a kind of coflim much in the form of ours, only that the lit rifes wich a lealae in the middle. Chuifians, indeed, as he tells un, are carried to the grave oa an open bier: but as the mol common kind of bier refembles our cofins, that vitd by the ptople of Nain miglt very poffibly be of the fame lind; in which cafe the word ooser was very proper.

COGGLE, or Cag, a fmall firking boat tipon the coalls of Yorkthire: and cogs (cogones) are a hind of little fhips or vefils ufed in the rivers Oufe and Humter; (Stat. 23.H. VIII. c. 18.) Praparulis carentbus, galitis, \&e dalis navibus, E゚c. (Mat. Pan is. ann. 1w66.) And hence the cogmen, boatmen, and famen, who after fhipwreck or lo!"es by fea travelled and wadered about to defrend the ptople by begesing and thealing, ustil they were rellrained by proper lavs.

COGITATION, a term ufed by fome for the ait of thinking.

COGNAC, a town of France in Angoumois, with a cafte, where Frarcia I. was born. It is feated on the river Charaite, in a very pleafant comerry, abounding in wine, and remarkable for excellent brandy. W, Long. c. 1c. N. Lat. 45. 42.

COGNATE, in Scots law, any male relation thro' the mother.

COGNATION, in the civilinn, at term for that Cognation line of confanguinity which is betuetr males and females, both difeeded from the fome fether; as at-
$\qquad$ nation is for the line of farentage between males only defeended from the ianne thock.

COGNII, an ancient and frong town of Caramania in Tuky in Afra, and the refidence of a beghtren. It is feated in a pleafant comntry, ahoroding in corn, fruits, polic, and cutte. Hercate fheep whefe tails weigh 30 pounds. E. Long. 32. 5K. N. Lat. 37. 50.
 creditor charges the heir of his delitor to eater, in order to conflitute the doth arnind him, and the heir renounces the lucceffor, the crelitor can obeain no decrect of conlitution of that dett againat the heir; but only a decreet fubjecting: the hareditas jacens, ir che ellate which belonged to the debor, to his dill:gence: and this is calied a decrect cognifionis carfo.

COGNIZ.ANCE, or Connusame, io law, has divers fipnifications. Sometines it is ar acknonledgement of a fine, or confefion of fomething dure; fomethes the hearing of a mater judicia!ly, as to take c nizance of a caufe; and fometimes a particular juridistion, as cognizance of pleas is an anthurriy to call a caule or plea one of anotaer court, which no peifon can do tht the king; except he can how a charter for it. This cognizance is a privilege granted to a city or a town to hold plea of all contracts, \& within the liberty: and if any one is impleaded fur fuch maters in the coarts at Wefminfter, the mayor, ©ic. of fuch franchife may demand comnizance of the plea, and that it may be determined before then.

Cognizance is alfo ufed for a badge on a waterman's or ferving-tran's tleeve, which is commonly the giver's creit, whereby lie is decerned to belung to this or that nobleman or genteman.
cogs. See Coggle.
COHABITATION, denotes the flate of a man and a woman who live tugether without being lespally married. By the comvon law of Scotland, cohabitation for year and day, or a complete twelvemonth, is deemed equivalent to matrin:ony,
CO-HEIR, one who fucceeds to a fiare of an inheritance, to be divided among feveral.

COHESION, one of the four fpecies of attraction, denoting that force by which the parts of bodies adhere or tlick together.

This power was firlt confidered by Sir Ifac New- Confücere ton as one of the properties effential to all matter, and ty sur lana the caufe of all that variety we obferve in the texture Newten as of different terreflial bodies. He did not, however, an eficurial abfolutcly determine that the power of cohefion was rupurtety an immaterial one; but thought it might poffbly arife, as well as that of gravitation, from the action of an cther. His account of the original conftitution of mat- His meronne ter is as follows: It ferms probable, that Gud in the of the oribeginning formed matier in iolid, malfy, impanetrable. numat en.moveable paticles: of fuch fizes, figures, and other fituricion. properties, and in fuch proportion to face, as molt conduced to the end for which lie formed them: and that thefe primitive particles being folid, are incomparably harder than any porous bodies compored of them : even fo very hard as never to wear of break in pieces; mo ordinary power being able to civide what God himfelf made one at the firtl creation. White

Crhefion the particles continue entire, they may compofe bodies of one and the fame nature and texture in all age3; hut Thould they wear awny, or break in pieces, the nature of alt things depending on them wouk be changed. Water and earth compofed of old worn particles and fragments of particles, would not now be of the fame texture with water and earth compofed of entire particles in the beginning. And therefore, that nature may be lafting, the changes of enrporeal things are to be placed in the various feparations and new afleciations and motions of thef: permanent paiticles; compound bodies being apt to break, not in the midat of folid particles, but where thefe partisles are laid together, and touch in a few points." It feems farther, "'That there particles liave not only a vis inertia, accompanicd with fuch paffive laws of motion as naturally refult from that force; but alfo that they are moved by certain ative principles, fuch as that of gravity, and the: which caufeth fermentation and the cohefien of budice. Thefe principles are to be confidered wot as ocenle qualitics, fuppofed to refrilt from the figecific forms of things, but as general has of nature tiy which the things themfelves are formed; their truth appearing to us by phenomena, though their caufe is not yet difenered."
Attracturn the erencral ture. ry particle of matter has an attractive force, or a tendency to every other particle; which power is Atronget in the paint of contact, and fuddenly decreafes, infomuch that it acts no more at the leati fenfible diftance: and at a greater diftance is converted into a repellent force, whereby the parts fly from sach other. On this principle of attraction may we account for the colction of bodies, otherwife inexpli4 c:ible.
Formation "The fmallefl particles may cohere by the flrongof purtictes ef attractions, and conpofe bigger particles of weaker
of differett of dificrevit fizes. virtue; and many of thefe may cohere, and compole bigger particles, whole wirture is fill lefs; and fo on for divers fuecullions, until the progreffion end in the biggen particles, on which the operations in chemiftry, and the colours of matural bodics, depend; and which, by cohering, compofe bodies of a fenfible magnitude. preffure without aily fliding of ite parts it is hard and claftic: returning to its figure with a force arifing from the mutual attraction of its parts. If the parts flide from one another, the body is malleable or foft. If they hip eahly, and are of a hit fize to be agitaicd by heat, and the heat is great enough to keep them in aritation, the body is Auid; and if it be apt to Atick 10 things, it is hamid; and the drops of every fluid affeet a round ugure by the mutual attractions of their parts, as the ghobe of the carth and fea affects a round higure from the mutual attraction and gravity of its parts.
"Since metals diffolved in acids attract but a fnall

6 quantity of the acid, their attractive force reaches but Exifine to a fmall diftance. Now, as in adgebra, where afof te 1 ehmative quantities ccafe, their negative ones begin; poier prote fo in mechanics, where attraction ceafes, there a revel.
flections of the rays of light ; the rays being repelled by bodies in both thefe cafes without the immediate contaf of the reflecting or infecting body. The fame thing feens alfo to fullow from the eraition of light; a ray, as foon as thaken off from a body by the vibrating motion of the parts of the body, and got beyond the reach of attraction, being driven away with exceeding great velocity: for that force which is fufficient to turn it back in reflection may be fufficient to emit it. Fiom the fame repclling power it feems to be that flies walk upon the water withont wetting their feet; that the object-ylaffes of long teleffopes lie upon onc another without touching; and that dry powders are difficultly made to touch one another fo as to Aick together, without melting them or wetting then with water, which, by exhaling, may bring them together.
" The particles of all hard homogeneous bodics which touch one another, colere with a great force: to account for which, fome philofophers have recourfe to a kind of hooked atoms, which in clfeet is nothing effe but to beg the quefion. Others imagine, that the particle of bodies are connected by rett, i. e. in effoct by nothing at all ; and others, by confpiring motions, i.e. by a relative reft among themfelves. For myfelf, it rather appears to me, that the particles of bodies cohere by an attractive force, whereby they tend mutually to each other."

From this account of the formation and conflitution No conof bodies, we can conclude nothing, except that they clufion to are compofed of an infinite number of little particles, be drawn kept together by a foice or power; but of what na-accouns. ture that power is, whether material or immaterial, we muft remain ignorant till farther experiments are made. Some of the Newtonian philofophers, however, have pofitively determined thefe powers to be immaterial. In confequence of this fuppofition, they have fo refined upon attractions and repalfions, that their fyftems feem not far from downight feepticifm, or denying the exiftence of matter altogether. A fyftem of this kind we lind adopted by Dr Prieftey *, Hif. of from Meffrs Befcovich and Michell, in order to folve ${ }^{2}$ ifion , vol. i. from Miffrs Botcovich and Michell, in order to (ove p.302. light. "The calieft method (fays he) of folving all Mr Midifficulties, is to adopt the hypothefis of Mr Bofcovich, , chell's hy. who fuppofes that matter is not impenetrabla, as has puthefis abeen perhaps univerfally taken for granted; but that br Prielfit conifits of phyfical points only, endued with powers ley. of attraction and repulfion in the fame manner as Solid matter is generally fuppofed to be:'provided therefore that any boly move with a fufficient degree of velocity, or have a lifficient momentum to overcome any powers of repullion that it may meet with, it will find no difficulty in making its way through any body whatever; for cothing elfe will penetrate one another but fowers, fuch as we know do in fact exilt in the famis place, and counterbalance or over-rule onc anollo.. "The moft obrious diticulty, and indeed almork the oulif one that attends this hypothefis, as it fuppodes mutual pentrakility of matter, arifes from the idea of the nater of matter, and the diff- Bodies op culty we meet with in atienpting te force two bodies infe each into tle fame plise. But it is demontrable that the other not firf offtruction aifes from no actual contad of mat-trual conter, but from mere powers of repulfion. This diffi-tan.

## $\mathrm{C} O \mathrm{O}$

Cohefon culty we can overcome; and having got within one fphere of repultion, we fancy that we are now impeded by the folid matter itlelf. But the very fame is the opinion of the generality of mankind with refpect to the firl oblitruction. Why, therefore, may not the next be only another fiphere of repultion, which may only require a greater force thou we can apply to overcome it, without difordering the arrangement of the conltuent particles; but which may be overcome by a body moving with the amazing locity of light.
" This fcheme of the immateriality of matter, as it may be called, or rather the mutual pentration of matter, firft occurred to Mr Michell on reading biaxter on sthe immaterizlity of the Soul. He found that this author's idea of matter was, that it confifled as it were of bricks cemented tagether with immaterial mortar. Thefe bricks, if he would be conlillent with his own reafoning, were again compoled of lefs bricks, cemented likewife by an immaterial mortar; and fo on ad infinitum. This putting Mr Michell upon the confideration of the leveral appearances of nature, he began to perceive that the bricks were fo covered with this immaterial mortar, that if they had any exiflence at all, it could not poffibly be perceived ; every effeet being produced, in nime intances of ten certainly, and probably in the tenth alfo, by this immaterial, fpiritual, and penetrable mortar. Inllead therefore of placing the world upon the giant, the giant upon the tortuife, and the tortoife upon he could not tell what, he placed the world at once upon itfelf."

Other ophitofophers have fuppofed the powers both of gravitation and collefion to be material; and to be only different actions of the etherial fuid, or clementary fire. In lupport of this it hath been urged, that before we have recourfe to a ipiritual and immaterial power as the caufe of any natural phenomeron, we ought to be well affured that there is no material fubftance with which we are acquainted, that is capable of producing fuch effects. In the prefent cafe, we are fo far from having fuclaffarance, that the contrasy is manifet to our temies. One intance of this is in the experiment with the Magthburg kemif) they are called. Thefe are two hollow hicmipheres of brafs, exactly fitted to one anoticr, fo as to form one globe when juined tegether, without admitting any air at the joining. In this hate, if the air with in them is exhauttad by means of a pump, they will cohere with fuch forec, if they are five or lix inches diameter, as tor require a weight of fome humdreds of pounds to feparate them. The preflure of the atuncfplete, we foe, is in this cafe capable of producing a very trong colfetion; and if there is in nature any fuid tore penctrating, as wall as more powerful in its eflects, than the air we breathe, it is pofible that what is called the attruation of colofion may fome how or other be an cffect of the action of that fluid. Such a fluid as this is the eleneent of fire. Its activity is fuch as to penctrate all bodics whatever; and in the fate in which it is commonly called fire, it aces according to the quantity of folid matter contaned in the budy. In this thate, it is cilpable of difiolving the firongett chefions olferved in nature: but whatevir is capable of diffolving any cohefion, muil necoflarily be endued with greater pewer than that by which the
cohcfion is canfed. Fire, therefore, being athe to diffolve cohcirons, mall altio be capable of cauling them, provided ins power is acerted for that purpofe. Nor will a feem it all Atrange that this 月uid thouhtaet in two fuch oppofte ways, when we conidu the different appeatances which is affimes. Thete are threc, $w$ : the or hat, in which it combon, dethross, and diflowes: light, in which it fombatolived of all icternetive or difinderit pewel, and to the the moth midd, quict, and placid being in nature. The third itate of this elemen is, when of heemme what is called the clearic flum: and then it attrater, repule, and moves boctios, in a wall watity of way*, without cither baning or andanige then simeloby its light. Ih this thate is is nut lets powerfins than in eitice of the other two; for a viokom thath of dicco tricity will difphee and terr in piecer the mol healy and folid bodies. The fecming eapricious matme of this fuid, however, prubably readers it tefs fupected as the caufe of colnelion, than it otherwite would be, were the attractions regular anel permanent, which we obferve it to occafion. liut here we mut ublerve, that the fluid has an cxittence in all bodies before the experiments are tried which make its cifects vifible to us, and was acting in them according to its fucted and ellablithed laws. White acting in this manner it was perfectly invilible; and all we can do is, to pron duce fome littic infringenent of thefe regular Jaw; according to which it commonly ates. In feme cafea, however, the electrical attractions produced by art are found to be pretty permanent and ilrong. Thus, Mr Symmer, in fome experimeats with filk Hockings, found their attraction fo Atrong, that it required appwarl:s of 15 pounds weight to feparate them from each other; and this attraction would continue for more then an honr. In plates of glafs, too, be obferved a remarkable cohetion when electrinich. In the Philofophical Sranfactions for 1777, we lind thi; hypothetis taken notice of, and in fome meafure adopted, by Mr Henly. "Some gentemen (fays he) have fuppofed that the electric mater is the caufe of the collution of the particles of bodies. If the chesric matter be, as [ fulpeet, a real elcmentary fire inherent in all bodics, that opinion may probably be well founded; and perhaps the folkering of metals, and the cementation of iron, by firs, may be condiduted as throng proofs of the truth of their hyporhetis."
On this lat hypothefis we mult oblerve, that if the clectric, or any other fluid, is fuppofed to be the caufe of tue atraction of colaction miverfally, the particles of that fluid mult he deftitute of all cohelion between thenflues; otherwife we thould be at as great alols to atcount for the cohefion of thefe brarticles, is for that (f terreltrial matter. Pbilofophers, imdeed, do not fuppofe any cohefion betwicen the partickes of the dectric fluid themfelves; it is generally beliered that the particles of this thaid are repulfive of one another, though attracted by ail uther mater. If this is a fact, we camot fuppote the etectric huid to be the caufe of colhetion. The probability or intprotasility of the hypothetis juft mentiond, muit greatly depend on its leing alcertained whether the particies of the tectric fluid do really repel one another, and attract all uther kinds of matter, or not ; but for this we mund refer to the article Elfectricits.
COHODATION, in chanilly, an operation by which:

## (. O 1 [ 128$] \quad$ C O I

(whrm which the fame liquor is frequenty diftled from the fame bods, either with an intention to diffse this body, or to produce fonte change upon it. This is ene of thote operations which the ancient chemils prochicd with grant patience and zeal, and whith are now negicoted. 'Lo make this opuration calice, aind to pocrent the trouble of frequenty changing the velfins, a particular kind of alombic, called at peiten, was in:suted. This veftel was made in the form of a chcubit whth an alembichead, but had two frouts com: manicatind with the boly. As the vapone role up Butu the heal, it was eramally condentect, and ran dusu the fpouts inter the body of the phlinan, from whane it was arsuin difilled; and for on. This vefflis repersered tlate CXXXIV. figo 6.
(OIfOkN (N.) the gratett engincer Hulland has produced. Among lais other woks, which are etteemad mater-pieces of dill, he fortitied Bergen-op - foom ; which, to the furprife of all Earope, was taken by the Fruch in 1747 . He wrote a treatife on fortification; and died in 1704.

COIHORT, m Roman antiquity, the name of put of the Ronan legion, compreheading about 600 Nem . 'l'hare were ten cohorts in a legion, the firlt of which exceeded all the rett buth in dignity and number of men. When the amy was ranged in order of battle, the firf colort wok ap the right of the hirt line; the reft followed in then natural order: for that the thiad was in the centre of the firt liae of the legion, and the difth on the left; the fecond betweon the firit and third; and the fouth between the third and fifth: the fre remaining cohorts formed a fecond line in their s.atural order.

COIF, the bader of a fergeant at law, who is called fergeant of the coif, from the lawn coif they wear under their eaps, when they are created fergeants.

The chief ule of the coif was to cover the clerical tonfure. Sec 'Ionsuke.

COILING, on fhipboard, implies a fort of ferpentine winding of a cable or other rope, that it may uccupy a fmall face in the fhip. Lach of the wiadines of this furt is callud a fake; and one range of fakes unon the fame line $i s$ called a ior. There are generally fron hive to feven fakes in a tier; and three or four tiers in the whole kength of a cable. 'Ihis, fousever, depends on the extent of the fakes. The finaller ropes emplaved about the fails are coiled upon cleats at fea, $w$ prevent their being entangled amoneft one anotiar in travorimg, contracting, or extending lie fat.

COILON, in the ancient Grecian theatres, the fame with the cavca of the Romans.

COMNBRA, a handiome, large, and celchrated town of Purugal, capital of the province of Beim, what a hitheps fee, and a funous unvertity. The cathodad and the fommains are vorymagmiticent. It is feated in a rory pleafont country abounding is wineyards, olive-trees, and fruits. It flands on a mountan, by the dude of the river Mondego. W. Long. 8. 57. N. Lat. yo. 10.

COIN, a piece of metal converted into moncy by the imprefting of cortain manks or figures thereon.

Coin differs from Money as the fpecios from the gemas. Aloney is any mater, whether metal, wood, kwhor, glafs, hom, paper, frouts, fadls, or kemels,
$\because=84$.
which heve curency as a medium in Commbrcer. Coin. Sum is a particular lacecies, ahwajs made of metal, and Atmek accurding to acertain pocefo catled Convag.

Whe precife epuchas of the invention of money is for ancient for our anals; and, if we might argue fiom the neceflity and obvioufnefs of the thing, mot be nearly coeval with the world.

Whether coins be of equal antiquity, may admit of fome doubt; efpecially as mot of the ancient writers are fo frequent and expref in their mention of lea. them-momeys, paper-mameys, wooden-romest, Eico Some, however, notwithtamling this, are of opinion, that the firit moneys wore of neetal : tha reafons they give, are the firmuefs, neatnds, cleanlinefs, durablenets, and univerfaity of metals; which, however, do rather condude they ought to have been fo, than that they actually were fo.

In clicit, the very commodisirs themfives were the firt moneys, $i$. were charent for one another by way of eschange: and it was lhe difinult: of cutting or divding certain commodities, and the impot. libility of duing it without great lof, that hat pui mea on the expedient of a general mediam. bee Exchange.

Indech, thus mach may be faid in behalf of coins. that, on this view, it was naumal for men to have their heft recourle to metals; as being almott the on1) things whofe goodnef, and as it were intergrity, is not dimmithed by patition; befides the adranarios above exprefed, and the converiences of melting and returning them intuanafo of any fize or weight.

It "as probinly, then, this propery of metals which fint atcultomed people, who traficked tersether, 10 account them in lieu of quantities of otian merchandizes in their exchanges, and at lemgth on fubtitute them wholly in thair thed; and thes ande money: as it was their other property to prefere any mark or imprefiot a long time, which contirmad them in the right; and thus was the firt rife of coans.

In the firlt ages, each perion cut his metal inte pieces of different fizes and forms, accurding to the qu:ntity to be griven for any mernamdioe, or according to the demand of the lelitr, us the cquatity firnlated between them. To this end they went to manket luaden with metal in proportion of ine purchate to be made, and fumined with inftruments for fartioning it, and foutes for dealing it out, according as occation required. Dy degrees, it was fund more commodious to have picees read. wheghed; and as there were different weights required according to the value of the diffecont wares, all thofe of the fame weight hegan to be diltinguithed with the fame mark or thgure : thas were coms cartici one llep further. At lencth the growing commerce of momey beginning to be diturted with frads, foth in the weights and the matter, the public intherity interpoled; and hence the firf famps or impatituts of money; to whiel facceeded the nomes of the momiers; atd at length the effigy of the prince, the date, legend, and wher precautions to revent the alterations of the fipecies; and thus were coins completed.

Aludern Corns. In Eagland the current fpecies of gold are the guinea, half-gumen, Jacobus, laureat, anrel, and rofenoble: the four lat of which are now fidiom to be met with; havieg been mort of them

Coin eonverted into grineas, chiefly during the raign of Charles II. and James II. The filver coins are the crown, half-crown, flilling, and dixpence. Cupper coins are the hadf-penny and farthing.

In Scotland, by the articles of the Union, it is appointed that all tive coins be reduced to the Englith, and the fance accomats olferved throughout. Till then the Scots had their pounds, hillings, and pence, as in England ; but thicir pound was but 20 pence Englifh, and the others in proportion: accordingly, their merk was $1 \frac{1}{3} \frac{1}{3}$ s. Scots, current in Eugland at $13 \frac{1}{3}$ d. Uheir noble in proportion. Pelides thefe they lad their tur-norer-pence and half-pence; their penny $\frac{1}{2}$ of that of England: betides lafe money of achifons, babees, and placks. The bedle $\frac{1}{5}$ of the penny, $\frac{1}{4}$ of the achifon, $\frac{7}{3}$ of the babee, and $\frac{7}{2}$ of the P lack.
In Ireland, the coins are as in England, viz. Miillings, pence, $\begin{aligned} & \text { ch whit this diference, that their thus- }\end{aligned}$ ling is but equal to $11-\frac{3}{0}-\mathrm{d}$. Sterling: whence their pound is only 18 s .5 f d.

But, for at view of all the coins prefently eurent in the four quarters of the gk be, with their salues and proportions, fee the table fubjoined to the article M )ney.

In many places thells are current for coins; particuharly a fmall white kind dus out of the ground in the Maldives, and fome parts of Amcrica, called in the Indies cozories, or coris, on the coaft of Africa bonges, and in Anerica porctaines; of which it takes a vait number to be equivaleat in value to a penny. Of zimbis, anothor kind of fhell current, paiticularly in the kingdoms of Angola mal Congo, two thoufand make what the negroes call a macouff; which is mo real mo. ney; for of this there is none in this part of Africa but a mamer of reckoniag: thus, two Flemilh kuives they efteem a macoutc; a copper-bafon two pounds weight, and 12 inchus diameter, they reckon three macoutes; a fufe 10,0 .

In forne places fruits are eurrent for coins. Of thef there are three forts ufed; two in America, particulanly anong the Mexicans, which ar: the cacaonand maize ; the other in the Eaft Indies, viz. almonds brought thither from Lar, and frowing in the defarts of Arabia. Of cacao 15 are elleemed equivalent to a Spanifh rial, or feren pence furling. Maize has eeafed to be a common money fince the difovery of America by the European:. Almonds are chicfly ufd where the co:rriss are not current. As the year preves more or lefs tavomade t.. thes fruit, the value of the money is higher or lower. In a common year 40 almonds are fet againtt a pecibin, or halfpenny flerling; which brings cach almond to $\frac{1}{2}$ of a farthing.

Ancicht Conss are thofe chiefly which have been current among the Jews, Greeks, and Romans. Their values and proportions are as follows.

Note: Of thefe the drachma, didrachm, \&ce. were of fluer, the reft for the motl pant of brafs. The other parts, as tridrachm, trivbolus, \&c. were fimetimes coined.

Note alfo: The drachma is here, with the gencrality of authors, fuppofed equal to the denarius; thongh there is reafon to believe that the drachma was fonewhat the weightier. See Drachma and Dinarius.

Cons, in architecture, a lind of dye cut diagonalwife, after the manner of a hight of a ftair-cafe, lerving at bottom to fupport columos in a level, and at bup to correet the frchation of an entablature fupportimes a vanle.

Cond atho uhal for a fuid antle compofid of two furfaces indined towards each other, wheler that angle be exturior, as the coin of it wall, a tree, Ece. or interior, as the coin of a chamber or chimney. See Qunin.

COINAGE, or Cointac, the art of making money, as perfonmed either by the lammer or mill.

Formerly the bamic of coins was different from what it is at prefent. 'Iher cur a large plate of metal into feveral litete farater, the corners of which were cut off with theers. After having thaped thefe picces, fo as to rumer them perfectly conformable, in point of waighe, to the fandard piece, they took ench paiece in hand again, to malie it easactly round $b_{y}$ a gentle hammering. This was called a plantort, and was fit for immediate coining. Then engravers prepared, as they ilill do, a couple of theel mafes in form of dyes, cut arud terminated by a fat furface, ronded of at the edges. They engraved or famped on it the hollow of a head, a cros, a foutcheon, or any ofiner figure, according to the curton of the times, with a flort legend. As one of thefe dyes was to remain dormant, and the other novealle, the fommer ended in a fquare prifm, that is might be introdued into the fquare hol: of the block, which, beiner fixel very falt, kept the dye as fuendy as any vice condld have cone. The Flanchet of metal was horizontally hid upon this inferior mafs, to receive the ftamp of it on one fide, and that of the lipper dye, wherewith it was curered, an the other. This moveable dye, having its mond engraved furface relling upon the planchet, had at its oppofite extremity a fiat fquare, and hager furface, upon which they gave feveral heavy blows, with a hammer of an eriomons fize, tiil the dubic namp was fufficiently, in relievo, inprefted on cath fide of the planchet. This being fimifud, was mmediately fucceeded by another, and they thus beanme a fandard toin, which had the degree of finenefs of the weight and rark determined by the judgment of the infpectors, to make it good ctarent money. 'Slie frong tempering wheli was and is bill given to the two dyes, rendering them caputbe of bearing thefe repeated blows. Coming has been confoderably improved and rendered espeditious, by feveral ingenious machines, and by a wite application of the furelt phyfacal experiments to the methods of fining, dyeing, and thamping the efferent metals.

The three finct inflruments the mint-man ufes, are the laminating ungine; the machine for making the impreitions on the edges of coins; and the mill.
A.ftor they bave taken the lamine, or phates ef me-
tal, out of the nould into which they are caft, they do not beat them on the anvil, as was formorty done, but they make them pars and repals between the feweral rollers of the laminating engine, which being gradually brought clofer and clofer to cach other, pee fentity give the lamina its uaiform and exact thicknds. Intuad of dividing the lamina into finall fquares, thes at once cut clean out of it as many planchetts as it can contain, by means of a harp fleel trepan, of a roundith ligure, hollow within, and of a proportionable dianeter, to fhape and cut of the piece at one and the fame time. After thefe planchus have been prepared and weighed with fandard pieces, filed or feraped to get off the fuperf:rous part of the netal, and then Filed and made clean, they arrive, at laft, at the machine (fig. 1.), which marks them upon the edge; and finally, the mill (fig. 2), which, fquesang each of them kingly butween the two dyea, bronght near cach other with one blow, forces the two furfaces or fiedds of the piece to itl exat bly all the vacancies of the two figures engraved hollow. The engine which ferves to liminate lead, gives a fufficient mution of that which ferves to faten gold and filecr damine between rollers of a lefter lize.

The principal pieces of the machine (fig. r.), to faunp coins on the cdse, are two fteel lamine, about a line thick. One hatli of the legend, or of the ring, is engraved on the thicknefs of one of the lamine, and the other half on the thicknefs of the other; and thefe two lamine are feaight, although the planchet markel with them be circalar.

When they ilamp a plan het, they firk put it between the laminx in luch a manner, as that thefe being cach of them luta dat upen a copper-plate, which is fakened upona very thick wooden table, and the planchet being likewite lad flat upon the fame plate, the edge of the planchat may touch the two lamine on each fide, and in thit thick pat.

One of thete laminx is immoreable, and fatened with ferend ferews; the other Rides by means of a dented wheel, which takes into the teeth that are on the furface of the limina. 'This nideng lamina males the phanchet turn in fuch a manner, that it remains famped on the edree, when it thas made one turn. Only crown and haif-crown pieces can bear the inspreffion of letters on the thicknefs of their edges.

The coining engine or mill is fo handy (tig. 2.), that a fingle man may itamp twenty thoufand planchets in one day: guld, fils, and copper planchets, are all of them coined with a mill, to which the coining fquares (tig. 3.), commonly called dyes, are fattened; that of the face under, in a fquare box garnilhed with male and female forews, to fix and keep it fteady; and the other above, in a little box garnimed with the fame farews, to falten the coining fquare. The planchet is laid flat on the fquare of the effigy, which is dormant; and they immediately pull the bar of the mill by its cords, which caufes the forew fet within it to turn. This enters into the female forew, which is in the body of the mill, and turns with fo much frength, that by pufhing the upper fquare upon that of the effigy, the planchet, violently prefled between both fquares, receives the impreffion of both at one pull, and in the twinkling of an eye.

Plate CKLIV.

## C 01

Coining. The plancict thus famept and coined, goes through a final cxamination of the mint wardens, from whine hands it goes into the wrorld.

In the Comev, of Alctuls, the procers is the fane, in effect, with that of moncy ; the primipal diference coniling in this, that money laving but a fanall ralievo, reccives its imperefion att a fingle throke of the engine: whereas for melals, the loight of their relievo makes it neceflary that the fluge be repuated feveral times: to this end the pine is taken ont from between the dyes, heated. and returnel again; which procefs, in modallions and burge moclat, is repeated fiften or twenty times before the full impreflion be given : care mat be taken, every time the planchet is renored, to take off the fupatluous metal firetched beyond the circuaterence with a ife. Medallions, and moldeds of a high rel cro, are whally firlt call in fand, by raton of the dificulty of flampiug then in the prefs, where they are pat only to perfict them; in regard the fand does not leare them char, fmonth, and accurate chometh. Therefore we may foe that medals revive their fum and imprethon lig dearecs, whereas money reccives then all it once.

Lititibl Comage, luth by the loconty of the engraving, and by the incution of the imperfens on the edges, that admiatle expedient for poweming cise alteration of the factis, is carriul to the utm perfection.

It was orly in the reign of king Whilim III that the hammer-mony ceafed to be conent in Luldand, where till then it was flruck in that mancr, as in other nations. Defore the lammer fpecies was calle ol in, the Englith moncy was in a wetched condition, having been filect and clipped by natives as well as foreigners, infonuch that it was fearce leit of half the value: the retrieving this diffeffed thate of the Erg. lifh money is looked upon as one of the ghe ries an kagg William's reigu.

The Britih coinage is now wholly perfurmed in the Tower of London, where there is a corporation for it, under the tite of the mint. Formerly thare were here, as there are fill in other countries, the rights of feinorage and braffage: but fince the eightenth year of king Chartes 11. there is nothing taken cither for the king or for the expences of coning: fo that weisht is returned for weight, to any perfon who canies their frold and filver to the Tower.

The fpecies coined in Grat Britain are fleemed contrabiand goods, and not to be exported. All foreign feccies are allowed to be fent out of the realn, as well as gold and filver in bars, ingrots, cunt, \&ic.

Rarbary Colnage, parlicularly that of Fez and Tunis, is under no proper regulations, as every guldfmith, Jew, or cenen private perfon, undertakes it at pleafure; which praftice renders their monsy exceeding bad, and their commerce very unfafe.

Mufrozite Cornsgf. In Muicuvy there is mo other coinflruck but filver, and that ondy in the cities of Mufcow, Novogrod, Twere, and Plefkow, to which may be added Peterfourgh. The coinage of cach of thefe cities is let out to ferm, and makes pant of the royal revenue.
Perfian Cumpge. All the money made in Pafia is fruck with a hammer, as is that of the reit of A fin; and the fame may be undentood of America, and the
coath; of Afrian, and cen Prfufory: the hins"s dutp,
 neys comed, whim ar. litely melneed on fixat ind
 of medalo, at the acceflom of a new fopin.
 in Eureppe. It is fettal at serithe and seagerid, the whly citios where soble and fitver are thock.
(C) ARk, or, to the Gemans call it, Chuk, a latre and baddinne town of Switzerland, and cap, itst of the commty of the Grifans, with a bimop's fee whof we butc has the bight of comint momey. It is divided inte two parts ; the leat of which is of be Roman Callatie religion, and the greatull of the drotuthat. It is governed by its own laws, and fata in a plair, abonding in wineyards and game, on the river Ple $f$. fare, half a mile from the Nhine. E. Long. 9.27 . N. Lat. 46. 50.

COITLON, the irtercourfe betwien male and female in the act of generation.

It is obfoved that fregs are forty dety in the ane of coition. Marthohme, Š. relate, that butterfinc mate I 30 vibations of the wines in one act of coition.
(OAD, jnf"s-T"Ape: A genes of the triandian order, bulonsing to the monoccia clars of plants; and in the natural mothod ranking monder the th onder, faromina. The male foness grow in fukes rumote from one another ; the caly is a biflowno, leardets grome. The calys of the fomate is a bifto ons theme; the: colrolly a heardlefs grume: the !ry hatrite; the fead curcend whith the calyx offined. Of this thate is lat
 frequatly cultivated in $S_{\text {Pain }}$ and Portaral, and ahis in the Tfell Indics. It is an anuun plant, rifing from a fibmons root, with 4 wo or thece jointed thathas, to the height of two feet, with fingl, homs, narow leaves at ench jinat, refombling thote ot the reet; at the bufe of the leaves come out the pidecs whows hameng Un diont foot-ilalks; the lecds greatiy retonhl: thofe of crommell; whence the plan has by fone writers been catlect iethopermum. This fant may be propaGrited in this country by feed boought from lorimal, and fown on a hot-bed; after which she youno plants are to be removed into a wa in borcore, and phanted at the ditance of wo feet at leaft from ach outho They will require no other care than to b kept free from weeds. In Spain and Portyoal the poor people grind the feeds of this phat, in times of fea th, and make a codric kind of bread of them. The reds are inchofod in finall capfules about the bignefs of on Lngtith pea, and of different colours. Theft are it.. ing upon filk, and ufed inilead of bracelets by fume of the poorer fort in the Wrelt Indies, but efpecially by the negroos.

COKE, on Cooke (Sir Elwad), lore chief jutice of the king's bench in the reign of James 1. was defoended from an ancient family in Norfolk, and born at Milcham in 1549 . When he was a fudent in the Inncr-I'emple, the firft oceafion of his diftinguifiner limfelf was the ilating the cafe of a cook belonging to the ' Temple fo exactly, that all the houfe, who were puzzed with it, admired him and his pleading, and the whule bench tock notice of hins. After his manriage with a lady of a great fortune, preferments bowed in upon him. The cities of Norwich and Cosentry chofe him for their recorder; the contaty of Norfork, for IR 2

Cuke
one of their knights in parliament ; and the houfe of commons, for their fpeaker, in the $35^{\text {th }}$ year of queen Elizabeth. The quen appointed lim folicitor-general in 1592, and attorneygeneral the next year. In 3603, he was knighted by Fing James I.: and in Novenber the fame vear, upon the trial of Sir Watter Raleigh, $\dot{G}$ e. at Winchenter, he teated that gentleman with a fentrility of langrage lardly to be paralleked. June 27. he was appointed lurd chicf jutice of the common pleas; and in 1613 , lord chief judice of the king's bench, and fivorn one of the privy council. In 1615, he was very vigorons in the difcovery and profecution of the perfors employed in poitoning Sir Thomas Overbury in the Tower in 1612. His contett not long after with the lord chancellor Egeton, with fome other cafes, liatened the ruin of his intereft at court: fo that he was fequeftered from the council-table and the office of lurd chief jufice. In 1621, he vigorontly maintained in the houfe of commons, that no proclamation is of any force againt the parliament. The fame year, being looked upon as one of the great incendiaries in the houle of commons, he was removed from the council of Atate with difcrace; the king fyying, that "he was the fiteft inArrment for a tyrant that ever was in lingland:" he was alio committed to the Tower, and his pafers were fized. Upon the calling of a new pariament ia 1625 , the court party, to prevent his being elected a member, got him appointed fheriff of Buclinglamfhire; to avoid the office, if poffible, he drew up exceptions againft the oath of a fheriff, but was obliged to undertake the office. In 1628 , he fooke vigoroully upongrievances; and made a fpeech in which he affirmed, that "the duke of Buckingham was the caule of all cur miferies." While he lay upon his deathled, his papers and latt will were feized by an order of conncil. He died in 1634 , and prolifhed many woks: the mofl remarisable are his Intitutes of the laws of England; the fint part of which is only a tranflation and comment of Sir Thomas Littleton, one of the chief jutices of the common pleas in the reign of Edward IV.

COKENIHAUSEN, a Atrong town of Livonia in Sweden, on the river Diviaa. E Long. 24. 26. N. Lat. 56. 40.

COL, a name given by fome to one of the weftern illands of Scotland; it abounds in corn, palture, falmon, eels, and cod. W. Long. 7.35. N. Lat. 57 .
COLAPIS, Colops (anc. geog.), a river of Liburnia, which after a winding north-ealt courfe, falls into the Savus, at the Infula Segellica. Now the Culpe, the bundary of the Alps, running through Croatia into the Save. Culapiani, the people living on it (Pliny).

COLARBASIANS, or Colorbasians, a fet of Chriftians in the fecond century; fo called from their leader Colarbalus, a diciple of Valentinus; who, with Marcus, another difciple of the fame mafter, maintained the whole plenitude, and perfection, of iruth and religion, to be contained in the Greek alphabet: and that it was upon this account that Jefus Clirift was called the alpla ano cmega. This feEt was a branch of she Valentimians. See alfo Marcosians.

COLBERG, aftrong, handfome fea-port town of Germany, in Pomerania, belonging to the king of Prufia. It is remarkable for its falt works; and is
feated at the month of the river Pufart, on the Baltic Colbert. fea, 60 miles north-ealt of Stetin, and 30 north eaft of Camin. E. Long. 15.57. N. Lac. 5.f. 13.

COLBERT' (John Iisptist), marquis of Segnelai, one of the gresed ftat-fimen that Franes ever had, was born at Paris in 1619; and defenaded from a fa. mily that lived at Kheims in Champagne, no way confuerable for its fplendor and antiquiry. His grandfataer is taid to have been a wine-merchact, and his father at faf followed the fame occupation; butafterwards thated in cloth, and at lalt in fiik. Cur Colbert was inftructed in the ats of merchandice; and afterwards became c!ak to a notary. In iof8, his relation Juhn Baptit Colbet, iurd of 8 S. I' uange, pteferred him to the fervice of Michat Le Tellicr, fecretary of late, whofe tifter he had narried; and here he difcovered fuch diligence, and exactnefs in executing all the commifions that were entrulled to his care, that he quichly grew ditlinguithed. One day his mater font him to cardinel Mazarine, who was then at Sedan, with a letter written by the queen mother; and ordered him to bring it hack, after that miniter had feen it. Colbent carried the letter, and would not retum withont it, though the cardinal treated him roughly, ufed feveral arts to deceive him, and obliged him to wait for it fiveral days. Sume time afier, the cardinal returning to court, and wanirg one to wrice his agenda or memoranda, defired Le Tellier to funifi him with a fit ferfon for that emploment : and Celbert being prefented to $!\mathrm{im}$, the ca-dial had tome remembrance of him, and defired to kuow where he had feen him. Colbert was afraid of putting him in mind of Sedan, led the remembrance of his importunacy, in demanding the queen's lecter, foonld renew the cardinal's anger. Dut his eminency was fof from hating him for his failnfulnefs to his late matter, that he received him on condition, that he hould ferve him with the like zeal and fidelity.

Colbert applied himfilf wholly to the advancement of his mafter's intereft., and gave lim fo many marks of his diligence and $\cap$ ill, that afterwards he made him his intendant. He accommodated himfelf fo dexterougy to the inclinations of that miniler, by retrenching his luperlavas expences, that he was entrufted with the manayement of that gainfal trade of felliag bencfices and governments. It was by Colbert's counfel, that the cardinal obliged the governors of frontier places to mantain their garrifons with the contributions they exacted; with which advice his eminency was extromely pleafed. He was fent to Rome, to negociate the reconciliation of cardinal de Rets, for which the Pupe had howed fome concern; and to perfuade his holinefs to confent to the difincamerating of Cato, according to the treaty concluded with his predeceffor Uiban VIII. Upon the whole, Mazarise had fo high an opinion of Colbert's abilities, and withal fuch a regard for his faithful fervices, that at his death, which happened in 1661 , he earnettly recommended him to Lousis XIV. as the properett parfon to regulate the finances, which at that time ilood in much need of reformation. Lonis accept. ed the recommendation, and made Colbert intendant of the finances. He applied himielf to their regulation, and fucceeded: though it procured him many enemies, and fome affronts. France is allo

## C O L.

colbert. obliged to this miniter for efablifhing at that time ber trade with the Eat and Well Indies: a great defign, and from which the has reaped innomerable advantages.
In 1661 , he became fuperintendant of the buildings ; and for that time applied himfelf fo carne fly to the enlarging and adoming of the royal edifices, that they ane at prefent fo many mafter-pieces of architecture: witnefo the palace of the Thuilleries, the Louvre, Si Germain, Fontzimblem, and Chumbord. As for Verfailies, it may be faid that he raifed it trom the ground. It was formelly a dog-kennel, where Lomis XIlI. kept his hanting furniture: it is now a palace fit for the greateft monarch. But 1 oyal palaces nere not Collert's only care: he formed feveral defigns for increaing the beauty and convenionce of the capital city, and he did it with great maguife nee and grandeur. The public was obliged to this hame minilder for the efablimment of the academy for painting and culpture in 1564. The king's printers and kealpturs, with other fkilful profefe rs of thofe atte, be iny profecuted at law by the mafter-pinters at Pani, juised together: and began to form a focicty, winder the ne ne of the Royal Academy for Sculpture and Paintiag. Their defign was to keep public cxercifes, for the fake of inproving thefe fine arts, and aduancing them to the highett degree of perfection. They put themfelves mo der the protection of Mazarine, and chofe chancellor Seguier their vice-protector; and atter Ihazame's death chore Seguies their protector, and Culbert their vice-protecter. It was at his folicitation that they were finally ftablihed by a patent, containing nes privilegrs, in 1664 . Colbert, beims made protector after the death of Seruier, thourght fit that an hitoriographer fhould be appatited, whofe bultitefs it hould be to collect all curions and ufeful obfervations that flould be made at theis conferences. This was accordingly done; and his majetly was pleafed to fente on him a falary of 30 , lives. To Culbert alf, the lovers of naval knowledge are obliged for the erefion of the Academy of sciences: for the making of which the more ufiful, the caafed to be crected, in 1 row , the royal obfervatory at Paris, which was firt inhabited by Calfini. But thefe are not the only obligations France has to that minifur: fle owes to him all the advantages the reccives by the union of the two feas; a prodigions work, begun in 1666 and linithed in 1650 . Colbert was alfo very intent upon matiers of a more private nature, fuch as regarded the order, decency, and well being of fociety. He undertook to reform the courts of juftice, and to put a thop to the ufarpation of noble tites; which it feems was then very common in France. Io the former of thofe attempts he failed, in the latter he ficceeded.

In 1669 , he was made fecretary of Aate, and entrufted with the management of affairs relating to the fea: and his performanees in this province were anfwerable to the confifence his majefly repofed in him. He fuppreffed feveral offices, which were elargeable, but uflefs: and in the mean time, perceiving the king's zeai for the extirpation of herefy, he fhut up the chamber inftituted by the edifis of Paris and Roan. He propofed feverally new resulations conceraing criminal courti; and was extremely fevere with the parliament of Tholoufe for obtructing the meafures he
took to carry the fame into execution. His main de- Cobbet, fign in reforining the tedious methods of paoceding at Colchetter. litw, was to give the people more leifure to ay ply themfclues to tradine: for the advancement of which he procured an edict, to ereet a gueral infuranceoffice at Patis, for merchants, \&e. In 1672 , he was made miniter of Alate: for lin wh belied fuever be was in the regulation of public alfairs, yat he never neglected his own or his tamily's iatercit and grandeur, or iniffel any opportunity of advacing cither. He had been married many years, had fows and danghters grown up; all of which, as occafion ieved, he took cate to marry to great perfons. For though he had no reafon to douit of his mailer's fivour, yet he wifly fecured his fortune by powenful alliznces. However, bufincefo was certainty Colbert's natural turn ; and he not only loved it, but was very impatient to be interrupted in it, as the following anectute may ferve th fhow. A lady of great quality was one day urging him, when he was in the ho icht of his power, to do her fome piece of fervice; and peceiving him inattentive and infexitle, therew herfitit at his feet, in the prefence of above 100 perions, crying, "I ber your greatuefs, in the name of Gid, to giant me thio favour." Upon which Colbert, hnecling down (var againf her, replied, in the fame mournful tone," I corijure you, madam, in the name of God, not to ditturb me."
This great miniller died of the tone, September 6 . 1683 , in his 6 th year; leaving behind him fix fors and three daughters. He was of a middle flature, rather lean than fat. Hha mien was low and dejected, his air gloomy, and his afpect fern. He flept litile, and was very tober. Though naturally four and momofe, he knew how to act the lover, and had miltreffes. He was of a huw conception, but fpoke judicioufy of every thing after he had once comprehended it. He underfload butinels perfecty well, and he purhard it winh unweatied application. Thus he filled the moll importint places with high reputation and eredit; and his infurice difuifd iatif though every part of the government. He reflored the finances, the navy, the commerce: and he erecied thore various works of art, which have cuer fince been monuments of his tale and magnificence. IEe was a hoser of learning, thongh he never applied to it himfif; and therefore conferved nations and peations upon ficholars in oher counties, while he chablihed and protected acacemies in his own. He invited into Frauce painters, llatuaries, mathematicians, and artills of all kinds, who were any way eminent: thas giving new life to the fciences, and making them foumith, as thry dict, exceedingly. Upon the whole, he was a wife, active, generous lpinted minitter; ever aitentive to the intereits of his matler, the happinefs of the people, the progrefs of arts and manulactures, and in fhort to every thing that coulld advance the credit and interett of his comutry. He was a pattern for all minitlers of ftate; and every maion may wilh themfelves bleffed with) a Collert.

COLCHESTER, the capital of the county of Ef. fex in Eogland. It is by fome thought to be the place mentioned by Antominus under the nanse of Colonis, different from Cilonia Camaluduni, and by the Saxons cailed Cater Colin. It is a beautiful, popnturs, and pleanant town, extonded on the bruw of a hill from
CO 1. [137] C O L
 "inumb formerty torgy wills emil a cattle, but now therc are fearce any renairs of cither. This place is said to lave given birth to Fl. Julia Helena, mother to ConAtmentine the Cleat, and daughter to king Corluy, fo on ach celt-bratel for hur piety and zeal in propagatiun 5 the Corittann ofligion. Ifce, and in the out hanering towns, is a ereat manulacture of brys and fays. It is alfo funens for its oyllers; in pickling and barrelting which, die inhabitemts esecl. The rendering navigable the river C ha, on which the town llands, has greatly promoted its trade and manyfactures. The town lad firmerly an abbey whore ablot was mitred and fat in pariamsat. In the time of the civil wars it was beffeged by the parliantent's troops and reduced by famine. It was furmerly a corporation, but hetely toit its charter for fome midecmeanor; however, it thil fends two members to parliament. E. Long. i. 2. N. Lar. gr. 55.

COLCHI (Anian, Pulleny), a town of the Hither Ludia; thonglit to be Cocchin, on che craft of MAfabar; now a fattory and flrong font of the Dutch. E. Long. ;5.0. N. Lat. 10. O.
COLCHICUM, meadow-saferon: A genns of the trigynia order, belonging to the hexandria claf3 of plants; and in the natural method ranking under the ninth order, Spatharee. The corolla is fexpartitc, with its tube radicated, or having its root in the ground ; there are three capfules, connected and infated. There are thrce fpecies, all of them bulbousrocted, lew, perennials, poffefing the fingular properity of their leaves appearing at one time, and their flowres at another ; the former rifing long and narrow from the foot in the fpring, and decaying in Jure; the flowers, which are monopetalous, long, tubular. erect, and fis-parted, rife naked from the foot in anturn, not more than four or five incles high. Thup co. lours afferd a beautiful varicts; being purple, variegated purple, white, red, rode colloured, yellow, icco with fingle and double flovers. They are all hardy Flants, informuch that they will flower though the roots happen to lie out of the ground; but by this they are much weakence. They are propagatid by offets from the roots, of which they are very prolific. Thicfe are to be tiken up and divided at the decay of the leaf in furmer, planting the whole again before the middle of Augut. They are to be placed at nine inches diflance fiom one anoiht, and three inches deep in the ground.

The ront of this plant is poifonons. When young and full of fap, its tafte is very acrid ; but when old, mealy and faiut. Two drochms of it killed a latge dig in 13 hours, operating violently by flool, vomit, and urine. One grain of it fwallowed by a heathy nain, produced heats in the ftomach, and foon after Alubing heats in difficent parts of the budy, with frecuent hliverings, followed by colicky pains; after which an itching in the loins and urinary pallages was perceived; then came on a continual indination to nake water, a teniefons, pain in thic head, quick pulfe, thirft, and other difagreeable fymptoms. Notwithlanding thefe effuts, however,', an infurion of the roots in viregar, forned into a fyrup with honey or fugar, proves a fale and powerful pectoral and diustic, and is often of
fervice in drophes, \&c. The virtues of colchicum feem rumbl to refemble thofe of fquills. The hermodactyl of the dhops is faid to be the root of the variegatum, a fpecics of this genus.

COLCHLS, a country of Afra, at the fouth of A fiatic Sarmotia, call of the Euxime Sea, north of Armenia, and well of lberia. It is famons for the expedicion of the Argonauts, and as the birth-place of Medea. It was fruitful in poiforous herbs, and produced excellent flas. '['he inhabitants were originally Egyptians, who fetled there when Sefotiris king of Egypt extended his compuets in the north.
COI.COTHAR, the fubftance temaining after the difillation or calcination of marcial vitriol by a violcnt firc. See Chemastry, $n^{\circ}$ Gzi.

cold. whare the action las commenced, and continne it mtil the equibbrium is reftored, as is particulany exdaned under the artiche Chemasray
'The power of producig cold ba longs part:culaly to budies of the faline clafs. In a roper of the lahmen
 count of in ree remarkable exponiments sith regard to the production of coid. Felir ounces of hat ammonac diffolved in a pint of water, made his thermometer che feend two inches and three quarters in lefo than fition minutes. An ounce of the fame lalt put into fom or Give ounces of dintled water, made the thanometre defcend two inches and a guarter. Halt an ontice of fal ammoniac mixed with thece ounces of fumt of nitre, made the thermometer defend $t$ wo binches ald five lines; but on ufng fpirit of vithin indead of nitre, it funk two inches and fix linez. In this buth experiment it was remarked, that the vapours railed from the mixture had a cunfiderable degrec of heat, though the liquid itfelf was fo extremely cold. Tour onnces of faltpetre mixed with a pint of water, fank the thermsmeter one inch three lines; but a hike quantity of feafalt funk it only two lince. Acids always produced heat, even common falt with its own dpirit. Solatile alkaline falts produced cold in propontion to their purity, but fixed alkalies hent.
The greatelt degree of cold produced by the misture of falts and aqueous fluids wai that fhown by M. Homberg; who gives the following receipt for making the experiment: "Take a pound of corrofive fublimate, and as much fal ammoniac : powder them leparatuy, and mix the powders very exactly; put the bixtule into a vial, pouring upon it a pint and a loalf of diblilled vinegar, thaking all well together." '「his cumporttion grows fo cold, that a man can force hold it in his hands in fummer; and it happence, as IN. Wumberg was making the experimnat, that the fubjuct froze. The fame thing once happened to M . Geoffoy in making an experiment with hal amoniac and water, but it never was in his powtr to make it iuscend at fecond time.

If, inftead of making thefe experiments, however, with fluid water, we take it in iss congealed flate of ice, or ather fnow, degrees of cold will be produccad vally fupenior to any we have yet incutioned. i mix ture of frow and common falt finks Iahnonlisit's thermometer to 0 ; potafhes and poredtred ice fink it eight degrees farther; two affulions of fpirit of falt on'pounded ice funk it below $14^{\frac{10}{2}}$ below 0 ; but by repeated afufons of fpirit of nitre Mr Fahrenheit funk it to $40^{\circ}$ below 0 . This is the ultimate degree of cold which the morurial themometer will meafure: becaufe the morcury itfelf begins then to congeal; and therefore we muft afterwards have recoufe to fpirit of wine, naptha, or fome other fluid which will not conguil. The grateft degree of cold hitherto producible by artificial means has been $80^{\circ}$ below 0 ; which was done at Hudfon's Bay by means of frow and vitriohic acid, the thermometer flanding naturally at $20^{\circ}$ below 0 . Greater degrees of cold than this have indecd been fuppofed. Mr Martir, in his Treatife on Heat, relates, that at Kirenga in-Siberia, the mercurid themometer fank to $118^{\circ}$ below 0 ; and Profefor Brown at Peterfburg, when he made the firf experiment of congealing quickfilver, fised the point of congelation at $350^{\circ}$
behwo: but Dr Biack, as fuon as the cxarrmant was male koows in this countre, ohfervert, that is all

 100 derrees at a lime. "!his, he cobjesmat, mint Froced fora the incerlar equte ethon of the metal after it was congealud; arat he wremed, that thare
 was not frozen, and whim lid not delend io low 1 ys a great many degeres. fromience has fance rerifical his conjecture: and it is now semanily bnom, that 40 below $o$ is the freeming puint of guadolua.

Since the difovery of the polibility of producins coh by anticial means. various expeninents hambern made on the efficacy of faline fubtances in this way; ali of whel, when properle aphied, are foned to loave a condaleable degrec of posir. Dr Buerhave found, that hoth fal anmonise and nitre, whon well dried in a ertacible, ane redeced to the powder, will produce a gratar degree of cold thin if they had not been treated in this manncr. His experments were re- Nit vo... peated by Mr. Wralker apothucary to the Rudelifie In-ker's exper firmary in Oxford with the fame refult: but he found, rimers. that his thamonocter funk $32^{3}$ by means of a fulution of fal ammoniac ; when Boerhatice's, with tha fata, fall only $28^{\circ}$. Nitre funk it $10^{\circ}$. On mixing tita two fale together, he fond that the power of prosicing cold was contuerably incroated. Wy equal parta of thefe faits, lae woled frame water to 22 , the thermongeter fandiag at 47 in the open air. Adding to this fome poved of the fanc kind, and immering two nuall fhinds in the mixture, one contaning boiled and the other unboikl water, he foon found them both frozen, the whoiled water freczing firft.

Having observed that Glaboer's dale, when it retains the waits of eryfallization, produces cold duing its folution, he tried its power when miaed with the other faits, and thus funk the themomacter from 65 to 19 ? and thus he was able to freeze water when the thermometer fiood as high as 70. And, laftly; by firlt cool. ing the falts in water in one mixture, and then making another of the cooked thermoneters, he was able to fink the themometer 64. Thus he froze a mistum of firit of wine and water in the proportion of feven of the latter to one of the former; and by adding a quantity of cooled materials to the mixture in whicis this was frozen, the thermometer lunk to - 4 , or $6 g^{\circ}$. Spirit of nitre diluted with water reduced the thermo. meter to -3 ; ard, hy the addition of fal ammoniac, to - $15^{\circ}$. Nitrous ammoniac reduced it from $50^{\circ}$ to 15 ; but the cold was not atgmented by the addition of ham amoniac or nitre.

The moft remarkable cxperiment, however, was Hismetho with firit of nitre poured on Glauber's falt, the ef. of freezing fect of which was found to be limilar to that of the cuichfilver. fame fpirit poured on ice or fnow; and the addition of fal ammoniac rendered the cold fill more intenfe. The proportions of thefe ingredients recommended by $\mathrm{Mr}_{\mathrm{r}}$ Walker are concentrated nitrous acid two parts by weight, water one part; of this mixture cooled to the temperature of the atmofphere 18 onnces, of Glauber's falt a pound and an half avoirdupois, and of fal ammoniae 12 ounces. On adding the Glauber's falt to
C O L 136 C O L
 or 52 degaces; and on the addition of the falammoniar, to - 9 . Thus Mr Walker was able to freeze quick. filver withont cither ice or frow, when the thememeter thood at +5 . For the experiment four pans were procured of different fizes, fo that one might be put within the other. The larget of thefe pans was phaced in a vethl fill larger, in which the materials for the fecond frigorific misture were thinly fpread in order to be cooled; the fecond pan, containing the liquor, anz. the vitriv'ic acid properly diluted, was placed in the largetl pan ; the third pan, containing the falts for the third mixture, was immerfed in the liquer of the fecond pan; and the liquor for the third mix. ture was put into wide-mouthed phials, which wore ammerfed in the fecond pan likewife, and floated round the thind pan: the fourth pan, which was the fmallent of all, containing its cooling materials, was placed in the midt of the falts of the third pan. The materials for the firt and fecond mixtures confilted of diluted virrivic acid and Clander's falt; the third and fourth of diluted mitrcus acid, Glauber's fit, and fal ammoniac, in the propurtions above mentioned. The pans baing adjuted in the mamer atrealy mentioned, the matibials of the frit and larged pan vere mixed : this reduced the themmmeter to 10 , and coold the liquor in the fecond yan to $20^{\prime}$; and the falts for the fecond mixture, which wore flaced underneath in the large veffel, nearly as much. The fecond mixture was then made with the materials thas cooled, and the thermometer was reduced to 3 . The ingredients of the thind mixture, by immertion in this, were cooled to 10; and, when mixed, reduced the thermometer to - 15 . The materials for the fout mixture were coold by immerfion in this third mixture to about - 12 . On mixure they funk the metcury sery rapidly, and feeningly below - 40, thongh the froth occationed by the thalition of the materais perented any accurate ob. forvation. The reation why this lat mixime reduced the thermometer more than the third, though both were of the fame matchials, and the hater of a lowser temperature, was luppoled to have been part'y becaufe the fourth pan had not another immerfed in it to give it heat, and partly bicanfe the materals were reduce in a finer ponder.

The exporiments were repeated with many variaains: but only one misture appeared to Dr iscudoes, bey whom the acconent was communicated to the Reoral Ciukite, to be applicable to any ufeful purpore. This is oil of riviu! dhated with ab ut an eqral quantity of wate ; which, sy diffolving Charber's falt, produces Thout $45^{\circ}$ of cold, and by the addition of 位 amoniac beones more intemfe by a few degres. At one time, whul Kor Walker has tajing a mixture of tro parts of cil of vituiot and one of water, he perecivel, that at the temperatare of 35 the mistove coapllated as if froyen, and the thermmeter became ilationary; but on addiag more Clanber's falt, it fill a a ain in a thort time: but 1 ifs cold was produced than whem this circomtance did wot wecor, and when the acid was weaker. The fame appearance of cogalation took place with oticer propurtions of acid and water, and "iels other temperatarcs.
$1:$ is obfervalle, that this effect of Glauben's folt in producing cold tuck place only wher it was porefled $\mathrm{N} \mathrm{S}_{4}$.
of its water of cryfallization; and thus the mincral alkaii alfo angmented the cold of fome of the mix. tures: but when the water of crytallization was dif. fipated, neither of them had any eftect of this kind. timons on the "This circumatance (fays Dr Beddoes) leads us in exprimen: fome meafure to the lheory of the phenomenon Water undoubtedly exits in a folid thate in cayfals; it mult therefore, as in other cafes, abfurb a determinate quantity of fire before it can return to its liquid flate. On this deponds the diference between Glauber's falt and mincral alkali in its different flates of cryltallization and eflorefeence. 'The fame circurftance, too, enables us to underlland the great effect of Glauber's falt; which, as far as I uidertand, has the greateft quantity of water of cryfallization." On this the revicwers rumark, that "if in fummer the water brought. from a deep well is at $5^{\circ}$, in this clieap and eafy way it might be reduced to $12^{\prime}$; and wire placed in it would be chilled."

Thefe excefive degrecs of cold occur naturally in many parts of the globe in the winter-time. It is true, we are very much unacquainted with them in this commery: yet in the winter of 1780 , Mr Wilfon of Glafgow oblerved, that a thermometer laid on the frow funk to 25 below 0 ; but this was only for a fhort time; and in general our atmofphere does not admit of very great degrees of cold for any lenget of tine. Mr Derham, however, in the year 1708 , obferved in England, that the mercury food within onetenth of an inch of its tation when plunged into a mixture of finow and falt. In 1732, the thermometer at Peterfburg llood at $28^{\circ}$ below 0 ; and in 1737, when the French academicians wintered at the north polar circle, or near it, the thermometer funk to $33^{\circ}$ below $\circ$; and in the Afiatic and American continents, thill greater degrees of cold are very common.

The elects of thefe extreme degrees of cold are very furpiting. Trees are burt, rocks rent, and rivers and lakes froren, feveral fect deep: metallic fubtances blifter the fin like red-hot iron: the air, when drawn in by refpiation, hurts the lungs, and excites a cough : even the effects of fire in a great meafure feem to ceafe; and it is obferved, that though inctals are kept for a continemble time before a llougg tire, they will llill freeze water when thrown apon them. Whon the Trench mathematicians wintered at Tornea in Laphand, the eaternal air, when fuddenly admitted into their romas, converted the manture of the air into whists of luw ; their becatls feemed to be rent when they brealaci it, and the conatut of it was intolerable to their budics: and the ipirit of wine, which had not been lig illy rectilied, burlt fome of their themometers by the cunselation of the aqueous part.

Extreme cold very often proses futal to animals in thefe comatries where the winters are very fevere; and thus , coo Siweres perifhed at once in attempting to pafs the mountains "hich divide Non way from Sweden. It is not neceflary, indecd, that the cold, in order to prove fatal to the human life, fhould be fo very intenfe as hatis been jult mentioned. There is only requitite a degtes fomerchat below $32^{3}$ of Falrenheit, accompanide with fnow or hail, from which fhelter canuot be obtained. The fow which falls upon the clothes, or the neovered parts of the body, then melts, and by a continual evaporation carries off the animal heat to fuch

Cond fuch a degrec, that a fufficient quantity is not left for the fupport of life. In fuch cales, the perfon firtt fects himfelf extrencly chill and uneafy; he begins to turn liftefs, unwilling to walk or ufe exercie to kecp him. fiif warm; and at lafturns drow fy, fits down to refrefh himflf with fleep, but wakes no more. An infance of this was feca not many years ago at Terra del Fuego; where Dr Solander, with fome others, having taken an excurfion up the country, the cold was, fo intenfe, that one of their namber died. The Doctor himfelf, though he had warned his companions of the danger of fleeping in that fituation, yet could not be prevented from making that dangerous experiment himide; and though he was awaked with all poffilhe expedition, his body was fo much thrunk in tulk, that his fores fell off his feet, and it was with the utmoft difficulty that he was recovered.

In thofe parts of the world where valt maffes of ice are produced, the accumatation of it, by abforbing the heat of the atmof here, occafions an abfolute Aterility in the adjacent countrics, as is pariculaty the cafe with the ifland of Icelaul ; where the valt collections of ice floating out from the Northern Ocean, and flopped on that coatl, are fometimes feveral years in thawing. Indeed, where great quantitice of ice are collected, it would feem to have a power like fire, both angmenting its own cold and that of the adjacent hodies. An infance of this is related under the article Evaporation, in Mr Wedgewood's experment, where the true caufe of this phenomenon is alfo pointed out.

Cold, in medicine. Sce Menicine. Indix.
Cold, in farriery. See thele, \& iii.
COLDENIA, in botany: A genus of the tetragynia order, belonging to the tetrandria clafs of plants; and in the natural method ranked among thofe the order of which is douhtful. The calyx is tetraphyllous; the corolla funnel fhaped; the fyles four; the feeds two and bilocular. 'There is but one fpecies, a native of India. It is an annual plant, whofe branches trail on the ground, extending about fix inches from the rout. They are adorned with fmall blue fowera growing in cluilers, which come out from the wings of the leaves. They are propagated by feeds fown on a hot. bed; when the plants come up, they may te remowed each into a feparate pot, and flunged into a hot-bed of tannel's bark, where they are to remain confantly.

COLDINGHAM, fuppofed to be the Colcria of Pollmy, and called by Bede the city Coldana and of Colud (Coludun) , fituated on the borders of Scotland, about two miles from Eymouth, was a place famous many ages ago for its convent. This was the oldett fumnery in Scotland, for here the virgin-wie Etheldreda took the veil in 670; but by the ancient name Coluchum it fhould feem that it had before been inhabited by the religious called Cullefes. In 870 it was deltroyed by the Danes, but its name rendered immortal by the heroim of its nuns; who, to preferve themfelves inviolate from thofe invaders, cut off their lips and nofes; and thus rendering themfelves objects of horror, were, with their abbefs Ebba, burne in the monaftery by the dilerpointed favazes. After this it lay deferted till the year 1008 , when king Edyar founded on its fite a priory oftendietines in fonnur of St Cutbbert, and bettowed it on $t$ e monks of Durham.

Mr Penuant': defeription of the black, joylefs, Vot. V. Part I.
heathy moor, where it was fituated, mirgit be foflit. Culdieguen ch: 10 عulat the far iohabitants of the numery were it fill fubfiting. That defeription, however, is now altogether inapplicable: The whele tart, five miles over, has been fine inproved, and converted into conn fulds; the checrlefs villdge of Ond Cambes is no more; a decent inn with good accommotations has been eftablifted at a convenient dillaner; and the patfage of the atep geten called the Paje, which terminates the moor on the ruad towards Edinburgh, and was fomerly the terror of travellers, is now rendered fafe and caly by means of a bridge extending from one fide of the chatm io the other.

COLDINGUEN, a town of Denmark, in North Jutland, and diocele of Ripen. It is remarkable for its bridge, cver which pafs all the oxen and other cattle that go from Jutland into Germany, which brings in a confoderable revenue to the king. It is feated on an eminence, in a pleafant country abounding with game. E. Long. 9. 25 . N. Lat. 55. 35.

COLI) risch, a fpecies of Motacilla.
COLI-SHIRE IRON, that which is britele when cold.

COLE (William), the mof famnus betanit of lis time, was born at Adderbury in Oxfordfhire, about the year 1626 , and ftudied at Merton college in Oxford. He at length removed to Puncy, near London; and publifhed "The Art of Simpling; and Adam in Eden, or Nature's Paradife." Upon the refloration of king Charles II. he was made fecretary to Dr Duppa, bifhop of Winchefter; tint died two vears after, aged 37.

COLE fish, a fpecies of Gadus.
Cole-Sect, the feed of the mapus futiza, or lonerrooted, narrow.leaved rapa, called in Englifh navew, and reckoned by Limmens among the braficas, or cab-bage-kind. See Brassica.

This plant is cultivated to great advantage in many parts of England, on account of the rape oil expreffal from its feeds. The practice of fowing it was firk introduced by thofe Germans and Dutelinen who drained the fens of Lincoluhlire ; and hence the notion hath generally prevailed, that it will thrive only in a mailhy foil; but this is now found to be a miltake. In preparing the land which is to receive it, care mutt be taken to plow it in May, and again about midfummer, making the ground as fine and even as porfible. It is to be fown the very day of the laft plowing, about a gallon on an acre. In the months of Ja nuary, February, and March, it affords very good food for catte, and will fprout again when cut ; after which it is excellent nourifhment for fheep. After all, if it is not too clofely fed, it will bear reed againtt next July. T'le fame caution, however, is requitite with this food as with clover, till cattle are accuftomed to it, otherwife it is apt to fwell them. When this plant is cultivated folely with a view to the feed, it mult be fown on deep trong land without dung, and muft be fuffered to fland till one-fialf of the feeds at leait are turned brown; which, according to the feafons, will be fometimes fooner fometimes later. In this flate it is to be cut in the fame manner and with the fame care as wheat ; and every handful as it is cut is to be regutaly ranged on fheets, that it may dry teifuely in the fun, which will commonly be in a fortnight ; after which it is to be carefully threfled out, and car-
$\underbrace{\text { Con }}_{\text {Cule }}$

## C O L [ 138 [ C O L

Celentera ried to the mill for expreffing the oil. The produce of cule-fted is generally from five to eight quarters on an acre: and is commonly fold at 20 s . per quarter.

COLEOPTERA, or Beetle, the name of Lin new, fill orier of infe Ets. Sec Zoology. COlewort. See Brassica.
COLERAIN, a large town of Ireland, in the county of Londonderis and province of Ulter; feated on the river Bann, four miles fonth of the ocean, in W. Long. 7. 2. N. Lat. 55. 10. It was formerly 2 place of great confideration, bein? the chief town of a connty erected by Sir John Perrot, during his govemment of Ireland; wheras it is now ofly the head of one of the baronics in the county of Londondery; but it. is fitl a corporatima, and fende ewo members to parliament. It is of a teterable fize, and very elegantly buil. 'The port is very indifferen, nccafioned by the extreme rapidity of the tiver, which repels the tide, and makes the coming up the town difficult; $f$ that it has but little trade, and might perhaps have lefs, if it was not for the valuable falmon fighery, which amounts to fome th ufand pounds a. year. If the navigation of the Bann could be opened, which is wotaliy obltruated by a ridge of rocks, it would quickly change che face of things; for then, by the help of this river, and the Newly canal, there would be a direct communication acrofs the kingdom, and, with the affllance of the Dlack-water river, which likewite falls into Lough Neagh, almult all the comties of the province of Ullter might have a correfpondence with each other by water-carriage, to their reciprocal and verv great emolument.

COLES (Elifa), aithor of the well known Latin and Englith dictionary, was born in Nonthamptonfhire about the year 10 to ; and was entered of Maydatene College Oxfort, which he left without taking a degree; and taught Latin to young people, and Englifh to forcigncrs, in Lomdon, about the year 1663. He afterwards became an uhter in Merchant taylon's 'chool; but for fome great fault, nowhere capretisly mentioned, he was forced to witheraw io I:chand, whence he never returned. IIe was, however, a good critic in the Engliband Latin tonques; and wrote feveral ufeful broks of inflenction in his profellion.

COLET' (Jun), dean of St Pal's, the fon of Henry Culet knight, was born in Lundon in the year $1+66$. His education began in St Anthony's fehool in that city, from whence, in 1483 , he was fent to Oxford, and probably to Mapdulene college. After feven years fudy of togic and philorophy, he took his degrees in arts. About the year 1493 , Mr Colet went to Paris, and thence to Italv, probably with a defign to improve himelf in the Greek and Latin languages, which at this time were imperfectly taught in our univerfities. On hio return to England in 4 +97, he took orders; and returned to Oxfind, where he read lectures gratis, on the epittles of St Paul. At this time he polfefled the rectory of Demuington in Suffolk, to which he lad oben inflituted the the of 59 . He was alfo prebendary of Yook, and canon of St Martin's le Grand in Londoa. In 1502 be became prebendary of Sarum; prebendary of St Paul's in 1505 ; and 1 mnediately after dean of that cathedral, having previoufly taken the degree of ductor of divinity. He was no fooner saifed to chis dignity, than he introduced the practice
of preaching and expounding the fcriptures; and foon Coliberts after eltallihed a perpetual divinity lecture in St Paul's church hrse days in every week; an intitution which gradmally made way for the reformation. About the yeat 1503, dean Colet formed his plan for the fo $n$ dation.e. St Peul's frhool, which he complted in 15:2, and endowed with eflates to the amount of L. 122 and uppard. Trecelcbated gram narian, William Lilye, was his firt matter, and the company of mercers were app inted trultees. The dear's notions of religion were f) much $\cdot$ m.re rational than thofe of his cotemperary priefs, that they deemed him little better than a heretic; and on that account he ras fo frequently multled, that he at talt determined to fpend the reit of his days in peaceful retirement. With this iutention he bult a hon!e near the palace at Richmond; but, being feised with the fweating ficknefs, he died in 1519 , in the 5 . ${ }^{\text {d y year of his age. He was buried }}$ on the foum fide of the choir of St Paul's; and a fone was laid over his grave, with no other infeription than his name. Befides the preferments ab ove mentioned, he was rector of the guild of Jetus at St Paul's, and chaphin to king Henry VIII. Dean Colet, though a papil, was an enemy to the grofo fuperAtitions of the church of Rome. He difapproved aurieular confeflion, the celibacy of the prietts, and fuch other ridiculous tenets and ceremouies as have ever been condemned by men of found underftanding in every age and country. He wrote, I. Rudimeata grammatices. 2. The conftruction of the eight parts of fpeech. 3. Daily devotions. 4. Epiflola ad Erafmum. 5. Siveral fermons; and other woriss which till remain in manufeript.

COLIBERTS ( Coliberli), in law, were tenants in foccage, and particularly luch villeins as were manumitted or made freemen. But they had not an abfolute freetom; for though they were better than fervants, yet they tiad fuperior lords to whom they paid certain duties, and in that refpect might be called fervants, though they wcre of middle condition between freemen and fervants.

COLIC, a fevere pain in the lower venter, fo called becaufe the colon was formerly fuppofed to be the part affected. See Medicine-Index.

Coluc, in farriery. Sec there, fxiii.
COLIGNI (Gafpard de), admiral of France, was born in 1516. He fignalized himfelf in his youth, in the reigns of Francis I. and Henry II. and was made colonel of infantry and acmiral of France in 1552. Henry II. employed him in the moft important affais ; but after the death of that prince, he embraced the reformed ocligion, and became the chief of the Proteftant party: he Atrongly oppofed the houfe of Guife, and rendered this oppofition fo powerful, that it was thought he would have overturned the French go-. vernment. On the peace made after the battles of Jarnac and Montcontour, Charles IX. deluded Coligni: into fecurity by his deceitful favours; and though he recovered one attempt on his life, when he attended. the nuptials of the prince of Navarre, yet he was included in the dreadful maflacre of the Proteftants onSt Bartholomew's-day 1572, and his body treated with. wanton brutality by a mifguided Popifh populace.

COLIMA, a fea-port town of Mexico in North America, and capital of a fertile valify of the fame

Colioure name. It is feated at the mouth of a river in W. Long. 109. 6. N. I.at. 18. 30.

COLIOURE, a fmall, but aneient and ftrong town of France, in Ruofillon, feated at the foot of the Py renean monntains, with a fmall harbour. E. Long. 3. 10. N. Lat. 43. 2 s .

COLIR, an officer in China, who may properly be called an infpector, having an eye over what paifis in every court or trihunal of the empire. In order to render him impartial, he is kept indspendent, by having his poll for life. The power of the coliss is fueh, that they make even the princes of the blond tremble.

COLISEUM, or COLIS, 5 m , in the ancient architecture, an oval amphitheatre, built at Rome by Vefpalan, in the place where atood the bafon of Nero's gilded houfe. The word is formed from colojum, on account of the colofins of Nero that llood near it; or, according to Nardini, from the Italian colifoo. In this were placed Hatues, reprefenting all the provinces of the empire; in the midulle whereof ftood that of Rome, holding a golden apple in her hand. The fame ierm, colifun, is alfo given to another amphitheatre of the emperor Severus. In thefe colfen were reprefented fames, and combats of men and wild bealts; but there are now little remaining of either of them, time and war havine reduced them to ruins.

COLITES, in natural hiftory, a name given by fome writers to a kind of pebble, found in the fhape of the human penis and telles, and that cither feparately or both together.

COLLAERT (Adrian), an eminent engraver who flourihed about 1550, was born at Antwerp. After having learned in his own country the firf principles of engraving, he went to Italy, where he refided fone time to perfeé himfelf in drawing. He worked entirely with the graver, in a firm neat thyle, but rather ftiff and dy. The vall number of plates executed by his hand fufficiently evince the facility with which he engraved; and though exceedingly neat, yet they are feldom highly finithed.

Colfaert (Hans or Juhn), fon to the foregoing, was alfo an excellent artilt. He drew and engraved exactly in the ftyle of his father; and was inevery sefpect equal to him in merit. He mult have been very old when be died; for his prints are dated from 2555 to 1622. Hu afflled his father in all his great works, and engraved belides a prodigious number of plates of various fubjects. One of his belt prints is Mofes faiking the rock, a large print, lengthwife, from Lambert Lombard. A great number of fmall figures are introduced into this print; and they are admirably well executed:--the heads are fine, and the drawing very correct.

COLLAlr, in Romen antiquity, a fort of chain put generally round the neck of flaves that had run away, after they were taken, with an inforiptions round it, intimating their being deferters, and requiring their being reftored to their proper owners, \&e.

Collar, in a more modern fenle, an ormament confinting of a chain of gold, cnamelled, frequentiy fet with ciphers or other devices, with the bedee of the order hanging at the bottom, wore by the knights of feveral military orders over their houlders, on the mantle, and its fgure drawn round their armories.

Thus, the collar of the order of the garter confills
of S. S. with rofes enamelled red, within a garter en. amelted blue, and the George at the bottom.

Land Mianor's CoLLiA is more uluatly called clano. Seccriain.

Kuishts of the Corlan, a military order in the republic" of Venice, called allo the order of St Mark, or the medal. It is the dose and the fenate that confer this onder; the knights bear uo particular habit, only the collar, which the doge puts anomed their neck, with a medal, wherein is reprefented the winged lion of the republie.

Collas of a Draugh-burfe, a part of harnefs made of leather and canvas, and Ituffed with fraw or woot, to be put about the horle's neek.

COLLARAGE, a tax or frime laid for the collars of winedrawimt horfus.

COLLATERAL, any thing, place, country, \&e. fituated by the fide of another.

Collateral, in genealogy, thofe relations which proceed from the fame fock, but not in the fame linc of afeendents or defcendents, but being, as it were, afide of each other. Thus, uncles, aunts, nephews, nieces, and coufins, are collaterals, or in the fame collateral line: thofe in a higher degree, and nearer the common root, ieprefent a kind of paternity with regard to thofe more remote. See Consanguinity.

Colemteral Succeflom. When a defunct, for want of heirs defcended of himfelf, is fucceeded in his eftate by a brother or filter, or their defcendents, the eftate is faid to have gone to collitioral beirs.

COLLATIA (anc. geog.), a town of the Sabines: thought to be ditlant between four on tive miles out of Rome to the eaft ; fituated on an eminence (Virgil). Of this place was Tarquinius Collatinus, mantied to Lacre. tis, ravifhed by Sextus Tarquinius (Livy) ; lituated on this or on the left fide of the Anio (Pliny). Extant in Cicero's time, but in Strabo's day only a village; now no trace remains of it. - Another fuppofed Collatia of Apulia, near mount Garganus; becaufe Pliny mentions the Collatim in Apulia, and Frontinus the Ager Collutimus.

COLLATINA porta, a gate of Rome, at the Collis Hortulorum, afterwards called Pinciana, from the Pincii, a noble family. Its name Collatima is from Callatia, to the right of which was the Via Collatina, which led to that town.

COLLINA, a gate of Rome at the Collis Quirinalis, not far from the temple of Venus Erycina (Ovid); ealled allo Salaria, becaute the Sabines carried their falt through it (Tacitus). Now Salara.

COLLATION, in the canon law, the giving or be. ftowing of a benefice on a clergyman by a bithop, who has it in his own gift or parronage. It diflers from inflitution in this, that inflitution is performed by the bifhop, upon the prefentation of another ; and colltion is his own act of prefentation: and it differcth from a common prefentation, as it is the giving of the church to the perfon, and prefentation is the giving or offering of the perfon to the church. But collation [upplies the place of prefentation and inftitution: and imounts to the fame as inflitution where the bilhop is both pation and ordinary. Anciently the right of prefentation to all churches was in the bifhop; and now if the patron neglects to pretent to a charce, then this right retarns to the bifhop by colla. tion: if the bifhop neglects to collate within fix monthe
tollation after the elapfe of the patron, then the archbinop 11 Sollect. hath a right :o do it; and if the archbimop neglects, then it devolves to the king; the one as fuperior, to
fupply the defects of bimops, the other as fupmene, to fupply all defects of government.

Collation, in common law, the comparifon or prefentation of a copy to its original, to fee whether or not it be conformable; or the report or act of the officer who made the comparifon. A collated act is e'quivalent to its criginal, provided all the parties cuneered were prefeat at the collation.

Collation, in Scots law, that right which an heir has of the wing the whole heritable and moveable rthates of the decealed into one mafs, and fharing it equally with the others in the fame degree of kindred, whes he thinks fuch fare will be more than the value of the heritage to which he had an exclufive title.

Collation is alfo ufed among the Romanilts for the meal or repait made on a falt day, in lieu of a fupper. Only fruits are alowed in a collation: F. Lo. bineau obferves, that ancieatly thete was not allowed even bread in the collations in Lent, nor any thing belide a few comfits and dried lierbs and fruits; which cuftom, he adds, ubtained till the year 1513 . Cardinal Humbert obferves further, that in the midale of the ith century there were no collations at all allowed in t!e Latin church in the time of Lent ; and that the cu. flom of collations was borowed from the Greeks, who themfelves did not take it up till about the $t$ th century.

Collation is allo popularly ufed for a repaft between meals, particularly between dinner and fupper. The word collation, in this Cenfe, Du Cange derives from collocutio, " conference;" and maintains, that originally collation was only a conference, or converfation on fubjects of picty, held on fall days in monafteries; but that, by degrees, the cultom was introduced of bringing in a few refrethments; and that by the exceffes to which thofe fober repalis were at length carried, the name of the abufe was retained, but that of the thing loit.

Collatins of Seals, denotes one feal fet on the fame label, on the reveife of another.

COLLEAGUE, a patner or afociate in the fame office or magiftrature. Sie Adjunct.

COLLECT, cOLLEction, a voluntary gathering of money, for fome pious ur chariatle purpofe. Some Gay, the name collus, or collection, was ufed, by reaton thofe gatherings were anciently made on the days of collecis, and in collects, i. e. in affemblies of Chriftians; but, more probably, quia colligebatur pecunia.

Collect is fometimes alfo ufed for a tax, or im. pofition, raifed by a prince for any pious defign. 'Thus, hiftories fay, that in 1166 , the king of England, coming into Normandy, appointed a collect for the relief of the holy land, at the defire and after the example of the king of France. See Croisade.

Collect, in the liturgy of the church of England, and the mafs of the Romanits, denotes a prayer accommodated to any particular day, occafion, or the like. See Litupgy, and Mass.

In the general, all the prayers in each office are called collects; either becaule the prieft fpeaks in the rame of the whole affembly, whofe fentiments and denires he fums up by the word oremus, "let us pray," as is obferved by pope Innocent III. or, becaufe thofe
prayers are ofired when the people are afimbled
toguther, which isthe optaion of Panclias on Tertellian.
The congregation ittelf is in lome ancient anthors called colleq. The popes Gelafius and Gregury are faid to have been the firlt who ettablined arlicts. Defpence, a doctor of the facmlty of Pris, has an exprets treatife on collce?s, theirorigin, antiquity, authors, 疋.

COLLECYIVE, amonígrammarians, a term applied to a no m exprefring àmuhtude, thongh itlele be only fingular; as an arniy, company, roup, \&ic. called cullative nouns.

COLLECTOR, in reneral, denotes a perfon who gets or brings together things formerly dipufed and feparated. Herce,

Collector, in ma:ters of civil fohicy, is a perfon appointed by the commiffoners of any daty, the inhabitents of a parifh, \&c. to railic orgather any kind of tax.

Collector, among totanils, one who gets together as many plants as bee can, withou: ftuiying bue tany in a fcientifical manner.

COLLEGATORY, in the civil law, a perfon who has a legacy left him in common with one ur more other perfons.

COLLEGE, an affemblage of feveral bodies or fo. cietics, or of feveral perfons into one fociety.

College, among the Romane, ferved indifferently for thofe employed in the ofices of icligion, of $g$ )vermment, the liberal and even mechancal arts and trades; fo that, with them, the word fignificed what we call a corporation or company.

In the Roman empire, there were not cnly the collegre of augurs, and the collerge of canitalini, i c. .f thofe who tad the fuperintendence of the capitalize raves; but alfo colleges of artiticers, colkgin artitiom; colliege of carpenters, fulricorian, or fubroruin therariormm; of potters, figulorum; of founders, ararionam; the college of lockimiths, fabroram forrarioran; of enginetrs of the ammy, tignarioum; of butctets, lunctain; of devdrophori, dentrophororum ; of certinares, comonariorum; of makers of military catcues: faboriorun: of tent-makers, tabernacularioram; of bakers, fighorum; of muficians, ALicinm, Ac. Pluarch obferves, that it was Numa who firlt divied the people into colleges; which he did to the end that cach confulting the interefts of their college, whercby they were divided from the citizens of the other colleges, they misht not enterinto any general confpiacy arsaint the public repofe.

Each of thefe colleges had dilline meeting places or halls; and likewife, in imitation of the !taie, a treafury and common cher, a regitter, and one to reprefent them upon public occations, and ases of government. Thefe culleges had the privile $2=$ of manumitting haves, of being legates, and making by-laws for their own body, proviced they did not clafh with thofe of the government.

There are various colleges on foot among the moderne, founded on the model of thofe of the ancients. Such are the thrce colleges of the empire, aviz.

Colleges of Eleianors, or thair Diputics, afferbled in the diet of Ratifoon.

College of Princes; the body of pinces, or their deputies, at the diet of Ratißon.

Colleger of Cities, is, in like manner, the body of deputies which the imperial cities fend to the diet.

Caleegs of Cardinals, or the Sacrad Coleegf; a
college body compofed of the three otders of cardinalis. Sce Cardinals.

College is alfuted for a prolic place endoned with certan revenu: a, where the he wral parts of hearning are taught.

Aa affemblage of feveral of thefe colleges conflitute an a iverfity. The erestion of colleges is fart of the royal prerogative, asd nut to be done withont the king's licence.

The eltabihment of colleges or univerftes is a remarkable period in literary hitory. The Ichools is cathedrals and monatlerics contined themfelves chietly to the teaching of grammar. There were only onc or two mathers employed in that office. But, in colleges, profeflors are arponited to teach all the different parts of ceicnce. Tibe firth obfcure nathion of academical degrets in the univerjity of Paris (fiom which the other univetfities in Europe have borrowed moft of their cuttons and inflitutions), occurs A. D. 1215 .

Coniege of Ciwhans, common'y called Doarors Commons; a cullege founded by 1) Harvey, dean of the arches, for the profeflors of the civillaw refiding in London; where ufually, likewife, refides the judge of the arches court of Canterbuy, judge of the admiralty, of the prerogative court, ice. with other civilians; who all live, as to dict and lodging, in a collegide manner, commoning together; whence the appellation of Dodors Commons. Their houfe being confumed in the great fire, they all relided at Exeterhoulfe in the Strand till 1672 ; when their former houfe was rebuilt, at theil own expence, in a very fplendid manner. To this college belong 3 tproctors, who make themfolves parties for their clients, manage their caufes, $\$$

Collfts of Pbyfiuns, a corporation of phyficians in London, who, by Several charters and acts of parliament of Henry VHII. and his fuccefors, have certain privilegrs, whereby no man, though a graduate in plyyfic of any univerfty, may, without licence under the faid college feal, practife phytic in or within feven miles of London; with power to adminiter oaths, fine and imprif on offenders in that and feveral other particulars; to fearch the apothecaries fhops, \&ec. in and about London, to fee if their drugs, \&e. be wholefome, and their compofitions according to the form preferibed by the faid college in their difpenfatory. By the faid charter they are allo freed from all troublefome offices, as to ferve on juries, be conitable, keep watch, provide arms, \&c.

The fociety had anciently a college in Knight-riderftreet, the gift of Dr Linacre phyfician to king Henxy VIII. Since that time they have had a houfe built them by the famous $\operatorname{Dr}$ Harvey in 1652, at the end of Amen-corner, which he endowed with his whole irheritance in his lifetime; but this being burnt in the great fire in 1666, a new one was crected, at the expence of the Fellows, in Warwick-lane, with a noble library, given partly by the marquis of Dorchefter, and partly by Sir Theodore Mayeine.

Of this college there are at prefent a prefident, four cenfors, eight electors, a regither, and a treafurer, chofen annually in Ottuber; the cenfors have, by charter, power to furvey, govern, and arreft, all phylicians, or others pratifing plydic, in or within feven miles of London; and to fine, amerce, and imprifon them, a:
difertion. The number of fellows was anciently thiris, till hidy Chans If. incrafed thair number to forty: and king fancs II. giving them a new chater, allemed the number of fellows to toe cmlayed of as not to exceed fourfore; r:ferving to himfif and fuccoffors the power of placing atal dilplacing any of them for the fustare.

The college is not very rigorous in afouting their privileges there beins a great number of phyficians, fume of vay grod afilitio, who praclife in L wion, Sce withont their licence, and are comived at by the cullege: yet, by law, if any perfon not exjecefly an. lowed to pratife, the of him the chre of any dileafe, and die patient die under his lisud, it is derrond felo. ny in the practific. In $16 g 6$, the cullege made a fub. feription, to the number of forty-two of their members, to fet on foot a difpenfatory for the rolief of the fick poor: fince that they have erected two other difperfatories.

Euinburgh Cazlage of Phyfuians was erected on the 29:h November 363 . The defign of th inflution was, to prevent the aboies daily committed by foreign and illiterate impolors, quacks, \&c. For this realon, his majety, at the tine above mentioned, granted letters patent to eseet into a body corporate and politic, certain phyficians in Edinburgh and their fucceffors, by the title of ". :We Prefident and Royal College of Phyficians at Edimurgh," with power to choofe annually a council of feven, one whereof to be prefident: thele are to tlect a tieafurer, clerk, and other officers; to have a common fial; to fue and be fued; to make laws for prometing the art of phyfic, and regulating the practice thereof, within the city of Edinburgh, town of Leith, and dittricts of the Canongate, Wettport, Pleafance, and Potter row; through all which the juifdiction of the collage extends. Throushout this jurifdiction, no perfon is allowed to pratife phyfic, without a warrant from the college, under the penalty of L. 5 sierling the firt month, to be doubled monthly afterwards while the Gence is continued; one half the money arifing from fuch fincs to go to the poor, the other to the ufe of the college. They are alfo empowered to punifh all licentiates in phyfic withia the above mentioned bounds, for falts committed againt the intitutions of the college; and to fine them of fums not exceeding 40 s . On fuch occations, however, they mult have one of the bailes of the city to fit in judgment along with them, otherwife their fentence will not he valid. They are alfo empuwered to fearch and infpect all medicines within their jurifdiction, and throw out into the ftreet all fuch as are bad or unwholefome. That they may the better attend their patients, they are exempted from watching, warding, and ferving on jurits. "They are, however, reftrained from erecting fehoclis for teaching the art of phyfic, or conferning degrees on any perfon qualified for the office of a phyfician; but are obliged to licenfe all fuch as have taken their degrees in any other univerity, and to admit as honorary members all the profeffors of phyfic in tice uft of the univerfities of Sectland. Thefe privileges and immunities are not, however, to interfere with the rights and $p$. ivileges of the apothecary furgeons, in their practice of curing wounds ${ }^{\text {r }}$. contufions: fractures, and other external operations.

Edinlargh College of Surgeons. This is but a very
$\underbrace{\text { College. }}$

## C O L [ 142$] \quad$ C O I

College. late inflitution, by which the furgeons of Edinburgh are incorporated into a Raval College, and authorifed to carry into execution a fcheme fur making provition for their widows and chuldren, Sic. 'Chey have alfo the privilege of examining, and licenintry, if found qualiied, all practitioners in furdery within a ccriain bounds.

College of Tuffice, the fupreme civil court of Scotland; otherwife called Cont of Solfon, or, of Council and Soffion. Sce Lawr, Part 1II. N ${ }^{\circ}$ clvii. 4.

Sion Collage, or the enllege of the London elergy ; which has been a religious houfe time out of mind, fometimes under the denomination of a priory, fometimes under that of a fpital or hofpital: at its diffoIution under 3 If Henry VIII. it was called E/jin's Spita!, from the name of its founder, a mercer, in 1,329 . At prefent it is a compolition of both, viz. a coflegre for the clergy of London, who were incorporated in 1630 , in purfuance to the will of $\operatorname{Dr}$ Whice, under the name of the Prefident and Fellows of Sion Collige; and an hofpital for ten poor men and as many women. The officers of the corporation are the prefident, two deans, and four affiltants; who are annually chofen from among the rectors and vicars of London; and are fubject to the vifitation of the bithop. They lave a good library, built and nocked by Mr Simpfon, and furnified by feveral other benefactors, chiefly for the clengy of the city, without cxcluding other fudents on certain terms; and a hall, with chambers for fitudents, generally occupied by the miniters of the neighbouring parithes.

Greflam ColefgF, or Collegn of Philofoply; a college founded by Sir Thomas Grefham, and endowed with the revenue of the Royal Exchange: one moiety of this endowment the founder bequeathed to the mayor and aldermen of London and their fucceflors, in truit, that they fhould find four able perfons to read, within the college, divinity, geometry, aftronomy, and mufic ; who are chofen by a committee of the common council, conlifting of the lord mayor and three aldermen and eight commoners, and allowed each, belides lodging, L. 50 per annan. The other moiety he left to the company of mercers, to hid three more able perfons, chofen by a committee of that company, confifting of the mafter and thee waidens, during their otfice, and eight of the court of aflillat:ts, to read law, phyfic, and rheioric, on the fame terms; with this limitation, that the feveral lecturers fhould read in term-time, every day in the week except Sundays; in the morning in Latin, in the altemoon the fame in Englifin: but that in mufic to be read only in Englifh. By-8th George III. cap. $3^{2}$. the building appropriated to this college was taken down, and the excifeoffice erected in its room. Wach of the profeflors is altowed L. 50 fer annum, in licu of the apartments, sic. retinquifhed by then in the college, and is permitted to marry, notwithtanding the reftrition of Sir 'Thomas Greflam's will. The lectures are now read in a room over the Royal Exchange; and the city and mercers company are required to provide a proper place for this purpofe.

In this college formerly mer the Royal Socicty, that noble acaderny, infituted by king Charles II. and ceichrated throughout the world for their improvements in natural knowledige. See their hiftory and policy inder Society.
foutcer de Propaganda Fill; was founded at Rome
in 1622 by Gregory XV. and enriched with ample re. venues. It conilits of thitteen cardinals, two prictls, and a fecretary ; and was deligned for the propagation and maintenatice of the Romilh religion in all parts of the world. The funds of this college have been very confideratly augmented by Uiflan VIIl. and many pivate donations. Miffionaties are fupplied by this inltitution, together with a variety of books fuited to their feveral appoinements. Seminaries for their inflruction are fupported by it, and a number of charitable eftabliftments cunnected with and conducive to the main olject of its inflitution.

Another college of the fame denomination was eftablifhed by Urban V1II. in 1627, in confequence of the liberality of John Baptiat Viles, a Spanifla nobleman. This is fut apart for the inftuction of thofe who are defigned for the foreign miffions. It was at firlt committed to the care of three canons of the patriarchal churches; but ever fince the year $16 \mathrm{q}^{1}$ it is under the fame government with the former inllitution.

Coulegr of Heralds, commonly called the Heralls Offre ; a corporation founded by charter of king Richard III. who granted them feveral privileges, as to be free from fubtidies, tolls, offices, \&cc. They had a fecond charter from king Henry VI.; and a houle built near Doctors-commons, by the earl of Derby, in the reign of king Henry VII. was gisen them by the duke of Norfolk, in the reigi of queen Mary, which houfe is now rebuilt.

This college is fubordinate to the earl-marfhal of England. They are affiltants to him in his court of chivalry, ufuatly held in the common-hall of the collcge, where they fit in their rich coats of his majelty's arms. Sce Herald.

Collegr of Herellds in Scothaia, contifts of Lyón king at arms, fix heralds, and dix purfuivants, and a number of mefiencers. See Lyon.

COLlegians, Coleglani, Collegiants, a religious fect formed among the Arminians and Anabaptits in Holtand, about the beginning of the feventeenth century; fo called becaufe of their colleges, or meetings, twice every week; where every one, lemales excepted, has the fame liberty of expounding the feripture, praying, \&ec. They are faid to be all cither Arans or Socinians: they never communicate in the college, but met twice a-year from all parts of Folland at Rhinfergh, whence they are allo called Rbinflurghers, a village two miles from Leyden, where they communicate together ; admitting every one that prefents himfif, profefling his faith in the divinity of the holy feriptures, and refolution to live fuitably to their precepts and doctrines, without regard to his fect or opinion. They have no particular minilters, but each officiates as he is difpofed. They never baptize without dipping.

COLLEGIATE, or Colleglal, churches, are thofe which have no bifhop's fee, yet have the ancient retinue of the biflop, the canons and prebends. Such are Wellmintlen, Rippon, Windfor, $\xi \cdot$. governed by dcars and clapters.

Of thete colleyiate churches there are two kinds; fome of royal, and others of ectlinatical foundation; each of them, in matters of divine fervice, regulated in the famer manne as the cathedrals. There are even fome cullegiate churches that hate the epifopal rights.
rights. Some of thefe churches were arciently abbeys, which in time were feculuised. The church of St Peter's, Weftmin!er, was anci ntly a cathedral ; but the revenues of the monatlery being by att of parliament I Elizab th ve ed in the dean and chapter, it commenced a collegiate chmeh. In leverat caufes the fyling it cathation, intlead of collegiute, church of We minfter, has occalionctarer in the pleadings.

COLLE 3 , among jewellers, denotes the horizontal face or plane at the boitom of brilliants. See Brilhiant.

Collet, in ghafs-making, is that part of glafs veffels which ticks to the iron intrument wherewith the metal was taken out of the melting-pot: thefe are afterwards ufed for making green a'als.

COLI.ETICS, in pharmacy, denote mueh the fame with Agqlutinants or Vulneraries.

COLLIER (Jeremy), a karned Engtion nonjuring divine, born in 1650 , and educated in Caius college Cambriage. He had firlt the finall rectory of Ampton, near St Edmund's Bury in Suffolk: which in fix jears he refigned, to come to Londen, in 1685 , where he was made lecturer of Gray's Inn: but the change of goverment that followed, foon rendered the public exercife of his function impracticable. He was committed to Newgate for writing againfl the revolution; and again, for carrying on a correfpondence which that change of events made treafonable; but was releafed both times, without trial, by the intervention of friends. It is obfervable that he carried his feruples fo far, as to prefer confinement to the tacit acknowledgment of the jurifdiction of the court by accepting his liberty upon bail. Suitable to thefe principles, he next acted a very extmordinary part with two other clergymen of his own way of thinking, at the execution of Sir John Friend and Sir William Perkins for the affaffination plot; by giving them folemm abfolution, and by impofition of hands: abfeonding for which, he contimued under an outhawry to the day of his death in 1726 . Thefe proceedings having put a llop to his activity, he employed his setired hours rather more uffully in literary works. In 1698 , he attompted to reform our theatrical entertainments, by publithing his Short view of the immorality and frofaninefs of the Englifh farge; which engaged him in a controverfy with the wits of the time: but as Mr Collier defended his ceafures not only with wit, but with learning and reafon, it is allowed that the decorum oblerved, for the molt part, by fucceeding dramatic writers, has been uwing to his animadverfions. He next undertook a tranilation of Morreri's great 'Hiforical and Geographical Dictionary; a work of extraordinary labour, and which appeared in 4 vols. folio. After this he publithed "An EccleGaftical Hiftory of Great Pritain, chiefly of England," in 2 vols. folio; which is alluwad to be written with great judgment, and even wiih impartiality. He was befucs engaged in feveral controverfies, which his conduct and writings gave rife to, not material to mention. In queen Anne's reign, Mr Collier was tempted, by: ofiers of confiderable preferment, to a fubmiffion; but as he was a nonjurur upon principle, he could not be brought to lilten to any terms.

Collier, or Coallier. See Coallier,

COlliery, Coalery, of Coallery. See
Coalfry.
COLAINS (Anthony), a polomical writer, born at
Colliary Cu'lins. Hetten near Hommfon in the comenty of Jrliddle fex

 college, and then went to hime necondere Cambitime, where he had for his tutor Mr Pratucis II are, aíterwards biltop of Chichetter. He was aftorwand; a ftudent of the Temple; but wot relifing the buw, foon abandoned that thady. Ile was an inemious man, and author of feveral cerrion books. ITi, fatt remarkable piece was pulling in r":", "An IJ lay conecrning the we of reafon in prope wions the evidence whercof deponds on haman ridimony." In 1702, he cntered intu the contomedy betwen Mis Clark and Dr Dodwell, concerving the immortality of the fout. In ints, he publithed his difeonfe on free-thinking; which mare a poodicins noife. In 1715, he retired intes the county of Imex. and adoul as a jullice of peace and deputy hememant for the fame comety, as he liat lone before fer that of Middicfex and liberty o Weftmintes: The fane year, he puhlihed a " Phatofophical Ethey concemins lata man liberty." In 7 -18, the was cholen treafurer of the county of Efex; and this offece he difonarged with great honour. In 1-2f, he poblitied his "IViltorical and critical Fifay on the 39 articles." Soon after, he publifned his "Difcourfe of the gronnds and ratons of the Chiflian religion ;" to which is prefixed, "An Apulogy for free debatc and liberty of writing;" which picce was immediatcly attacked by a grat number of writings. In 1726, appeared his "Scheme of literary prophecy confidered, in a view of the controverfy occalioned by a late boof ertited, A difcourfe of the gromuds, Fic." In this diffourfe, he mentions a $M S$. differtation of his to thow the Sibylline orades to be a forgciry made in the times of the primitive Chrillians, who, for that reaton, were cailed Sibyllifls by the lagans; but it never appeared in print. His feheme of literary prophecy was replicd to by feveral writers; and particularly by Dr Joln Rogers in his "Neceflity of divine revelation afferted." In anfwer to which, our author wrote " A letter to the Reverend Dr Rogers, on occafion, $\vec{\square}$."," His health began to decline fonse years before his death, and he was very much aflicted wish the Etone, which at laft put an end to his life at his house in Ha:ky fquare in 1729 . He was interred in Oxford chapel, where a monument was erectel to him, with an epitaph in Latin. His curious library was open to all men of letters, to whom he reatily communicated ail the affirtance in his power ; he even funithed his antagonils with books to confute hinfif, and dirceted them how to give their arguments all the fore of which they were eapable. He was romakably avertis to all indecercy and obfeenity of dicourfe ; and wos, independent of his feepticifm, a dincerely good man.

Coblins (John), an eminent aecoumtat and mathematician, born in 1624, and brea a bookfeller at Oxford. Befides feveral treaties on praftical fuipects, he communicated fome curious papers to the R yal ionciety, of which he wata a member, which are to be found in the eany numbers of the Philufphical Trans. arwons.

Collinz， Collinion．
actions：and was t！e hiffacontar of many wher fcientifica！publications in him time．Lle died in 1083 ； and about 25 years after，aill his paper，coming imto the hands of the la arned William Juen，Efi；F．R．S． it appeared that Mr Collins held a conthen：currefpond－ ence for mary years with all the eminent mathema ticians；and that many of the latc diforeries in phy fical knowledge，if not aftually mace by lim，were jet brought forth by his endeavours．

Collins（William），an admirable pnet，was born at Chichefter，about the year 1724 ．He received his claffical education at Winchefter；atier which he Atu－ died at New college，in Oxford，was admitted a com－ moner of King＇s college in the fame univerfity，and was at length elected a demy of Magdalene college． While at Oxford，he applied himfelf to the Rudy of poetry，and publifined his Oiental Eclogues；after which he carne to London．He was naturally pof－ ieffed of an ear for all the varieties of harmony and modulation；his heart was fufceptible of the find feelings of tenderncts and humanty，and was particu． lanly carried away by that hishenthutiafm which gives to imagination its frongeft colouring；and he was at once capable of foothing the ear with the melody of his numbers，of intuenciag the paftions by the force of the pathos，and of gratifying the fancy by the luxn－ ry of defcription．With thefe powers，he attempted lyric poetry；and in $174^{\kappa}$ ，piolimed his Odes，de－ feriptive and allegorical：kut the fale of this work he－ ing not at all anfwerable to its morit，he burnt the remaining copies in indignation．Being a man of a liberal fpirit and a fmall fortune，his pecuniary te－ fources were unhappily foon exheufled；and his life became a miferable example of necclicy，indolence， and diffipation．He projected books which he was well able to execute；and became in idea an hiforian， a critic，and a dramatic poet；but wanted the means and encourarement to carry thefe ideas into esecu－ tion．Day fuccesded day，for the fupport of which he had made no provition；and the was obliged to fub． filt，either by the repeated contibutions of a fricad， or the generofity of a cafoal acquaintance．His fpi－ rits becane oppreffed，and he funt into a fullen de－ fpondence．While in this gloomy flate of mind，his uncle colonel Martin died，and left him a confderable fortune．But this came too late for enjoyment；he had been fo long harafled by anxiety and diftrefs， that he fell into a nervous diforder，which at length reduced the fivelt underflanding to the mof deplor－ able childifhnefs．In the filt thages of this diforder， he endeavoured to relieve himelf by travelling，and paffed into France；but the g：oring malady obliged him to return；and having continued，with hort in． tervals，in this pitiable ttate till the year 1756，he died in the armis of his filter．The ingenious Mr Longhorne has publifhed his poctical works，with me－ moirs of the author，in one volume duodecimo．

COLLINSON（Pcter），an eminent naturalitt and antiquarian，defcended of an ancient family，was born on the paternal eftate called Huggl Hall，or Heyght of Hugul，near Windermere lake，int the parift of Stave！+ ， about $t=n$ miles from Kendal in Wedmoreland．Whill a yourn he difcover 1 his attachmene to matural hiftory． He lege：ciry to maise a colloctoon of dried ipeci－ men．© hants，and had accefs to the beft gardens at

Nどヶ．
 come ean！：accumac！with the nun enrinent atural－ i：is of has time，tae Dis Dealam，Woonvad，Dake， I iny，and Swalle．were amongt his friend．Among the reat varice ef a diel s whith form that fuperb c．licetion，row（by the wite difpoftion of Sir IBare and the monifacerce of parliament）the Pritith Mo－ feum，fmall ras the nurber of thofe with whofe hi－ ftory Mr Collinfon was not well acquainted；he being one of thofe few who wifted Sir Hans at all times fa－ milianly；their inclinations and puffut．，in refpect to natural hitery beine the fame，a frm fricmanip had early been eqablihed between them．Pecer Collin－ fon was cleeted a fellow of the Rogal Socieiy on the 12 th of December 1728；and perhaps was one of the moft diiigent and ufeful members，not only in fupely－ ing them with many curioces oblervations himfelf，but in promoting and preferving a mot extemfive corre－ fpondence with learned and ingenions foreigners，in all comntries and on every ufeful fubject．Befides his at－ tontion to natural hiftig，he miauted every ftriking hint that oselsred either in reading or converfation； and from this fource he derived much information，as there were very few men of learning and ingenvity who were not of his acguaintance at home；and moft foreigners of eminence in natural hift ry，or in artsand feiences，were recommended to his notice and friend－ Gip．His difigence and ceconomy of time was fuch， that though he never appeared to be in a hurry，he maintained an extenlive correfpondence with great puactuality；acquainting the learned and ingenious in diftarit parts of the globe with the difcoveries ald im－ provements in natural hiftory in this country，and re－ ceiving the like information from the moft eminent perfons in almofe every other．His correfpondence with the iagenion：Cadwallader Colden，Eff；of New York，and the jutly celebrated Dr Franklin of Phila－ delphia，furnifh inftances of the benefit refoiting from his attention to all improvementa．The lattor of thefe gentlemen communicated his firt effays on elccaricity to Mr Collinfon，in a ieries of＇hters，which were then publimed，a d have been rer nted in a late edition of the Dector＇s ingenious difcevories and improvemerits． Perhaps，in fome futre perio？，the account procured of the managemert of heer）in Spain，puthined in the Gentlemme＇s Marazize for May and June 176t，may not be confidered among the leat of the benefits ac－ cruing from his extenfive and inquifitive correfpon－ dence．His converfation，cheerful and ufefully enter－ taining，rerdered his acquain：ance much defured by thofe who had a relifh for natural hifory，or were ftu－ dious in culcivatine rural improvements；and fecured him the intimate friendmip of fome of the mol emi－ nent perfonages in this kingdom，as dittinguifhed by their tafte in planting and horticulture，as by their rank and dignity．He was lae firt who introduced the great varicty of feeds and thrubs which are now the principa！ornaments of every garden；and it was ow－ ing to his ndefarigable induftry that fo many perfuns of the firlt difinction are mos enabled to behild groves tranfplanted from the wethern contivert Aowriflans as luxuriantly in their feveral domains as if they were already become indirenous to Britain．He had fome corefpendents in almott every nation in Europe，foree in Afa，and tren at Dexin；sho all tramitted to him

## $\mathrm{C} \quad \mathrm{O} \quad \mathrm{L}$

Ollin finia him the mot valuable feeds they could collect, in rechltat turn for the treafures of A merica. The great Linnxus, during his refidence in England, contracted an intimate friendhip with Mr Collinfon, which was re. eiprocally increafed by a multitude of pood offices, and continued to the laf. Belides his attachment to natural hiftory, he was very converfant in the antiquities of our own country, having been clected a member of the Society of Antiquaries April 7. 1737; and he fupplied then often with many curious articles of intelligence and obfervations, refpecting both our own and other countries. He died in 1768 , leaving behind him many materials for the improvement of natural kitory
COLLINSONIA, in botany: A renus of the monogynia order belonging to the decandria clafs of plants; and in the natural method ranking under the foth order, Perfonatz. The corolla is unequal, with its under lip multifid, and the fegments capillary. Theere is only one perfect feed. There is but one fpccies, a native of North America, but poffefled of no remarkable properties.
COLLIQUAMENTUM, in natural hiftory, an extreme traniparent fluid in an egg, obfervable after iwo or three days incubation, containing the firl rudiments of the chick. It is included in one of its own proper membranes; diftinct from the albumen. Harvey calls it the oculis.
COLLIQUATION, in chemiftry, is applied to animal, vegetable, and mineral fubtances, tending towards fufion. Sce Fusion.
Collevation, in phyfic, a term applied to the blood, when it lofes its crafis or balfanic texture; and to the folid parts, when they wafte away, by means of the animal fluids flowing off through the feveral glands, and particularly thofe of the flkin, fatter than they ought : which oceafions fluxes of many kinds, but moltly profufe, greafy, and clammy fweats.

COLLIQUATIVE EEYER, in phylic, a fever attended with o diarthes, or with profufe fweats.
COLLISION, the friking of one hard body againft another; "r the friction or perenffion of budies moving violently with different directions, and dafhing againt each otier.
COLLUMi, the fame with Neck.
COLLUSION, in law, a fecret undeftanding between tw panics, who plead or proceed fraudulent. ly againtt acin, to the prejudice of a chird perfon.

COLLUTHIANS, a religions fect, who rofe about the heginning of the fourth century; on occafion of the indnlgence hown to Arius by Alexander patiarch of Alexandria. Several people being feandajized at fo ruch condefcemtion; and, among the reft, Colluchus, a piiflt of the fane city ; he hence took a pretence for holding feparate affermblies, and by degrees proceeded to the ordination of pricfts, as if he had been a bilhop; pretending a neeffity for this authority, in order to oppole Arius. To his fetifm he added herefy; teaching, that God did not create the wicked; that he was not author of the evil: that hefal men, \&c. He was condemned by a cotweil held at Alexandwa by Ofus, in the year 330.
COLLYBUS (Ko入入veos), in antiquity, the fance with what is now called the rate of cxcbangt.
COLLYRA, or Collyrides, in antiquity, a cetVol. V. Part I.
tain ornament of hair, worn by the women on their neeks. It was made up in the form of the fmall roundifh cakes called xonupost, collyre.

COLLYRIDIANS, in ehurch hiftory, a feet, to- Cologne. wards the clofe of the the entury, denominated from a little cake, called by the Grecks yonaugusact, collyridia, which they offered to the Virgin Mary.

This feet, it feems, confifted chiefly of Arabian womea, who, out of an extravagance of devotion to the Virgin, met on a certain day in the yeas, to celbrate a folemn feaft, and to render divine honours to Mary as to a goddefs; cating the cake which they ofiered in her name. St Epiphanius, who relates the hiftory of this lupertitious ceremuny, ridicules it. They fprung up in oppotition to the Antidico-Marianites.

COLLYRIUM, in pharmacy, a topical remedy for a diforder of the eyes; defigned to cool and repel hot fharp humours.

COLMAR, a confiderable town of France, in Upper Alface, of which it is the capital. It has great privileges, and the Proteliants linve liherty of confcience. It is feated near the river Ill, in E. Long. 7.16. N. Lat. 48. $^{8 .}$

COLMARS, a town of France in Prowence, and the diocefe of Sens. It is feated near the Alps, in E. Long. 6. 25. N. Lat. 44 . 17.

COLMOGOROD, a town of the empire of Rufia, with an arehbilhop's fee, feated in an illand formed by the river Divina, in E. Long. 23. 30. N. Lat. $3^{\text {J. }} 32$. COLNBROOK, a town of Buckinghamihire in England, feated on the river Coln, which feparates this county from Middletex. It is a great thoroughfare on the weftern road, and has feveral good imns. W. Long. O. 19. N. Lat. 5 i. 30.

COLNE, a town of Lancafhire in England, feated on a fmall hill near the confines of the cumty. W. Long. 2. 2. N. Lat. 53. 45 .

COLOCHINA, an ancicnt town of the Morea in Turky in Europe. E. Lony 23.2. N. Lat. 36.32 .
COLOCYN IHIS, in botany, a fpecicsof 0 . COLOCYNPHIS, in botany, a fecies of Cocumas. COLOCZA, a town of Hungrary, featub on the Danube, and capital of the connty of Bath, with an Danube, and capital of the connty of Bath, with an,
arehbiflop's fee. It was taken by the Turks in 1686 , but afterwards retaken by the Imperialills. E. Long. 19. 42. N. Lat. $4^{6 .} 33$.

COLOGNA, a town of Italy in Padua, and in the territory of Venice. E. Long. II. 43. N. Lat. 45.39.

COLOGNE (the archibifoppic or diocefe of) is one of the flates that compofe the clectoral circle of the Rhine, in Germany. It is hounded on the north by the dichy of Cleves and Guel Jres, on the weft by that of Juliers, on the fouth by the archbifhopric of Cleves, and on the tall by the duchy of Berg, from which it is almon wholly feparated by the Khine. This country is very fruitful in corn and wine, which the inhabitants difpofe of by embarking it on the Rhine, it extending aboun feventy miles atong that river. It is divided into the Higher and 'ower Dioecfe; the Higher Linete contains that part which lics above Cologne, wherein is Bomee, the capital town of this clectorate, and where the lecter refides; bedides which there are Lecielmich, Andennach, Erayl, Z.wich, and Kerpen. The Luwer Diocefe is s, the other lide of Cologne, and contains the towne of Zonz,

Colorne. Neuys, Ifeizarwart, Kempen, Rhynberg, and Alpen. The city of Colorace and conenty of Mews, though within the diocefe of Culogne, do not bciong to it ; fur Colognc is a free city, and Mears belongs to the houfe of Nallau-Orange; but by way of recompence, the elector has confiderable poffeffons in Wedlphalia, which they call the Domuia. It contains the duchy of Weltphatia and the county of Rechlinchafen. This prelate is one of the electors of the empire, and holds alternately with that of Treves the fccond or third rank in the electoral college. He is arch-chancellor of the cmpire in ltaly ; which dignity was very imfortant when the cmperors were malters of Italy, but now it is next to nothing. When the emperors were crowned at Aix la Clapelle, the archbifhop of Cologne performed the ceremony, which caufed him to pretend to the fame right elfewhere; hut he was oppofed by the archbithop of Mentz. This occafioned an order, that they fhould cach of them have that honour in their own diocefe, but if it was done elfewhere, they thould perform it alternately. The archbithop of Cologne is elected by the chapter in that city, which is the molt illuftrious in all Germany. 'They are all princes or counts, except eight doctors, who have no occafon to prove their nobility.

Cologne, an ancient and celebrated town of Germany, in the diocefe of that name, with an archbithop's fee, and a famous univerfity, feated on the river Rhine, in E. Long. 6. 38. N. Lat. 50. 50. In the rimes of the Romans, this city was called Colonia $A$ sripina, and Ubiorum, becaufe it was built by Agrippina the wife of Cluodius I. and mother of Nero ; and becaufe the Ubii inhabited this country on the Lower Rhine. In 755, it was an archhifopric, and in 1260 entered into the Hanfeatic league. The univerfity was eflablifhed in 1388 by Pope Urban VI. The city is fortified with Hrong walls, flanked with 83 large towers, and furrounded with three ditches; but thefe fortifications, being executed after the ancient manner, could make but a poor defence at prefent. It lies in the flape of a balf-moon, and is faid to have 20 gates, 19 parithes, 37 monalkeries, and 365 churches and chapels; but the ftreets in general are dirty and badly paved, the windows of the houles compofed of finall bits of round ghafs, and the imhabitants are but few for fo large a place. It is imhabited mofliy by Papitls; but there are alfo many protellants, who reyair to the neighbouring town of Mutheim, in the duchy of Berg, for public wormip. Its trade, which is confiderable, cfpecially in Rhenifh wine, is chiefly in the hands of Protedtants, and carried on by the Rhine. The fhips with which they trade to the Netherlands are of a particular form, and confiderable burden. The clergy here are very numerous, and have large revenues. That of the archbifhop is L.130,000. Baron Polnitz fays, that though Colugne is one of the greatelt cities, it is one of the moft melancholy in all Europe; there being nothing to befeen but prie!ts, friars, and ftudents, many of whom beg alms with a fong; and nothing to be heard but the ringing of bells; that there are very few families of quality; that the rulgar are very clownith; and that the noblemen of the chapter ftay no longer in town than their duty obliges them. Mr Wright, in his travels, fays, that the women go veiled; and that the beet gin is that
difilled from the juniper berries which grow in this neighbourhood. 'This city is perhaps the molt remarkable of any in the world for the great number of precions relics it contains; of which the Popifh clergy, no doubt, make thair advantage. In the church of St Urfula, they pretend to flow her tomb, and the bones of the 11,000 pretunded virgin mattyrs, though that Itory is entirely orwing to a miltaken iafeription. The heads of fome of the imaginary matyrs are kept in cafes of filver, others are covered with Itufs of gold, and fome have caps of cloth of gold and vilvet. Brevat fays, he fow between 4 and 5000 fiulls, decked with garlands, and coronets, ranged on fhelres. The canonefles of St Urfula, who mutt be all comntefes, have a handfome income. In their church they pretend to fhow three of the thonns of our Saviour's crown, and one of the veffels which contained the water that he converted into wine at the marriage of Cana. In the church of St Gereon are 900 heads of Moorifh Cavalicrs, faid to have been in the army of Confantine before it vas converted, and to have been beheaded for refufing to facrifice to idols. Every one of the hoads has a cap of fcarlet, adorned with pearls. In the maynificent cathedral of St Peter, the three wife men who cane from the ealt to vilit our Saviour, are faid to be interred. They lie in a large purple thrine fpangled with gold, fet upon a pedeftal of brafs, in the midt of a fquare manfoleum, faced within and without with marble and jafper. It is opened every morning at nine o'clock, if two of the canons of the cathedral are prefent, when thefe kings or wife men are feen lying at full length, with their heads bedecked with a crown of gold garnilhed with precious ftones. 'Theit names, which are Ga/par, Melchier, and Buldbafor, are in purple characters on a little grate, which is adorned with an infinite number of large rich pearls and precions fones, particularly an oriental topaz as big as a pigeon's egg, and valued at above 30,000 crowns. Over againtt them are ins large branches of filver, with wax candles, which burn night and day. The bones of thefe men, we are told, were brought to Condantinople by Helena mother to Conftantine, from thence to Milan by Euftorpitus bifhop of that fee, and afterwards hither by archbifhop Rainold. In the Jefuits college are the portraits of the firl 13 generals of that order, with Ignatius Loyola at their head; and in the church, which is the fincit in Cologne, are many rich Ratues, with an amazing quantity of tine filver plate ; and the utenfils for mafs are all of gold enriched with precious ftones. In the Cordelicrs church, is the tomb of the famous Duns Scotus, furnamed Docoor Sudidis, with this epitaph, "Scotia me genuit, Anglia me fufcepit, Gallia me docuit, Colognia me tenet." Cologne is a free imperial city, and as fuch has a feat and roice at the diets of the empire, and circle of the Lower Rhine. In thofe of the empire, it has the firf place on the Rhenifh bench. Towards the defence of the empire, its affeff. ment is 825 forins; and towards the maintenance of the chamber-court, 405 rix-dollars, $72 \frac{1}{2}$ kruitzers each term. Its militıa contills of four companies of foot, who keep guard at the gatcs. It is governed by its own fenate, in refpect to civil matters and canfes; but the criminal jurifdiction belongs to the tlactor and his chapter; and fo jealous are the inha.

Colcmbn bitants of lim, that they will not permit him to fiay Culon. in the city above three days at a time, nor to come: into it with a large retinue. For this realon the clec-
tor refides commoniy at Dunn.

Couognf-Eum, at lind of very light batard ochere, of a deep brown colour.

COLOMEO, a handfome, pleafant, and ftrong town of Afia, feated on the eatern file of the illand of Ceylun in the Lait Indies. It was built by the Portuguefe in 1638 ; and in 16,58 they were driven from it by the natives, affited by the Buteh, who are now in poffefion of it. It is about three quarters of a mile long, and as much in breadth. The natives live in the old town, withont the walls of the new: the flreets of this laft are wide and fpacious; and the buildings are in the modern tate, particularly the governor's houfe, which is a handfome fructure. E. Leng. 80. 25. N. Lat. 7. 0 .

COLOMEY, or Colomia, a town of Poland in Red Ruffia, feated on the river Pruth, in E. Long. 25.9. N. L.at. 48.45:

COLOMNA (Fabio), a very learned botanif, born at Naples about the year 5567 . He became fkilled in the languages, in mufic, defigning, painting, and the mathematics; and died about the middle of the 17th century: He wrote, i. ©urofuacave, feu Plaritarum aliquot (ac pifcium) hiforia. 2. Minus cognitarum rariorumque lispiun espaok; itemque de aquatilibus, aliffue nomullis animalibus, libelins; and other works.

COL,ON, in anatomy, the fift and moft confiderable of the large intellines. See Anatomy, under $n^{\circ} 93$.

Colon, in grammar, a point, or character formed thus $[:]$, ferving to mark a paule, and to divide the members of a period. See Pointing; fee alfo Period, Comma, and Semicolon, Grammariansgenerally affig the ufe of a colon to be, to mark the middle of a period; or to conclude a fenfe lefs perfect than the dot or period:-but, a fenfe lefs perfert clian the period, is an expreffion extremely vague and indeterminate. See Pirind.

Others fay, a colon is to be ufed when the fonfe is pertect, but the fentence not concluded: bat neither is this orer clear and exprefs.

A late author, in an ingenious difcourie, De ratione mitcrumeroth, marks the offee of the colon, and whrein it difers from the fomiculun, \&c. more precikly. A coton, on his principles, ferses to dilisiguith thufe cenjunct memburs of a dentence, which are capable of being divided into other menters; whercof wac, at leaft, is conjunct. Thus, in the fentence, As woe corinot diferm the flataver mowing atong the dint-finte, fo the adoances we make in mozuledge are only pernived by the difunce grine over; the two manbers being both fimple, are on'y feparated by a comma. In this, fis * que ferciver tha bondanu to bave moved, but did nui peaceive it moving ; fo corr actumeis in untervernating, in thot that they confite of fuib minute faps, are cinly perctivathe by the difanie: - the fentence being divided into two equal parts, and thofe conjuct ones, fince they include others; we feparate the former by a femicolon, and the latter by commas. But in this, Als aup portive the Soratow to bawe nowed shag the dist', but "ike not fervive
il moving ; cul it whears the grafs lats groaten, theotgh no

 able be the iffunce-the adrancencont in knowtione is compared to the motion of a hardow, and the growto of grafs ; which comparifon divietes the fontence inen two principal parts: but fuce what is faid of the movement of the thaduw, and likewife of the growth of grafs, contains two fimple memers, they are to be feparared by a femicolon; confequently a higher pointing is required to feparate them from the oher frort of the fentence, which they are oppofed to: and this is a colon. See Puncturtion.

COLONEL, in military matters, the commander ia chief of a regiment, whether horfe, foot, or drayroons.

Skimer derives the word from colony; being of opinion, the chiefs of colonies, called colomiahs, might give the name to chiefs of forces. In the French and Spanif armics, colonel is confined to the infantry and dragoons: the commanding officer of a regiment of horle they ufually call mefre de comp. Vormerly, initead of colonel, the lirench ufed the word coronel ; and this old fpelling comes nearer to our common way of pronouncing the word colonel.

A colonel may lay any officer of his regiment in arref, but muft acquaint the genem with it; he i ; not allowed a gruard, only a centry from the quarterguard.

Colonel-Litutenam, he who commands a regiment of guards, where of the king, prince, or other perfon of the firt eminence, is coloncl. 'Thefe colonel-ficutenants have always a colonel's commifion, and are ufually general-officers.

Lintenant-Colonfl, the fecond officer in a regiment, who is at the head of the captains, and commands in the abfence of the colonel.

COLONIA, (anc. geog.) a town of the Trimobantes, a little above Camelodunum. Now Culchef ter in Effex, according to Cambien, who fuppofes it to take its name from the river Colne, and not that it was a colony. Though others think Antonine's didances agree with Sudbury.

Cozonite Equegris, an ancient and noble colonjo on the Lacus Lemamus. It appears to be the work of Juhins Cefar, who fettled there Lquites Limitumi: and to this Lucan is thought to refer. By the Itinerary it is fuppofed to have food between laufane and Gineva, 12 miles from the lat phace by Putinger's map; which dixcets to Nyon, pleced in Cinv Lemano, according to Lucan's expreffion, that is, a bay or core of the hlee. Its ancicnt name was Nurbothrum, (Notitia (Galliac) : hence its modern name.

Colone a Mc ulline, or Mitalizizultis, a town of Lafuanin, dituated on the right or well lide of the Anas, or Guadiana: but now on the kelt or calt lide, from the river's fhifting its be 1 or channel, and called Medelin, a town in Effrmadura. W. Long. 6 I2 Lat. $3{ }^{\circ}+5^{\circ}$.

Cobonza RIminumm, a town of Belgica, thourht to be Tamonna, the capical of the Itornio. Now Terrumen, a suma of Artuis. Li Leng. $215^{\prime}$, Lat. $50^{\prime \prime} 3 \%^{\prime}$.

Colowa Nortenfis, or Norba Gajitren, a town of Lulitania, to the fouth of "L'rijan"s bridge on tice "A"T. 2 guз.

Cumel II C.loniz.

Colonia gus. Now Alcantzra, in Eftremadura. W. Long. colony. 7 10', N. Lat. $39^{\prime \prime} 10^{\prime}$.

Colonia Trajana, (Antonine, Peutinger); a town of Belgica, furnamed alío (lipia, (Antoninc); and Triefoma, fron being the flation of the thirtieth legion, (Ammian). Now Jellen, a viliage of the duchy of Cleves, a mile from the Rhine.

Colonia Valentia, (Prolemy, Livy); a town of the Hither Spain, on the Turias; dellroyed by Pompey, (Sallutt) ; reftored by Julius Cefar: Still called Valencia, on the river Guadalaviar, in Valencia. W. Long. 35', Lat. $39^{\prime} 20^{\prime}$.

COLONITA, a town of Italy, in the Campagna of Rome, 18 miles eaflward of that city. E. Long. $13{ }^{3}$ $15^{\prime}$ N. Lat. $42^{\circ} 0$ !

Colonva (Pompey), cardinal archbithop of Montreal in Sicily, and bilhop of a very great number of places, made a conlpicantus tigure in the world. He was equally qualilid to wear the cardinal's hat and the helmet, and experienced more than once the reverfes of fortune. Julius II. removed him from all lis dignities; but Lieo l. reftored him, created him cardinal, and fent biim on feveral embaffies. Clement VUL. divefted him of the purple, andagain rettored him to it. It was pretended he was obliged to him for lis exaltation to the papal throne. The pope refufing him fone requat, he reproached him, faying, "That it was by his intertit he had arrived at his dignity." The pope replied, " lt is true, but let me be pope, and do not endeavour to be fo yourfelf; for by acting as $y^{\circ o u}$ do, you endeavour to difpolfers me of that you have raifed me te." He died viceroy of Naples in 1532. He wrote fome poems in praife of Ifabella Filsmarini, in which he protelts the challity of his withes. He wrote another work, De laudilus snilicrum.

COLONNADE, in architecture, a perityle of a circular figure ; or a feries of columns difpofed in a circle, and infulated within fide.

A Polyfyle Colonnidar, is that whofe numbers of column is too great to be taken in by the eye at a fingle view. Such is the colonnade of the palace of St Peter's at Rome, confifting of 284 columns of the Doric order, each above four feet and an half diameter, all in Thburtine marble.

COLONOS, (anc. geog.) an eminence near A thens, whither Cedipus, after his banithment from Thebes, is faid to have retired: and hence it is that Sophocles calls the tragedy on the fubject, Oedipus Colonaus. A place facred to Neprone, and where flood an equeftrian fattue of him. Here alfo flood Timon's tower; who, for his love of folitude, and hatred to mankind, was called ATF/antbropos, (Paufanias).

COLONSAY, one of the Hebrides or Weftern Iflands belonging to Scotland. It comprehends that of Oronfay, from which it is only feparated in time af flood, and both belong to the fame proprietor, viz. Mr M Neil. See Oronsay.

COLONUS, an hubaadman, or villager, who was bound to pay yearly a certain tribute, or at certain times of the year to ploughe fone part of the lord's land; and from hence comes the word clozon, who is salld by the Dutch boor.

COLONY, a company of people tranflanted in-
to a remote province in order to cultivate and inhabit it.

We nay diflinguifl three kinl; of crinaies. Firf, thofe ferving to cafe or difcharge the inhanitanto of a combtry, where the people an lecome $t(x)$ numerons, fo that they camot any longer conveniently fubfin.
The fecond are thofe ettabluhed by vicorions princes and people in the middle of vanquithed mations, to keep them in awe and ubedience.

The third may be called colonies of conmerce; becaufe, in effet, it is trade that is the fole occation and object thereof.

It was hy means of the firl kind of colonies that, fome ages after the detuge, the eall finh, and fuccerfively all the other parts of the earth, becane inhabited: and without mentioning any thing of the Phenician and Grecian colonies, to famous in ancient hiflory, it is notorious that it was for the edathimment of fuch colonies, that, duing the declenfion of the empire, thofe torrents of bablorous nations, iffuing, for the generality, out of the north, over-run the Gauls, Italy, and the other fonthern parts of Europe; and, after feveral bloody battles, divided it with the ancient inhabitants.
For the fecond kind of colonies, the Romans ufed tbem mor than any other people; and that to fecure the conquetts they bad made from the weft to the eaft. Every one knows how many cities in Gauf, Germany, Spain, and even England, value themfelves on their having been of the namber of Roman colomes.
There were two kinds of cilonics annong the Romans: thofe fent by the fenate; and the military ones, confifting of old Coldicrs, broken and difabled with the fatigues of war, who were thus provided with lands as the reward of their fervices. See Benefice. The colonies fent by the fenate were either Roman or Latin, i. e compofed cither of Roman citizens or Latins. The Colonixe Latine were fuch as enjoyed the jus Laatii; faid to confill in thofe two things: one, that whoever was edile or pretor in a town of Latium, became for that reafon a Roman citizen ; the cther, that the Latins were fubject to the ediets of their own, and not to thofe of the Roman magiltrates: in the year of the city fix hundred and fixty two, after the focial war, the city was granted to all Latium, by the lex Gulia. The colonixe Romanx, were fuch as had the jus Romanum, but not in its full extent; namely, in the right of fuffrage, putting up for honours, magittracies, command in the army, 風c.; but the jus Quiritium only, or private right ; as right of liberty, of gentility, or dignity of family, facrifice, marriage, Foic. For it was long a rule, never to grant the liberty of the city in full to colonies: nor is there any inftance to the contrary, till after the focial war, in the year of the city fix handred and fixty-two. According to Ulpian (l. ı. D. de Canf.), there were other colonies, which had little more than the name; only enjoying what they called jus Italicum, i.e. they were free from the tributes and taxes paid by the provinces. Sucb were the colonies of Tyre, Berytus, Heliopolis, Palmyra, Ecc. M Vaillant has filled a volume in folio with medals Atruck by the feveral colonies, in honour of the emperors who founded theme.

The

## C O L

Colory. The ordinary fymbel they engraved on their modals, was citlier an cagle; as what the veteran legions were diatributed in the colonies: or a labourer, holding a plougli drawn by a pair of oxea; as when the colony confited of ordinary iahabitants. On all the medals are fen the names of the decenvin, who held the fame rask and had the fame anthority there as the confuls had at Rome.

Laftly, the colonies of commerce, are theofe eftablinhed by the Englith, French, Spaniards, Portuguefe, and uther nations within thefe two lafl centuries, and which t'ey contime dill to eftabifi, in feveral parts of Afar, Africa, and America; either to keep up a regular commerce with the natives, or to cultivate the ground, by plantinc fugar-canes, indigu, tobacco, and othe commonitics. The principal of this hind of colonics, are in the one and the other Annerica, northent and fouthern; particularly Pern, Mexico, Camada (Iately Virginia, New-England, Carolina), Ia Lonifina, I'Acadia, Hudfon's Bay, the Antilles Iflands, Jamaica, Domingo, and the other iflands.-In Africa, Madagafcar, Cape of Good Hope, Cape Verd, and its iffands, and all thofe valt coafts extended thence as far as to the Red Sea. Lattly, in A fia, the famous Batavia of the Dutch; Goa, Din, of the Portuguefe; and fome other lefs confiderable places of the Englifh, French, and Danes.
The practice of fettling commercial colonics in diftarit countries hath been adopted by the wifett nations of antiquity, who acted fyttematically upon maxims of found policy. 'This appears to have been the cafe with the ancient Eyptians, the Chinefe, the Fhomicians, the commercial itates of Greece, the Carthaginians, and even the Romans; for though the colonies of the latter were chiefly military, it could caflily be fhown that they were likewife made afe of for the purpofes of trade. The favage nations who ruined the Roman empire, fought nothing but to extirpate or hold in vaffalage thofe whom they overcame; and therefore, whetrever princes enlarged their duminions at the expence of their neighbours, they had recourfe to ftrong forts and garrifons to keep the conquered in awe. For this they have been blamed by the famons Machiavel; who labours to fhow, that the fettling of colonies would lave been a clicaper and letter method of bridling conquered countries, than building fortrefles in the:n. John de Witt, who was one of the ablell and beft. ftatefmen that cer appeared, ftrongly recommended colonies; as affording a refuge to fuch as had been unfortunate in trade; as opening a field for fuch men to exert their abilities, as through want of intereft could not raife themfelses in their own country; and as a: fupplement to hofpitals and other charitable foundations, which he thought in time might come to be overcharged. Some, however, have ridiculed the fuppofed advantages of colonies, and afferted that they muft always do mifchief by depopulating the mother-country.
The hifory of the Britih colonies undoubtedly fhows, that when colonifts become numerous and opulent, it is very difficult to retain them in proper fubjection to the parent flate. It becomes then a queftion not very eafily arfwered, how far they are entitled to the rights they had as inhalitants of the mo-ther-country, or how far they are bound by its laws?

On this fubjec: Mr Blackillone hath the following cbFervation.
" latntations, or colonics in difant combries, are either fuch where the lands are chamed by if it of occupany only, by finding them delent and umoulivated, and poopling them from the mother-coenty; or where, when already cultivatal, they have eithus been eraned by conquett, or ected to us by treatica. And both the rights are funded upon the law of nat ture, or at leaft on that of nations. But there is a difference between thefe two fpecies of colonies a ith refpect of the laws by which they are bound. For it hath been loed, that if an uniniabited country be difcovered and planted by Englifh Eubjects, all the Englich laws then in being, which are the birthright of wery fubject, are immediately there in furce. But this mant be uncerllond with many and very great reflrictiom: Such colonils carry with them only fo much of :f e Englifh liw as is applicalle to their own fituation, and the condition of an infant colony; fuch, for intance, as the general rules of inheritance, and of protection from perfonal injuries. The artificial refuements and diftinctions incident to the property of a great and commercial people, the laws of pelicy and revanti (fuch efpecially as are enforced by penalties), the mode of maintenance for the eftablihed clerey, the jurifdic. tion of fpiritual courts, and a multitude of other provilions, are meither nceeffary nor convenient for them, and therefore are not in furse. What thall be admit. ted, and what rejected, at what times, and under what refrictions, mull, in cales of difpute, be decided in the firf infance by their own parincial judieature, fubject to the revifion and contron of the king in council; the whole of their conditution being alfo liable to be new-modelled and reformed by the general fuperintending power of the legiflature in the no-ther-country. But in conquered or ceded countrits, that have already laws of their own, the king may indeed alter and change thofe laws; but, till he does actually change them, the ancient laws of the country remain, unkefs fuch as are againft the law of God, as in an infidel country. Our American plantations are principally of this latter fort, being obtained in the lat century, either by right of conquell and driving out the natives (with what natural juttice I fhall not at prefent inquire), or by treaties. And therefore, the common law of England, as fuch, las no allowance or authority there; they being no pirt of the mother country, but diftinct (though dependent) dominions. They are fubject, however, to the contronl of the parliament; though (like Lreland, Mann, and the reft) not bound by any acts of parliament, unlefs particularly named."

With refpect to their interior polity, our colonies, whether thofe we formerly poffeffed or llill poffcfs, may be difinguifhed into three forts. 1. Provincial eftablifinments, the conflitutions of which depend on the refpective commiffions iffued by the crown to the governors, and the inltructions which ufually accompany thofe commiffions; under the authority of which provincial affemblies are contlithed, with the fower of making local ordinances not repugnant to the law: of Pritain. 2. Proprietary governments, granted ont by the crown to individuals, in the naw ture of fodatery principalites, with all the inferior re-
galities,

# $\mathrm{C} 0 \mathrm{~L}\left[\begin{array}{lll}\mathrm{i} 50\end{array}\right] \quad$ C O I 

oran gulities, and fohordinate powers of legritation, which formerly belonged to the owners of coanties patatime: yet ftill with thefe exprefs conditions, that the amb for which the graut was male be fubtant ially purfoch, and that nothing be aftempted which may derogate from the fovereignty of the mother-country. 3. Charter gevernments, in the nature of civil corporations ; with the power of making bye-laws for their own interior regulation, not contany to the laws of Britain; and with fuch rights and anthorities as are fpecially given them in their feveral charters of incorporation. The form of government, in moft of them, is borrowed from that of England. They have a governor naned by the king (or, in fome proprietary colonies, by the proprietor), who is reprefentative or deputy. They have courts of juftice of their own, from whole decifions an appeal lies to the $k \mathrm{kig}_{\mathrm{g}} \mathrm{i}$ council here in England. Their general affemblies, which are their houfe of commons, together with their conncil of llate, being their upper houfe, with the concurrence of the king, or his reprefentative the governor, make law ditited to their own emergencies. But it is particulatly declared, by fat. 7 and 8 SY. III. c. 22. that all lavi, byc-laws, ufares, and culome, whith flall be in practice in any of the plantations, repugnant to any law made or to bu made in this kingdom relative to the fuid plantations, thall he utterly void and of none effect. And, becanfe fereral of the colonies had chamed the fole and exclufiveninht of impofing taxes upon themfelver, the tatute 6 Geo. III. c. 12. expictsly dectares, that all his Majefty's colonies in America, have been, are, and of right ought to be, fubordinate to and dependent upon the imperial crown and parliamont of Great Britain ; who have full power and suthority to make laws and itatutes of fufficient validity to bind the colonics and people of America, fubjects to the crown of Givat Pritain in all cales what focver. And the attempting to enforce this by other acts of ${ }^{2}$ arliament, penaltics, and at lat by military puster, gave rife, as is wall knosin, to the late rovolt and final feparation of thirten coloniss. Sec the article Americs.

COLOMHON (ne. geng.), a tow of Ionia, in the Hither Ala, on a promontory on the Egean fea, and wafled by the Hilefis. The ancient Colophon was dethoyed liy Lymachus, in his war with Antigomas, in order to endarge Ephefos. Paufanias fays, it was rebuile in the negrabonloud, in a nore commodions fute. This was one of the cities that haid claim to Homer. Colvibam uticie, a proverbinl faying, exphined by Strato to denote, that the Colophonian loufe arned the feales in favour of the fide on which they fousht. The Cukophonians had agrove, a temple, aud an macle of Apollo Clarius (stratu). Of this tuwn wat the puet Antimachus, remaked on for his tumid digle by Catulivas. Ife wote a life of Domer, whom he makes a Cohphonina (Plutarch).

COLOPHONY, in phamacy, black rehn, or turpentime, boiled in water, and afterwards dried; or, which is itill betw, the caput mortum-remaining after the Giftilation of the etherial oit, being father urged by a more intenie and long continued fire. - It receives its matre of culphonin, from Colophon, a city of Ionia; becaule the bell was formrly brought from thence. Two forts ale mentioned in ancient writings; the one diry, the oulne in a liquid form, The latter
fecms to hav: been liquid pitch, which is the crude Coloquin relin of the pine brought fiom Colophon; the other was catked refina frimh, and confited only of the furmer deprived of its humid parts.

COLOQUINTIIA, in botany. See Cucumis.
COLORA'IURA, in mutic, denotes all manner of variations, trillos, diminutions, \&x. ferving to make a fong arrectable.

COLORNO, a town of Italy, in the Parmazan, near the river $F$ o, cight miles from Parma. The duke of Parma has a pleafure-houfe here, one of the moit delightful leats in all Italy, and the gardens are very fine. E. I.ong. 9. 15 N . Lat. 44.54.

COLOSSAE, or Coloseae (anc. geog.), a confiderable town of Phrygia Margua, in which the Lycus falls into a gulph, and at the diflance of five ladia emerges again, and rums into the Meander (Herodotus). Other fay, the genuine name is Coluffue, and the prople Colaffenfes, to whom St Fanl wrote an epitle: Strabo calls them Colofeni. In Nero's time the town was defroyed by an earchquake (Oroftus).

COLOSSUS, a tatue of enormous or gigantic fize. The mof eminent of this kind was the Coloffus of Rhodes; a fatue of Apollo, fo high, that ihips palfed with full fails betwixt its legs. It was the workmanhip of Chares, a difeiple of Lyfippus; who fpent 12 years in making it: it was at length overthrown by an earthquake, after having food 1360 years. Its height was fixfcore and fix fiet: there were few prople could fathom its thumb, \&c. When the Saracens became poffefled of the ifland, the flatue was found proflrate on the ground: they fold it to a Jew, who loaded goo camels with the brals.

The bafis that fupported it was a iriangular figure; its extremities were fultained with 60 pillars of marble. There was a winding-llair-cafe to go up to the top of it; from whence one might difcover Syria, and the Thips that weat into Egypt, in a great looking-glafs, that was hung about the neck of the flatue. Among the antiquities of Rome, thereare feven fanous Coluflufes: two of Jupiter, as many of Apollo, one of Nero, one of I) omitian, and one of the Sun.

COLOSTRUN, the firt milk of ary animal after bringing forth young, called bifints. It is remarkable that this milk is generally cathanic, and purges the meconium; thus derving both as am aliment and medicine.

An emuifin prepared with turponine difolved with the yolk of an egg, is fometimes called by this name.

COLOSWAR, a large and celebrated town of Tranflvam, where the lenates have their meetings. It is leated on the river Samos, in E. Long. 22. $45 \cdot$ N. Lat. 4 ك. 53 .

COLOUTR, in phyfics, a property inherent in light, by which, accordiug to the various fizes of its parti, or from fome other caufe, it excites diffrent vibrations in the optic nerve; which propagated to the fenforium, affer the mind with difforent fearations. See Curomaties and Oprics.

Colove, in painting, is apolied boch to the drugs, and to the tints produced by thofe drugs varioully mixed and applited.

The principal colours ufed by painters are red and white lead, "on cerufs; yellow and red oches; feveral kiads of earth, umbre, orpiment, Jamp. black, burnt

## 

Colarr. ivory, black lead, cimabar or vermillion, gamboge, ed diference of colour, though he cond only difin- Colour. lacea, blue and green afhes, verdigris, bittre, bice, fmalt, carmine, ultramarine: each of which, with their ufes, \&c. are to be found under their proper astictes.

Of thefe colours iome are ufed tempered with gumwater: fone ground with oil; oilhers only in frefco; and others for miniature.
Paineers reduce all the condmers they ufe under thefe two clafts, of dark and light colours: dark colours are black, and all others that are obfcure and earthy, as umbre, biltre, \&c.

Under light colours are comprebended white, and all that approach neareft to it.

Painters alfo difinguih colours into fumple and mineral.

Under fimple colours they rank all thofe which are extracted from yegetables, and which will not bear the fire; as the yellow made of faffron, French berries, lacca, and other tinctures extracted from flowers, ufed by limners, illuniners, \&c.

The mineral colours are thofe which being drawn from metals, \&ce. are able to bear the fire, and therefore ufed by enamellers. Changeable and permanent cslours is another divifion, which, by fome, is made of colours.

Changeable colours are fuch as depend on the fituation of the objects with refpect to the eye, as that of a pigeon's neck, taffeties, \&c. the firt however being attentively view id by the microfope, each fibre of the feathers appears compofed of feveral litule fquares, alternately red and green, fo that they are fixed colours.
Woter Coloves, are fuch as are ufed in painting with gum-water or fize, withont being mixed wich oil.

Incapacity of difinguifing Colours. Of this e:straordinary defect in vifion, we have the following inflaces in the Philofophical Tranfactions for 1777: Oue of the perfons lived at Maryport in Cumberland. The account was communicated by Mr Huddart to Dr Priettey, and is as follows. "His name was Harris, by trade a floe-maker. I had often heard from others, that he could difcern the form and masnitude of all objects vely diftinctly, but could not diflinguifh colours. This report having excited my curiofity, I converfed with him frequently on the fubject. The account he gave was this: That he had reafon to believe other perfons faw fomething in objects which be could not fee; that their language feemed to mark qualities with precifion and confidence, which he could only guefs at with befitation, and freequently with error. His firft fufpicion" of this arofe when he was about four years old. Having by accident found in the Areet a child's ftocking, he carried it to a neightouring honfe to inquire for the owner: he obferved the people called it a red flocking, though he did not underliand why they gave it that denomination, as be limfelf thought it completely deferibed Ly being callcd a flocking. This circumflance, how. ever, remained in his memory, and, together with fubfequent obfervations, led hin to the knowlcdge of his defect.
"He alfo obferved, that when young, other children could difeern cherries on a tree, by fome pretend-
guin then from the leaves by the difference of their fize and hape. He obiterved alfo, that by means of this difference of cotom they could fee the cherries at a greater diftance than he conld, though he could fee other objects at as great a diltance as they, that is, where the fight was not aftiled by the colour. Large objects he could fee as well as other perfons; and even the fnaller ones if they were not enveloped in other things, as in the cafe of cherries among the leaves.
"I helieve lee could never do more than guefs the mame of any colour ; yet he could difting uif white from black, or black from any tight or bright colour. Duve or flraw colour he called zobite, and different culowishe frequently called by the lame name; yet he could difcern a difference between them when placed cogether. In general, colours of an equal degree of brightnefs, however they might otherwifa differ, he confounded together. Yet a friped ribbon he could dilinguih from a plain one; but he could not tell what the colours were with any tolerable exactuifs. Dark colours, in general, he often millook for black; but never imagined white to be a dark colout, nor dark to be a white culour.
"He was an ineelligent man, and very defirous of undertanding the nature of light and coloners; for which end lie had attended a coufe of lectures in natural philofophy.
"He had two brothers in the fame circumfances as to fight; and two other brothers and filleta, who, as well is their parents, had nothing of this defuct.
"One of the firf mentioned brothers, who is now living, I met with at Dablin, and wifhed to try hic capacity to diftinguifh the colours in a prifm; but not having one by me, I afked him, whether he had cver feen a rain-bow? he replied, He had often, and could diltinguith the difierent colours; meaning only, that it was compofed of dificient colours, tor he couid not till what they were.
"I then plocured, and fhowed him a piece of ribbon: he inmediately, and without any diffeulty, prom nomuced it a feriptd, and nol a phain, ribion. Ife then attempted to rame the differe't fltipes: the feveral ftripes of white he aniformly and willout hefftation called white: the four black llapes he was deceived in; for three of them be thought brown, though they were exactly of the fame fhate with the other, which he properly called black. ITe fouke, however, with diffidence, as to all thofe fripes; and it muit be owned, that the black was not very diflinct: the light green he called yellow; but he was not very pofitive: he faid, "I think this is what you call yellow." The midhle ftripe, which had a fight tinge of red, he calted a fort of blue. But hew was noot of all deceived by the orange colour: of this he fpoke very confidently, faying, "This is the colour of grafs, this is green." I allo thowed him a great varicty of ribbons, the colour of which be fometimes named right$\mathrm{l} y$, and fometimes as differently as poffible from the true colour.
"I afked him, whether he imagined it poflible for all the varinus colours he faw to be mere diflerence of light and flade; and that all colours could be compos. fed of thele two mixtures only? With fome hefitation

## $\mathrm{C} O \mathrm{I} \quad \mathrm{I} 2 \mathrm{C}] \quad \mathrm{C}$

Nolour. (
he replied, No, he did imagine there was fome other differetice.
" It is proper to add, that the experiment of the Ariped ribbon was made in the day-time, and in a good light."

Colovrs for Raining diffornt kinds of Stones. Sce Chemistry, tio 753.

Colour, in dycing. See Dyeing.
Colouk of Plants, is an attribute found to be very variable. Different colouts are obferved, not only in different individuals of the fame fpecies, but likeuife in different parts of the fanse individual. Thus, marvel of Peru, and fweet-William, have frequently petals of different echlours on the fame plant. Three or four different colours are frequently found upon the fame leaf or flower; as on the leaves of the amazanthus, trieolor, and the flowers of the tulip, auricula, three-coloured violet, and others. To produce the moft beautiful and Atriking variety of colours in fuch flowers, is the principal delight and bufinefs of the forit.
The primitive colours, and their intermdiate fhades or gradations enumerated by botanilts, are as follow.

> Water-colours, byalinus. White.
> Lead-colour, cinereus. Black, niger.
> Brown, fufcus.
> Pitch-black, ater. Tellow, luteus.
> Straw-colour, flazes.
> Flame-colour, fulous.
> Iron-colour, gilvus. Red.
> Flefl-colour, incarnatus.
> Scarlet, coccincus. Purple.
> Violet-colour, caruleo-purpureus. Blue, caruleus. Green.

Thefe colours feem to be appropriated to particular parts of the plant. Thus, white is mott common in roots, fweet berries, and the petals of fpring flowers. Water-colour, in the filaments and ftyles. Black, in the roots and leeds; rarely in the feed vefich, and fearce ever to be found in the petals. Yellow is frequently in the anthere or tops of the flamina; as likewife in the petals of autumnol flowers, and the compound legulated fowern of Linnreus. Red is common in the petals of fumme, fowors, and in the aeid fruits. Bhe and violet-coluar, in the petals. Green, in the pares and calyx, bu rarely in the petalis. In the inacchanging of colous, which in plants is found to depend upun diferences in heat, climate, foil, and culture, a fort of elective attraction is obferved to take place. Thus, ed is more eafly changed into white and blue; blue into white and yellow; yellow into white; and white into purple. A red colour is ofen changed into a white, in the flowers of heath, mother of thyme, betony, pink, vifoous campion, cucubalus, trefoil, orchis, fux-glove, thiftic, cudweed, faw-wont, rofe, pappy, fumitory, and geranium. Red paffes into blt. in pimpernel. Blue is changed into white in be il-fower, greek-valerian, bindweed, columbine, violet,

N'S4.
vetch, milk-wort, goat's rue, viper's buglofs, comfrey, borrage, lyyflop, dragon's-head, fcabious, bluc-bottle, and fuccory. Dlue is changed into yellow in crocus. Yellow pafles cafily intorwhite in melilot, agrimony, mullein, tulip, blataria, it moth-mullein, and corn marigold. White is changed into purple in wood-forrel, thorn-apple, peafe, and daify.

Although plants are fometimes obferved to change their colour upon being moillened with coloured juices, yet that quality in vegetables feems not fo much owing to the nature of their nomifiment, as to the action of the internal and external air, heat, light, and the primitive organifation of the parts. In fupport of this opinion, we may obferve with Dr Grew, that there is a far lefs variety in the colours of roots than of the other parts of the plant; the pulp, within the fkin, being ufually white, fometimes yellow, rarely red. That this effect is produced by their fmall intercourfe with the external air appears from this circumitance, that the upper parts of roots, when they happen to fland naked above the ground, are often dyed with Ceveral colours: thus the tops of fored roots turn red ; thofe of turnips, mullein, and radihes, purple; and many others green: whilt thofe parts of the fame roots which lie more under ground are commonly white. The green colour is fo proper to leaves, that many, as thole of fage, the young fprouts of St John's wort, and uthers which are reddif when in the bud, acquire a perfect green upon being fully expanded. In like manner, the leaves of the fea-lide grape, polygonum, which when young are entirely red, become, as they advance in growth, peifectly green, except the middle and tranfecte ribs, which retain their former colour.

As flowers gradually open and are expofed to the ain, they throw off their old colour, and acquire a new one. In fact, no llower has its proper colour till it is fully expanded. Thus the purple flock-july fowers are white or pale in the bud. In like mamer bachelor's buttons, blue-bottle, poppy, red daifies, and many other flowers, though of divers colours when blown, are all white in the bud. Nay, many flowers change their colours thrice fucceffively; thus, the very young buds of lady's looking-glafs, buglofs, and the like, are all white; the larger buods purple, or murrey; and the open flowers blue.

With refpect to the colours of the juices of plants, we may obferve, that molt relinous gums are tinetured; fome, however, are limpid; that which drops from the domethic pine is clar as rock-water. The milk of fome platis is pale, as in burdock; of others white, as in daudetion, euphorbium, and feorzonera; and of others yell, wa in lovage, and greater celandine. Moft mucildyes lave litte colour, tate, or fnell. Of all the colours cove chumerated, grcen is the moft common to plants, black the moif pate.
Colour bemy a çulity in plarts fo apt to change, ought never to be roployed in diftaguifins their freeies. Thefe oughe to be characterifed frim circumftonus ar liable walte:ation by culture or wher acciriento. 'I te fame inconntancy of colver , borved in the flowers, is likcuile to be found in the other parts of planis. Peries ir ramently change from green to red, and from red to white. Even in ripe fruite, the colour, whether whitc, red, or blue, is apt to vary;
particularly

## C O L 「 153 〕 C O L

Co'orr. particularly in apple, pear, plum, and chony trees. Seeds are more contlant in point of colour than the veffld which contains them. In the feeds, however, of the poppy, wats, pea, heau, and kiducy-bean, nariations are frecpuently olvferved. The foot, too, although not remarkably fubject to cliange, is found to vary in fome fpecies of carrot and radifh. Leaves frequently become fpotted, as in a fpecies of orchis, hawk.weed, ranunculus, knot-grafe, and lettuce; but felform relinquifh their green colouraltogether. Thofe of fome fpecies of amaranthus, or flower-gentle, are beautifully coloured. The fpots that appear on the furface of the leaves are of different colours, liable to vary, and not feldom dilappear altogether. The leaves of officinal lung-wort, and fome feccies of fowbread, forrel, trefoil, and ranuncnlus, are covered with white fpots. Thefe of dog's-tooth violet, with purple and white. Thofe of feveral fecies of ranunculus, and orchis, with black and purple. Thofe of amaranthus, tricolor, with green, red, and yellow. Therfe of ranunculus acris, and a fpecies of bog-bean, with red or purple. The under fin face of the leaves of fome fpecies of pinpernel and the fea-plantain is marked with a number of dots or points; a white line runs through the leaves of Indian reed, black berried heath, and a fyecies of Canary grafs: and the margin or brim of the leaf, in fome fpecies of box, honey-fuckle, ground-ivy, and the evergreen oak, is of a filver-white colour. The whole plant is often found to aflume a colour that is unnatural or foreign to it. The varieties in fome fpecies of eyngo, mug-wort, orrach, amaranthus, punfane, and lettuce, furnifh examples.

Such being the inconftancy of colour in all the parts of the plant, fpecific names derived from that quality are, very properly, by Linneus, deemed erroneous; whether they refpect the colour of the fower, fruit, feeds, root, leaves, or exprefe in general the beauty or doformity of the entire plant, with a particudar view to that circumflance. Of this impropricty committed by former botanifts, Linnxus himfelf is not alway's guilthefs. Thus the two fpecies of fariacha, or the fide-Faddle flower, are diftinguifled by the colour of their petals into the yellow and purple farracena; although the thapes and figure of the leaves aforded much more conflant as well as flriking characters. The fame may be faid of his lupinus albus and luteus; refeda alba, glauca, and lutca; angelica atro-purpurea; dictamnus albus; lamium album; felago coccinea; fida alba; palliflora rubra, lutea, incarnata, and corrulea; and of many others, in which the fpecific name is derived from a character or quality that is fo liable to vary in the fame fpecies.

We fiall conclude this article with obferving, that of all fenfible qualities, colour is the lealt ufeful in indicating the virtues and powers of vegetables. The following gencral pofitions on this fubject are laid down by Linnens, and feem fufficiently confirmed by experiment. A yellow colour generally indicates a bitter tatk; as in geatian, aloe, celandine, turmeric, and other yellow flowers. Red indicates an acid or four tafte; as in cranberries, barberries, currants, raipberries, mulberrics, cherries; the fruit of the rofe, fea-buckthern, and fervice-trec. Herbs that turn red towards autumn, lave likewife a four tafte; as forrel, woodVol. V. Part I.
forrel, and bloody dock. Green indicates a crude al kaline talle, as in leaves and unripe fruits. A pake colour denotes an infipid talle, as in endive, aframgus, and lettuce. White promifes a fweet lufcious talte: as in white cmmants and plums, livet apples, \&er. Laftly, black indicates a haifh, naufcous, diagrecable talte; as in the berries of deadly nighthade, myrtleleaved fumach, herb-chritopher, and others; many of which are not only unpleafant to the tafte, but pernicious and deadly in their effects.

To be afcertainced of the acid or alkaline property of any plant, exprefs fome of the juice, and rub it upon a piece of blue paper ; which, if the plant in queflion is of an acid nature, will turn red; if of an alkaline, green. For the metheds of extracting colours from the different parts of plants, fee the article ColourMaking.

Corouk of the Humarb Spuitis, Differance of. See Complexiov.

Cozour, in heraldry. The colours generally ufed in heraldry are, red, bluc, b'ack, green, and purple; which the heralds call gules, azare, fuble, vert or finopl, and purpure; temne, or tawny, and fanguine, are not fo cormmon: as to yellow and white, called or and aro gent, they are metals, not colours.

The metals and colours are fometincs expreffed in blazon by the names of precious ltones, and fometimes by thofe of planets or llars. Sce biazoning.

CEnomaus is faid firlt to have invented the ditinction of colours, to diftinguifh the gundillie of conabatants of the Circenfran games; the green for thofe who reprefented the earth, and blue for thofe who reprefented the fea.

Colours, in the military art, include the hanners, flags, enfigns, \&e. of all kinds, borne in the army or fleet. See Flag and Standard.

Colours, in the Latin and Greek churches, are ufed to ditkinguilh feveral mytheries and fealls colcbraw ted therein.

Fise colours only are regulaly almitted into the Latin church: thefe are white, green, red, violet, and black. The white is for the mytheries of our Saviour, the feaft of the Virgia, t?ofe of the angels, faints, and confefors; the red is for the inytleries and folemnities of the holy facrament, the fealls of the apolles and martyrs; the green for the time between pentecoft and advent, and from epiphany to feptuagetima; the violet in advent and Chritmas, in vigils, rogations, \&ec. and in votive maffes in time of war; laftly, the black is for the dead, and the ceremonies thercto belonging.

In the Greek church, the ufe of colours is almoft abolifhed, as well as among us. Red was, in the Greek church, the colour for Clirittmas and the dead, as black among us.

To Colove Stranger's Goods, is when a freeman allows a foreigner to enter goods at the cuftom-houfe in his name.

Color'm-Making, the art of preparing the different kinds of colours ufed in painting.

This art properly belongs to chemiftry; and is one of the moft curions, though leaft underfluod, parts of it. The principles on which colour-making depends are entirely different from thofe on which the theory of other parts of chemiftry is founden ; and the pratiU (ni

eser colours as, when lad over pay, woud, $\dot{i}$ e. cover them fully fo as to cflace any ether painting or fain that might have bees there before: the others are of fuch a natture as to leave the gromen on which they are lind vifitle through them. Of the firl kind are whitelend, sed-lead, vermilion, üu; of the latter lind are the colours ufed for ilhmimation mase, ã.
Another divifion is into oil-colurs and water-colours; by whice is meant, fach as are appropriated to paintins in uil and in water. IIol of thofe which are proper for painting in water, are alio proper for being ufud in cil. There is, however, this remarkable diference betwixt cohours when mixed with water and vith oil, that fuch as are cuite opaque in water will become penfectly tranfparent in oil. Tleus, blue verditer, th.augh excetdingly opaque in water, if ground with oil, feems totally to diffore, and will beoune seyy tranfparent. The fame thing happens to fuch colours as have for their halis the call of tia, alabater, or calcareous earth. The mult porfectly onaque cobors in oil are fuch as have lead, mercury, or iron, for tiver bafis: to the latter, howeser, Prufian blue is an exception; for though the bafis of that colour is iron, it proves quite tranfparent when cround with oil. In water-colours, thofe paepared from metals, Pruffian Bre alune excoptec, are always opague; from vegetables or animats, trafnament. Coals, horrever, whether vegetaib or animal, are opapue buth in water and cil.
Simple ald Colunrs again, maty be confudered as cither limple or compound compound. The fingle ones are fuch as require noetics. thing to be faporided to them, in orde to make a fuil ithong colour, whitut regarding whather they are formed of rany or few ingredients; and in this viexp, white-lead, $r \in d-l e n d$, vermilion, calces of iron, sc. are fimple colours. Tlit compound anes are formed by the union of two or more coburinis fubitances; as 小lue and yellow mited together to form a gretn, red and velluw to form an orduce, a white tarth or calo with the red colour of cochineal or brazil to form a lake, Qc.; and thus comaine, lake, rofepiak, Dutch-pink, Englihh-pink, 求e are compound colours.
True ${ }^{4}$ and fa'fecodoars.
be regretted, that the mof beantiful are in general the leait perminent. It may, for the mot part, however, be expected, that the more fimple any culour is, the lers hable will it be to change upon expofure to the ain.

The meat diffenty of knowing ì priori whether a colour will face or not, is owing to our ignorance concerning the nature of colouring fubttances. With all our difadranages, however, we may obferve, that whatever change of colour is produced in any fublance by exporure to the fun and ar, that colour to which it changes will bid fair for being permanent, and therefore onght to be employed where it can be done. Of thefe chanres the inftances are but very rare. One is in the purple of the ancients, which affumed its colour by expofure to the fun, and confequently was exceedingly permanent. Another is in the folution of flver; which, being mixed with chalk, the precipitate terns to purplini bleck where it is expofed t') the fun. A third is in folutions of indigno by alkaline formances, which contantiy appear green till expofed to the air by freading them very thm, upon which they become almoft inflantaneomly blue, and 6 continue fo ever after. Sonictimes, though lill more By the nix. rarely, a viry rimarkable change of colour happens, ture of two. upon mixing two vegetable juices together. Almoit the only infarce of this we have on the anthority of Mr George Fontler, who informs us, that the inhabi. tants of Otalieite dye their cloth of a crimfon colour, by mixiag torether the ydlow juice of a fmall fpecies of fig with the greenim juice of a kind of forn. Hut the molt remakable atcuations of culour are effected by different metallic and foline folutions mixed with certain animal or vegetable fubtances; and witb thefe the co-lour-maker will be principally converfant.

It is a common obfictation in chemittry, that acids Efects of. mixed with blue vegetable jaices turn them red, and scids and alkalics green. It is equally certain, though not fo alkalies on generally known, that acids of all kinds genemay tend to heighten red colours, fo as to make them approach to the farlet or the crimfon; and alkalies to darken, or make them approach to blue or purple. Mixed with yellow colours, acids affo univerfally tend to briglaten the yellow ; and alkalies to turn it to an orange, and make it hecome more dull. But though this is very generally the cale, we are not to expect that all acids are equally powerful in this refpect. The nitrous acid is found to heighten the mott of any, and the marine acid the leaft of the mineral ones. The vegetabic, as might be expected, are kefs powerful than the minetal acids. Thus, if with a tincture of cochincal, either in water or © pirit of wine, is mixed the pure nitrons acid, it will change the colour to an exceeding high orage or fame colour, which it will impart to eloth. If the vitriolic acid is ufed, a full farlet, inclining to crimfon rather than orange, is produced. With marine acid a true crimfon colour, bordering on purple, is the confequence. Alkalies, both fixed and volatile, change the colour to a purple, which is brighter with the volatile than the fixed alkalies.

3
Here it is covious, that whatever colours are pro- Permancin duced by the mixtures of different fubflances together, cy of cothe permanency of thele colours can only be in pro- what deter potion to the ability of fuch mixtures to refilt the mined. weather.

## CO $1 .\left[\begin{array}{lll}155\end{array}\right]$ () O 1.

colow- weather. Thons, fuppofe a high fondet or onarge colour is prohluced by mans of fuirit of nitre, it is plain that, was fuch a colone expofed to the air, it comble remain no longer than the fpirit of nitre wisch produced it remained. In poportion, therefore, as the firit of nitre was exhaled into the arr, of othersine dethoyed, it bohoved the colons to fade, and at latt to be watlly defroyed: and thas, in proportion to que dentructibnity of the fubtances by which colu:rs ane produced, wit be the ditpoftion of fuch coluars bo fule, or the contrart. In this refpect allsties atre much more deltricthbe than atids, and contequently bele proper for the preparation of colours. With regard to acids, the nitrous feems mold dedrufilile, the vitrinlic lefs fo, and the marine the leall of all. From the cathome fixity of the phorphorine acid and fedative falt, perhaps they might bo of lervice in pretorsing colomas

As atl colours, whether derived fom the animal or vegetable kiaguon, mate be extacked cither by pure water or fome other liend mentrum, they cannot he ufed for the purporss of panaing till the columing fubtance is unised with fome early on fide rater, capable of giving it a bor's, as the workmen call it; and according to the nature of this fobbernee, the enlout will be tranparent or otherenic. This balis ought to loe of the mot fixed and dnable nature; unalterable by the weather, by acide, or ty alkaties It ought alfo to be of a pure white cosorn, and cafty reducible into an impapable powdu. Fur this reafon all earthy hibfances ihomld be avciued as buing acted upon by acids; and thereture, if any of thate were added to heighten the culou, they wonld not fail to be deftroyed, and their effect totally lofl. Precipitates of lead, bifmuth, \&ee though excerdimery fine and white, vught alfo to be avoided, as being apt to turn the mont in preference to all whore, is caln of tin, prepared roper batis either by fire or the nitrous acid. This is to exceedincly refraceny as not only to be unaltenable by alkalies, acids, or the fun and weather. blat even by the focus of a very large bunning mirror. It is befides white as fnow, and capable of being reduced to an extreme degree of finenefs, infomuch that it is made ufe of for polifinger metaline fpeculums. For thefe reafons, it is the moll proper balis for all fine co-

II selead moft memioned under the article Chimestry, $\mathrm{n}^{\circ} 702$, will rojer for anflier sery well. It hath a very throng body, i. e. is :oarfe ores very opaque, and will cover well; may be eafly gromed fine, and is much lefs apt to turn black than white lead; it is befides very chap, and may be prepared at the fmall expence of 3 d . per poumd.

If what we have jult now oblerved is attended to, the general method of extracting colours from any vegctable or animal fubllance, and fixing them on a proper bafes, mal be very cafily umdertood. For
ter mult be evtraced with fpirit of win. without leat. When time farit is fuficiently imporgated, it is whe praned lo hate and litue apon the colv, mbbing it constanty, in order to ditribute the colour equally througlall parts of the calk. She fpirt foon evarorates, and leares the cols coluned with the cochinas. Nowe of the tincture is then w! a pourd on, robbing the misture conllamly as bones and thus, wilh proner mantroment, in ty very isautiful colours, not inferior to the bett carmine, bi prepared at a molerate expence. If, inted of cocinmeal, we fubtitute brazilwowd, tumbric, logwond \& \& diferent kinds of red, ycluw, and purple, will he produced. For the conrfer colomes, aquents decoctions are to he uled in at fimila manore; only as the fe are marb lunger of exaporating than the pigit of wine, very liate inult be proures un at a time, and the coloners ought to be made ir lavee cruantity, on acemont of the tedionfinefs of the procetis.

 ent colsu:s; but by cmbming the acils with alka- kmils of liso, earths, or metals, the fe effict. may be raried dits. almoll in intistan: neither is there any rate ret laid duwn b, which we earn julse a pront of the changes of coloar that will happen on the abmixture of this or that particular fale with any colonsins fabitance. In gencral, the pelfort montrils act wakly; the imperfeet once, ofpecially thofe formed frus metals, much mone protrally. Ahm and fal ammonice confiderably beishten the colser of cochincal, bazil, tumeric, fullic, mader, logwoud, \&e. The dame thines is done, though in a lefs degree, loy comanon fidt, Glauber's holt, firmetre, and maty obleer neatral: Sulations of ioun in all hee acids thike a thack whth every one of the above-mentiond foblames; and likewife with fumach, galls, and other ahmoments. Solutions of lead, or faccharum fatum, miserfalls: debate red cuicurs to a dull paple. Solation of copper changes the parple colour of logwood tor a pretty grood blue; ans, in general, flations of this mital are friendly to blue colours. The effects of folutions of geld, filver, and mercury, are net fo well known ; they feem to produce dark condours of no great beauty. The molt powerinl fu'ution, how- if ever, with regard to a great nun her of colours, is emthemate that of tin, made in aquaresia. Hence we may fee puwerim. the fallacy of $M 1$ Deldval's hypotheff conceminir colours *, that the leald refrangible ones are produced - See Gorso by the mof denfe metals: for tin, which hath the leatt wiens, denfity of any metal, hath yet, in a thate of folution, $n^{\circ} S_{\text {. }}$ the molt extraodimary efects upon the lealt refangille colours as wall as thole that are moft fo. The colour of cochineal is changel by it into the mort beatifnl foarlet; a fimila: change is made upon the colouring matter of gran itc. Brazil-wood is made to yield a tine purplith crimfon; logwood, a beatiful dark purple; turneric, futic, weld, and all yellowe colouring woods and thurers, are made to comminicute colours far more beautiful than ean be erot from them by any other method. The blec colver of the !lowers of violets, eye-bright, inis, axe. are haghtened for as to equal, if not eacel, the blue protucal by a fulution of copper in volatile alkali. In. Wher, this folution fems to be of much mose extentive ufe in colouromaking, this purpofe, a quantity of calx of tin is to be procured in proportion to the quantity of colour defired. This mut be well rubbed in a glafs mortur, with a dittle of the fubllance defigned for brightening the co. lour, as alum, cream of tartar, fpirit of nitre, \&c. after which it muft be dried, and left for fome time, that the union between the two fubltances may be as perfect as poflible. If the colour is to be a very Tae one, fuppole from cochineal, the colouring mat-

## C O L [ 156 C C O

crour. making.
when 1 roperly applied, than any thing hitherto thought of. It is not, however, univerfally ferviceable. 'lhe colour of makder it totally deftroys, and likewife that of fal-fower, changing them both to a dull orange. It likewife fpoils the coluur of archil; and what is very remarkable, the fine red colour of tincture of rofes made with oil of vitriol, is by folution of tin changed to a dirty green.

The moft important confideration in colour making is to make choice of firch materials as produce the moll durable colours; and if thefe can be procured, an ordiary colour from them is to be preferred to a bricht one from thufe which fade fooner. In what the diffrence confits betwen the colours that fade anel thole which do not, is not known with any begree of certainty. Firom fome appcarances it wotkd feem, that thofe fubtances whichare mot remarkable for keeping their colour, contain a vifcuns glutinous matter, fo combined with a refinous one as to be foluble both in water and fpirit of wine. 'The moft durable red colour is prepared from gum-lae. This is very ftrongly refinous, though at the fame time fo far glutinous, that the coluuring-matter can be extraeted from it by water. Next to gum-lac are madder roots and cochineal. 'l'he madder is an exceedingly penetrating fubtance, infomuch that, when given to animals along with their food, it tinges their honcs of a deep red colour. Its colouring-matter is foluhle both in water and fpirit of wine. Along with the pure red, however, there is in madder a kind of vifoous afringent fuhlance, of a dark brown colour, which feems to give the durability to the whole. The colouring-matier of coclineal, though foluble both in water and foiris of wine, is very tenacious and mucilaginous, in which it bears fome refemblance to the purnura of the ancients, which kept its colour exceedingly well. Where the colours are fugitive, the tinging fubitance feems to be too refmons or too mucilaginuts. Thus the colours of brazil, thmeric, \&ce are very refinous, efpeciaily the latter; infommeh that the colouring-matter of turmeric can farcely be extracted by water. Both thefe are perifhahle, though weantiful colours; and much more are the red, purple, and blue flowers, commonly to be met with. Thefe feem to be entirely mucilaginous withont the leat quantity of refinous matter. The yellow flowers are different, and in general keep their colour pretty well. Whether it would be poffible, by adding occafionally a proper quantity of gum or relin, to make the fugitive colours more durable, hath not yet been
r6
Mr Hellor's method of improving the durabl lity of bra zil-wood.

Picprira-
tus of dif. ferent cusours.
pended upen for enablihing a general theory of co-lour-making, we fhall now proceed to give an account of the different pigments generally to be met with in the colour-fhops.
t. Blark. 'Thefe are lamp-black, ivory-black, bhe' 18 black, and Indian-ink. The lirft is the binelt of what blak. are called the foot-hlacks, and is more ufed thm any other. Its preparation is deferibed in the Swedifh Tranfactions for the year 1754, as a procefs dejendient on the making of common redin: the impore relinous juice collected from incthons made in pine and lir trees, is builed down with a little water, and thaneal whilt hot through a bag: lice dregs and pteces of bark left in the ftrainer are burnt in a low oven, from which the fmoke is conveyed through a luns paftage into a fquare chamber, having an opening on the tup on which is a large fack made of than woolien Atuff: the lout, or lamp-black, coneretes partly in the chamber, from whence it is fwept out once in two ar three days, and partly in the fack, which is now and then gently ltruck upon, buth for haking down the foot, and for clearing the intertices betwist the threads, fo as to procure a fufficient draughe of air through it. In this maner lamp-black is prepared at the turpentine houfes in England, from the dregs and refufe of the retinous matters which are there manufactured.

On this fubject Dr Lewis hath fome curious obfer- Dr 19 vations. "The foot (fays he) aniting ia commonobervachimneys, from the more oily or relinous woods, as the tions. fir and pine, is obferved to contain more difloluble matter than that from the other woods : and this diffoluble matter appears, in the former, to be more of an oily or refinous nature than in the latter; fipirit of wine extracting it molt poweafully from the onc, and water from the other. The vilynefs and folunility of the foot feeming therefore to depend on thofe of the fubject it is made from, it has been thought that lampblack muft poffefs thefe qualities in a greater degree than any kind of common foot. Newerthelefs, un examining feveral parcels of lamp-black, procured from. different thops, I conld not find that it gave any tincture at all, either to fpirit or to water.
"Sufpecting fome miltake or fophiltication, or that the lamp-back had been burnt or charred, as it is to fit it fur fome particular ufes, I prepared myfell fome foot from linfeed ol, by hanging a large copper pan over the flame of a lamp to receive its lmoke. In this manner the more curious artills prepare lamp-black for the nicer purpofes; and from this collection of it from the flame of a lamp, the pigment probably received its name. The foot fo prepared gave no tincture either to water or to fpirits, any more than the common lamp-black of the hops. I tried different kinds of oily and refmous bodies with the fame event ; even the foots obtained from fifh-oils and tallow did not ap. pear to differ from thufe of the vegetable-oils and refins. They were all of a finer colour than the lamp. black commonly fold.
"Some foot was collected in like manner from fir and other woods, by burning fmall pieces of them nowly under a copper-pan. All the foots were of a decper black coluur than thofe obtained from the fame kinds of woods in a common chimmey; and very little, if at all, inferior to thofe of the oils: they gave only

Colour. making.

Colour a juf difcernible tincture to water and fpirit, whide making. the foots of the chimncy imparted a ftrong deep one to both. The fout of mineral bitumens, in this clofe way of burning, appeass to be of the fame qualitics with thofe of woods, oils, and refins: in fome parts of Germany, great quantitics of good lanp-black are prepared from a kind of pit-coal.
" It appears, therefore, that the differences of foots do not depend altogether on the quadities of the fubjects, but in a great meafure on the manner in which the fubject is burnt, or the foot caucht. The foots produced in common chimneys, from different kinds of wood, refinous and not refirous, dry and green, do not differ near fo much from one another; as thofe which are produced from one kind of wood in a common chimney, and in the confiaed way of buraing abuve mentioned."

Ivory-black is prepared from ivory or bones burnt in a clofe velfel. This, when finely giruad, forms a more beautiful and deeper colour than lamp-black ; but in the common methods of manufacturing, it is fo nuch adulterated with charcoai duft, and fo grofsly levigated, as to be unfit for ufe. An upaque deep black for water-colours, is made by grinding jvory-black with gum-water, or with the liquor which fettles from the whites of eggs after they have been fuffered to fland a little. Some ufe gum-water and the whites of eggs tugether, and report, that a frall addition of the latter makes the mixture flow more frecly from the pencil, and improves its gloflinefs. It may be obferved, however, that though ivory-black makes the deepeft coloar in water as well as in cil-painting, yet it is not on this account always to be preferred to other black pigments. A deep jet-black colour is feldom wanted in painting ; and in the lighter fhades, whether obtained by diluting the black with white bodies, or by applying it thin on a white ground, the particular beauty of the ivory black is in a great meafure loft.

Blue-black is faid to be prepared from the burnt flalks and tendrils of the vinc. Thefe, however, the colour-makers feldom give themfelves the trouble of procuring, but fubftitute in its.place a mixture of ivoryblack and the common blue wfed for clothes.

Indian-ink is an excellent black for water-colours. It hath been difcovered by Dr Lewis to conlilt of a mixture of lamp-black and cemmon gluc. Ivory-black, or elareoal, he found to anfwer equally well, provided they were levigated to a fufficient degree of finenefs, which indeed requires no fmall trouble.
2. White. The white colours cummonly to be met with are, white-flake, white-lead, calcined harthorn, pearl-white, Spanifh-white, egg-fhcll white, and magithery of bifmuth. The flake-white and white-lead are properly the fame. The preparation of the former is kept a fecret ; the method of preparing the latter is deferibed under Chemestry, n- 875. Thefe are the only whites that can be ufed in oil, all the reft being tranfparent unlefs they are laid on with water. Calcined larthorn is the moft ufful of the carthy whites, as being the leat alkaline. Spanifh-white is only finely prepared chalk. Pearl-white is made from oyfter-fhells; and egg-hell white from the thells of eggs. All thefe, by their attraction for acids, muft zeceflazily deftroy fich colours as have any acid or
metallic falt in their compofition. The magitery of bifmuth is apt to turn black, as are alfo Rake-white and white-lead, when ufed in water. The white precipitate of lead recommended under Chmostry, $n^{\circ} 703$, is greatly fupcrior as a water-coluur to all thefe; being perfectly free of any alkaline gualty, and not at all apt to lofe its own colutir, or to injure that of other fubtances.

Colour. making.
3. Ked. The red colours ufed in painting are of g ed $\mathrm{cos}^{24}$ two forts; viz. thofe which incline to the purple, and luns. fuch as are of a fall fanket and tend rather to the orange. The firt are carmine, lake, rofe-piuk, redochre, and Venctian-red. The fecord ase vermilion, red-lead, fearlct-ochre, common ladia-red, Spanith brown, and terra di Siena, burnt.
We have alrcady ( $\mathrm{n}^{\circ}$ 22.) laid down fome generak rules for the preparation of carmine and lake. Particular receipts have been delivered with the greatelt confidence for making thefe fine colours; but all of them muft neceffarily prove ineffectual, becaufe an eathy batis is recommended for ttriking the eclour upon: from the principles of chemiltry, however, we are certain, that if aquafort:s, or folution of tin, is made ufe of for brightening a colour made with any earthy balis, it muft infallibly be deltroyed by that batis, by reafon of its alkaline quality. Carmine is the brightelt and moft beautiful red colour known at prefent; the belt comes from France. Lake diters from it in bcing eapable of mixture with oil; which carmine is not, unlefs with great difficulty. The former is alfo much more inclined to purple than carmine. This laft quality, however, is reckoned a defect; and accordingly, the more that lake approaches to the fearlet or true crimion, the mure it is salucd. On dropping folution of tin into an aqueous tincture of braza-wood, a beautiful precipitate falls, of a purplifl crimfon colour. This may be very well fubtituted in place of the dearer lakes on many occalions.

Rofe-pink is a very beautiful colour, inclining more to the purple than fearlet. It feems to he made of chalk, coloured with a decoction of brazil-wood, heightened by an alkaline falt; for which reafon it is execedingly. perifhable, and but little efteeneed. The culour might be made much more durable as well as better, by amploying for a bafis the white precipitate of lead aborementioned, and brightening it with folution of tin.

Red ochse and Venetian red differ in nothing fromthe coleothar of vitrind well calcined. The calues of in, may be made to appear either purplith, or inclining to the fearlet, accurding to the namer in whichthe calcination is performed. If the matter is perfectly deprived of its phlugillon, and frobjected to an intenfe fire, it aloways turns out red: but the mixture of a fmall quantity of inflammable maticr gives it a purplifh calt. Hence valious paints are kept in the thops under different names, which $y \in t$ differ from each other only in the flight circumflance above mentioned: and fuch are the fearlet-ochre, Spanith-brown, and terra di Siema burnt. It is remarkable, that the calces of iron never fhow their colour till they become cold. Colcothar of vitriol, while hot, always appears of a very dark dutky purple.

Of the preparation of vermilion and red lead, an account is given under the article Chemistry, no 1213, 14c4. 'Thefe are very durab.e culuare, the lirlt is the

Cintr

$\qquad$
fed uha in oil painting, but does not anfwer well in water; the other is rather an ore nge ; and, like otler prepations of lead, is in fome cafos apt to tura black.
Orate co 4. Orange. The only true orange-coloured rains tnes. are red orpiment and orange lake. The fint is a fub. limate formed of arfenic and fulphur: the other my be preparid from turmeric infufed in firit of wine, having its colour ftruck upon calx of tin, and brightened by a folution of that metal. All the thades of omange, however, may be extemporancounty prepated by mixing red and jellow colonrs together, ia due proportions.
5. Tellan. The yellow paints molt commonly in ufe are, king's-yellow, Naples-yellow, Dutch-pink, Englifh-pink, mafticot, common orpiment, yellowochre, teria di Sienna unburnt, and Tuntith-mineral.

Kings-yellow is evidently an arlenical preparation. Its cclour is exceedingly beautiful, hut apt to fade; on which account, and its great plice, it is feldom ufd.

Naples.yellow was for a long time thought to be a preparation of arfenic, but is now difcovered to have lead for it bifis. It is therefore aje to tum black and lofe its colour, which males it the lefs valuahle. It is neverthelefs ufed in preference to kiag's-yelhow, on account of its inferionity in price. This colour is particularly liable to be fpuld by iron when moilt, and therefore fhould never be tonched by that metal malefo previoufy ground in oil.

Dutch-pink is faid to be prepard by triking the culour of yellow berries upon finely levigated chalk. But of this there is great reafon to doubt; the batis of Dutch-pink feems much more hard and gritty than chalk, and its colour mone durable than thofe Itruck upon that earth whally arc. Very good jcliows may te prepard with the white precipitate of lead, formorly memticned, by ufing cither yellow berries, futtic, or any ohther fubfance capable of yielding that colour. Englim pink is paker than the Dutch, and keeps its chlour grataly womfe.

Mallicot is prepared by calcining white-lad till it aTumes a yollowin colour. It is net apt to chanse, but the colour is fo dall that it is fiduan ufed either in oil or water.

Common orpinent is a pretty bright greenino-yellow, prepard by fuhliming arfenic will fulphur. Its naufeons fmell, which is greatly increafed by grinding in oil, makes it tery difagreable; nor does it keep its colour for any length of time. That kind of orpiment leatl inclined to green is to be preferred for the purpofis of painting.

Yellow-ochre and terra di Sienna, are fermginous eaths, capabie of becoming itd by calcenation. Green witriol precipitated hy lime may be advantagcount fubfituted to sither of them. Sie Chemistry, $n^{\circ} 699$.

Turbith mineral is but little ufed in painting, though its fine yellow colour feems greatly to recommend it. This preparation is in all probability very durable; and houid feem there fore worthy of a prefience either to king's or Napies y cllow. The method of preparing it is defubud under Chimestry, no 705.

Gamboge is a paint that can only be ufed in water, and is the moll common yellow made ufe of for co-
louring maps, \&c. but for this it is not very proper, being neither quite tranfparent, nor very durable.
6. Grese. The only fimple green colour that hath a toleabice derree of brichtnefs is verdigreafe, or pre- 27 parations of it. This, however, though a very beau-lours. tiful culour, is far from being durable. It is improved in colour, though not in durability, by diffolution and cryitalization in dilllled vinegar; in which fate it is calted diffilled verdigreafe. A more durdble watercoluur is made by difolving the verdigreafe in cream of tartar, or rather the pure tartarous acid; but in oil this is found to be equally fugitive with the verdigreafe itfclf. For an account of thefe preparations, fee CheMistry, $\mathrm{n}^{\circ} 894$.

Compound greens are either made of Pruffan or fome other blue, mixed with ycllow; but in whatever way thefe colours can be compounded, the beauty of the green produced is greatly inferior to diltilled, or even common, verdigreafi. The tartarous folution of verdigreafe, mixed with a little gamboge, is the bert tranfparent green water-colour we have had an opportanity of try ing; and a mixture of Pruflam-blue and turbith-mineral is prohably the beft opaque one.

Sap-green is a fimple colour, but cesceedingly inferior to dililled verdigreafe, or even to the tartaruas fulution of vordigreafe with gamboge. It is prepared from the juice of umipe buckenom Lerries evaporated to the conflence of a grm. Its green colour is gratly. inclinad to yellow. A kind of conapumd green has been fometimes ufd, called Pruffun-green, which contilts only of Pruifian blue and y ellow-ochre. It has no beaty, nor is it durable. It is prepared as l'ruf-fian-bluc, only not pouring on any fpirit of falt to diffolve the colireous fediment which falls at the fame time.

Another green fometimes ufed is called terra verte. This is a native earth. probably impresnated with copper. It is of a bluith green colour, much of that taint called fea-gicin. It is erritty, and therefore mult be well levigated before it is ufed. Its colour is durable, but not very bright.
7. Elue. 'The bhe colours are ultramarine, Pruf fan-blue, verditer, finalt, bice, and indigo Of the mue ca the ultramarine is the finet, but its great price hin. ecrs its being much ufed. It is a preparation from lapis laruli ; is an exceeding bright colour, and never fades with whatever tubtance it is mixed. It is now, however, in a great meafure fuperfeded by Prufian thue, to the difadrantage of painting in general; as Pruflian blue, though tery beautiful, is far from being durable. For an account of its preparations fee the artide Ultramariee.

The procefs for making Prufian blue is deferibed, and its nature fully confidered, under Сhemistry, no 1103 : for that it is fufficient here to obferve, that Prufilan biue is to be accounted of the bert quality when it is deep, bright, and not inclined to purple. It ought to be tricd by misture with white lead, as the bightnefs of the colour will appcar much more when diluted than when concentrated in the lumps of the blue itfulf.
The preparation of blue verdites is kept a fecret, and the beft chemitts have been puzzled to find out the method. The culuur is exceedingly bright, and has a

## CO 0 [1;0] CO

Colorr- confiderable tinge of green. A methoch of preparing nakine. a colour equally beautiful, and agreing in alt refpets with what is fold in the hoons, exeent that of efervefcing with acids, we lose fomal to be follows:
 has athamed a very decp blue eohn ; and the decper this colour is, the fince will your veliter ber. When the menttroum bas diffolved as much of the metal as it can take up, it is to be poured out into a broad anal wel! glazed earthen pan, hold over a roy gentle fine; and from the moment it is put on the liguor is th be continually agitated with a wooden foatuli, fo that the liquor may be heated as equally as pofitble. The whole fecert confils in prozerly regulating the derere of heat ; for if it exceeds the due proportion ever [in little, the verditer will turn out of a dirts' green. 'lye proper degree is about $90^{\circ}$ of Fahrenheit's themometer. In this gentle heat the alkali flowly evaporates; and in proportion to its duing fo the verditer falls to the bottom. After it is once formed, ficed from the alkaline liquor, and dried, it can bear the affufun of boiling water without the latt injury. Dr Prietley, in his fisth volume, takes nutice, that folution of conper in volatile alkali affords a blere preciuitate by heat, but without taking notice of the requilites for its fuccefs. In makins this preparation, it is necetlary to diffolve copper in its metallic fate; for the folution of any caly will not yield a blue but a green colour. This colour is durable in water, but diffolves in oil, and has them all the inconveniences of verdigreafe above mentioned.

Smalt is chafs-coloured with zafice, a preparation See zafrefrom cobalt ${ }^{*}$. It is cumataly fo coufly powdered d Smalk that it cannot be ured in jainting, and its texture is fo hard that it cannot eafily be levigated. Its culvur is exceedingly brinht and amable; fo that when finely levigated it is ufed intead of utumarine. The mont proper materials for levirating this fubfance feem to be the plates of M. Reammers porcelain recommended by Dr Lewis. See Chemistry, no 502, 509. Fur the preparation and qualities of bice, lee the articies Ärmenus Lapis and Bres.

Indigo is but little ufed in painting either in oil or water, on account of the dulneis of the colour. It requires no other preparation thin beiner wathed over. Its goodnefs is known by the darknefs and brightnefs of the colour. See Indigo.
8. Purple. The only fimple colour of this hind ufed at prefent is colcothar of vitriol. A beautiful purple lake may be prepared from logwood by means of folution of tin ; but this method of preparing colours is very little known as yet.
9. Prown. The brown cuicurs are, hiftre, brownochre, Culogne-earth, umbre, and brown-pink. Under the article Bistre is given a procefs for making that colour, by infufing foot in water, pouring off the tincture, and then evaporating it to an extract; but Lr Lewis is of opinion, with Mr Landois in the French Encyclopidie, that the foot is either boiled in water, or ground with a little liquid of fome kind into a fmooth pafte; it is then diluted with more water, and after flanding for about half an hour till the froffer fubflance of the foot has fettled, the liquor is poured off into another veffel, and fet by for two or three days, that the finer parts may fall to the bottom, and this

Fine matter is the bifle. This is a very urofnl colo:ar in water, being crocediasly far, darable, and not apt to fonil any other colours with which it is mincd. "Ihe loown pink is hide to combil of chalk tim red with tie

 ufed. The oiher browns are a hime of ociowas earths; for a defoription of witub foc their froper articles.

from infulions of atringent versetables miked with Blacl: from green vitiol. is produced a derp black liquor of rery atritgeres.
 duce the depenthack are gallis and logrovod. When ing. a decention or infufion of the galls is dropped into a folletion of the vitrin! largely diluted with water, the tist irops produce bluth or purplith red cionds, which from mingling with the liquor, turn it uniformly of their own colonr. It feems to be on the quality of the water that this difference in the culour depende. With difilled water, or the common foring-waters. the mixture is always blue. If we previnatly diflolee in the water the mat mingte quatity of any alkaline falt, tou limall to be difoovered I $y$ any of the common meas by which waters are wfoully tricd, of if the water is in the lant fatrid, the coloar of the minture proves purple or reddith. Rain-watcr, cauglat as it talls from the chouds in an epen fich in clean glaswhels, cises a blue; but fimh as is collected from the tups of the houfer, grows parple with the mixtare of vitrid and galls: from whence it may be prefuned, that this lat has contracted a putrid tendency, or received an alkaline impregnation, though fo fight as not to be fenfible on orter ways of trid.
both the purple and blue liquors, on adding more of the allingent infufion, decpen to a black, more or lefs intenfe according to the nature of dilution: if the mixture proves of a deep opaque blacknefs, it argisa heromes bluif or puplifh when further dilutal. If fuffered to fland in this diluted fate for two or three days, the coluning matter feities to the bottom in form of a fine black mud, whish by flighty fhaking the vaffel, is diffufed again through the liquor, and tinges it of its former colour. When the mixture is of a fill blackncfs, this feparation dues not happen, or in a far lefs degree; for though a part of the black matter peccipitates in flanding, yet fo much remoins difo folved, that the liquor contimues black. 'This fufpenfon of the colouring fubltance, in the black liquid, may be attributed in past to the gummy matter of the aftringent infulion incerafmg the confiltence of the watery fluid; for the leparation is retarded in the diluted mixture by a fmall addition of gum Arabic. If the mixture either in its black or diluted fate $\mathrm{i}_{3}$ poured into a filter, the liquor paffes through coloured ; only a part of the black matter remaining on the filter. The filtered liquor on ftanding for fome time becomes turbid and full of fine black tlakes: being

## C O I [ 160$] \quad$ C O I.

Cal ur- freed from thefe by a fecond filtmation, it again puts making. on the fame appearance; and thus repeatedly till all the colouring parts are feparated, and the liquor has become colourlefs.

Dr Lewis, from whofe Philofophical Commerce of Arts this account is taken, further informs us, that this colouring matter, when feparated from the liquer and dried, appeared of a deep black, which did not feem to have fuffered any change from the air by expofure for upwards of four months. Made red-hot, it glowed and burnt, but did not flame, and became a rully brown powder, which was readily attracted by a magnetic bar; though in its black ftate the magnet had no action upon it. The vitriolic acid, diluted with water and digefted on the black powder, diffolved the. Ereatell part of it, leaving only a very fmall quantity of whitifh matter. Solution of pure fixed alkaline falt diffolved very little of it : the liquor received a reddifh brown colour, and the powder became blackifh brown. This refiduum was attracted by the magnet after being red-lot, though not before: the alkaline tincture, paffed through a filter, and mixed with a folution of green vitriol, truck a deep brownifh black colour, nearly the fame with that which refults from mixing with the vitriolic folution, an alkaline tineture

34
Black from a combina. tion of $0-$ ther cos lours.
of galls.

It hath allo been attempted to produce black from a combination of other colours; as green may be produced from a mixture of blue and yellow. Mr le Blon, in his Harmony of Colours, gises a method of forming black, by mixing together the three colours called frimitize, viz. blue, red, and yellow; and Mr Caltel, in his Optique des Coulours, publifhed in $17 \% 0$, fays that this compound black has an advantage, in painting, above the fimple ones, of anfvering better for the darkenirg of other coluurs. Thus, if blue, by the addition of black, is to be darkened into the colour called llue-black, the fimple blacks, according to him, if ufed in fulficient quantity to produce the requifite deepnefs, conceal the blue, while the compound blacks leave it dittinguifhable. Le Blon does not mention the proportions of the three culours neceffary for producing back. Callel directs 15 parts of blue, tive of red, and three of y fllow; but takes notice, that thefe proportions are rather fpeculatively than practically jalt, and that the eve only can be the truc judge; our colours being all very imperfect, and our pigments or other bodies of one denomination of colour being rery unequal in their degree of intenfity. He obferves, that the pigments hould all be of the deepent and darkell kind: and that, inftead of taking one pigment for each colour, it is better to take as many as can be got ; for the greater difoord there is of heterogenoous and difcordant drage, the more true and beautiful, he lays, will the black be, and the more capable of uniting with all other colours, without fuppreffing them, and cren without making thom tawney.

Dr Lewis acquaints us, that by mising different blue, red, and yellow colcurs, he has not been able to produce a perfect black; but has often obtained from them very dark colours, fuch as may be called browinblucks, or grey-hacks; fuch as we commonly fee in the dark parts of paintings, and fuch as the charcoal and foot blacks appear when dituted a litte. The ingre$\mathrm{N}^{\circ} 84$.
dients beior cach of a dark deep colow is a rery neceffary condition; for biorlat blues, bright reds, and brieht yellows, mixed in fuch proportions that acither colmer presaled, prodused only a grey. In effect, all compontions of this kind, phyfically confledered, cane be no other than greys, or lome of the intermediate teints between whitends and danknefs; and thefegreys will be fo much the lighter or darker as the compoponent colours of themfelves are bright or dark.

With regard to the extraction of the colouring matter from the different kinds of vegetables commonly to be net with of all coluurs, this would certainly be a very vatuable acquiftion, could the coluurs fo procured be made durable. On this fubject nothing hath yet appeared more fitisfastory than what is delivered by Dr Leewis in his notes on Neumann's chemultry. His obfervations are curious, but promife very little fuccefs to any who thall attempt to fix thefe vegetable colous.
"Among the infinite variety of colours (fays he), which glow in the flowers of plants, there are very few which have any durablity, or whole fugitive w . beauty can be arrefted by art, fo as to be applied to colours.

Colournuaking. any valuable purpofes. The only permanent ones are the ycllow, the red, the blue; and all the intermediate fhades of purple, crimfon, viokt, \&c. are extremely perifhable. Many of thele flowers lofe their colonrs on being bartly dried; efpecially if they are dried flowly, as has been ufually directed, in a fhady, and not warm place. The cclours of all of them perith on keeping even in the clofelt veffels. The more hatily they are dried, and the more perfectly they are fecured from the air, the longer they retain their beaty. The colouring matter extracted and applied on other bodies is ftill more perifhable: oftentimes it is changed or deltroyed in the hands of the operator.
" The colour of many bhe flowers is extracted by infufion in water; but there are fome from which water gains only reddifb, or purplith blue. Of thofe that have been tried there is not one which gives any blue tince ture to ipinituous licpuors: fome give no colour at all, and fome reddith one. The juice preffed out from the freth flowers is for the mof part blur. The blue juices and iafuhons are changed red by all acids. The marine acid feems to llrike the motl llorid red. The flowers thembelves, macerated in acid liquors, impart alfo a deep red tincturc. Alkalies, both fixed and volatile, and lime-water, change them to a green. Thofe infufions of the juices which have nothing of the native colour of the flowers, fuffer the fame changes from the addition of acid and alkaline liquors : even when the fluwers have been kept till their colour is loult, infuitons made from them acquire till a red colour from the one, and a green from the other, though in a lefs degree than when the flowers were fredh. The red colour produced by acids is fearcely more durable than the original blue : applied upon other bodies and expofed to the air, it gradually degenerates into a faintith purple, and at Jength difappears, leaving hardly any ftain behind. The green produced by alkahes changes to a ycllow, which does not fade fo foon. The green, by lime-water, is more permanent and more beantiful: green lakes, prepared from thefe Huwers bj lime-water, have been ufed as pigments by

Solour- the painter. The flowers of eyanus have been greatly making. recommended, as affording elegant and durable blue pigments; but 1 have never been able to extract from them any blue colour at all. They retain their colour indeed, when hallily dried, longer than fome other blue flowers: but they eommunicate nothing of it to any kind of mentlrum. Infutions of them in watery, fpirituous, and oily liquors, are all of them more or lefs of a reddifin eall, without any tendency to blue. Alum, which is faid to heighten and prefere theiblue colour, changes it, like that of other bhe llowers, to a purplifa red; acids to a deep red; alkalies and line-water to a green ; folution of tin added to the watery infution, turns it of a fine crimfon; on ftanding, a beautiful red fecula fubfides, but it lofes all its colour by the time it is dry. The watery infulion, infpiffated to the contiflenee of an extract, appears of a dark reddih brown: an extract made with rectified fpirit is of a purphith colour. The colour of bothextracts fpread thin and expofed to the air quickly fades. The fowers employed in thefe experiments were thofe of the common bluc-bothe of the cornficids.
" Red fowers readily communicate their own red colour to watery mentrua: among thofe that have been tried, there is not one exception. Thofe of a full red colour give to rectified fpirit alfo a deep red tincture, brightce, thoughi fomewhat paler, than the watery infufion: but the lighter red flowers, and thofe which lave a tendency to purplifh, impart very little colour to fpirit, and feem to partake more of the nature of the bluc fowers than of the pure red. Infufions of red flowers are fuppofed to be heightened by acids, and turned green by alkalies, hike thofie of the blue; but this is far from being univerfal. Among thure I bave examined, the rofe-colours and purplith reds were clanged nearly in the fante manner as the blues; but the full decp reds were not. The deep infufion of red puppies is changed by alkalies, not to a green, but to a dulfy purple.
" The colours of $y$ cllow flowers, whether pale or deep, are in general durable. Nany of them are as much fo, perhaps, as any of the native colours of vegetables. The colour is extracted both by water and by fpirit. The watery infufions are the deepelt. Neither alkalies nor acids alter the fpecies of the colour, though both of them vary its fhade, acids rendering it paler, and alkidies deeper: alum likewife combiderably heightens it, though not fo much as alkalies. An infulion of the fiowers, made in alledine ley, precipitated by alum, gives a durabic yellow lake. In fome of the deep reddih yclow, or orange-coloured flowers, the yelow matter feems to be of the fane kind with that of the pure ydlow fowers, but the red to be of a dificrent kind from the pure red ones; watery menftrua take up only the yellow, and leave the red, which may afterwards be extracted by rectified fipit of wine, or by water acuated by fixed alkaline falt. Such particularly are the faffon-coloured flowers of carthamis. Thicf, after the yellow matter has been extracted by water, are faid to give a red tincture to ley; from which, on flanding at rect for fome time, a deep bright red fecilla fiubutides; ealled from one of the naves of the plant which produces it, fotforeecr ; and from the countries whence it is commonily brought to Voz. V. Part I.
us, Spanikered, and China-like. This pisment iu- Coborprefuates lpint of wine with a berutiful red tincturs, makieg. but communicates no colour to water. I have crdedvoured to feparate, by the fanc teanment, the red matter of fome of the nther reldith yellow Rower, as thofe of garden matigold, but without fuccels? Ilain water extracted a yellow colour, and alkaline ley extracted afterwards conly a paler yellow: though the digeltions were continued till the fowers had loft their colour, the tinctures were no other than ycllow. and not fo deep as there obtained from the parc ye low fowers. The little yellow fofenli, which in fome kinds of flowers are collected inte a compat round dife, as in the duify and corn-marigold, ages. fo far as they have been examined, with the expanded ycllow petala. Their colour is affected in the fam. manner by acids, by alkalies, and by aham: and cqually extracted by water and by fivit. Put the yet low farina, or fine dut, louged on the tips of the diamina ot flowers, appears to be of a different kink. It gives a fine bright ychow to fpirit, and a dulle: galow to water; the undiflolved part proviag in both cafes of a pale yellowith white. Both the watery and fpirituous tinctures were heightencd by alkaline hguors, turned red by acids, and arain to a deep yallow on adding more of the alkali: I know no vilici vegetable yellow that is turned red by acids.
"White flowers are by no means deflitute of colouring matter. Alkaline lixivia extract from fome of them a green tincture, and change their colourlef; expreffed juices to the fame colour ; but I have not oblerved that they are tumed red by acids. The flowers of the common wild convolvalns or bind-weed, which in all their parts are white, give a decp y dlow or orange tincture to plain water; which, like the tinctures of howers that are naturelly of that colour, is rendered paler by acids, heiglitened a little by ahm, and more confiderably by alkaline falts. The vapours of the volatile vitriolic acid, or of burning fulphur, which whiten or deftroy the colour of the coloured flowers, make no change in the white.
"The red juices of fruits, as currants, mulberries, calis, elder-beries, morello, and black chenica, EFi. gentiv lome frote infpifated to drynefs, difulve again amoll totally in water, and appear nearly of the fanc red colour as at firt. Rectified finit extracts the tinging particle's, laving a confiderable portion of mucilagimous matter undiffolved; and hence the fpirituous tincture proves of a brighter eolour than the watery. The red folutions, and the juices themfelves, are fonctines made dull, and fometimes more forid, by acide, and generally turned purplith by akalics. 'Ithe colours of the fe juices are for the moll part perifablle. They refitt, indeed, the power of fermentation, and cominue almolt unchanged, after the liquor has been converted into wine; but when the juice is fpread thin upon other bodies, exficcated, and expofed to the air, tic colour quickly alters and decays: the brieplit livels red changes the foonett: the dark dull red ftain from the juice of the black eherry, is of confiderable darabitit!. The fruit of the American opuntia or prickly pas, the plant upon which the cochineal infect is produed, is perhaps an exception: This bripht red fruit, atccording to Labat, gives a beautifil red dye. Some experiments, bowever, made unon the juice of that

## C O I

Colous makin-
fruit, as brought into England, did not promife to be of any great advantage: but the particulars I cannot now recollect.
" The ripe berries of buckthorn ftain paper of a green colour. From thefe is prepared the fubtance called fop-green, a pisment futficienly durable, readily foluble in water, but not mifcible with oil. The berries dried while grcen, and macerated in alumwater, are faid to yield a yellow pigment; and when they lave grown over ripe fo as to fall off fontaneoufly, a purple one. It is faid that the berry of the helintropiam tricoccum, which grows wild about Moutpelier, Itains paper of a green colour, and that this green turns prefently to a blue: that the common blue paper receives its colour from this juice: and that the red rages called turnfol, employed for colouring wines and other liquors, are tinctured by the fame juice turned red by acids. According to M. Niffole of the French academy of feiences (as quoted by Savary in his Dictionaire de Commerce), the colouring juice is obtained not from the berries, but from tops of the plant grathered in Auguit, ground in mills, and then committed to the prefs. The juice is expofed to the fun about an hour, the rags dipt in it, dried in the fun, moitened by the vapour which arifes duriag the flaking of quickime with urine, then dried again in the fun, and dipped again in the juice. The Dutch and others are faid to prepare turnfol rags, and turnfol in the mafs, from different ingredients, among which archil is a principal one.
"In fome plants, peony for intance, the feeds at a certain point of maturity are covered with a line flining red membrane. The pellicles of the freels of a certain American tree afford the red maffes brought into Earope under the names of annotto, orlcan, and - See An- raucou*. Mr Pott, in the Berlin Memoirs for the year 1752, mentions a very extraurdinary property of this concrete. 'With the vitriolic acid it produces a blue colour, of extreme beauty; but with this capital defect, that all falts and liquors, and even common water, deftroy it.' 'The feecimen of annotto, which I examined, was not fenfibly acted upon by fpirit of vitriol; it received no change in its own colour, and communicated none to the liquor. Nor did any vifible change enfue upon dropping the acid into tinctures of annotto made in water, or in fpirit.
" The green colour of the leaves of plants is extracted by rectified firit of wine and by oils. The fpirituous tinctures are generally of a fine decp green, even when the leaves themielves are dull-coloured, or yellowifh, or hoary. The colour, however, feldom abides long even in the liquor; nuch lefs when the tinging matter is feparated in a folid form, and expofed with a large furface to tbe air. The editor of the Wirtemberg Pharmacopeia obferves, that the leaves of acanthus brankurfine, or bear's-breach, give a more durable green tincture to fpirit than thole of any other herb. Alkalies heighten the colour both of the tinctures and green juices; aeids weaken, deitroy, or change it to a brownih: lime-water improves both the colour and durability: by means of lime, not inalegant green lakes are procurable from the leaves of acanthus, lily of the valley, and feveral other plants. There are very few herbs which communicate any share of their green colour to water; perhaps none
that give a green of any confiderable deepnefs. It is Colourfaid, however, that the leaves of fome plants give a making. green dye to woollen, without the addition of any other colouring matter ; partieularly thofe of the wild chervil, or cow-weed, the common ragwort, and de-vil's-bit. The leaves of many kinds of herbs and trees give a yellow dye to wool or woollen cloth that has been previoufly boiled with a folution of alum and tartar. Weld, in particular, affords a fine yellow, and is commonly made ufe of for this purpofe by the dyers, and cultivated in large quantity in fome parts of Ergiand. There is no colour for which we have fuch plenty of materials as for yellow. Mr Hellot obferves, that all leaves, barks, and roots, which on being chewed difcover a flight aftringency, as the leaves of the almond, peach, and pear-tiees, afh-bark (efpecially that taken off after the fint rifug of the fap in the fpring), the roots of wild patience, Eic. yield durable yellows, more or lefs beautiful according to the length of time that the boiling is continued, and the proportions of alum and tartar in the preparatory liquor: that a large quantity of alum makes thefe yellows approach to the elegant yellow of weld: that if the tartar is made to prevail, it inclines then to an orange : that if the roots, barks, or leaves, be too long boiled, the yellow proves tarniffed, and acquires thades of brown." See the artice Dreing.

Thie moit capital preparations from the leaves of plants, are thofe of indigo and weld; which are both very much ufed in dyeing, though the firlt only in painting.*. Both the indigo and woad plants give see Indig out their colour, by proper management, to water, and Woad. in form of a blue fecula or lake. Mr Hellot fufpects that a like blue fecula is procurable from many other vegetables. Blue and yellow blended together, com- of indigo vegetables. Blue and yellow blended together, com-accounted
pole a green. He fuppofes the natural greens in ve-for. getables to be compounded in like manner of thefe two colours; and that the blue is oftentimes the melt permanent, fo as to remain entire after the putrefaction or deftruction of the yellow. The theory is fpecious, and perhaps jutt : we know of no other that accounts in any degree for the production of the indigo and woad blue. Dr Lewis, lowever, informs us, that he never was able to produce the leaft appearance of either blue or yellow from any of the plants he tried by treating them in the manner ufed for the preparation of indigo.

There are fundry moffes, which in their natural Colours ftate, like the indigo and woad plants, promife nothing from of the elegant colours that can be extracted from them noffes by art. The moft remarkable of thefe is archil; for the preparation of which, and the colours that may be produced from it, fee the article. Linnaus fufpects that there are feveral other more common. moffes from which valuable colours might be extracted: a quantity of fea-mofs, having rotted in heaps on the fhore, he obferved the liquor in the heaps to be as red as blood; the fea-water, the fun, and the putrefaction, having brought out the colour. Mr Falm, in an appendix to linnzus"s paper, in 1745 , mentious two forts of moffes actually employed in Sweden for dyeing woollen red: one is the Lichenoides coralliforme apicibus coccineis of Ray's Synopfis; the other the Lichenoides tartareum, farinaceum, fcutel-

## C O L $\left[\begin{array}{lll}163\end{array}\right] \quad \mathrm{C} \quad \mathrm{O} \quad \mathrm{I}$

Colnur lartm umbone fufco, of Dillenius. This laft is a white masing. and tops of hills. It is thaved off from the rocks af- ter rain, purified from the flony matters intermixed amone it by wafhing with water, then died in the fun, ground in mills, and again wathed and dried: it is then put into a veffel with urine, and fet by for a month: a little of this tincture added to boiling wa. ter makes the dyting colour. In the fame Tranfactions for the year 1754 , there is an acconnt of another mofs which, prepared with urine, gives a beautiful and durable red or violet dye to wonl and filk. This is the lichen foliaceous umbilicatus fubtus lacunenfis, Limn. flor. Suec. It grows upon rocks, and is readily dif. tinguifhable from others of that clafs, by looking as if burnt or parched, confiting of leaves as thin as paper, convex all over on the upper fide, with correfponding cavities underneath, adhering firmly to the tones by a little root under the leaves, and coming afunder, when dry, as foon as touched. It is gathered after rain, as it then holds beft together, and parts eafiett from the fone. In France, a cruftaceous mofs, growing upon rocks in Auvergne, is prepared with lime aad urine, and employed by the dyers as a fuccedanem for the Canary arehil, to which it is faid to be very little inferior. Mr Hellot relates, that he has met with feveral other moffes, which, on being prepared in the fame manner, acquire the fame colonr. The moft expeditions way, he fays, of trying whether a mofs will yield an archil or not, is to moilt. en a little of it with a mixture of equal parts of $\int$ pirit of fal ammoniac and frong lime-water, and add a fmall proportion of crude fal ammoniac. The glafs is then to be tied over with a piece of bladder, and fet by for three or four days. If the mofs is of the proper kind, the little liquor which runs from it upon inclining the reffel, will appear of a deep crimfon colour; and this afterwards evaporating, the plant it Celf acquires the fame colour. Dr $\mathrm{L}_{\mathrm{t}}$ wis informs us, that he has tried a geod number of the common moffes, many both of the cruftaceous and foliacerous kind, and not a few of the fungi; as allo the herbs clanmomile and milfoil, which yield a blue effential oil; and thyme, whofe uil becomes blue by digeition with volatile firits; but never met with any that yielded a colour like archil. Mok of them gave a yellow or reddifh brown tincture. A few gave a deep red colour to the liquor: but, when diluted, it fhowed a yellowith calt, and when applied on cloth it gave only a yellowifh red.

To thefe obfervations we fhall only add, that though, in gencral, the blue colours of fowers are exceedingly perifhable, there feem to be at lealt two exceptions to this rale; for the blue flowers of iris, or flower-de-htee, and thofe of columbine, when treated with folution of tin, yielded a colour tolerably permanemt. Indeed, when experiments are male with a view to extract the colour from any part of a vegetable, it will always he proper to try whether it can bear a mixture with this tolution. If the colour is not deftroyed by it, there is a very great probability that the folution will, by proper management, prelerve, and give a durability to $i t$, which could farce be obtained by any other method. It muft, however, be oblerved, that there are feveral fubftances ufed in colour-
making, which folution of tin cannot bear to be mixed with. Thete are principally fugar of lead and cream of tartar, as well as all the calcarcous earths and alka. line falts. With alum it may be mixed very fafely, and is in many cales the better for it. The roots of plants, however, feem to promife more durability of co. C.lours lour than the upper parts. We have feen a blue co. from roois. lour of confiderable durability and brightnels prepared from the roots of common radifhe; by exprefing the juice, combining it with tobacco-pipe clty, and brightening it with a litele alum. The root of the red beet is alfo faid to yield a durable colour of a beautiful red. inclining to fearlet ; but this we cannot aftimn from our own experience.

Colour. malcing II Colt.

With regard to liquid colours for maps, \&ce. we Colrurs apprehend there can be very little difficulty of pre-for man'so paring all the poffible varieties of them, if what we have above laid down is attended to. The only colour with which there can be any difficulty is b/ue : but the common folutions of indigo in alkalies or acids may be made to anfwer this purpofe, though, on account of their Arongly faline quality, they are not very proper. A very curions method of procuring a beautiful tranfparent blue colour is by extracting the culouring matter from Prufian blue, by means of a caultic alkali. This when laid upon paper appears of a dirty brown colour; but if wathed over with a weak folution of green vitriol, is inftantly changed to a molt beautiful blue. This feems to afford a method of pro. curing blue tranfparent colours of greater beauty than they are ufually met with.-See fpecimens of trandparent colours prepared according to the above rules, on the Cbart fubjoined to History.

COLOURING, among painters, the manner of applying and conducting the colour of a picture; or the mixtures of light and fhadows, formed by the various colours employed in painting. See Painting.

Coltie, fore : and when you carry him in arain to fet him tup, Coluber. take off his fadde gently, clothing him for all the night.

COLTIE, a term ufed by timber-mcrchants, for a defect or blemifh in fume of the anuular circles of a tree, whereby its value is much diminifled.
COLUBER, in soology, a genus of ferpents belonging to the order of amphibia. The chatacters are thefe: they have a number of futa or hand crulls on the belly; and futelle or feales on the tail. Linnxus enumerates no lefs than 27 fpecies under this name, diftinguifhed folely by the number of fonta and fatellic. The moll remarkable are the following.

1. Tlie Vipera, or common viper of the thops, has 118 fouta, and only 22 feuthe. The body is very thort, and of a pale colour, with brownifh fpues; and the head is gibbous, and covered with final! fcales. It is a native of Egypt, and other warm countrices. It has always been remarkable for its poifonous nature ; infomuch that vipers, when numerons, have often been thought the miniters of divine vengeanee, hise the plague, famine, and other national caia nities. A notion alfo prevailed among the ancients, that few or none of the parts of a viper were free from poifun; for which reafon they made no expetintents or difcoveries concerning the nature of thefe creatures. It is now, however, proved, by undoubted experiments, that the poifon of vipers, as well as of all other ferpents whofe bite is hamful, lies in a bas at the bottom of theit two greater teeth or fangs. Thefe teeth are perforated; and when the creatnre bites, the comprothon of the bag forces out a little drop of the poifon into the wound, where it produces its mifchievous cefects. The purpofe anfwered by ihis poifonous liquor to the creatures themfelves, is probably the detlruction of their prey; fur as ferpents frequently feed upon animals of very confiderable magnitude and trength, they would often undoubtedly make their efcape, did not the poifonous juice intilled into the wounds made by the ferpents teeth almoft intantly deprive them of life, or at leaft of all power to truggle with their enemy. For an account of the fymptoms produced by the bites of vipers and other venomous ferpents in the human body, together with the belt methods of cere, fee the $I n$ dex. fubjoined to MEDIrist. After the viper is deprived of thofe bags which contain its poifon, it is entirely harmlefs: nay the fleh of it is highly nutritive, and jufly efteemed a great reftorative. It hath been much recommended in ferophulous, leprous, and other obfirate chronical diforders; but, to anfiver any good purpofe, it mult undorbtedly be ufed for a conliderable time as food. The dried flefl which conies to this country from abroad, is jufly efteemed by Dr Lewis to be totally infignificant. A volatile fult was formerly drawn from vipers, and fold at a great price, as a fovereign remedy againtt the bites of vipers and other poifonous animald; but it is now found not to be materially different from the volatile alkaline falts procured by ditilling other animal fubtances.
2. The berus, or common Britifh siper, is fond in many couatries of Eurepe. 'Lisey fwarm in the lit.
brides, or wettern Pritifn ifles, and abound in many parts of Britain; particularly in the dry, fony, and chalky counties. According to Mr l'ennant and other naturalils, they are viviparous, but proceed from an internal egg. The crogs atre, as it were, chained together ; and eacls ahout the fize of the esg of a biackbird. 'This viper fellumgrows longer than two fert ; though Mr Pemant tells us he once lay a female (which is neally a thind larger than the niale) almont three feet long. The gronnd colour of the male is of a dirty yollow, that of the lemale decper. Its back is marked the whole length with a feries of raombuidul black foots, touching each oiher at the points; the fides with triangular ones; the belly entircly Hack. It hath $1 f^{6}$ focta, and 39 fintelle. There is a variey wholly black; but the rhomboid marks are way confpicuous even in this, being of a deeper and more ghote fy bue than the rett. The head of the viper, foy; Mr Dennant, is infated, which dithinguilhes it from the common fnake. Mr Catefby affures us, that this ditherense between the vipers and fakes or wher lerpents is, that the former have long hollow fangs, or tufks, with an opening near the point; the neck is fmall, the head broad, the cheeks extending wide, fales rough, the body for the moft part that and thick; they are llow of motion; fwell the head and neck when initated, and have a terrible and ugly afpect." Another material difference, however, confilts in the production of their young: the viper hatches its egga wichin infelf, and then difcharges the young; whereas the fuake depofits its eggs, which are therefore externally hatched. The tongue is forked, the tceth fmall ; the four canine teeth are placed two on each fide the upper jaw : thefe indruments of poifon are long, crooked, and moveable; capable, like thofe of the former fpecies, of being raifed or deprefled at the pleafure of the animal, and they intil their poifon in the fame manner. The vipers are faid not to amive at their full growth till they are fix or feven years cl!; but they are capable of engendering at two or three. They copulate in May, and go about three montls with their young. Mr White informs us $\ddagger$, that a viper which he opened had $\ddagger$ Prif. $\mathscr{V}^{*}$ in it 15 young ones of the fize of earth woms, aburu sinmare 7 inches lorg. This little fry iffued into the world $\mathrm{p} \cdot \mathbf{2 1 0}$ with the true viper-fpisit about them. They twited and wriggled about with rreat alertnefis; and when touched, they erected themfelves, and gaped very wide, thowing immediate tukens of menace and defiance, tho' no fangs could be perecived even with the help of glatfes: which the autlon remarks as an inflance among others of that wonderful indlinet which inprefles youms animals with a motion of the ficuation and ufe of their naiural weapons even before thefe weapons are formed. Mr Penmant tells us, that he has been affured of a fact mentioned by Sir Thomas Brown *, who was far from "rot being a credulons writer (A), that the young of the Eroor. viper, when terrified, will iun down the throat of the 114. parent, and feek for thelter in its helly, in the farme manner as the young of the opoflun restre into the ventral pouch of the old one. From this fome have inagined that the viper is fo mmatuat as to devom
(A) The viper catchers, however, infit, that no fuch thing ever haprens. Sce What's Nat. Hifh of Soumera p.5t.

## C O L [ 166$] \quad$ C O L

Coluber. its own young : but the affertion deferves no credit; it being well known that the food of thefe ferpents is frogs, toads, lizards, mice, and, according to Dr Mcad, even an animal folarge as a mole, which they are able to fwallow entire, their thoat and neck being capable of great diftenfion. It is alfo faid, from good authority, that vipers prey on young birds; but whether on fuch as neftle on the ground, or whether they climb up trees for them, as the Indian ferpents do, is quite uncertain: the fact, however, is very far from being recent ; for Horace tells us, Ut affrdens implunibus pullis avis Sorpentium allabjis simet.

## Epod. 1.

 Thus for its young the anxious bid The gliding ferpent fears.The viper is capable of fupporting very long abftinence; it being known, that fome have been kept in a box fix months without food, and yet did not abate of their vivacity. They feed only a fmall part of the jear, but never during their confinement ; for if mice, their farourite diet, fhould at that time be thrown into their box, though they will kill, yet they never will eat them. The violence of their poifon decreafes in proportion to the length of their confinement, as does alfo the virtue of their flefh whatever it is. The animals, when at liberty, remain torpid throughout the winter; but, when confined, lave never been obferved to take their annual repofe. The method of eatching them is by putting a cleft fick on or near their head; after which they are feized by the tail, and inftantly put into a bag. The vipercatehers are vory frequently bit by them in the purfuit of their bufinefs, yet we very rarely hear of their bite being fatal. Salad oil, if applied in time, is faid to be a certain remedy. The fleth of the Britifh viper has been celebrated as a rutorative, as well as that of the foreign kind. Mr Keyfler relates, that Sir Kenelm Digby ufed to feed his wife, who nas a moft beautiful woman, with capons fattened with the flefh of vipers.
3. The punctatus of Linnxus, by Mr Cateßy called the suater-viper, is a native of Carolina. According to Limmens it is afh-coloured, variegated with ycllow fpots. Mr Catelby informs us, that the head and back of this ferpent are brown ; the beliy marked tranfuerfely with yellow, and alfo the fides of the neck. The neck is fmall, the head large, and the mouth armed with the deftructive fangs of the riper or rattle-fnake, next to which it is reckoned the largeft ferpent in this country. Contrary to what is obferved in moft other vipers, thefe are very nimble and active, and very dexterous in catching fith. In fummer, great numbers are feen lying on the branches of trees hanging over rivers; fiom which, on the approach of a boat, they drop into the water, and often into the boat on the mens heads. They lie in wait in this manacr to furprife cither birds or fint : after the latter they plange with furprifing fwiftnefs, and catch fome of a large fize, which they bring afhore and fwallow whole. The tail of this animal is fraall towards the end, and teminates in a blunt homy point about half an inch long. This harmlefs little horn hath been the occation of many terible reports; as, that by a jerk of its tail, the anmal is capable of inftantly dettroying both men and beats; that a
tree Aruck with this terrible horn, in a fhort time Coluher. grows biack, withers, and dies, \&c. but all thefe Mr Catelby affures us have not the lealt foundation in fact.
4. The cherfea is a native of Sweden, where it is called afping. It is a finall reddith ferpent, whofe bite is faid to be mortal. Concerning this fpecies Mr Pcomant afks, "Is it poffible that this could be the fpecies which has hitherto efcaped the notice of our naturalits? I the rather fufpect it, as I have been informed that there is a fmall fnake that lurks in the low grounds of Galloway, which bites and often proves fatal to the inhabitants."
5. The pretter of Linnæus, or black viper of Mr Catebyy, is a native of Carolina and Virginia. It is fhort and thick, flow of motion, fyreads its head fur prifingly when irritated, very flat and thick, threatening with a horrid hifs. They are very poifonous; their bite being as deadly as that of the rattlefake. They frequent the higher lands, and are of a rulty black colour.
6. The coluber luridus of Forller, called hy Mr Ca tefby the brozun riper; is a native of the lame countries with the preceding. It is about two feet long, and large in proportion; very flow in its motion, even when thrcatened with danger: notwithitanding which, it defends itfelf very fieredy when attacked, and its bite is as venomous as any. They prey upon efts, lizards, and other aminals of that kind.

Befides thefe fpecies of which we lave a particular defeription, the following are alfo reckoned among the poifonous ferpents, viz. 7. 'The atropos, with 13 I fcuta and 22 fcutelle. It is a native of America, the body white, and the eyes brown, with a white iris. 8. The leberis, with 1 to feuta and 50 foutelle, is a native of Canada, and has many black linear rings. 9. The ammodites, with $1+2$ fcuta and 32 foutclle, is a native of the Eati. It is about fix inches long, and has a flethy protuberance on its nofe. 10. The afpis, with $1{ }_{q} 6$ feuta and $q 6$ fentelle, is a native of France; and is of a reddith colour, with dutky fpots on the back. II. The lebetinus, with 155 fenta and 46 feutellix, is a native of Alia, and is of a cloudy colour, with red fpots on the belly. 12. The feverus, with 170 feuta and 42 foutelle, is likewife a native of Afia, and is afh-coluured with white belts. 13. The follatus, with $1+3$ fcura and -6 foutellx, is a native of Afia, and is of a greyith colour, with two white fillets. I 4The lacteus, with 203 feuta and 32 feutellx, is a native of the Indies. Ins colour is white, with black fpots. 15. The naja, with 193 fcuta and 60 fcutclix, is a native of the Ealt Indies, and is reckoned the moft poifonous of all ferpents. The root of the lignum colubrinum (opbiorrisa) is faid to have been pointed out to the Indians as an antidote againtt the bite of this ferpeat by the viverra ichneumon, a creature which fights with this ferpent, and cures itfelf by eating of this plant when wounded. The lndians, when bit, intantly chew it, fwallow the juice, and apply the matticated root to the puncture. It is killed by the ichmemon. 16. The atrox, with ig6 feuta and 69 fcutella, is a native of Atia. It is of a hoaly colour, and the head is compreffed and corered with fmall fcales. 17. The nireus, with 209 feuta and 62 felltelle, is a aative of Africa. It is white, and with-

## $\mathrm{C} O$ L $\left[\begin{array}{llllll}167\end{array}\right] \quad \mathrm{C} \quad \mathrm{O} \quad \mathrm{L}$

duber. out any 「pots. 18. The corallinus, with 193 fcuta and 82 fcutelle, is a native of Aria. It is greyih, with three brown fillets. 19. The dipfas, with 152 fcuta and 135 fcutellie, is a native of America. It is of a bluifh colour, with the margins of the fcales white. 20. The mycterizans, with 192 fcuta and 167 fcutelle, is a native of America. It is of a bluilh-green colour, hath a fletehed ont triangular fnout. Inhabits trees, and lives on infects.
, The above 20 fpecies are all the ferpents of the genus of coluber that are reckoned poifonous. Of the reft we thall only mention the following, which are the mof remarkable.
21. The erythrogatler of Forter, called by Mr Cateßy the copper-belited Jnake, is a native of Carolina, and grows fometimes near to the fize of a rattlefnake. It is of a brown colour in all parts of its body, except the belly, which is of a red copper coluar. They frequent water, and puobably prey on fifln; but they will alfo devour birds and fuch other animals as they are able to orercome. They are boid and active, frequently entering poultry houles, devouring the fowls and fucking their egys.
22. The conltrictor, or black fnake, is a native of feveral parts of America. They are very long, fometimes meafuring fix feet, and are all over of a fhining black. This fpecies is not only perfectly harmkff, but extremely ufeful in clearing the houfes of rats, which it purfues with wonderful agility to the very roois, and all parts of barns and outhoufes, for which grood ferwices it is cherifhed by the generality of Aimericans. It is alfo faid, that it will deftroy the rattlefnake, by twifting round it, and whipping it to death. In the time of copulation it is extremely bold and fierce, and will attack mankind; but its bite has no more effect than a feratch with a pin. It is fo fwift that there is no efcaping its purfuit. Many ridiculous frights have happened from this innocent reptile. As every ore in America is full of the dread of the rat:tefnake, they are apt to fly at the fight of any of the ferpent kind. This purfues, foon overtakes, and by twidting round the legs of the fugitive, foon brings him to the ground: but he happily receives no hurt, but what may refult from this fright: all the mifchief this fpecies does is to the houlewives, for it will flim their milk-pans of the cream, and rob their henroots of all the eggs.
23. The annulatus, or little brown bead-fnake, is always fmall, and is feldom found above ground, but commonly dug up, and found twifting about the roots of ihrubs and plants. All the back and other parts of the body have tranfverfe fputs of brown and white fo difpofed as to have fome refemblance to a ftring of Englifh beads; whence probably it takes it name. It is quite harmlefs, and is a native of Virginia and Carolina.
24. The flagellum, or coach-whip fnake, is of a brown colour, very long, flender, and active. It runs fwiftly, and is quite inottenfive; but the Indians imagine it is able to cut a man in two with a jerk of its tail.
25. The tulvius, or corn fnake, is beautifully marked with red and white, refenbling a fpecies of Indian corn, whence its name. It is liarmelefs as to its bite, but frequently robs hen-rocits.
26. The xitivus, or green fnake, is all over of a green colour. It inhabits Carolina; where it lives
among the branches of trees on flies and other infects. ColumbIt is of a fmall fize, and catily becomes tame and familiar, infomuch that fome people will carry them in their bofom.
27. The fafciatua, or wampum finke, derives its name from its refemblance to the Indian wampum. It fometimes grows to the length of tive fect; and like other large inakes, is very voracions, but its bite is not venomous. The back is of a dark blue, the belly finely clouded wath fpots of a brighter blue; the head is imall in proportion to the relt of the body. See further the article Serpint.

COLUMB-KILL. See Jona.
COLUMBA, the Pigegon, in ornithology, a genus beloinging to the order of paffercs. The characters of this genus are as follow: The bill is ftrait, and defcends towards the point ; the notrils are oblong, and half covered with al foft tumid memhrane; and the tongue is entire, i.e. not cloven. 'There are ahout 70 fpecies, all natives of different countries. The following are the moll remarkable.

1. The cenas, or domeltic pigeon, and all its beautiful varieties, derive their origin from one fecies, the flock-dove; the Englith naine implying its being the flock or ftem from whence the other dometic birds fpring. Thefe birds, as Varro obferves, take their Latin name, columb, from their voice or cooing: and, had he known it, he might have added the Britifh alfo; for k'lommen, kylobman, kulm, and kolm, fignify the fame bird. They were, and itill are, to be found in moft parts of our ifland in a ftate of ma. ture; but probably the Romans firt taught the Britons how to confruct pigeon-houfes, and make the birds domettic. The characters of the domelt ic pigeon are the following. It is of a deep bluifh afh-colour; the breall dafhed with a fine changeable green and purple; the fides of the neck with fhining copper-colour; its wings marked with two black bars, one on the coverts of the wings, the other on the quill feathers; the back white, and the tail barred near the end with black. They weigh 14 ounces: In the wild tate it breeds in holes ot rocks and hollows of trees; for :hich reafon fome people ftyle it columba carerenalis, in oppofition to the ring dove, which makes its neft on the boughs of trees. Nature always preferves fome agreement in the manners, characters, and colours of birds reclaimed from their wild ftate. This fuecits of pigeon foon takes to build in artificial cavities, and from the temptation of a ready provifion becomes eafily domefticated. Multitudes of thefe wild birds are obfenved to migrace into the fonth of England: and, while the beech-woods were fuffered to cover large tracts of ground, they ufed to haunt them in mr" riads, reaching in trings a mile in length, as they went out in the morning to feed. They vifit Britain the latell of any bird of paffage, not appearing till Nuvember, and retiring in the fpring. Mr Pennant imagines, that the fummer haunts of thefe creatures are in Sweden, as Mr Eckmark makes their retreat thence coincide with their arrival in Britain. Numbers of them, however, breed on cliffs of the coatt of Wales, and of the Hebrides. The varieties produced from the domettic are very numerous, and extremely elegant ; they are ditinguinhed by names expreflive of their feveral properties, is timblers, car-
riets,
 nuns, \&e. The molt echebrated of thefe is the carrier, of which an accommt is ahready given under the article CARRIFR-Pision. The nature of pigens is to be gregarious; to lay only two eggs, and to breed many times in the year. So quick is their inereafe, that the author of the "Occonomy of Nature" obferves, that in the fpace of four years, 14,760 pigeons may co:e from a lingle pair. They bill during their courtfhip : the male and female fit, and alfo feed their young, by turns: they call provilion out of their craw into the young one's mouth; and drink, not by lipping, like other birds, but by continued dranghts like quadupeds, and lave mournful or plantive notes.
2. The palumbur, or ring-dove, is a native of Etarope and Afia. It is the largeft pigeon we have, and might be difinguifed from all others by its tize alone. Its weight is about 20 ounces; its kenth 28 , the brealth 3 c, inches. The head, back, and covers of the wings, are of a bluith afh colour: the lower fide of the neck and brealt are of a purplifh red, dafned with afh-colour : on the hind pant of the neck is a lemicicular line of white; above and beneath that, the feathers are gloffy, and of changeable colours as oppofed to the light. This fpecies forms its neft of a few dry flicks in the boughs of trees. Atiempts have been made to domelicate them by hatching their egos under the common pigeon in dove houles; but as foon as they could fly, they always took to their proper haunts. In the beginning of winter they aftemble in great flocks, and leave off cooing, which they begin in March when they pair.
3. The turtur, or turtle-dove, is a native of India. The length is 12 inches and a half; its breadth 21 ; the weight four ounces. The irides are of a fine yellow, and the eye-lids encompafied with a beautiful crimfon circle. 'The chin and forehead are whitin; the top of the head afmecoloured, mixed with olive. On each fide of the neck is a foot of black feathers prettily tipe with s. se: ' n...k wh-coloured, bordered with wive browi. . ... i . . nlarn and coveits of a red. difl bro: , fpotted wit. black : the brealt of a lizht purplitara, having the varge of cach feather ythow: the belly whit. The tat is three inches and a half iong ; the tuo middle Ee..hers of a dukiy brown; the wiver black, witi $\because$ hite lips; the end and exteior fice of the outmolt fatices wholly white. In the brecdiar feakn thefebids are $f$ ond in Buckinghamfhire, Glowcefermire, Shrowhire, and the wett of England. They are very fhy and retired, breeding in thick woods, gearally of ooh : in autumon they migrate i.tu ett er comrtries.
4. The afferina, of ground-cove of Carolina, is about the fize of a lark. The till is yellow, and bhack at the end; the iris red; th brealt and whole font of a changeable purple, with dark purple foots; the large quill-feathers are of a raddy purple; the legs and feet of a dirty yellows; but the whole bird has fuch a compolition of colours in $i t$, that a very particatar defoription is impurfible. They Hy many of them together, and make hort figlats from place to phace, generally lighting on the ground.
5. 7'? migratoria, or pikicoll of parage, is about the fize of an Enghifl wouci-pizeon; the bill black; aris red: the hend of a du?sy the ; the brent and

Nos.
belly of a faint redt above the fonnice of the wing Columba there is a patch of feathers hining lise guld; the wing is coloured like the head, haviar frame few fots of black (except that the larger feathers of it are dark brown), with fome white on the caterior vancs; the tail is very long, and covered with a black father, under which the refl are white; the legs and feet are red. They come in pratisions numbers from the north, to winter in Virginia and Carolina. In thefe countries they roolt upon one another's backs in fuch quantities that they often break down tlec limbs of oaks which fupport them, and leave their dung fome inches thiek below the trees. In Virgiria Mr Cate By has leen them fly in fuch continued trains for three days fuccenively, ibat they were not lofl firht of for the leat incerval of time, but fomewhere in the air they wete feen continuing their fight fouthward. They breed in rooks by the fides of rivers and lakes far north of S: Lawrence. They Hy to the fouth only in Lard winters, and are never known to return.
6. The coronata, or great erowned pigeon, a very large Speeies, the fize of a turkey. The bill is black, and two inches long; the irides are red; the head, neck, breaft, belly, fides, thighs, and under tail coverts, cinereous blue; the hend is erefted; the back, rump, fcapulars, and upper tail coverts, are of a deep afh-colour, with a mixture of purplif chefnut on the upper part of the back and feapulars; the wing-coverts are afh-coloured within, and purpilh chefnut on the outide and tip; quills deep blackin an-eclour ; tail the fame, but of a light aflocolur at the tip; the legs are blackifh. This fpeeies inhabits the Molucca ines and New Guinea, and has been brought to England alive. Luñon mentions five having been at once alive in France. In fize it far exceeds any of the pigeon tribe; but its form and manners tell us that it can belong to no other. Indeed Brifon has placed it with the pheafants; and the planches enduminet's have copied that name; but whoevtr has oblerred it cannot doubt in the leatl to which it belongs. Its note is cooing and plaintive, like that of other pigeons, only more loud in proportion. 'The mouraful notes of thefe birds alarmed the crew of $B$ ugamuilie much, when in the neighourhood of the.n, thinking they were the eries of the human fpecies. In France they ware never obferved to lay eggs, nor in Holland, though they were kept for fome time; but scopoli affures us, that the male approache; the fomale with the head bent into the brath, making a wofe more like lowing than cooing; and that they not only made a nelt on trees, in the menagery where chey were kept, but lad eggs, The nott was compored of hay and links. The femate never fat bat thood upon the eags; and he fuppeled it was from this cauie alone that these was no produce. They are faid to be kept by fome, in the Eall Indies, in their count-yards, as domettic poultry. The Duch at the Moluceas call them crurun-rogel. M. Sonnerat, as well as Dampier, found theie in plenty at New Gainea; and it is probable that they wore originally tranfputed from that place into Banda, from whence the Dutcia chiefly now procure them.

Among the great number of other fpecies of columba, there are fome very fmall, not larger than a woodlark. The Malacea pigeon deferibed by Sonnerat is little bigger than the houfe-fparrow. It is a moft
beautiful

Columba beautiful fuecies, and the flef faid to be extremely delicate. It has beentranfported imo the ine of France, where it has multiplied exccedingly.

Pigens, beftes being etteemed as a delicacy for the table, are of walue on sther accounts. Their dung is thought to be fo good amendment for fome hinds of land, that it has been fetched 16 miles, and a load of coals has beengiven for a load of it: it is alfo ufed for tanning the upper-leathers of fooes, as well as applied as a cataplaim to this day. Indeed formenly faltpetre was collected from it. The greatelt ufe of pigeuns is at Iloahan in Perfia, where there are record. ed to be above 3000 pigeon-honfes, and thele kept by the Turks alone, as Chriftians ane not allowed to kedp any. Dr Pooocke mentions the freguency of pigeonhonfes in Egypt ; adding, that the pigeon houle is recksmed a great part of the ellate of the hubandman: and the common proverb in thofe parts is, that a man who has a pigcon-houfe need not be careful about the difpofal of his davelter. Tavernier fay's that alacir dung is ufed to fmoke melons. 'The ufual way taken to entice pireons to remain where they are intended, is to place what is called a follocat near them; this is compofed of loam, old rubbih, and falt, and will fo eftectually anfwer the purpole ai to decoy them from other phaces, and is therefore hehd illegal.

Columba (St), in allofon to whole name the ifland of Jona (one of the Hebrides) received its name; Fona being derived from a Hebrew word fignifying a dove. This holy man, inftigated by his zeal, left his native country, Ircland, in the year 565 , with the pions defign of preaching the rolpel to the Picts. It appears that he left his native foil with warm refentment, vowing never to make a fettlement within light of that hated i!land. He made his firlt trial at Oranfay; and finding that place too near to Ireland, fuc. ceeded to his wifh at $H y$, for that was the name of Jona at the time of his arrival. He repeated lecre the experiment on feveral hilis, erecting on each a heap of Rones: and that which he latt aftended is to this day called Coman-obud-rel-Eiriun, or "The emincace of the back turned to I reland."

Celumba was foon ditingrimed by the fanctity of his manners : a miracle that he wrought foo operated on the Prith bing Bradeus, that he immediately made a prefent of the little ine to the faint. It feems that his maj ly had refufed Columba an audience; and even procededfor far as io order the palace-gates to be fhut ageintl him: but the laint, by the power of his word, inllantly canfed t'em to fly open. As foon as he was in poffection of Jona, he founded a cell of :nonks, borrowing tio inttitutions from a cortaia oriontal monattic order. It is faid that the fift religions were canons regular, of whom the founder was the firt abbot; and that his mo"ks, till the year 716, differed from thofe of the church of Rame. both in the obforvation of Eaker and in the elerical tonfure Culumba led here an exemplary life, and was lighly ripoeted for the fuctity of his manners for a condierabie number of years. II is the firft on recoed who had the faculiy of hecolt fight, for he told the victury of Aitan ever the Picts atd Saxons on the very indant it happened. He had the honour of burying in this ifland, Conrallius and Kinnatil, two kings of Scotland, and of crowning : thind. At length, worn out with age, Vol. V. Part I.
he dicd in Jona in the arms of his diciples; was in. Crumbar terced there, but (as the [rifs protend) in afte: times nus
 his remains wete depolited with thole of its Bridget and st Puthick.

\end{aligned}
$$

But this is totally denied by the Seots ; who anerm, that the contraty is fhown in a life of the frime, extracted out of the pope's library, and tranfated out of the Latin into Eile, by Father Collo o bown: which decides in favour of Jona the momentous difpute.

COLUMB.INUS', a faint and a poct, was born in Ireland, and brought up to a religious life among the difciples of St Columba. He made ullommon progrefs in learning : and wely tarly in life dikinguithed himfelf for poetical abilities, by the compofion of a book of pfatins, and a number of moral prems, intend. ed allo to be let to mafic. Jumas, a writer of ecclefiaftical hiftory, mentions, tiat Columbanas helonged originally to a monattery of the names of Penchor. The fame monaltery is mentioned by St bernard in his life of his fiend St Malachi ; and he relates that it font out a great numitr of morks, who fotcad over Europe. Columbanus porid fom Dritain iato Fance, and founded the monallery of Lomeville near Bufançon. He had been kiadly received and patronifed by king Chitdebert; tot he was afterwards expelled out of France by the wicked quen Brmichild. He retired to Lombardy in Italy, and was well receised by king Arsulphas. In Lombardy he again founded the moantery of Dobio. I'ase Regula Caroblialis and Penitonimfis, which he ellahhan of in that munatery, have been publimed in the Coden Regralam compilad by the larned Holatenius. He was cotemporary with $S_{t}$ Denedict. It was in the year 589 lie went into Fiance.

COLTMBARIA (anc. geog.), an inand like a rock on the well of Sicily, oppulite to Dicpanum: faid by Zonaras to lave been taken from the Cathaginians by Numerine Fabius the confol. Now Crlambar, with a very frong and almult mpregnable citadel (Cluverias).

COLUMDINE, in botany. Sce Aquilfgia.
COLUMBO-ROOT, an artide lat ly introduced into the materia medica, the natual hithory of which is not ret well known. Accordins tu Dr Percival's account it grew originally un the contineme of Amaica; form whence it was tramplanted $t$, Culumbo, a then in Ceylon, which gives name to it, and fuppliee anl India with it. The inhabitms of thefecountries lave for a long rime vfed it in difordos of the llomach and bowels. They carry it abunt with them, and take it fliced or feraped in Madcira wine. Tuis rout comes to us in ciacular pieces, which are from hatt an inch or an inch to three inches in dianceer; and divided into frufia, which mealu e from two inctere to onc quar. ter of an inch. The fides are covered whin a thick corrugated tark, of a dark br wh hue on $i$ :s cxemma! furfece, but interally © a lists yellon colom: The
 highedt at the edges, and forining a neavit) " Wards the center Ondeparating this farface, tive mot is obferved to confift of theter lamina, viz. the contical, which, in the larger roots, is a quarter of an inch Y' thick:

## $\mathrm{C} O$ I $[17$

Coumbo. thick; the ligneous, about half an inch ; and the me-- dullary, which forms the centre, and is near an inch in dizmeter. T'his lat is much fuftes than the other parts. and, when chewed, feems mucilaginous; a nurnber of fall Gones rua longitudinal! throngh it, and appear on the furface. The contical and lignems pats are divided by a black circular !ine. All the thicker pieces have fmall holes drillet through ihem, for the convenience of drying. Columboroot las an aromatic fmell; but is difagreeably bitter, and flightly pungent to the tafte, fonewhat refmbling muflard-feed, when it has lon, by long keeping, part of its dential oil. Yet, though angrateful to the talke, when recci-
 antifeptic, fedative, and puwerfully antiemasic. In the cholera morbus it alleviates the villent tormina, checks the purging and vomiting, corrects the putrid tendency of the bile, quiets the inordinate motions of the bowels, and fpeedily recruits the cxhautted Arength of the patient. It was adminitered to a great number of patients, rometines upwards of 20 in a day, aflicied with the cholera morbus, by Mr Jchnfon of Chefer, in 1756 . He generaily found that it foon thopped the vomiting, which was the molt fatal iymprom, and that the purging and remaining complaints quickly yielded to the fame remedy. The dofe he gave was from half a drachm to two dracims of the powder, every three or four hours, more or lefs according to the urgency of the fymptons. Though this medicine poffeffes little or no aftringency, it has becn obferved to be of great forvice in diarlioes, and even in the dyfentery. In the firf flage of thefe diforders, where altringents would be hurtful, Columborrout may be preferibed with lafety; as, by its antipar. modic powers, the irregular actions of the primis vite are correted. But as a cordial, tonic, and antifeptic remedy, it anfwers better when given towato their decline. Its efficacy has alfo been obferved in the vomitings which attend the bilious cholic ; and in fuch cafes, where an emetic is thought neceffary, after adminiftering a fmall dofe of ipecacuan, the flomach may be wafhed with an infuffon of Columbo-root. This will tend to prevent thofe violent and convulive reachings which in irritable habits abounding with bile are fometimes excited by the mildeft emetic. In bilious fevers, 15 or 20 grains of this root, with an equal or double quantity of vitriolated tartar, given every four, five, or lix hours, produce very berieficial cffects. From its efficacy in thefe bilions difeafes of this counery, it is probable that it may be ufeful in the yellow fever of the Weit Indits, which is always attended with great ficknefs, vislent reachings, and a copious difcharge of bile. The vomiting recurs at fhort intervils, often becomes almoil inceffant, and an increditle quantity of bile is fometimes cuacuated in a few hours. Childsen daring dentition are often fubject to fevere vomitings and diarthoas. In thefe cales the Columborent is an ufeful remedy, and bath often procured alnot inftant relicf, when other efficacisus remedies kave been tried in vain. This root is alfo extremely benelicial in a languid tate of the fomach, attench ed with want of appetite, indigeltion, naulea, and flatulence. It may be givin either in fubtance, with fome grateful aromatic, or infufed in Madeira wine. Hobitual romiting, when it proceeds from a wealnefo
or irritability of the fomach, from an inregular gout, acidities, acrimonious bile, or an increafed and depraved fecretion of the pancreatic juice, is greatly relieved by the ufe of Columboroot, in conjunction with aromatics, chalybeates, or the teftaceous powiers. In the naufea and vomiting occufioned by preg:ancy, an infufion of Columboroot fucceeds better than any other medicine that haill been tried.

From Dr Percival's experiments on this root, it appears, that retified firit of wine extracts its virtues in the greatect perfection. The watery infufion is more perifhable than that of other bitters. In 24 hours a copious precipitation takes place; and in two days it becomes ropy, and even mully. The addition of orange pect renders the infufion of Colunbo-root lefs ungrateful to the palate. An ounce of the powdered root, half an ounce of orange-peel, two ounces of French brandy, and 14 ounces of water, macerated 12 hours withont heat, and then filtered throngh paper, afford a fufficiently Atrong and tolerably pleafant infufion. The extract made firt by fpirit and then with water, and reduced by evaporation to a pilular confifence, is found to be equal if not fuperior in efficacy to the powder. As an antifeptic, Columboroot is inferior to the bark; but as a corrector of putrid gall, it is much fuperior to the bark; whence allo it is probable that it would be of fervice in the Weft India yellow fever. It alfo reftrains alinentary fermentation, without impairing digettion; in which property it refembles multard. Hence its great fervice ia preventing acidities. It hath alfo a remarkable power of neutralizing acids already formed. It doth not appear to have the leaf leating quaity; and therefore may be ufed with propriety and advantage in the phatiins pulmonalis and in hectical cafes, to correct acrimony and ftrengthen direttion. It occafions no diturbance, and agrees very well with a milk diet, as it abates flatulence, and is indifoofed to acidity.

Columbo, a maritime town of the ifland of Ceylon in the Eaft Indies, feated on the fouth-weft part of its coaft, and fubject to the Dutch. E. Long. 68. 10. N. Lat. 7. 5 .

COLUMBUS, or Congregation of St Colvasbus, a fociety of regular canons, who formerly had 100 abbeys or monalteries in the latith illes.

Columbus (Chriftopher), a Genoefe, the celebrated navigator, and firtl difcoverer of the iflands of America, was a fubject of the republic of Genoa. Neither the time nor the place of his birth, however, are known with certainty; only he was defeended of an honourable family, who, by tanions misfortunes, had been reduced to indigence. His parents were fea-faring people; and Columbus laaving difcovered, in his early youth, a capacity and inclination for that way of life, was encouraged by them to follow the fame profeffion. He went to fea at the age of 14 : his firlt voyages were to thofe ports in the Mediterranean frequented by the Genoefe; after which he took a voyage to Iceland; and proceeding till further north, advanced feveral degrees within the polar circle. After this, Columbus entered into the fervice of a fanous fea-captain of his own name and family. This man commanded a fmall fquadron, fitted out at his own expence; and by cruifing, fometimes againft the Mahoulctans and fometimes ogaiult the Venetians,

## $\mathrm{C} O$ L $\left[\begin{array}{ll}\mathrm{My}\end{array}\right] \quad \mathrm{C} O \quad \mathrm{I}$

:ounsus the rivals of his country in trade, had acquired both wealth and reputation. With him Columbus continued for feveral years, no lefo dillingurthed for his courage than his experience as a failor. At length, in an obttinate chegrgement off the coult of Portugal, with fome Venetian caravals returning sichly laden from the Low Countrics, the veffel on buard which he ferved took tire, together with one of the encmies fhips to which it was fatt grappled. Columbus threw himfolf into the foa; laid hold of a floating oar; and by the fupport of it, and his dexterity in fwimming, he reached the hore, though above two leagues ditant.

After this difaller, Columbus repaired to Lifoon, where he married a daughter of Bartholomes Pereftrello, one of the captains employed by Prince Henry in his early navigations, and who had difoovered and planted the iflands of Ponto Santo and Madera. Having got poffection of the journals and charts of this experienced navigator, Columbus was feized with an irrefiltible defire of viliting unknown countries. In order to indulse it, he made a voyage to Madeira, and continued during feveral years to trade with that illand, the Canaries, Azores, the fettements in Guinea, and all the other places which the Portugucfe had difcovered on the continent of Africa.

By the expericnce acquired in fuch a number of voyages, Columbus now became one of the molt thilful navigators in Europe. At this time, the great ubject of difcovery was a paffage by fea to the Eant Indies. This was attempted, and at laft accomplithed By the Portugucfe, by doubling the Cape of Good Hope. The danger and tectioufnefs of the pafage, however, fuppoling it to be really accomplifhed, which as yet it was not, fet Columbus on coniidering whether a fherter and more direct paffage to thefe regions might not be found out; and, after long conlideration, he become thoroughly eonvinced, that, by failing aerofs the Atlantic Ocean, directly towards the wett, new countries, which probably formed a part of the valt continent of India, mult infallihly be difcovered. His reafons for this were, in the firt place, a knowledge he had acquired of the true ligure of the earth. The continents of Europe, Afia, and Africa, as far as then known, form but a fmall part of the globe. It was fuitable to our ideas, concerning the wildom and beneficence of the Author of nature, to believe, that the vaft face, ftill unexplored, was not entirely covercd by a wafte and barren ocean, but occupied by countries fit for the habitation of man. It appeared likewife extremely probable, that the continent on this tide the globe was balanced by a proportional guantity of land in the other hemifphere. Thefe conjectures were confirmed by the obfervations of modern navigators. A Portuguefe plot having tretched farther to the wefl than was ufual at that time, took up a picce of timber, articicially carved, floating upon the fea; and as it was driven towards him by a wefterly wind, he concluded that it came from fome unknown land fituated in that quarter. Columbus's brother-in-law had found to the well of the Madeira illes a picce of timber fathioned in the fame manner, and brought by the fame wind; and liad feen alfo canes of an enormous fize floating upon the wayes, which refembled thofe defcribed by Ptolemy, as prodections pecuiar to the Eaft Indies. After a courfe
of wellerly winds. trees torn up by the roots were Colimbur. often driven upon the egait of the Alores; and at $\underbrace{\text { and }}$. one time the dead bodies of two men, with lingular features, which refembled aeithor the imhabitans of Europe nor Africa, were calt athore there. The mort cugent reafon, however, was a miftaken notion of the ancient geographers concerning the immenfe extent of the continent of India. Though hardly any of then had penetrated bcyoud the river Ganges, fone Greek writers had ventured to deferibe the provinces beyond that river, which they reprefented as regions of an immenfe extent. Cteflas affirmed that India Wads as large as all the reft of Alia. Oneficritus, whom Phay the naturalite follows, contended that it was equal to a thind part of the habitable earth. Nearchus afferted that it would take four months to march frous one extremity of it to the other in a fleaight line. The journal of Marco Polo, who travelled into Alia in the I 3 th century', and who had proceeded towards the calt far beyond the limits to which any European had ever advanced, fermed alfo fo much io confirm thefeaccounts, that Columbus was perfuaded, that the diftance from the moil wellerly part of Entope to the moit catlerly part of Alia was not very contiderable; and that the thorten, as well as mof direct courfe to the remute regions of the caft, was to be found by failing due weft.

In r.174, Columbus communicated his ideas on this fubject to one Paul a phyficion in Florence, a mata eminent for his knowledge in cofmography. He appruved of the plan, fuggeted feveral facts ia confirmation of it, and warmly enconaged Columbus to perfivere in an undertaking fo laudable, and which muit reciound fo mach to the honour of his conatry and the bentit of Europe. Columbus, fully fatislied of the trath of his syltem, was impatient to let out on a voyage of difcovery. 'Ihe fith thep towards this was to fecure the patronage of fome of the conliderable powers of Europe capable of undertaking fuch an enterprife. He applied firlt to the republic of Genoa; but his countrymen, Itrangers to his abilities, inconliderately rejected his propofal as the dream of a chimerical projector, and thus loft for ever the opportanity of rettoring their commonwealth to its ancient lullre. His next application was to the court of Portugal, where King fohn 1I. liftened to him in the mont gracious mamper, and reforred the confideration of his plan to Diego Ottiz, bifhop of Ceuta, and two Jewilh phyficans, eminent cofmographers, whom he was accuifomed to confult in matteis of this kind. Unhappily thefe were the perfons who had been the chicf directors of the Portuguefe navigations, and had advifed to fearch for a paffage to India by Aleering a courle directly oppolite to that which Columbus had rccommended as thorter and mere certain. They could not therefore approve of his popofal, without fubmitting to the double mortilication of condemaning their own theory, and of acknowkedying his fuperioraty. The refnlt of their conferences was, that they advifed the king to tit out a vellel privately, in order to attempt the propofed difcovery, by following exactly the courfe which Columbus feemed to point out. John, forgetting on this occalion the fentiments of a monarch, meanly adopted this perfidious counfel. But the pilot chofen to execute Columbins's phan had weither the ge-

## C O I [ $1 / 2$ ] C O L

Coluntue, mine nor fonsitude of its antlon. Contrary winds arofe; no fign of approaching land appeared; his courage failed; and he ecturned to libon, exumang the projuct as equally extravagant and dangerons.

On difovering this dithomonabie tranfactom, Columbes immodincly quitted Portugal, and applied to the king of Spain; but ledl he thould be luese again difappointed, he fent his brother Bartholomsw into England, to whom he had fully commmicated his ideas, in order that he might negociate at the fame time with Henry V II. who was seckoned one of the moll faracions as well as opulent princes of Europe. Bartholowew was very unfortunate in his voyage: he frli ino the hands of pirates, who thipped him of crey thing, and detained him a prifoner for feveral years. At latt he made his cfeape, and arrived in London, but in fuch extrome indigence, that he was oblied to employ himfelf, during a confiderable time. in draning and lelling maps, in order to pick up as much money as would purchafe a decent dreis in which he might venture to appear at conrt. The Fropefals were received by Henry with more approbation than by any monarch to whom they had hitherto becta prefented.

Cohmbus himfelf made his propofals to the king of Spain, net without many doubts of fuccels, which foun appea;ed to be well funded. T'rue fedence had as yet made fo little progrefs in the kingdom of Spain, that molt of thofe to whom the confacration of his flin was referred wure uterly ignomat of the funt principles on which he founded his hopes. Some, from miftaken notions concerning the dimentions of the globe, contended that a voyage to thofe remote regions of the Eaft which Columbus expected to difcover, could not be performed in lefs than three years. Others concluded, that either he would find the ocean of infinite extent, according to the opinion of fome ancient philofophers; or that if he thould perfilt in Ateering weftwards beyond a cerrain point, the convex figure of the globe mult infallibly prevent his return, and he mult perifh in the vain attompt to unite the two oppofite hemifpheres, which uature had for ever disjoined. Eren without deigning to enter into any particular difcufion, fome rejected the fcheme in gencral, upon the credit of a maxim made ufe of by the ignorant in all ages, "That it is prefumptuous in any perfon to fuppofe that he alone poffeffes knowledge fuperior to all the reft of mankind united." By continual difappointments and delays, he was at lat wearied out, and refolved to repair to the court of England in perfon, in hopes of meeting with a farourable reception there. Fe had already made preparations for this purpofe, and taken meafures for the difpofal of his children during his abfence, when Juan Peree, the prior of the monallery of Rabida near Palos, in which they had been educated, cameltly folicited him to deftr his journey for athort time. Perez was a man of confiderable learning, and fome credit with Queen Ifabella. 'To her thercfore he applied; and the confuquence of his application was a gracious invitation of Columbus back to court, accompaned with the prefent of a fmall fum to equip him for the journey. Ferdinand, however, ftill rygarded the project as chimerical; and liad the addrefs to employ, in this new negociation with
him, fome of the perfons who had formaly pro- Columbus nownced his fcheme to be impracticable. 'To their aftonifunent, Columbus appared before them with the fame contident hopes of fuccefs as formerly, and infiled on the fanc ligh reconpence. He propofed that a fmall flect thonld be fitted out, under his command, to attempt the difovery; and demanded to be apointed perpetual and hereditary adminal and vicero) of all the feas and lands which he funold difcover; and to have the tewth of the prohits arifing from them fettled irrevocably mon him and his defoendents for wer. At the fame time he offered to advance the eighth part of the fum neceffary for accomplifhing his dehgn, un condition that he thouk be imitled to "a proportionad thare in the adventure. If the contorprife thomb totalle mifearry, he made no lipuiation for any reward or emulument whatever. 'lhele demands were thonght unreafonable: Ifabella broke off the treaty fhe hed began, and Columbus was once more difappointed. He now refolved finally to leave Spain; and had actually procecded fome leagnes on his journoy, when he was mertake? by a meffenger from Habelta, who had been pheraiked upon by the arghments of ()niatamilla and Santangel, two of Colnn. bus's patrons, agan to lavour his undentakings. The negocition now went formard with all manner of facility and difpatch; and a treaty witl. Columbus was Iggred on the 17 th of April $1 \not+92$. The chite articles of it were, that Columbur fhould be confituted high admiral in all the feas, illands, and continents he thould difcorer, with the fame powers and prerogatives that belouged to the high admiral of Callile within the limits of his juridiction. Fe was alfo appointed viceroy in all thofe conntries to be difcovered; and a tenth of the products accuing from their productions and commerce was granted to him for ever. All controverfics or law-fuits with refpect to mereantile tanafactions were to be detemmined by the fole authority of Columbus, or of judges to be appointed by him. He was alfo permitted to advance one eighth part of the expence of the expedition, and of exrying on commorce with the new comtries; and was intitled, in return, to an cighth part of the profit. But, thoterh the name of Ferlinand was joined with Ifabella in this tranfaction, his diftruil of Columbus was fill fo violent, that he refufed to take any part in the enterprife as king of Arragon; and as the whole expence of the expedition was to be defrayed by the crown of Caltile, Ifabella referved for her fubjects of that kingdom an exclufive right to all the benehto which might accrue from its fuccefs.

At laft our adventurer fet fail with three fmall hips, the whole expence of which did not exceed L. 4000. During his voyagre he met with many difficulties from the mutinous and timid difpofition of his men. He was the firf who obferved the variation of the compafs, which threw the failurs into the utmolt terror. For this phenomenon Columbus was olliged to inveut a reafon, which, though it did not fatisfy himfelf, yet ferved to difpel their lears, or filence their marmurs. At laft, howerer, the failors lof all patience; and the admiral was ubliged to promife folemnly, that in cafe land was not difcovered in three days he fhould return to Europe. 'That very night, howeser, the inand of San Salvador was difcovered, which quickly

## C O L [ 173 ] G O L

$\underbrace{\text { lumbus. put an end to all their fears. The failors were then }}$ as extravagant in the praife of Columbus as they had before been infolent in reviling and threatening him. They threw themfelves at his feet, implored his pardon, and prononced lim to be a perfon infiped by heaven wih more than human fagacity and fortitudc, in order :o accomplith a delign fo far beyond the ideas and conception of all fomer ages. Having vilited feveral of the Weit India inhands, and fetted a colony in Hifpaniola *, he again fet fail for Spain; and after (f. capiug great dangers from violent tempeils, arrived at the port of Pallus on the 15 th of March $1+23$.
As foon as Columbus's thip was difcovered approadhing, all the inhabitants of Palos ran eagely to the firore, whore they received the admienal with royal homours. 'The court was then at Bacelona, and Colmabas took eare immodiatily to acquaint the kiore and queen of his arrival. They were no lefs duthed than athonihed with this anexpected event. "They gave anders for conduating him into the cily with all imsinable ponp. They received him clad in their royal robes, and feated on a throne under a magaifent © (uopy. When le approiched, they flour up; and, raifang him as he kaculed to kifo their hauds, commanded tom to take his feat upon a chair pacpared for him, and to give a circumbantial account of his voyage. When he had fimithed his oration, which he dclivered with much modelly and haplicity, the king and quecn, kuceling down, offered up folemn thanks to God for the diforery. Every polfible mark of honow that could be fueseted by gratitude or admiration was confored on Columbus; the former capituation was conimed, his family was ennobled, and a fleet was ordered to he ecpupped, to enable him to go in qued of thofe more opulent comtrics which he till confidatly expected to find.
Notwithtanding all this refpect, however, Columbus was no lunger regarded than he was fuce diful. The colonifts he cantided over widh him wore to the laft degree umreafonable and umanascable; fo that he was obliged to ufe fome fererities with thom ; and complaints were made to the court of Spain agann him for cruelty. On this, Francis de Buvadilia, a knight of Calatrava, was appointed to inquire into the conduct of Columbus; with orders, in cafe he found the charge of maladminitration proved, to fuperfcde him, and affune, the office of governor of Hifpaniola. The corfequence of this was, that Columbus was fent to Spain in clains. From thefe, however, he was freed immediately on his arrival, and had an opportunity granted him of vindicating his innocence. He was, however, deprived of all power; and notwithftanding his great fervices, and the folcmuity of the agrement between him and Ferdinand, Coliumbus never could obtain the fulfilment of any part of that treaty. At latt, difgufted with the ingratitude of a monarch whom he had ferved with fuch fidelity and fuccefs, and exhaulled with fatigues, he ended his life on the zyth of May 1506.

Columbus (Bartholomew), brother to Chriftopher, fanous for his marine chat ts and fpheres, which he prefented to Heary VII. of England. He died in 1514.

Columbus (Don Ferdinand), fon of Chrifopher, and writer of hes life. He entered into the ecclefiati-
cal fate; and founded a libary, which he berqueathed C fumellas to the church of Seville, to this day called the Colunbine lilrary. He died in 1560.

Colun
COLUTIELLA (Lucius Jumius Moderatus), a Roman phitofopher, was a matice of Caüir, and fived under the tmperor Chadius mbut the san +2 . He wrote a book on agiculturc intiticed $D_{e} R_{i}$ rup Pa, and anothe Do A, ivorizes.

COLUTiEia, a town of Red Ruffa in Phand, feated on the river Pruth, towarda the confines of MIMdavia, abont $3^{8}$ miles from Haliez, and 63 fonth of Leopent. This town bab been very ill thated by the Coffacks, minfonch that it is now inconfideable, tho' there are feveral mines of falt in its dillict. E. Long. 16. 25. N. L.t. 4 . 45 .

CULUMN, in architcelure, a round fillar made to fuppat and adorn a building, and compofed of a bafe, a hhart, and capital. Sot Apchitecture, $12-3$.
 cal culman is a kind of obfervatory, in furs of a very bigh tower beilt hollos, and with a fipiral afient to an armillary finere fheced atop for obfering the motions of the heaveny budies. Such is that of the Doric order erected at the Hotel de Soiffons at Paris by Caz tharine de Aledicis for the obfervations of Orontias Finews, a celctrated allonomer of that time.

Chenologiral Coleas, that which bears fone hiftorical infeription digelted according to the order of time; as by laltres, olympads, fathi, epochas, anuals, \&ce. At athens, there were columas of this kind, whereon "cre inferibed the whole hitory of Greece digetted into oly mpiads.

Funcol Cormen, that which bears an urn, wherein are fuppofed to be inclofed the athes of fome deceafed hero; and whofe fiaft is fometimes overfperad with tears and flunes, which are fymbuls of grief and of immortalty.

Guonamic Corman, a cylinder wheren the how of the day is reprefinted by the thadow of a tile. See Dial.

Higorial Conoms, is that whofe haft is atomed with a balio-relievo, ruming in a firial line its whole length, and comaining the hifory of fone geat purfonare: fuch are the Trajan and innorine colurns at Rome.

Hollow Comzon, that which has a fival fariecafe withinfide for the covenience of afecming to the top; as the Trajan column, the dair-cafe whereof confits of IS 5 teps, and is illuminated by +3 lithe windows, each of which is divided by tumbours of white mable. The monument, or fire-colum, at London, has alfo a Hair-cale; but it does not reach to the lop. Thefe kinds of columus are alfo called coluniat corlidica, or cocilider.

Indicative Column, that which ferves to fhow the tides, \&c. along the fea-coatts. Of this kind there is one at Grand Cairo of marble, whereon the overflowings of the Nile are exprefled: by this they form a judgment of the fucceeding feafon; when the water, for intlance, afeends to 23 feet, it is a figh of great fertility in Egypt. See Nilomiter.

Influabive Colesen, that raiful, according to Jofephus, lib. i. cap. 3 . by the fons of Adam, wherem were engraven the principles of arts and feiences.

## C O L [ 174$]$ C O I

Corurin. Paudelot tells us, that the fon of Pifitratus maifed ano-$\underbrace{-}$ ther of this kind, of fone, containing the rules and procepts of agriculture.

Ahnerary Conoms, a column with feveral faces, placed in the crofs ways in large roads; ferving to fhow the different routs by inferiptions thereon.

Lagny Column, at Rume, according to Feftus, was a column erected in the herb-market, now the place Montanara, which had a cavity in its pedeltal, wherein young children abandoned by their pazents, out of poverty or inhumanity, were expofed, to be brought up at the public expence.

Lergal Colums:- Among the Lacedemonians there were columns raifed in public places, whereon were engraven the fundamental laws of the thate.

Linitrophous or Boundury CoLumn, that which fhows the limits of a kingdom or country conquered. Such was that which Pliny fays Alexander the Great erected at the extiemity of the Indies.

ATanubiary Coresn, from the Latin manuhia, "fpoils of the enemy ;" a column adorned with trophies built in imitation of trees, whereon the fpoils of enemies were anciently hung. See Trophy.

Menortal Colcos, that raifed on occafion of any crazkable event ; as the monument of London, built to perpetuate the memory of the burning of that city in t 656 . It is of the Doric order, fluted, hollow, with a whinding flaircufe; and terminated a-top with waving flames. There is alfo another of the kind, in fonn of an obllik, on the hanks of the Rhine in the Patuinate, in menory of the famous pafage of that river hy the great Guitavus Adolphus and his army.

Mentian Colemn, any column which fupports a balcony or meaiana. The origin of this kiud of column, Svetonius and Afcanius refer to one Menias; who having fold his houfe to Cato and Fhuccus, confuls, to be converted into a pablic edifice, referved to himfelf the right of raifing a column without fide, to bear a balcony, whence he might fee the thews.

Milliary Column, was a column of marble raifed by order of Augultus in the middle of the Roman fosum; from whence, as a centre, the diftances of the feveral cities, \&c. of the empire were reckoned, by other miliiary columns difpofed at equal ditances on all the grand roads. This column was of white marble, the fame with that whieh is now feen on the balluftrade of the perron of the capital at Rome. Its proportion is mafive, being a thort cylinder, the fynbol of the globe of the earth. It was called milhiarium curcum, as having been gilt, at leaft the ball, by order of Auguitus. It was reftored by the emperors Vefpafian and Adrian, as appears by the infcriptions.

Military Colusn, among the Romans, a column whereon was engraven a lift of the forces in the Ruman army, ranged by legions, in their proper order; with detign to preferve the memory of the number of foldiers, and of the order preferved in any military expedition. They had another kind of military column, which they called cotumna Lellica, Itanding before the temple of Janus; at the foot whereof the conful deciared war, by throwing a javelin towards the enemies countries.

Scqulctiral Cozem, , ancientiy was a column erected cna tomb or fepulchre, with an infcription on its bafe.

Thofe over the tombs of perfons of ditinction were very large; thofe for the common people fmall : thefe latt are called fele and cipp:

Sutuary Colcmin, that which fupports a fatne. Such was that erected hy Pope Paul V. on a pedettal before the church of St Maira at Rome; to fupport a flatue of the Virgin, which is of gilt brafs. This column was dug up in the temple of peace; its thait is a fingle block of white marble $49 \frac{1}{2}$ feet high, and five feet eight inches diameter, of the Corinthian order.

The term faturry column may likewife be applied to Caryatides, perfians, termini, and other human figures, which do the office of columns; and which Vitruvius calls telomones and atlants. See Architecture, $\mathrm{n}^{2} 54$.

Triumpal Cozens, a column eresed amony the an cients in honour of an hero; the joints of the funes, or courfes whereof, were covered with as many crowns as he had made diferent military expeditions. Each crown had its particular name, as vallaris, which was befet with fikes, in memory of having forced a palifade. ATuralis, adomed with little turrets or battlements, fur having mounted an affault. Nazolis, of prows and beaks of veffols; for having overcome at fea. Olfdioncles, or granzinales, of grafs: fur having raifed a fiege. Oirans, of myrtle; which exprefled an ovation, or little trimmph; and triundsh:lis, of laurel, for a grend triumph, See Crown.

COLUMNARIUM, in Roman antiquity, a beary tribute, demanded for every pillar of a houfe. It was firt laid on by Julius Cofar, in order to put a flop to the extravagant expences laid out on fumptuons buildings.
COLUMNEA, in botany: A genus of the angiofpermia order, belonging to the didynamia clafs of plants: and in the matural method ranking undee the 4oth order, Porjonatz. The calyx is quinquepartite: the upper lip of the corolla arclutd and entire; gibbous above the Dufe; the anthere convex; the capfule bilocular There is but one fpecies, a native of Martinico, of which we have no particular defcription.

COLUMNIFERI, in botany, an order of plants in the fragnenta methodi naturalis of Linneus, in which are the folloring genera, viz. hixa, corchorus, heliocarpus, kiggelaria, microcos, muntingia, thea, tilea, turnera, trumfetta, ayenia, grevia, helicteres, kleinhovia, adanfonia, alcæa, althæa, bembax, camcllia, gofypium, hermannia, hibifcus, lavatera, malope, malya, melochia. napra, pentapetes, fida, Hewartia, theobroma, urena, waltharia.

COLURES, in aftronoms and geography, two great circles fuppofed to interfect each other at right angles in the poles of the world, and to pafs through the folftitial and equinoctial points of the ecliptic. See Geography.

COLURI, a little illand in the gulph of Engia, in the Archipelago, formerly called Salamis. The principal town is of the fame name, and feated on the fouth fide, at the bottom of the harbour, which is one of the fineft in the world. The famous Grecian hero, Ajax, who makes fruch a figure in Homer's liad, was king of this ifland. It is now, however, but a poor place; its commodities confift of wheat, balley, tar, rofin, pit-coal, fponges, and pot-ahhes, which they carry to Athens.

Athens. It is feven miks fouth from Athens, and is feparated from the contiment by a flrait about a mile over.

COLUTEA, eastardesens, in botany: Agenu: of the decandria arder, belonging to the diadelpha dafs of plants: and in the natual method ranking under the 3 edurder, Pupilimacap. The calys is quinquefid; the lerumen inflated, opening at the apper part of the bafe. There are theee fpecies, all of them deciduous floweriug fhrubs, adorned whit many-lobed leaves, and buttertly-maped flowers, of a decp ychlow or red colour. 'They are propagated buth ley fecels and layers, and are hardy enongh, thourh they lometimes require a little fieter when the weather is very cold.

COLYBal, or Colybus; a term in the Greek liturgy, lignifying an offering of corn and boiled pulfe, made in honour of the faints, and for the fuke of the dead.

Balsamon, F. Coar, Leeo, Allatius, and others, have written on the fubject of colybe: the fubllance of what they have faid is as follows: The Greeks boil a quantity of wheat, and lay it in little heaps on a plate; adding beaten peas, muts cut fimall, and grape-ftones, which they divide into feveral compartments, fepirated from each other by leaves of parney. A little heap of wheat, thus feafoned, they call ronuex. They have a particular formula for the benediction of the colyba: wherein, praying that the children of Babylon may be fed with pulfe, and that they may be in better condition thith other people, they delire God to blefs thofe fruits, and thofe who eat them, becaufe offered to his glory, to the honour of fuch a faint, and in memory of the faithful deccafed. Dahamon refers the inftitution of this cermony to St Athanatios; but the Greck Symaxary to the time of Juhian the apoftate.

COLYMBUS, in ornithology, a genus belonging to the order of anferes. The bill has no teeth, is fubirlated, fraight, and harp-pointed; the teeth are in the throat; the noftrils are linear, and at the bafe of the bill; and the legs are unfit for walking. This genus includes the divers, guillemots, and grebes; of which the following are the mot remarkable fpecies.

1. The grylle, or black guillemot, is in length 14 inches, in breadth 22 ; the bill is an inch and an half long, fraight, Render, and black; the intide of the mouth red; on each wing is a large bed of white, which in young binds is footted; the tips of the leffer quill-feathers, and the coverts of the wings, are white: except thofe, the whole plunage is black. In winter it is faid to changre to white; and a variety fotted with black and white is nost uncommon in Scotland. The tail confits of 12 feathers; the legs are red. Thefe birds are found on the Bafs ine in Scotland; in the iftand of St Kilda; and, as Mr Ray imagines, in the Farm Iflands off the coall of Northumberland. It has alfo been feen on the rocks of Llandidno, in Caernarvonhhire, in Wales. Except in breeding-time it keeps always at fea: and is very difficult to be fhot, diving at the flath of the pan. The Wellh call this bird cafian longur, or "the failor's hatred," from a notion that its appearance forcbodes a ftorm. It vifits St Kilda's in March; makes its neft far under ground; and lays a grey egg, or, as
 with allecolour.
2. 'The troile, or foulith कuillemot, we"shaza ounces: its length is 17 inches, the breadth $27-2$; bis bill is these

 of the mouhth bllow; the feathers com the naporat of the bill are thont and fult like velect: frem the eye to the hind part of the hact is a form divian of the futhers. The lteal, nocis, back, wing', and tail, are of a deep moufe-colour ; the tips of the leffer quit-- feathers white; the whole under pant of the bondy is of a pure white ; the dokes under the winge mathoed with duky lines. Lmanchiatcily above the thighs are fome long feathers that end wer athm. The legs are dulky. They are form in amangen nombers on the hig! chil's of feveral of the Britith corats, and appea* at the fame time with the ank. 'They ane vory fimple birds: for mutwithanding thaty ate lhot at, and fie their companions killed by them, they will not quit the tock. Like the auk they lay only one cere, which is very lrge: fome are of a fine pale blae; others White, fpotud, or moil elegantly fteaked with lines croming each other in all diredtions. They continue about the Orkneys the whok winter. The chiel places they are known to breed in are the uninhabite ifle of Prietholm, near the ille of Anglely; on a sock cetted Gudreve, not far from St Ives in Comwall; the Farn illes, near the coalt of Northumberland ; and the cliffs about Scaborough in Yorkhire. They areallo found in moft of the northern paits of Europe, to Spitbergen, the coaft of Lammark, and along the white and icy fea quite to Fimmehatka. Is frequently met with on the coatts of Italy in the winter. It is alio known in Nen fundand, and in a few parts uã the continent of Nurib America, but has not hitherto been talked of as common. Our hat voyagers met with it on the coalt nosth of Nootka Sound. It is known by feveral names; by the Wckh, guillem; at Northumberland and Duham, guillemed or fectobin; in Torkfhire, a fout; by the Cornifh, kiddah; in the fornthern parts, willock; and in Kamtfhatka, aru or kelric. The inhabitants of the laft kill them in numbers for the fake of their fefh, though it is certainly very tough and ill taled; but more efpecially for their fkins, of which, as of other fowls, they make garments: the eggs are alfo accounted a gieat delicacy.
3. The feptentrionalis, or red-throated diver, is more elegantly haped than the others. It weighs three pounds. The length to the end of the tail is two fiet; to the toes two feet four inches: the breadth. three fiet five inches. The hatad is fmali and tuper, the bill ftraight ; the head and chin are of a tine misform grey; the hind part of the nock marked wibl dulky and white lines pointing downwards; the throat is of a dull red; the whole upper part of the body, tuil, and wings, of a deep grey, almolt duky; but the coverts of the wings and the back are marked with a few white fpots; the under fide of the body is white ; the legs duply. This fpecies breeds in the nothem parts of Scotłand, on the borders of the lakes. It is found alfo in Ruffia, Siberia, and Kamtfchatka; but does not haunt the inland lakes. It is common in lee.

Combur land ame Creeniand, whe it breed in June, and lays
 it makes ite wefl in tle grafs on the hores, compond of mof and grafi, and placed contignons to the water. It frims and dives wdt, and fies admiably, and rihite fying is very monif. It feeds on Fmail nh, crabs, and fea infects. In the fummer, it inhabits the rivers of Hudfon's bay. apparing as foon as the rivers are cpen. Hene it lays in fune, and lines the neit with a hittle down from its own brall; the young fly before the end of Augut, and they all depart in September. They are called by the natises offic-moqua. They prey much on the fifh entangled in the nets; but are often thereby caught themfelves.
4. The arcticus, or black-throated diver, is fomewhat lager than the latt: the bill is black, and alfo the front; the hind part of the head and neck cincreous; the fides of the neck marked with Wlack and white lines pointing downwards; the fore-part of a glofly variable black, purple, and green. The back. feapulare, and coverts of the winge, are black, marked, the wo firl with fquare, the latt with round fous of white; the quill-feathers dunsy; the breaft and belly wite; the tail thort and black; legs partly dunty, ard party reddifh. This fpecies is now and thon fome in Enerland, but is not common. It is fuificiotly flaty in the nomthern parts of Enrope, Norwase, sacden, and Demmark. Frequent in the inland haks of Siberia, efpecially thote of the ardic regions: in Iccland, Grecnland, and the Feroe llos: and in America at Haddon's bay. It is fuppofed to cry and be very reftlefs before rain, making a great noile: hence the Nowegians think it impious to deftroy this fpecies; but the Swedes, lefs fupertitious, drefs their flins, which, like all of this genus, are evceedingly tonch, and ufe them forgun-cafes and faciner for wint cr caps.
5. The ghacia, or monthem diver, is three feet hae inches in fength ; the breadh four feet eight ; the bill to the corners of the month four inches long, black and Atrurly male. The head and neck are of a deep black; the hend pat of the kutw is warked with a large fomilunat whitebnus; immseintely under the throat is another; both maked with hack oblong trokes pointing lown: the lower part of the neck is of a deep black, gloffed with a rich preple: the whole tamber lide of the bociy if white: the fides af the treaf marked with black Biats; the bats, concts of the winge, and liopume, are bidek malice widi white fucts: thof oa the forpulars aue very ho re, and of a fquare thape: two at the ead we each father. The tat is very fhort, and ahomen conctata by the conets, which are dulty, fpeted with whe; the kegs ach Wack. This fpecies i: Matits Several parts of the north of Tumpe, but is 2ut iery fiquan: on on hores: not cerer fean fouth*arel racept in vay forme winters. It is foldom met with on lath leting for the molt part on the epon fea, where it is comtmatly ring for tha, which it does with geat atity. and fites high and well. It is common in Icolod an! Cureatond, where it breeds. and at that ione fana wh tice fich waters. It is fufficiatly plentiful in Somsay, and all nong the aretic coater, as for as the river (ib, ia tie Ranian dumianos. The larabinzians, a nation fisuated between that siver and the Irtifh, tan the breats of this and other water-fowl; whofe lkins they prepare in fuch a manner as to pre$\mathrm{N}^{\mathrm{O}} 85$.

Ecrec the down upon them; and fewing a number of Colymbe them together, their hutbands fell them, to mase pelliese, aps, de. Garments made of the fe are very warm, uver imbibing the leat moiture: and are more latting than could be imacined. It is. alfo met with among the lahes of Iudfon's bay. The natives of Greenland ufe the Rins for coathing ; and the Indiaus about Hudfon's bay adorn their heads with circlets of their feathers. At the latt place it is known by the name of athinue-moqua. As they are feldom feen on the fea-evafts, but chicfly among the lakes, they are called ly the Indians inland lozas.
6. The immer, of ember-goofe, is fuperior in fize to a common groofe. The head is dufly; the back, coverts of the wings, and tail, clouded with lighter and darker foades of the fame. The primaries and tail are black; the under fide of the neck fpotted with dufly; the breat and belly filvery: the legs black. They inlabit the feas about the Orkney I hands; but in fevere winters vilit the fotthern parts of Great Britain. They are found alfo in lccland, and moft parts of northern Europe; likewife in Kamtfehatka; but not in any parts of Siberia or Ruffa. It likewife inhabits Switrerland, particuarly on the lake Conitance, where it is known by the name of forder. It is faid to dise wonderfully well, and to rife at an amazing diflance foom the place where it plinged. The female makes its nett among the reeds and flags, and places it in the water; fo that it is continually wet, as in fome of the grebe genus. It is difficult to be taken, either on land or fwimming on the water; but is not unfrequently eaught under the water by a hook baited with a fmall fin, its ufual food.
7. The Chinefe diver, defcribed by Mr Latham ; the fize uncertain, but in the drawing the length was it inches. The bill dufty: inides afh-colour: the upper pats of the head, neek, body, wings, and tail, dufny greenith brown; the middle of the feathers much darker: the fore part of the neck the fame, but condiderably pader: chin pale rufous: breaft and under parts of the lody pace rafous white, marked with duky rufon fots: the quills and ail are plain brown, the Int thert : legs ath-colour. Suppofed to inlabit China. as Mri lathom faw it among other wel painted dranings at Eir joleph Panks's; it was in the attitude of hifhir, with a brats ring round the middle of the reck, in the manacr of the ligure, Plate CXXVI. From the various and uncertain accounts of authors; we are not clear what birds the Chinefe ufe for catching tith; the coftom, however, of doing it is manifelt, from the relations of many travilers. The bid ufed for this purp. Se has a ring fatened round the middle of the neck, in order to prevent its fwallowing; befodes this it has a flender long ltring fatened to it ; and, thuns accoutred, is taken by its malter into his fraing-bon, from the edge of which it is tanght to piunge after the fin as they pafs by ; and as the ring prevents their pafting further downwards, they are taken from the moth of the bird as fat as they are caaght. In this manner fometimes a great many are procured in the courle of a few hours. When the keeper of the bird has taken fufficient for himfelf, the ring is taken off, and the poor flave fuffered to fatisfy its own hunger. We do not here give this bird as the one muat commonly uled for the abore purpofe; but have

## C O L [ 1ヶク $]$ C O M

ymbus have thought right to figure it, as a fpecics, if not new, at leat as not generally known ; and probably, from the ciremmftance of its fitnation in the painting, may prove one of the birds ufed on this occation.
8. The ftellatus, or fpeckled diver, a fpecies left than the furner, weighs two pounds and a half: and is 27 inches in leagth and three feet nine in breadth. The bill is three inches long, bending a trifle upwards; and is of a pale horn-colour, the top of the upper mandible danky; the head is dulky, dotted with grey; hind part of the neek plain duky; the fides under the eye, the chin, and throat, white; fore part of the neck very pale ah-colour; back dulky, marked with oval fpots of white; fides of the break and body the fame, but fmaller ; the fots on the rump and tail minute; breal and under parts white; quills duky; legs brown; webs and claws pale. This bird is pretty frequent in England; fufficiently fo on the river 'thames, where it is called by the fifhermen forat loon, being often feen in vaft numbers ameng the thoals of that fifh, civing after them, and frequently approaching very near the boats while fifhing. It is common about the Baltic and the White Sea, but not obferved in other parts of Kuffia, yet is a native of Kamtfehatka. It lays two eggs, in the grafs, on the borders of lakes nut far from the fea; they are exactly uval, the fize of thofe of a groofe, dufly, narked with a few black fpots. Thefe are alfo frequent abont the finh ponds in France, cxcept they arc frozen, when they betake themfelves to the rivers. [his and the two laft wift New York in winter, but return very far north to breed.
9. The cry Aatus, eretted diver, or cargoofe, weighstwo pounds and an half. Its length is 2 t inches, the breadth 30 ; the bill is two iuches and a quarter long, red at the bafe, and black at the puint; between the bill and the cyes is a flipe of black naked gin; the irides are of a fine pale red; the tongue is a third part thorter than the bill, hender, hard at the end, and a little divided; on the head is a large dufly creft, feparated in the middle. The eteeks and thront are furrounded with a long pendent ruff, of a bright tawney colour, edged with black; the chin is white; fown the bill to the eye is a black: line, and ahove that a white one; the hind part of the neck and the back are of a footy hare; the rump, for it wants a tail, is covered with long foft down. The covert-feathere on the fecond and third joints of the wing, and the under coverts, are white; all the other wing-feathers, except the fecondaries, are dukky, thofe being white; the brealt and belly are of a moft benutiful filvery white, glofiy as fattin : the outide of the legs and the botom of the fett are dufky; the indede of the legs and the toes of a pale green. Thefe birds frequent the meres of ShropThire and Chethire, where they breed; and the great fen of Lincolnhire, where they ase called gaunis. Their dims are made into tippets, and fold at as ligh a price as thofe which come from Geneva. This fpecies lays four egge of a white colour, and the fame free with thofe of a pigeon. The nelt is formed of the roots of bugbane, thalks of water-ily, poad-weed, and water-violet, floating independent ameng the reeds and flags; the water peactrates it, and the bird fits and latches the exga in that wet condition; the nelt is fonetimes blown from among the flags into the middle of the water: in thefe circumflanees the fable , Vol. V. Part I.
of the halleyon's neft may, in fome ancatiure, be vindicated. It is a carcful nurfe of its young ; being obTurph in feed them nott afliduouly, commonly witia frall eds; and when the infant brood are tired, the farent will casry them cither on its back or wader its wings. It preys on tifh, and is almoil peppetually diring; it docs not fhow much more than the head aLove water: and is very difficult to be fhot, as it datc down on the leaft appoarance of danger. It is never feen on hand; and, though difturbed ever fo often, will not fly farther than the end of the lake. Its ^ine is out of fafon about February, lofing then its bright colour ; and in the breeding time ita breaft is almolt bare. The flef is exceffively rank.
to. The urinator, or tippet-grehe, thouglat hy Mr Latham not to be a different feecics from the former, being only fomewhat lefs, and wanting the ereft and ruff. The fides of the neck are thiped downwards from the head with narrow lines of black and white: in other refpects the colours and marks agree with that bird. This fpecies has been fhot on Roflem Mere in Cheflite. It is rather fcarec in England, but is common in the winter time on the lake of Geneva. They appear there in flucks of 10 or 12 ; and are killed for the fake of their beautiful thins. The under fide of theme being dreffed with the feathers on, are made iato muffs and tippets: each hird fells for about 14 thillings.
11. The auritus, cared grebe, or dolnchick, isin length onie foot to the rump ; the extent is 22 inches; the bill Dlack, fender, and hightly recurvated; the irides crimfon; the head and neck are black: the throat fpotted with white; the whole upper fide of a blackith brown, except the ridge of the wing about the firt juint, and the fecondary feathers, which are white; the breat, belly, and inncr coverts of the wings are white; the fuhaxillary fathers, and fome on the fice of the rump, ferruginous. Behind the eyes, on eas': fide, is a teft of long, loore, ruft coloural fuathers hanging backwards; the kezs are of a dutly green. They inhabit the fers nea: Spalding whene they breed. No external cifference is to be obferved between the male and the fenale of thin foceies. Ther make their nef not unike that of the frmer: and lay four or five fall cggs .
12. The horned grebe, is about the fire of a teal: wtight, one pound; length, one foot; breadth, 16 inches. Bill one inch, dufcy; head wery full of feathers, and of a glofiy deep green, nearly black: :thro' each eye is a ftreak of yellow fcathers, clongated into a tuft as it paffes to the hind head: the upper part of the neck and back is a dufly brown; the fere part of the neek and hreall. dats orange red: the leffer wing coverts, cinerous; the greater and quills, black; middle ones, white: bolly, gleify white; legs, cinerous blue before, pale behind.- It inhabites Hudion's bay: and firlt appears in May, about the freh waters. It lays from two to four white egrgs in June, among the aquatic plants; and is faid to cover theem when abroad. It retires fouth in autumn; appears then at New York, ttaying till fpring, when it returns to the north. For its vait quicknefs in diving, it is called the water-weitch. At Hudfor's bay, it is known by the name of jeckeq. See Plate CXLIII.
COM, a town of Afra in the empire of Perfia, and province of Lacagemi. It is a large populous place,

Com but has fulfered gratty by the civil wars. E. Long Com'tina- 49. 1 N. Lat. 34. o.
tw. COMA, or Cova-vigil, a preternatural propenfity to fleep when, neverthelef, the patient does net Alep, or if he doce, arakes immediately without any relief. See Me icinf-Indes.

Coma Bornices, Bereniee's hair, in aftronony, a modern eontellation .f the northern hemifphere, compofed of unformed itus between the Lion's tail and Bootes. This confellation is fuid to have heen formel by Conon, an aitronomer, in order to confole the queen of Pulumy Evergetes for the lofs of a lock of her hair, whith was itolen out of the temple of $V$ enus, where the had dedicated it on aceount of a vietory obtained by her hufband. The hars of this conllellation, in Theho's Catalogue, are iourteen; in Hevclius's, twenty-one ; and in the Britanaic Catalogue, forty-three.

Const Sumblenum, is when the patient continues in a profond fleep; and, when awakencd, immediately relapfes. withont being able to keep open his eyes.

COMARUM, mash-chreremin: A genus of the polyernia order, bflonging to the icofandra chafs of plants; and in the natural method ranking under the 35 th order, Suticof. The calyx is decontid; the petals five, lefis than the calys; the rectpate of the feeds ovate, fpongy, and perfiting. There is but one feecies, a native of Britain. It rifes abont two feet high, and bears fruit fomewhat like that of the Atravbery. It grows naturally in bogs, fo is not eafily preferved in gardens. The root dyes a dirty red. The Irifh rub their milking pails with it, and it makes the milk appen thicker and richer. Goats eat the herb; cows and theep are not fond of it ; horfes and fwine refufe it.

CONB, an initrument to clean, untangle, and drefs flas, wool, hair, ise.
Combs for wool are prolibiced to be inported into England.

Coms is alfo the crefl, or red fellyy thit, growing upon a cock's head.

COMBA'T, in a general fenfe, denotes an engagement, or a diffrence decided by arms. See Batrle.

Combit, in our ancicat law, was a formal trial of fome douhtful caufe or quarrel, by the fwords o: battons of two champions. This form of proceediug was very frequent, not only in criminal but in eivil eaufes; being built on a fuppolition that God would never grant the vienty but to him who had the beft right. The late trial of this kind in Enghand was between Donald lord Ray appellant, and David Ramfay, Efiq; defendant, when, after many formalitics, the matter was referred to the King's pleafore. See the artiele Battle.

COMBER, or Cumber (Thomas), an eminent divine born at Weltram in Kent, in 1645 , was educated at Cambridge ; ereated doctor of divinity ; and, after feveral preferments in the church, was made dean of Durinan. He was chaphain to Anne princefs of Denmak, and to king William and queen Mary. He was auther of fereral woks, viz. 1. A fcholatical hiilory of the primitine and gineral ufe of Liturgies. 2. A Compani n to the Ahos. 3. A Lrief difcourfe upa the offers of cumilin, catedifur, and conlirmatik. . He died in I Gyg, agod $55^{\circ}$

COMBINATION, pruperly denotes an afemblage wf ferceal thirges, two by two,

Combinition, in mathematics, is the variation or alteration of any number of quantities, letters, or the like, in all the differeat manners potible. SeeChang:s.

Aphori/ms. I. In all combinations, if from an arithmetic decreafing feries, whofe firth term is the number out of which the combinations are to be formed, and whole common difference is 1 , there be taken as many terms as there are quantities to be combined, and thefe terms be multiplied into each other; and if from the feries $1,2,3,4,8$. there may be taken the fame number of terms, and they be multiplied in. to cach other, and the firit product be divided by the fecond; the quotient will be the number of combina. tions required. Therefore, if you would know how many ways four quantities can be combined in feven, multiply the firt four tern: of the feries, $7,6,5,4$, \&e. together, and divide the product, which will be 8 fo, by the product of the firlt four terms of the feries, $1,2,3,4$, 太e. which is 24 , and the quotient 35 will be the combinations of 4 in 7 . II. In all permutations, if the feries $1,2,3,4$, \&e. be continued to as many terms as there are quantities to be charged, and thofe terms be multiplied into each other; the produt will be the number of permutations fought. Thus, if you would know how inany permutations can be formed wilh five quantities, multiply the terms $1,2,3,4,5$, together, and the product 120 will be the mmber of all the permutations.

Problens. I. To fund the number of changes that may be rung on 12 beils. It appears by the fecond aphorim, that mothing is mone neceffary here than to multiply the numbers from I to 12 continually into each other, in the following manner, and the latt produit will be the number fought.

$$
\begin{array}{r}
1 \\
\frac{2}{2} \\
-3 \\
-\frac{1}{6} \\
-\frac{4}{24} \\
-\frac{5}{120} \\
\frac{6}{720} \\
\hline \frac{7}{5040} \\
8 \\
\hline 40320 \\
\hline 362880 \\
\hline 10 \\
\hline 3628800 \\
\hline 39916800 \\
\hline 12
\end{array}
$$

II. Suppofe the lettors of the alphabet to be wrote fo frall that no one of them fhall take up more face than the hundredth part of a fquare inch : to find how many $f_{q}$ uare yards it would require to write all the permutations of the 2.4 letters in that lize. By following the fame method as in the laft problem, the number of permutations of the $2+$ letters will be found
ambina- to he $62,044,8,40,173,3^{2}, 3,9+3,936,000$. Now the inches in a fquare yand being 1296 , that number multiplied by 100 gives 129,600 , which is the number of letters each fquare yard will contain; therefore if we divide $62,044,840,173,323,943 \cdot 936,000$ by 129600 the quotient, which is $479,741,050,720,092,160$, will be the number of yards required, to contain the above mentioned number of permutations. But as all the 24 letters are contained in every permmation, it will require a fpace 24 times as large; that is, $11,489,785,217,282,211,840$. Now the number of fquare yards contained on the furface of the whole earth is but $617,19 \%, 435,008,000$, therefore it would require a furface 18620 times as large as that of the earth to write all the purmutations of the $2+$ letters in the fize above mentioned.
III. To ind how many different ways the elden hand at piquet may take in his five cards. The eldelt hand having 12 cards dealt lim, there remain 20 cards, any five of which may be in thofe lee takes in ; contequently we are hore to find how many ways five cards maty be taken out of 20 . Thercfore, by aphosim I. if we multiply $20,19,18,17,16$, into cach other, which will mate 1850480 , and that number be diviued by $1,2,3,4,5$, muinplied into each other, which make t20, the guotient, which is 15504, will be the number of ways five cards may be taken out of 20. From hence it follows, that it is 15503 to 1 , that the eldcil hand does not take in any five certain cards.
IV. To find the number of deals a perfon may play at the game of whit, without ever holding the fame cards twise. The number of cards played with at whilt being 52 , and the number deale to each perfon being 13 , it follows, that by taking the fame method as in the laft experiment, that is, by multiplying 52 by 51,50 , \&c. fo on to 4 I , which will make $3,954,2+2,643,911,2,39,680,000$, and then dividing that fun by $1,2,3$. \&c. to 13 , which will make $6,227,020$, S00, the ghotient, which is $635.013,559,600$ will be the rimber of different ways i 3 cards may be taken out of 52 , and comfequently the number fought.

The conftruction of this table is very fimple. The line A a confints of the firt 12 numbers. The line A $b$ confifts every where of units; and fecond term 3 . of the line $B, c$, is compored of the two terms 1 and 2 in the preceding rank: the third term 6 , in that line, is formed of the two terms 3 and 3 in the precerting rank: and for of the rell ; every term, after the forth, being compured of the two next terms in the precteling rank: and by the fame method it may be continued to any number of ranks. F'o find whis tatic how often any number of things can be combined in another number, under 13, as fuppofi. 5 carls out ot 8; in the eighth rank look for the fifth term, which is $5^{6}$, and that is the number required.

Though we have thown in the foregoing problens the manner of finding the combination of all numbers whatever, yet as this table aufiwers the fame purpof, for fmall nnmbers, by infpection only, it will be fomet ufeful on many occalions; as will appear by the following examples.
V. To tind how many diferent founds may be produced by thiking on a hatphichord two or more we the feven matural notes at the fame time. I. The combinations of two in feven, by the foregring triangle are
2. The comhinations of 3 in 7 , are - 35
3. The combinations of 4 in 7 , are - 35
4. The combinations of 5 , are - 21
5. The combinations of 6 , are - 7
6. The feven notes all together once
Therefore the number of all the found will be $\quad 120$
VI. Take four fquare pieces of patieboard, of the fame dimenfion, and divide them diagonally, that is by draving a lize from two oppofite anoles, as in the figlurvs, into 8 triangles; paint 7 of the fe triangles with the primitive colorrs, red, orange, yellow, green, 1,he, indigo, violet, and let the eighth be white. To find how many chequars or reqular four-fided figures, different either in fom or colour, may be made our of thofe cight triangles. Firt, by combining two of thefe triangles, there may be formed either the triangular fquare A , or the inclincd fquare B culled a rhomb. Secondly, by combining four of the triangles, the large fquare $\mathbb{C}$ may be forned; or the long fquare 1 , called a paralldogram.

D

Now the firf two fquares, confinting of two parts out of 8 , they may each of the , by the eighth rank of the triangle be taken 28 different ways, which makes 56 . And the lat two fquares, confiliag of four pats, may each be taken by the tame rank of the triangle 70 times, which nakes 140 'l'o which add the foregoing number 56
And the number of the different quares that may be formed of the 8 trianglea, will be

## $\mathrm{C} 0 \mathrm{M} \quad[180] \quad \mathrm{C} O \quad \mathrm{M}$

Combina: vil. A man has 12 different forts of dowers, and a thon. lagge number of each fort. He is defrous of fetting them in beds or flourithes in his partores : Six flowers in fome, 7 in others, and 8 in others; fo as to have the createll variety poffible; the flowers in no two beds to be the fame. 'I'o find how many beds he mult have. 1. The combinations of 6 in 12 by the Lut rank of the triangle, are

## 2. The combinations of 7 in 12 , are

## 3. The combinations of 8 in 12 , are 495

 Therefore the number of beds muft be 2211VIII. 'To find the number of chances that may be thrown on two dice. As each die has 6 faces, and as every face of one die may be combined with all the faces of the other, it follows, that 6 multiplied by 6 , that is 36 , will be the nomber of all the chances; as is alfo evident from the following table:

| Numb. ef chateces. | Numb. of points. |
| :---: | :---: |
| 1 | \| 21 |
| $=1$ | 16 |
| 3 | 12 |
| 4 | 20 |
| 5 | , 30 |
| 6 | 142 |
| 5 | 40 |
| 4 | 36 |
| 3 | 30 |
| 2 | 22 |
| 1 | 12 |
| 36 | 252 |

It appears by this table, :. That the number of chances for each point continually increafes to the point of feven, and then continually decreafes till 12 : therefore if two points are propofed to be thrown, the equality, or the advantage of one over the other, is cleariy vilible (A). 2. The whole namber of chances on the dice being 252 , if that number be divided by $3^{6}$, the number of different throws on the dice, the quotient is 7 : it follows therefore, that at every throw there is an equal chance of bringing feven points. 3. As there are 30 chances on the dice, and only 6 of them doublets, it is 5 to 1 , at any one throw, againlt throwing a doublet.

By the fame method the number of chances upon any number of dice may be found: for if 36 be maltiplied by 6 , that product, which is 216 , will be the hances on 3 dice; and if that number be multiplied by 6 , the product will be the chances on 4 dice, sie.

Combinitions of the Cards. The following experiments, founded on the doctrine of combinations, may poffibly amufe a number of our readers. The tables given are the bafis of many experiments, as well on numbers, letters, and other fubjects, as on the cards; but the effect produced by them with the laft is the moft furprifing, as that which thould feem to prevent any colluifon, that is the fhuffling of the cards, is on the contrary the caufe from whence it proceeds.

It is a matter of indifference what numbers are made ufe of in forming thefe tables. We flall here confine ourfelves to fuch as are applicable to the fubfequent experiments. Any one may confruct them in fuch manmer as is agretable to the purpofes he intends they fhall anfwer.
'I'o make them, for example, correfpond to the nine digits and a cipher, there mult be ten cards, and at the top of nine of them mult be written one of the digits, and on the tenth a cipher. Thefe cards mult be placed upon each other in the regular order, the number I being on the firf, and the cipher at botron, You then take the cards in your left hand, as is commonly done in fhufling, and taking off the two top eards, I ard 2, you place the two following, 3 and 4 , upon them ; and under thofe four cards the three following 5, 6, and 7: at the top you pit the cards 8 and 9 , and at the bottom the card marked o; conftantly placing in fucceffion 2 at top and 3 at bottom: And they will then be in the following order:

$$
8 \cdot 9 \cdot \cdot 3 \cdot 4 \cdot \cdot 1.2 \cdot \cdot \cdot 5 \cdot 6 \cdot 7 \cdot 0
$$

If you flumfle them a fecond time, in the faise manner, they will then fland in this order:
$6.7 \cdot .3 \cdot 4.8 .9 . .1 .2 .5 . .0$
'Thus, at every new thoffle, they will have a diffirent order, as is expreffed in the following lines: 1 thuthe 8.9.3.1.1.2.5.6.9.0

| 2 | $6.7 \cdot 3 \cdot 4 \cdot 8 \cdot 9 \cdot 1.2 \cdot 5 \cdot 0$ |
| :--- | :--- |
| 3 | $2 \cdot 5 \cdot 3 \cdot 4 \cdot 6 \cdot 7 \cdot 8 \cdot 9 \cdot 1.0$ |
| 4 | $9 \cdot 1 \cdot 3 \cdot 4 \cdot 2 \cdot 5 \cdot 6.7 \cdot 8.0$ |
| 5 | $7 \cdot 8 \cdot 3 \cdot 4 \cdot 9 \cdot 1.2 \cdot 5 \cdot 6.0$ |
| 6 | $5 \cdot 6.3 \cdot 4 \cdot 7 \cdot 8 \cdot 9 \cdot 1 \cdot 2.0$ |
| 7 | $1.2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8.9 .0$ |

It is a remarkable property of this number, that the cards return to the order in which they were dirlt phiced, after a number of thuffes, which added to the number of columas that never change the order, is equal to the number of eards. 'Thus the number of thuffes is 7 , and the number of columns in which the cands marked 3, $4, \& \mathrm{E}$. never change their places is 3 , which are equal to 10 , the number of the cards. This property is not common to all numbers; the cards fometimes returning to the firtt order in a lefs number, and fometimes in a greater number of thulfes than that of the cards.
 Couftructad on the foregoing principles.

## I. For ten numbers.

(A) It is eafy from hence to determine whether a bett propofed at hazard, or any other game with the dice, be advantageous or not; if the dice be true (which, by the way, is rarely the cafe for any long time together, as it is fo eafy for thofe that are poffeffed of a dexterity of hand to chage the trae dice for falle!.
C O M

Tombina- Thefe tables, and the following examples at piquet tion. except the 36 th, appear to have been compoled by M. Guyot.
II. For iwenty-four nunters.

Order before dealing. After ith dad. After the ad. After the 3 d .

| 29 | 27 | 25 | 30 |
| 30 | 30 | 30 | 30 |
| 31 | 31 | 31 | 31 |
| 32 | 32 | 32 | 32 |

I. "Several letters that contain no meaning, being " written upon cards, to make them, after they have " been twice hluffed, give an anfwer to a queftion "that fhall be propofed; as, for example, What is " love ?" Let 24 letters be written on as many cards which, after they have been twice fhufled, thall give the following anfwer:

A Iream of joy tbat foon is o'cr.
Firf, write one of the letters in that line on each of the cards(.B). Then write the aufwer on a paper, and affign one of the 24 firft numbers to each card, in the following order:
A DREAM OF JOY THAT SOON I ${ }^{2} 3456 \quad 78210111213141516171812$ I S O'ER.
2021222324
Next, write on another paper a line of numbers, from 1 to 24 , and looking in the table for 24 combinations, you will fee that the firft number after the fecond fhufle is 21 ; therefore the card that has the firt letter of the anfwer, which is $A$, mult be placed againft that number, in the line of numbers you have jut made(c). In like manner the number 22 being the ficond of the fame column, indicates that the card
which
(B) Thefe letters frould be written in capitals on one of the corners of each card, that the words may be eafily legible when the cards are fipread open.
(c) For the fame reafon, if you would have the anfwer after one fhuffe, the cards inut be placed accordirs to the firt colum of the table; or if after three fhufles, according to the thind column.

## $\mathrm{C} O \mathrm{M} \quad\left[\begin{array}{lll}182\end{array}\right] \quad \mathrm{C} O \quad \mathrm{M}$

Comhina-which aniwers to the focond letter Dof the anfwer, not. mutt be placed againt that mumber: and fo of the rett. The cards will then hand in the following order:

|  |
| :---: |
|  |  |
|  |  |

From whence it fullowe, that after llefe cards have been twice fluthed, they mult infallibly fand in the order of the leters in the anfwer.

Obferce 1. You thould have feveral quellions, with theis anfwers, coniliting of $2+$ ketters, writen on cards: thele cards fould be put in caics, and numbered, that You may know to which quellion each anfwer belongs. You then prefent the queltions; and when any one of them is chofen, you pull out the cafe that contans the anfuer, and fhowing that the letters written on them make no fenfe, you then fhufle them, and the anfiver becomes obvions.
z. To make this experiment the more extraordimary, you may have three carls, on each of wheh an anfwer is written ; one of which eards mull be a little wider, and another a little longer, than the others. Tou give thefe three cards to any one, and when he las privately chofen one of them, he gives yon the other two, which you put in your poeket withont looking at them, having difoosered by feeling which he has chofen. You then pull out the cafe that contains the cards that anfwer to his quettion, and perform as before.
3. You may alfo contrive to have a long card at the bottom, after the fecond fluffle. The cards may be then cut fereral times, till you perceive by the touch that the lons card is at bottom, and then give the anfwer ; for the repeated cuttings, however often, will make no alteration in the order of the cards.

The fecond of thefe obfervations is applicable to fome of the fubfequent experiments, and the third may be practifed in alnolt all experiments with the cards. You thould take care to put up the cards as foon as the anfwer has been hown; fo that if any one fhould define the experiment to be repeated, you may offr enother queflion, and pull out thofe cards that contain the anfwer.

Though this experiment camot fail of exciting at Ell times pleafure and furprife, yet it mul he owned that a great part of the applaufe it receives arifes from the addrefs with which it is performed.

I1. "The 24 letters of the alphabet being written " upon fo many eardi, to thuffe them, and pronounce " the letters fhall then be in their natural order ; but "that not fucceeding, to thutfe them a fecond time, " and then how them in proper order." Write the $2 . f$ litters on the cards in the following order:

$$
\begin{aligned}
& \begin{array}{llllllllll}
1 & 2 & 3 & 5 & 6 & 8 & 9 & 10 & 11 & 12 \\
\mathrm{~K} & \mathrm{~B} & \mathrm{O} & \mathrm{E} & \mathrm{~F} & \mathrm{~T} & \mathrm{P} & \mathrm{G} & \mathrm{U} & \mathrm{X} \\
\mathrm{C}
\end{array} \\
& \text { 131+15161718192021222324 } \\
& \text { NOD Y Z I k \& A B L M }
\end{aligned}
$$

The cards being difpufed in this manner, flow them upon the table, that it may appear they are promif. cuonfy marked. Then fluffle and lay them argain on the tathe, pronomeing that they will be then in alphabetical oder. Appear to be furprifed that you have failed; take them up again and give them is fecond fhuple, and then counting them down on the table they wit! all be in their natural order.
III. "Several letters being written promifououfy " upon 32 eards, after they have been once fhuffed, "to find in a part of them a quellion; and then "flutlling the remander a fecond time, to thow the "anfwer. Suppofe the queftion 10 be, What is achb "Eniton's boafl" and the anfwer, His liberty; which " taken together contain 32 lerters."

After you hase written thofe letters on 32 eards, write on a paper the words, hir lihory, and anncx to the letters the lird ten mombers thas:

$$
\begin{array}{cccccccc}
\text { H I S L I B E R } & \text { I Y } \\
\text { I } 24 & 3 & 4 & 5 & 6 & 8 & 9 & 10
\end{array}
$$

Then have recourfe to the table of combinations for ten numbers, and apply the refpective numbers to them in the fame manner as in experiment I. taking the firlt cohmon, as thele are to be fuufted only once, according to that order.

$$
\begin{array}{lllllllll}
1 & 2 & 3 & + & 6 & 8 & 10 \\
1 & \mathrm{~S} & \mathrm{~S} \\
\mathrm{~L} & \mathrm{R} & \mathrm{~T} & \mathrm{H} & \mathrm{Y}
\end{array}
$$

This is the order in which these cards mult fland after the whole number 32 has been onee thuthed, io that after a fecond thu fle they may fland in their proper order. Next difpofe the iwhole mumber of letters according to the fint colmm for 32 letters: the lat ten are to be here placed in the order above; as follows,

$$
\begin{aligned}
& \text { VHATISEACHBRITON'S } \\
& 123+56789101112131+151617 \\
& \text { BOAS 'T? } \\
& 1819202122 \\
& \text { I B S L E R T H I Y } \\
& 232425 \quad 2627 \quad 28 \quad 29303132 \\
& 123+56789101112131+151617 \\
& \text { B O A S T? } \\
& \text { I B S L E R T H I Y }
\end{aligned}
$$

Therefore, by the firlt column of the table, thes will next itand thus:
$123+5678910111213141516$ ITBRONSCHBOAEAS T long card.

I7181920212223242526272829303132
I I S E S L I B E R T VIITA Y
You muit obfenve, that the card here placed the 16 th in order, being the latt of the quetion, is a long eard; that you may cut inm, or bave thom cut, after
the firft fhulae, at that part, and by that means fopaeard; that you may con them, or bave thom cut, after
the firft fhulte, at that part, and by wat means foparate them from the ofler ten cards that contain the anfwer.

Your cards being thus difpofed, you foow that they make no meaning; then fruffe them once, and cutting them at the long card, you gi, e the hirt part to any one, who seads the qucfion, but can find no auany one, who wads the queftion, but can find no an-
lwer in the ethers, which you open before him : you then fulke them a fecond time, and fhow the anfwer as above.
IV. " To wite 32 letters on fo many cards, then "thufle and deal them by two to two perfons, in
"fuch manner, that the cards of one 1 arif contain a
" quedion, and thole of the other an anfoer. Sup-
"fuch manner, that the calds of one 1 haith contain a
" qualion, and thore of the other an andwer. Sup"pofe the queltion to be, Is notining cesmin?" and the " anliver, lis, stliafoinim. mre."

Over the lettors of this queltion and anfwer, write the following numbers, which correfpond to the order in which the cards are to be dealt by two and two. IS NO THINGCERTANN? $3 \mathrm{I} 322728232+10201516 \mathrm{III} 2783+$ YES, DI S A PO I N I'MENT. 203025262122171813149105612 Then have recourfe to the fird column of the table
5 Y

## Comhins.

 $\underbrace{\text { tion. }}$ $\rightarrow \ln$

[^5]$\qquad$

Combina- for 32 numbers, and difpofe thefe $3^{2}$ cards in the fol-
tion tion. lowing order, by that cohmm.

12345678910111213141516
OIEKGCAN'T I N'AA 1 S
$171819202122232+2526272829303 \times 32$

The cards being thus difpofed, fhuffe them once, and deal then two and two: when one of the parties will neceffarily have the quellion, and the other the anfwer.
Intlead of letters jou may write words upon the 32 cands, 16 of which may contain a quettion, and the remainder the anliver; or what other matter you pleafe. If there be found difficuty in accommodating the words to the number of cards, there may be two or mone letters or fyllables written upon one card.
V. "The five beatitudes." The five bleflings we will fuppofe to be, 1. Science, 2. Comrage, 3 . Health, 4. Riches, and 5. Virtue. Thefe are to be found upon eards that you deal, one by none, to tive perfons. Fint wite the letiers of thefe words fucceffively, in the order they thand, and then add the numbers here annexed to them.

$$
\begin{array}{ll}
\text { SCIENCE } & \text { COURAGE } \\
31262161161 & 3227217127 \\
\text { HEALTH } & \text { RICHES } \\
2823181383 & 292+1919+ \\
\text { V1 RTEUE } \\
30252015105 &
\end{array}
$$

Then range them in order agreeable to the firt column of the table for $3^{2}$ numbers, as in the lat experiment. Thus,

LHNATEREUACR GT I U
$171819202122232+2526272829303132$
EECIICHSOHREEVSC
Next, take a pack of cards, and write on the four fint the word Science; on the four next the word Courage; and fo of the ref.

Matters being thus prepared, you how that the cards on which the letters are written convey no meaning. Then take the pack on which the words are written, and fpreading open the firft four cards, with their backs upward, you defire the fit $\ell$ perfon to choofe one. Then clofe thofe cards and fprcad the next four to the fecond perfon; and fo to all the five; telling them to hold up their cardslet you fhould have a confederate in the room.

You then flumfle the cards, and deal them one by one, in the common order, beginning with the perfon who chofe the fillt card, and each one will find in his hand the fame word as is written on his card. You will cblerve, that after the fixth round of dealing, there will be two cards left, which you give to the firlt and fecond perfons, as thit words contain a letter more than the others.
VI. "The cards of the same of piquet being mixed together, after humfing them, to birg, by cutting them, all the cards of each fuit together." The order in which the cards mult be placed to prowuce the effect defired being eftablithed on the fame principle as that explained in the experiment II. except that the flhuf-
fling is here to be repeated three times, we think it Comionswill be fufficiat to give the order in which they are to be placed betore the firt fhufle.

Order of the Cards.

| I Acc ? clubs | 17 King clubs |
| :---: | :---: |
| 2 K inave $\{$ crubs | $\pm 8 \mathrm{~T}$ ¢ ${ }^{\text {a }}$ \} |
| 3 Eight $\}$ diamonds | 19 Nine $\}$, |

31 'Ten diamon is
32 Ace hearts (wide card)
The cards being thus difpofed, you afi your adverfary in what fuit you fhall repique him? It he fay in clubs or diamonds, you muft deal the card soy threes, and the hands will be as follows,

Elder
Hearts, king
queen
knave
$\ldots$ nine
$=$ cight
feven
Spades queen
—__ knawe
Diamonds, eight
Clubs, eicht
Rentréc, or take in of the elder.
Seven foades
Seven diamonds
Nine ?
King fprides
If he againft whom you play, who is fuppofed to be cider hand, has named clubs for the repique, and has taken in five cards, youmult then lay out the quen, knave, and nine of dimonds, and you will have, with the three cards you take in, a fixiem major in clubs, and quatorze tens. If he leave one or two cards, you moft difeard all the diamonds.

If le recquire to be repiqued in diamonds, then difcard the queen, knave, and nine of clubs: or all the chubs, if he leave two cards; and you will then have a hand of the fame trength as before.
None, If the alveriary flould difuard five of his heate, you will not repigue him, as he will then have a feption in fpades: or if he oaly take one cand: bat ncither of thefe any one can do, who has the leaft knowledge of the game. If the perfon againt whom you play would he repiqued in heats or ipades, you muft deal the cards by twos, and the game will fand thas:

Elder hand.
King
Knave
Nine
Eight
Queen
Knave
Nine
Eight
Seven
Eight
Seven
Eight fuades
Rentrie.

Seren

[^6] by her to M. (abrot.

Dombina-Seven lpades
Seven diannonds Nine ) King frades Ace )

If he require to berepiqued in hearts, you keep the quint to a king in lieats, and the ten of foudes, and lay out which of the relt you pleafe: then, even if he fhould leave two cards, you will have a fixicm major in hearts, and quatorze tens, which will make a repique.

But if he demand to be repigued in fpades; at the end of the deab you mult dexteroully pafs the three cards that are at the bottom of the tock (that is, the ten of cluns, tex: of diamonds, and ase of hearts) to the top ( F ), and loy that means you referve the nine, king, and ace of fpades for yourfelf: fo that by kecping the quint in hearts, though you fhould be obliged to lay ont four cards, you will have a fixiem to a king in fpades, with which and the quint in hearts you mult make a repique.

Obferve here likewife, that if the adverfary lay out only three cards, you will not make the repique: but that he will never do, unlefs lie be quite ignorant of the game, or has fome knowledge of your intention.

This lant ftroke of piquet has gained great applaufe, when thofe that have publicly performed it have known how to conduct it dexteroully. Many perfons who underttand the nature of combining the cards, have gone as far as the pafling the three cards from the bottom of the fock, and have then been forced to confefs their ignorance of the manner in which it was penformed.
IX. "The Metamorphofed Cards." Provile 32 cards that are differently coloured; on which feveral diferent words are written, and difierent ubjecta painted. Thefe cards are to be dealt two and two, 10 four perfons, and at thee diflerent times, fhuming then each time. After the firt deal, every one's cards are to be of the fame colour ; after the fecond deal, they are all to lave objects that are limilar; and after the third, words that convey a fentiment.

Difpofe of the cards in the following order.

| Cards. | Colurs | Ohjtests. | Worls. |
| :---: | :---: | :---: | :---: |
| I | Yellow | liid | I find |
| 2 | Jeliow | Dird | In you |
| 3 | Green | Flower | Charming |
| 4 | Green | Flower | Flowers |
| 5 | White | Bid | 'To lucar |
| 6 | White | Orange | Beauty |
| 7 | Rcd | Butterny | My |
| 8 | Red | Flower | Notes |
| 9 | Rad | Flower | In |
| 10 | Red | Butterfly | Shemherdefs |
| If | Green | Butterfly | Lover |
| 12 | Green | Putterfy | Your |
| 13 | White | Flower | Of |
| 14 | White | Flower | an inconflant |
| 15 | Yellow | Orange | Image |

| 29 | Red | Bird | Bufum |
| 30 | Yellow | Orange | Me |
| 31 | White | Butterfy | Your |
| 32 | White | Butterfy | I long |

The cards thus coloured, figured, and tranforibed, are to be put in a cafe, in the order they here ltana.

When you would perform this experiment you take the cards out of the cafe, and how, withent changing the order in which they were put, that the colours, objects, and words are all phaced promifcuon:ly. You then fhume them in the fame manner as before, and deal them, two and two, to fuur perfons, obferving that they do not take up their cards till all are dalt, nor mix them together: and the eight cards dealt to each perfon will be fomed all of one colour. You then take each perfon's cards, and put thofe of the fecond perfon mader thofe of the firth, and thufe of the fourth perfon under thofe of the third. After which you flufle them a fecond time, and having dealt them in the fame manner, on the firtt perfon's cards will be painted all the birds; on the fecond perfun's cards, all the butterfies; on thofe of the third, the oranges; and on thafe of the fouth, the flowers. You take the cards a fecond time, and obferving the fame precautions, fhuffe and dal them as before, and then the firt petfon, who had the laft time the birds in his hand, will have the words that compofe this fentence:

> Sing, diar lirds; I long to hear your enchanting nutes.

The fecond perfon, who the laft deal had the but. terfies, will tow have thefe woeds:
Of an inconfant lover your changes prefent ane the inaze.
The thind, who had the oranges, will have this fentence:

The fourth, who had the fiowers, will have thefe words:

Charming fowers, adorn the bofom of ny fuxpherdefs.
It feems quite unneceflary to give any further detail, as they who underland the furegoing experiments will catily perform this.

Among the diffcrent purpofes to which the doctrine of combinations may be applied, thofe of writing in cipher, and deciphering, huld a principal place. See the articic Ciptier.

COMBINATION, in chemiftry, fignifies the union A a
(F) The manner of doing this is cxplained in the article Legerdemain,

## C OM M $\quad[186] \quad \mathrm{C} O \quad \mathrm{M}$

Cund of two bodies of ilifferent natures, from which a new compound body refalts. For cxample, when an acid is mind nith an alkali, we fay that a combination be- twist thefe two faline fubltances takes place; becaufe from this mion a neutral falt refults, which is compofed of an acid and an alkali.

COMBUS'T, in aftronomy. When a planet is in conjunction with the fun, or not diftant from it above half its difk; it is faid to be combuft, or in combullion.

According to Argol, a planet is combuft, or in combuftion, when not above eight degrees and thirty minutes diftant from the fun, cither before or after him.

COMBUSTIO pECUVIR, the ancient way of trying mixed and corrupt money, by melting it down, upon payments into the Exchequer. In the time of king Henry II. a conftution was made, called the trial by combufion; the practice of which differed little or nothing from the prefent method of aflaying filver. But whether this examination of money by combuftion was to reduce an equation of money only of Sterling, aiz. a due proportion of alloy with copper, or to reduce it to pure fine filver, does not appear. On making the contitution of trial it was confidered, that though the money did anfwer mumers et pondere, it might be deficient in value; becaufe mixed with copper or brafs, \&ic.

COMBUSTJON, a term denoting the operation of fire upon any inflaminable fubfance, by which it fmokes, flames, and is recuced to afhes.

There is not a phenomenon in nature by which the attention of phitofophers has been more engaged, nor which las puzzled them more to account for, than this very common operation. To explain it, theories have been invented the moll uppofite and contradiciory to one another that can be imagined; and, till very lately, the flate of fcience did not afford data fufficient I. to explain it in a rational manner.

Theories of enrientchesints.

Dy former chemifts it was fuppofed, that the parts of the combunible bods itfelf were converted into fire. Accordingly Sir Ifaac Newton propofes it as a query, whether grofs bodits and light are not convertible into one anuther? and many chemifts of a more modern date have determined this queftion in the aflirmative, hy maintaining that the light of the fun is or contains phlogiton. The interference of the air, however, in moll cafes of combuttion known to us, p:ored a difficulty in this theory almoft, if not totally, unfurmountable; for if the fire proceeds entircly from the combultible body, what occafion is there for any third fubtanse ditinct both from the fire and that body to produce combuation? This naturally excited a conjecture, that the fire by which the combuftible body is confumed, proceeds in reality from the air, and not fromthe body itlelf. And hence we fte that Mr Hutchinfon's fyftem of fire and air being convertille into one another, might have paffed as a a rational Foman theory, if he had not attempted to force Frif fin it upon mankind as a divine revelation. The modern Ene on difcoveries in aerology, however, have entirely difㄴ.iham.衤: i丁 fuz!
 © 1 .
oferation is performed. It ia now almon univerfally known, that the air we breathe is compofed of $t$ wo kinds of elatic fluids, only one of which (called dthlogiflicated, prace, enfyreat or vital air) contributes to the lupport of thme, as well as of animal life; and t! is part is found to be by far the leall in quantity of the atmofphere we breathe. It is computed from good obfervations, that, among the various component parts of our atmofphere, there is abont one-fouth, $\frac{9}{i 5}$ according to Mr Scheele, or one-fifth according to Mr Cavendifh, contained in it ; and to this fmall part alone is owing the combuttion of infammatle becties.

Since the eftablimment of this important fact, fe veral theonies of combution have been formed. Ac ficres lave cording to M. Lavoifier, dephlogiticated air is a com. ${ }^{r}$ pound of two fubtlances intimately combined; one is called by him the oxymonors foryminle, and the other fpecific clementary fire. During the combution of fulphur, phofphous, inflammable air, or any other fubflance of that kind, the oxygenous pinciple of the dephlogifticated air, according to him, combines with thefe bodies, to which it lias a ftrong attraction, and forms new compounds of falts and other bodis; at the fame time that the elementary fire contained in thefe is fet loofe, and becomes fenfible, producing heat and Hame, according to circumftances. Thus the fire produced in combution does not proceed from the burned body, but from the decompoftion of the dephlogifticated air, in which it is contained in a latent and infenfible $f$ tite; while its oxygenous principle combines with the fulphur, phorphorus, or inHammable air, and forms vitriolic and phofphoric acids, or pure water. In like manner it is alfo fuppofed by this theory, r. That metals are fubftances abfotutely fimple. 2. That netallic calces are true compounds formed by the oxygen us part of pure air with the metallic particles; and, 3 . That pure water is a fimilar compound of the fame principle with inflammable air.

According to Fourcroy, combuftible bodies are Fourcroy's. thofe which have a ftrong attraction to combine or theorg. unite with pure or dephlogifticated air; and combultion is nothing elfe but the act of that combination. This affertion is founded on the following facts: 1. That no fubftance can be burnt without air; 2. That the purer this air is, the more rapid is the combuttion; 3. That in combution, an abforption or watte of air always takes place; and, 4 . That the refiduom contains often a very fenfible quantity of that pure air which it abforbed, and which may fometimes be extracted from it.

In Mr Scheele's new theory of heat, fire, light, and Scheele's. phlogitton, he confiders heat and light themielves as Theory. compound fubtances. The former, according to him, confilts of phlogitton and empyreal air. The calces of gold, reducible by teat alone, in a retort, how that phlogifton is contained in heat; becaufe it combines with the calces to revire them, and the dephlogiticated air is found in the receiver. The precipitate fer fe of mercury, if levived in this manner, affords, according to our author, another inflance of the truth of his doctrine: "If phlogifton alone (fays he) could pals through the retort, there would not be found the empyreal air in the receiver, and the ignoble metals. might be revived in the fame manner."

Light, according to Mr Scheele, is a compound

## C O M

$187 \quad \mathrm{C} O \quad \mathrm{M}$
plogegton, increafe their capacity for fpecific fire. Thus, when regudus of antimony is deprived of its phio. gifon, by calcimation, which is then called diaplometio antinony, it nearly tripls its fpecific fire. 'The fame change takes place in crocus martis and in iron. This fact is generally true, whatever be the nature of the fubftance: and even the aeriform ones are in the fame cafe, for phlogitlicated air has very little fpecific fie, common air has more of it, and dephlogitticated air flows a molt prodigious quantity. Trom thefe facts it is clear, that phlogifon and fire are difinct, and incompatible fublances ; fo that when one enters into the compolition of any body, the other of courfe is expelled tiom it. Thus metals are calcined in con. fequence of a double attraction, by which the metal imparts its phlogittun to the air, while the air communicates its fire to the metallic calces; which is further contirmed by the air that is fuund in metallic calces, whofe increafed weight by calcination correfoonds to the air that is expelled from them by theirreduction to a metallic llate.

All combultible bodies are abfolutely in the fame cafe. By thefe are meant fuch bodies as contain a large quantity of phlogittesi in their compolition, but loofely adherent to them. Dephlogificated air, whieh is greatly loaded with fpecific firc, has at the came time a trong attraction for phlogiton; and, in the act of combuftion, comnunicates its lire to the combuflible body, whilft the air becomes phlogriticated or loaded with phlogifon. Thus we find, that fulphur contamiates the air, when burned, by the phluyiton it throws into it, and the produced vitriulic acid, if any, becomes impregnated with the fame.

In fome cafes the moft intenfe heat or fenfible fire is produced in the combuftion; but in others it is vely moderate. This variation gencrally depends on the quantity and quality of the vapous produced during the combuttion: when thefe are very inconfiderable, and the refduum cannot ablorb the fire which is emitted by the air, the remainder is precipitated, or diffuled all around, and produces a very fenfible heat. On the contrary, if the vapours are capable of abforling it, very little heat is produced. We know, by the mofl certain experiments, that, for intance, the vapou, of water abforbs about 800 degrees of heat bejond that of its boiling fate; from whence it follows, that, whenever there is a quantity of wacery vapours produced by combution, very little fenfible fire matl be felt. So when fpirits of wine are fired, the heat then produced by the comburtion is very inconfidetable, the greater part being abforbed by the watery vapours that are then prodnced: but when the phofphorus of Kunkel is fet on fire, the heat is very flong; there being but a fmall quantity of acid to carry uf the fpecific fire that is fet loole.

Thefe are the principal theories of combution that M. Ntagelhave appeared. M. Magellan, from whofe notes on lan's reCronftedt's Mineralogy the above account is taken, marks. objects to M. Lavoifier's opinion, that the oxygenous principle canont be fhown to our fenfes, nor is it better domontlated than the fologiflon fuppofed by the great Stahl and his followers. Mi. Fourcroy's fytleme he fuppofes to be lefs objectionable: but to scheele he objects from Mr Kirwan, 1. That in no inlance it appears that phlogifon penctrates glatis, much lels a
$\Delta a 2$ compound

Combi:
fuman.
fion.
of Dr Crawford.- He has by a gieat number of experimenis endeavoured to fhow, that bodies which comtain a large portion of phlogifton, poflefs but a fmall Share of fecific heat or fire; on the contrary, that thofe with a great fhare of this lant, contain but little phlogiton; and laftly, thofe which are deprived of
containing phlogitton and heat, from which both may feparate themfeles in proper circumblances. A follition of filver in nitrous acid mixed with chalk, and expofed to the funfhine, is revived into a metallic form by the phlogifton of light. Nitrous acid alfo in a glafs veffel, receives phlogifton from light, and becomes of an orange colour: hut if the glafs be painted black, the acid receives the heat, not the phlogiton. Even the various coloured rays of light, according to our author, contain unequal thares of phlorifon; fince the violet rays part more eaflly with their phlogiton to revive metals than any other. When light is not Iopped in its paffare, no heat is perceived; but if flopped in its courfe, the oppofing body receives heat, and fometimes phlogifton. Light feems therefore to be the matter of heat, loaded with a fuperabundant quantity of phlogiton. That which concs out from a íurnace, prudaces heat on the furrounding bodies, which afcends with the rarehed air; procteds forwad in flraight lines; and may be reflected from polithed furfaces, with this peculiatity, that a concave glafs mirror retains the heat, whill it reflects the light; for although its foews is bright, yet it is not warm. A pane of glafs alfo put before a burning mirror, retains the heat, and allows the light to pafs through it.

Fire is the more or lefs heated, or more or lefs luminons ftate of hodies, by which they are refolved into their conftuent parts, and entirely deltroyed. It requires, that they be previonnly heated in contact with air: for to every combullible body a certain quantity of heat muft be communicated, in order to let it in the fiery commotion.

Combuftion is the action of heat penctrating the pores of bodies, and deftroying their colnefon: in this cale the body parts with its phlogitlon, provided there be a fubfance prefent which has a trong attraction for the inflammable principle. If the heating be performed in open air, the empyreal part, on account of its ftronger attraction, umites with the inflammable principle, which is thus fet at liberty ; from which union the heat is compounded; and farcely is this heat generated, when the combuttible body is fill more expanded by it than in the begimning, and its phlogifton more laid open. The more the heat is increafed, the more minute are the particles into which the combutible body is diffolved. The empyreal air meets more finfaces; confequently comes in contact with more phlogifton; and, according to its nature, forms an union with a greater quantity of it, which produces a radiant heat. At this moment the corfituent parts of the combuttible body are fo much difunited by the fill increafing heat, that the empyreal air, contimuing to pour in upon it in Areams, attracts the phlogifton in trill greater quantitics; and hence the moft elattic fubtance, light, is compofed; which, according to the quantity of combutible matter, hows various colours.

The laft theory we fhall here take notice of is that -

Conshe cemprund of pure air and phlorition; and, $2 d y$; That sion. if Mr Scluck's notions were truc, then other metallic calces, or at leat black manganefe, would be seluced by heat slone: for this cals depilogiticates nitrous acil, and has a Aronger affinity with phlogifton than it ; and therefore ought io decompofe the hest with as great facility as the nituous acid, or even with greater on account of its greater attraction. The former ebjection M. Magellan does not fuppofe to be abouether conclulive, as there are many combinations (he fays) of two or more fubitances that pals through bodies, each of which would he Rupped before they were cumbined; and what Mr Scheele has faid on light feems to prove that glafs is not alway quite imfrevicus to phogifton; but the latter he decms altogether unonfwerable.

Having thas rejeited three of the fe theories, he acquiefces in that of Dr Crawford, which, he tells us, $\because$ is the mot fatisfatory concerning the wature and procels of combuftihle bodies and of their combullion, fo far as the pafent tlate of our knowledse has opened the ficld of our views into the operations of nature." Before fich a full allent, however, is given to any theory, ic is altorether neceffary that it thould be confiftent with every known faet, as far as that fact can be invefigated by us in our prefent fate of knowledge; and that this is not the cafe with the theories either of Fourcroy, Scheele, or Crawford, will appear from the following confiderations.

1. With regard to that of Fourcroy, it is evidently deficient in one of the effential requilites to produce combution, even fre itfelf; for if comburtion depends only on the attrabion between combultible bodies and pure air, then it ought to take place on all occations wherever pure air and combultible bodies are prefented to each other. But this is not the cafe; for though we put a piece of unlighted charcoal into a jar full of deplulogifticatel air, no combultion will enlue. To produce this it is neceffary that the charcoal be already, in part at lealt, in a llate of combution, or that fire he applied to it from wibout. This theory therefore, infteal of explaining the matter, gives not the frallett infight into it; fince we are perpetually left to feck for the caule of the fire which produced that in quedion: for the combination of a combullible body 9 with air is the effal of combultion, not the caule.

To Mr Sibecle's
II. Mr Scheele's theory is foexceedingly contrary to the common notions of manlind, that it can farce ever be ferionfly believed. The pure light of the fun can never be fuppoled by any mortal to confift principally of a fubilance as grofs as the foot of our chimneys, without a degree of evidence of which the fubject is quite incapable.
III. Under the article Chemistry, Dr Crawford's theory of heat is fully confidered, and found to be infufficient. It is there hown that the degree of $\sqrt{p e}$ cific heat contained in bodies cannot be mealured by
any method yet known to us; that the phrale, quantity of beat, fo frequently made ufe of by Dr Crawford and others, is vagne, inaccorate, and improper ; as exprefling only the degree of fenfible heas extricatad, prodreced, generated, or which becomes perceptible in certain circumblances by us, withont regatd to the real quantioy contained in the body itceif, either originally, or after it has parted with that in quellion. Thus all experiments founded on the quantities of frecific heat contaned in diferent bodies mult be falitenus and inconclufive. Not m infil, lowirer, on thele general arguments, it is contrary to fact, that " budies which contain a harge portion of phlogifton contain but a fmall flate of faceitic heat," and wice vecfer, as the Doctor afferts; which will appear from the following confiderations.

1. The only methorls by which we can mealure the quapity of any material fubtance is either by its bulk or weight.
2. Whatever occupies fpace, and refits the touch, we lave a wisht to call a material fubtance, whether we can fee it and weigh it or mon. Thus air, which is invilihie, and not very eafly ponderable, is univerally allowed to be a fabfance and not a quality.

3 In cafes where we cannot conveniently meafure the weight of any fobitunce, its quantity mint always be judred of hy its bubk. Thus the quastity of air contained in a bladder, or in a bellows, is always judged of by the degree of expantion of eilher.

4 Heat, which is till more fubtile than air, is meafured in this way, as Dr Crawford himfulf acknowledres; fir the expanfions of mercury are in an arithmetical progrefion expreffive of the real degrecs of heat.
5. Applying this rule to bodies in general, we muf conclude, that the expanfons of all bodies will be its proportion to the degrees of heat which they contain. Thus, if a body is expanded by heat to double its bulk, and in this flute remaine even when the beating canfe is withdrawn, we may then fay with jufice, that this body contains double the quanity of latent or Specific heat that it did before, and to on $(A)$.
6. As the vapour of water is found to abforb a val quanity of heat, and lisewile to bccome prodigiouly expanded in comparifon with the water from whence it is produced, we may jufly conclude, that the quantity of heat abforbed, or of jpecific beat contained in the feam, is to the fpecific heat contained in the water as the bulk of the fleam is to that of the water. It is dificult indeed to determine how much fteam exceeds in bulk the water from which it is derived: but from fome experiments, Dr Black concludes, that it is augmented in bulk between 1600 and 1700 times; and from the great quantity of heat emitted by fteam during its condenfation, which in fome cafes exceeds 1000 degrees of Falrenheit, we have reafon to believe
(A) This is not contradictory to the obfervation that the expanfions of all bodies are not in proportion to the degree with which they are heated, nor equal at diffrent times. It is the degree of heat abforbeg and entangled among the particles of the body which expands it, not that which flows out from it, and affects our fenfes or the thermometer. Thus, though a body is heated to 100 degrees, it may abforb only to; and after it has done fo, it may require 300 or 400 degrees more to caufe it abforb ether ten.

Combu- believe that the quantity of its expanfion is proportionftion. able to that of the heat abforbed.
7. As we thus are afcertained, by the great expanfion of aqneous rapour, that it has abforbed a valt quantity of heat, it will evidently follow, that from the expanfion of ofher fublances we ought allo to know the quantity of heat abforbed by them. To apply this then to the prefent cafe. In Dr Priettley's experiments on the convertion of charcual into infanmable air, he found, that cne geain of charcoal, difperfed by the heat of the finn in racuo, gave fix ounce meafures of inflammable air. In another experiment, he found that $2 \frac{1}{2}$ grains of charcoal gave $15 \frac{1}{2}$ ounce mealures of the fame kind of air. But from a conputation of the weight of the air fo produced, it appeare, that at leaft an equal quantity of water with that of the chatcoal goes to the confolition of the aerinl huid. In meafuing this expanfon, therefore, we may allow one-half fir that of the water requibite to form the inflammable air; and hence the grain of charcoal, properly ipeaking, atiorbs only the ce ounce meafures of free. That this cxpantion was the efiect of fire is very evident: for there was nothing elle prefent but fire, or the concentrated light of the iun; the experiment being performed by n.cans of a burning glafs in vacua. It cannot be a fuet then, as Dr Crawford aficuts, that a phlogittic bedy contains but a fmall quantity of fpecthe heat; for here fo fmall a quantity as one grain of charcoal was made to contain as much fpecific tire as is equivalent in bulk to three ounce mealures. It appears therefore, that the quantity of fpecific fire contained in bodies is not determined by their being combutible or not, ot by their containing philogiton or not: much kefs can we believe that heat and phlogillon are fo incompatible with one anesher, that where "one enters into the compofition of any body the other is of courfe expelled from it ;" fince here we find the purelt fire we know united in wat quantity with the parelt phlogitun we know, and both together conftituting one of the molt inflammable fubllances in nature, viz. mflammable ais.
8. In hike manaer mut the lalt part of the Doctor's theory be erroneous, viz. that "in the act of combution the deptlegitlicated air commenicates its fire to the combutibie body." In the intance juit now adduced, the combultible fubltance, infamable air, contains already as much fire as it can hold; and according to the general rule in thefe cafes, if it was to ablorb more fire, it ought to become thll more expanded. But inftead of this, when dephlogiticated and inflammable air mixed together in due proportion, are fet on fire, they fhrink in a manner into nothing; fo that it is plain, inftead of one communicating its fire to the other, both of them throw out almof all the fire chey contain; to that they are no longer air, but water, or fome other fubllance about which philofophers are not yet agreed.
9. Dr Crawford's theory of comburtion is liable to the very fame objection with that of Fourcroy, viz. that it fets afide the neceffity of any external caufe to fet on fre the combuftitle bodies. If dephlogitticated air attracts the phlogifton of the combuttible body, and the phlogillon in the latter attracts the fine of the dephlo. gifticated air, the confequence of which is combultion; then, wherever dephlogitlicated and inflammable air are

189 ] C O M
mixed, comburion ought immediately to enfue. But Conthuthis is not the cafe. A candle, a fpark of electricity, fion. or, in a word, fome body chready in a fate of combufion, mult be appiied before we can probuce the effect in queilion. We mutt therefore leck for the caufe of combuttion in the burning body appliet, which will be fond equally inexplicable : and thus we cannot procted a fingle ilcp in real knowledge, though affited by all that 10 . Crawford has aduanced.
10. The thenry of M. Lequifier, notwithtand M Lavoi. ing M. Marcllan's criticifr, leeras to come much fier's theonearer the trath than that of Dr Crawford. With re- :ybice to the gard to the exittence of what Lavoifier calls the oxy-formes. genous priaciple, it is certainly ettablifhed on as fure grounds as that of any invilible fubfance cau be. M. Magellan complins, without raafon, that it "cannot be hown ti) cur fenfes." It has not yet indeed been made vifich, per fe; but it is found to increafe the weight of tolits very fenfibly. Perhaps, indeed, it may not be an oxyscrious or acidifying principle; perlaps it may be water, or fome other fublance; but thiti it is foncthing which, by being combined with elemeita, $y$ fire, is expanded into a vaff bulk, and which, by being deprived of this fire, flainks into its former dimentions. Thus it manifels itfelf to be a real fubftance; and not only, fo, but a terreftrial gravitating fubthance; and which, twen when lightened by a mixture of chacopal fo as to conflituse the folid part of fixed air, has been fhown nearly to tepual the denfity of gold. In this refacet, therefore, M. Levoiher's thenry is faultlefs, as will as in that which affrms that in the act of combution the deplly, cillicated air parts with its fire : but it is imperfect in this refpect, that he does not confider the quantity of fire contained is the inflammable body, whech is thrown out at the fame time, nor the occalion there is for fome body in a thate of actual inflammation to begin the combution. 'That the combinations mentioned by him do actually take place is not denied; but they are undoubcedly confequences of the combultion, nut caufes of it, as they are generally fuppofed. 'To undertand this fuif jeet fully, therefore, it will thill be neceffary to confideı farther,
if. Under the article Cefemistry, already quoted, Another it is thown that heat and cold are not effentially dittinct theory. from one another, but that heat coulifts in the motion of a ceriain fubtle and iavifible fuid fron a centre towards a circumference, and that cold confits in the action of the fame fluid from a circumference to a centre. In other words, when elementary fire acts from any body outwards, we fay that body is hot, becaufe it heats other bodies; but when it flows from others into any particular body, we call the latter coll, as depriving the neighbouring bodies of part of their relative quantity of heat. We may farther illuftrate this by the example of electricity, where the fluid rufhing out from any body produces a kind of electricity called pofitive; but, when entering into it, produces another, oppofite in many refpects to the former, called negative electricity. In like manner all bodies in the act of thowing out elementary fire are hot, and in the act of abforbing it cold. Vapours of all kinds, therefore, ought to be naturally cold: and experience fhows that they really are fo; for, by means of evaporation, very intenfe degrees of cold may be produced. See Cold and Evaporation.
$12, \operatorname{In}$.

3 nib: fiun.

I2. In mott terreftial bodies the heat eafly flows out from one to another, and therefore they are in a manner indifferent as to the tate ol being either bot or rold: but in rapuuts, the heat, laving once flowed in. to them, continues to have a tendency to do fo without regard to the external temperature of bodies. Hence thefe fluids are naturally cold to the touch; and thofe who have been immerfed in clonds on the tops of high mountains or otherwife, have uniformly related that they found the vapour exceffively cold; and thus our atmofphere, unlefs fupplied by the powerful inthuence of the lun-heams, not only becomes extremely cold itfelf, but likewife cools to an extreme degree the furface of the earth and every thing upon it.
13. In all cales therefore, where a quantity of vapour, whether inflammable or not, is collected into one place, there is a conflant influx, or at leaft a contant preflure inwards of the elementary fire exiting invifibly all around: which preffure muft coninue until by dome means or other the flow or preflure of ethereal fiuid be reverfed, and inflead of tending from without inwards. is made to tend from within cutwards.
14. One method of reverfing this influx is by external preffure, or by any other means bringing the particles of vapour nearer to one another. On this fubject, a treatife has been written hy Dr Weblter of Edinburgh, in which he endeavours to eftablifh the doctrine, that condenfation is in all cales the caufe of heat. That it really is the immediate caufe, in a great many cales, is very certaia; but it is equally evident that, cven in thefe cafes, the caufe of condentaion mul be the ultimate caufe of heat. Thus, if a quantity of air be violently compreffed in an air-gun, it is found to become hot; but though the compreffion be the immediate caufe, the force by which the compreffion is occafoned mult be the ultimate caufe of the heat. The immediate agent, however, by which the heat is produced, is neither the compreffing caufe nor the condenfation, but the efllux of elementary fire fiom the air, by bringing the particles of the latter nearer to each other. In like manner, when iron is hammered until it becomes hot, the metal may probably be fuppofed to be condenfed, and the elementary hire to be fqueezed out of it as water from a fponge: but it is neither the action of the hammer, nor the approximation of the particles to each other, that is the caule of heat; but the flux of elementary fire directed from the iron every where from within outwards.
15. Thus we may now at once explain the action of combuttion; to do which, we fhall take the example of a mixture of inflammable and dephlogifticated air already mentioned. When thefe are mixed together, there is a contant preffure of the elementary fluid inwards from all quarters into the aerial vapours, by which their elallicity and form as airs are preferved; and this preflure will continue as long as we let them remain undilturbed. But when a burning body is brought into contact with them, the influx of the elementary fire is not only prevented but reverfed in that part which comes in concact with the burning body. 'Thus the whole contitution of both inflammable and depllogifticated airs is duftroyed in a moment ; for the fubtle fluid, feeling (if we mey uie the expreffion) that the preffure is leffened in one place, infantly directs its whole force thither; and the prefure inuards being
thus reverfed in this part infantly becomes fo in every other, and the whole fluid contaned in both is difcharged with a bright fath and loud explution.
16. In a fimilar manner may we explain the combuttion of folid bodies. None of thefe can be ignited withont the affitance of external fire. This in the firf place rarefies fome part of them into vapour; which by means of dephlogriticated air is decompoled in the manner already mentioned; while, by means of the heat thrown out, a fref quantity of vapour is raifed, at the fame time that the fire is angmented, and would continue to be fo in infritum, as long as luch could be fupplied. When no more inflammable vapour can be raifed, the combution ceafes of conde; and the remainder becomes chatcoal, afhes, flag, \&c. according to its different nature, or the combinations it is capable of alfuming with the terreltrial or gravitating part of the pure air by which the fire was fupplied.
17. It may now be afked, If the caufe of combu-objectior ftion be merely the reverning of the influx of elemen-anfwered tary fire, why cannot inflammable vapours be fired in racuo, by means of heat applied to fome part of them externally ? Thus, as inflammable air has a conttant influx of elementary fire into it, why may not this in. flux be reverfed, and a flame produced, not fo violent indeed as with dephlogiticited air, but fufficient to authonife us to fay that fuch a body was actually in the flate of combuftion? But this, we know, cannot be the cale unlefs fome pure air be admitted; for a ftream of inflammable air, if nothing elie be admitted, will as effcéually put out a fire as a flream of water. Here, however, we may reply, that this wonld fuppofe infammable air to be dettroyed by the very power by which it was produced. It leems to be the nature of all vapours to abforb heat without any limitation, as is evident by the incleafe of dalticity in them by an increale of leat. Elementaty fire is one of the component parts of vapour, and no fubftance can be decompofed merely by the action of one of its component parts. Something leterogeneous mult therefore be added, on which one or both of the component parts may act ; and then the vapour will be decompefed in waveo as well as in the open air, though with lifs obvious circumitances. Thus charcoal once difperfed by heat into inflammable air cannot be decompoled merely by heat, becaule its tendency is always to abiorb this element: But if into a jar full of inflammable air we introduce a quantity of calx of lead, and then heat it, the preffure of the fluid is interrupted in that part whete the calx is, and prefently becomes reverfid by means of the additional heat there, which, at the fame time that it furnifhes no more charcoal, afords a fubftance with which the charcoal in the inflammable air may unite. The air is therefore decompoled, thourh too flowly to produce actual flame. For combuftion, therefore, it is neetflary that the following circumftances fhould concur: 1. The mixture of two vapours containing a great quansity of fpecific fire each. 2. That the terrefrial biles of thele rapours thould be capable of acting upon one another; but no third fubftance capable of immediately abforbing the fire frould be prefent. 3. The prefence of actual tire in fome part, to leften the preffure of the elementary fluid, fet it in motion, and reverfe it. This is the cafe when infammable and deplulogitlicated

## $\mathrm{C} O \mathrm{M} \quad[19 \mathrm{l}$ [ C O M

phlogifticated airs are mixed togcther. Both thefe comain fpecific fre in great quantity. The bafis of the ome, known to be charect. is capatle of boing united by means of heat to the hafis of depblogitticated air, and of forminer wioh it in fome cafesfixed air, in others water, or fome eher fubfance, according to their varions propouicons; and after this inion is formed, there is no third cobit:..... by which the ele. mentary fire may be abforbed. "ie infia"ed body by which they are fet on fire firfteffens the itherd pref. fure of the clementary fire on one part, by which ine bafes are allowed to approach nerer each other, and to form a chemical union according to the seneral obfervation: But this union cannot be effected without the emifion of part of the elenentury fire, which being contained in the mixture in sreat quantuty, produces a bright flame. This leffens the preffare fill more; a new clemical union and a new flame are pooduced ; and fo on as long as any of the materials res main.

When all thele circumftances concur, it is not a property peculiar to dephlogilticated air to fupport flame, though it feems to be fo to preferve animal life. It is well known that pyrophorus will burn in common nirrons air, and a candle will burn with an enlarged flame in that kind called dopblugificated nitrous air. But where any of the concurrent circumilances above mentioned is wanting, no combuftion will be produced. Thus, though the Iteam of water contains a valt quantity of fpecitic fire, and though it is decompofed by paffing over red-hot iron, yet no combuftion is produced; becarife, in the very moment of extrication, the elementary fire finds a quantity of phlogifon either in the iron, the water itfelf, or both, with which it combines, and forms inflammable air, but without any flame.

With regard to the fubttances which have the property of taking fire foutaneoully, as Phosphorus and Pyrophorus, fee the $\begin{aligned} & \text { articles. }\end{aligned}$

COMEDY, a fort of dramatic poetry, which gives a view of common and private life, recommends virtue, and corrects the vices and follies of mankind by means of ridicule. See the article Poetry.

This lalt kind alone was reccived among the Ro. mans, whon neverthelefs made a new fuldivition of it into ancient, middle. and new, according to the various periods of the commonwealth. Among the ancient comedies were reckoned thofe of Livias Andronicus; among the middle thofe of Pacuvius; and among the new ones, thofe of Terence. They likewife diftinguifhed comedy according to the quality of the perfons reprelented, and the drefs they wore, into togatre, pretextate, trabeate, and tabernaiie, which lait agrees pretty neariy with our farces. Among us, comedy is didinguithed from faree, as the former reprefents nature as the is; the other dittorts and overcharges her. They both paint from the life, but with different view's: the one to make nature known, the other to make her ridiculous.

COMENIUS (J,hn Amos), a.granmarian and Protellant divine, born in Moravia in 1 j92. He was eminent for his defign to introduce a new method of teaching languages: for which purpofe the publifhed fome effays in 1616 , and had prepared fome others, when the Spaniards pillaged his library, after having
taken the city of Fulnec, where he was miniller and mafter of the fehool. Comenius fed to Lefua, a city of Poland, and tanght Lation there. The book he pu blifted in 1631, under the title of Fanue limuturam rofircta, gained him a prorli-: us ruvtatoos, intemuch that he was offered a conminun for erallting a!l the fehools an Polard. The parlianene of Eratimeld delired his afinance to regulate the febools in flat kingdom. He arrived at London in 1 fat 1 ; and would have beca ieceived by a curmittee to hear his plan had not the patliament been taken up with other matters. 'He therefore weat to Switen, being invited by a generous patron, whe fettled a ttipend upon him that delivered him from dhe fatirues of tcaching ; and now l.e employed himfelf wholly in difcovering general methods for thofe who inthructed youth. In 1657 he publiflued the differeut purs of his new methou of teaching. He was not only taken up with the reformation of fehools; but he alfo filled his brain with prophectes, the fall of Anticlrill, Millennimm, \&e. At falt Comenits took it into his head to addicfs Louis XIV. of France, and to fend him a copy of the prophecies of Drabicius; infmmating that it was to this monarch God promifed the empire of the world. He became fenlible at laft of the vanity of his labours, and died in 167 I .

COMET, an opaque, fpherical, and folid hody like a planet, performing revolutions about the fura in elliptical orbits, which have the fura in one of tar foci.

There is a popular divition of comets inte. biled, bearded, and bairy comets: though this divifun. rather relates to the different circumbtances of the lame co met, than to the phenomena of feveral. Thus when the light is weftward of the fun, and fets after it, the comet is faid to be tailed, becaufe the train follows it in the manner of a tail: when the comet is eaftward of the fun, and moves from it, the comet is fuid to be bearded, becaufe the light marches before it in the manner of a beard. Laftly, when the comet and the fun are diametrically oppofite (the earth between them), the train is hid behind the body of the comet, except a little that appears round it in form of a border of buir: and from this laft appearance the word comet is derived; as kountns, comata, comes from \%oun, coma, hair. But there have been comets whofe difk was as clear, as round, and as well defined, as that of Jupiter, without either tail, beard, or coma. See A-stronomer-Index.

COMETARIUM, a curious machinc, exhibiting an idea of the revolution of a comet about the fun. Sce Astronomi-Index.

COMETEAN, a town of Bobemia in the circle of Saltz, with a handfome town-houfe. It wat taken by form in $1+2 \mathrm{t}$, and all the inhabicasts, men, women, and children, put to the fword. It is feated in a fertile plain, in E. Long. 13.25. N. Lat. 50.30.

COMLTES, in botany: A genus of the monogynia order, belonging to the tetrandria clafs of plants. The involucrem is tetraphyllous and triforous; the calyx tetraphyllous; the capfule tricoccous.

COMFREY. See Srmpнутиm.
COMINES (Philip de), an excellent hiforian, born of a noble family in Planders in 1476. He lived in a kind of intinacy with Charles the Bold, duke of Engundy, for about eight years; but being feduced.

## C. OM

Comnes in the conut of litance ly lanuis XI. he was lighly II promoted by him, and executed feveral fuccefoful nogociations. After this king's death he experienced many troubles on nccuant of being a forcigner, by the envy of other contiers, and lay leng in prifon before he was difcharged: the died in 1509 . Cumines was a man of more natural abilities than learning; lie fpoke feveral living but knew nothing of the dead languages; the has left behiad hing fome menoirs of his own times, that are admired by all true judges of hitory. Catherine de Medicis ufed to fay, that Comines made as many heretics in politics as Luther had in relizion.

Cumenes, a town of Erench Flandera on the lines Which the French have made to defend their country againt the Autrian Netherlands. It is fituated on the river Lis, in E. Long. 3. I. N. Lat. 50. 30.

COMITATUS, in $\mathrm{l}_{\mathrm{w}} \mathrm{w}_{\text {a }}$ a comenty. Ingulphue tells ua, that England was firt divided into counties by king Alfred: and the counties into hundreds, and thefe again into eytilings: and Fortefue writes, that regraum Anglic per comitatus, wt regnum Fruncia per lodlivotus diflimgitar. Sometimes it is taken for a urritory or jurificion of a patiendar piace; as in Mat. Paris, ano 1234. Sue Counts.

COMILIA, is Ruman antiquity, were general affemblies of the people, lawfilly called by fome mafitrate for the enjominent or prohibition of any thiug by their rotes.

The proper conitia were of three forts; curiata, senturitia, and trituta; with referenec to the three grand divifins of the city and people into curtio, centurrine, and tribes: For, by conitia calata, which we fometimes meet with in authors, in elder times were meant all the comitia in general: the word calata from xars, or calo, teing their common epithet; though it was at haf reatrained to two forts of afemblits, thofe Sor the creation of priette, and thofe for the regulation of lat wills and teltaments.

The comida curata awe their origin to the divifion which Ronalus made of the perple into 30 curix: ten being contained in every tribe. They anfwerd in molt refpects to the parihes in our cities, bring not only feparated ty proper bounds and limite, but diAtinguihed too by their diferent places fet apast for the celcbratien of divine ferwice, which was performed by particular plicits (one to every cuia), with the name of amianes.

Befure the inditution of the comitia centuriata, all The grand concerus of the thate were tranfacted in the affembly of the cuix; as the clection of kinge and other chief offecre, the making and abrogating of lew, and the judring of capital cautes. After the expulturn of the kings, when the commons had ubtained the privilege to hase tribuncs and welles, they elected then for fome time at thefe afintlies; but that ceremony bring at lenghta traferred to the conitian trio buta, the , mise were never convened to ave hair yotea, exatpe mand then uporacount of making fome patioular luw relating to adoptions, wills, atid teftaments, or the creation of offerers for an experition; or for clecting fume of the prielts, as the flanines, and the curio maximus, or fupatintendant of the curiones, who were thenfelves chofen by every paticular cursa.

N 85.

The power of calling thefe affemblies belonged at Conitiz fint only to the kings; but upon the citablifment of $\underbrace{\text { C- }}$ the democracy, the tame priviltge was allowed to molt of the chief magifrates, and fomectimes to the pontilices.

The perions who had the liberty of voting here were fuch Roman citiones as belonged to the cunic; or fuch as actually lived in the city, and conformed to the cuttons and rites of their proper curix; all thofe being excluded who dwelt without the bound of the city, retaiaing the ceremonies of their own country, though they had been honoured with the jus ciutatis, or admitted free citizens of Rome. The place where the curize thet was the comition, a part of the forum : No fet time was appointed for the holdiug thef,, or ayy other of the comitia, but only as bufinels required.

The people being met together, and contirmed by the report of good omens from the angurs (which was neceffary in all the affemblies), the rogatio, or bufinefs to be propofed to them, was publicly read. After this (if none of the magiftrates interpofed), upon the order of him that prefided in the comitia, the people divided into their proper curias, and confulted of the matter; and then the curias being called out, as it happened by lot, gave their yotes man by man, in ancient tinte qiva wece, and afierwards by tablets; the mott votes in every curia going for the voice of the whole curia, and the mont carix for the general confent of the people.

In the tian of Cicero, the comitia curiata were fo much out of fanhion, that they were formed only by 30 lictors reprefenting the 30 curis; whence, in has fecond oration againt Rullus, he calls them comitia adambiata.

Tilne comitia centuriota were inflituted by Servius Yullius: who, obliging every one to give a true aecomst of what be was worth, according to thole accounts, divided the people into fix manks or clafies, which he fibdivided into 193 centuries. The firtt clatim, comtaning the equites and riduef citizens, conlitted of 98 conturies. The ficond, taking in the tradefinen and mechanics, confifted of 22 centuries. The third, 20. The fourth, 22. The lifth, 30 . The fixth, filled up with the poorer fort, but one century : and this, though it had the fame nane witt: the reit, yet was feldom regardect, or allowed any puwer in public maters, Hence it is a common thing with the Roman authors, when they fpeak of the chafes, to reckon mo more than five, the fixth nut being worth their notice. This late clatis or order was divided intor two pats, or orders; the prolitarii and the cogite corf. The former, as their name implies, were defigned purely to thock the repablic with men, fince they conid fupty it with fo litthe money; and the latter, who paid the lowel tax of all, were rather. conated and mathalled by their heads than by their ethates.

Perfons of the firlt rank, ber reafon of their pre-minence, had the name of chafici; whence came the name of chalicici aulhoris for the mott approved writers. All others, of what clalfis foever, were faid to be infra cloform. The aficmbly of the people by centuries was held for the clecting of confuls, ceafors, and prixtors; at alfo for the judering of perfons aceufed of what they called
tomitia. called crimen perduellionis, or actions by which the party had flowed himfelf an enerny to the thate, and for the confirmation of all fued laws as were propofed by the chicf magiftrates, who had the privilege of calling thefe afemblies.

The place appointed for their meeting was the camfus martius; becaufe in the primitive times of the eommonwealth, when they were under continual apprehenfions of enemies, the people, to prevent any fudden affault, went armed, in martial order, to hold thefe affemblies; and were for that reafon forbidden ly the laws to meet in the city, becaufe an army was upon no acconnt to be marfhalled within the walls: yet, in later ages, it was thought fufficient to place a body of foldiers as a guard in the janiculum, where an imperial fandard was erected, the taking down of whicla denoted the conclufion of the comitia.

Though the time of holding thefe comitia for other matters was undeternined; yet the magillates, after the year of the city 6or, when they began to enter on their phee, on the kalends of January, were couftantly diffrech about the end of July and the beginning of Àugut.

All the time between their clection and confirmation they continued as private parfons, that inquifition might be made inte the election, and the other candidates might have time to enter objections, if they met with any furpicion of foul dealing. Yet, at the elcetion of the cerifors, this cullom did not hold; but as foon as they were elected, they were immediately invelted with the honour.

By the inltitution of thefe comitia, Servius Tullius feeretly conveyed the whole of the power from the eonmons: for the centuries of the firt and richeft chafs being called out firf, who were three more in number than all the ref put together, if they all agreed, as generally they did, the butinefs was already decided, and the other chafes were needlefs andiningnificant. However, the three laft fcarce cver came to vute.
The commons, in the time of the frec flate, to remedy this difadvantage, obtained, that before they procecded to voting any matter at thefe comitia, that century fhould give their fufferges firt upon whom it fell by lot, with the name of centuria prevergation; the ref being to follow aceording to the order of their claffes. After the conntitution of the 35 tribes into which the clafles and their eenturies were divided, in the firft place, the tribes ealt lots which flould be the prerogative tribe; and then the centuries of the tribes for the honour of being a prerogative century. All the other tribes and centurics had the appellation of jure vocata, becaufe they were called out aceording to their proper places.

The prerorative century being chofen by lot, the ehief magillate, fitting in a tent in the middle of the campus martius, ordered that century to come out and give their voices; upon which they prefently feparated from the reft of the multitude, and came into an inclofed apartment, which they termed fepta, or arilin, pafling over the pontes or narrow boards laid there for the occation; on which account, de ponte dejici fignilies to Le dunied the privilege of voting, and perfons thus dealt with are called deportani.
At the hither end of the pontes food the dirilitores Vou.V. Part.
(a fort of under officers fo calted from their mariol ling the people), and dulivered to every man, in the clection of magiliates, as many tables as there appeared eandidates, one of whole names was writen upon every tablet. A proper number of great chefts were fet ready in the fote, and every body threw in which tablet he plafol.

By the chets ware placed fome of the publie fervant ${ }^{\text {a }}$, who taking out the abblets of evcry century, for every tablet, made a prick or a point in another tablet which they kept by them. Thus, the butinefs being decided by moll pointe, gave oecafion to the phrafe omme telit punchum, and the like.

The fame method was obferved in the judiciary procefs at thefe comitia, and in the confirmation of laws; except that, in both thefe cafes, only two tablets were offered to every perfon; on one of which was written U. R and on the other A, in eapital letters: the two firlt thanding for uti rogas, "be it as you detire," relating to the magitrate who propofed the queftion; and the latt for antiquo, or "I forbid it."

It is remarkable, that though it the election of magiftrates, and in the ratification of laws, the votes of that century, whofe tablets were equally divided, fignified nothing ; yet in triais of life and death, if the tablets pro and con were the fame in number, the perfon was actually acquitted.

The divifion of people into tribes was an inveation of Romulus, after he had admitted the Sabines into Rome; and though he conftituted at that time only three, yet as the ftate increafed in power, and the eity in number of inhabitants, they rofe by degrees to 35. For a long time after this inftution, a tribe firs nified no more than fuch a fpace of ground with its in. habitants. But at laft the matter was quite altered, and a tribe was no longer pars urbis, but fars civitutis; not a quarter of the city, but a company of citizens living where they pleafed. This change was eliefly occafooned by the original difference between the tribes in point of honour. For Romnlus having eommited all fordid and mechanie arts to the care of drangers, flaves, and libertines; and referved the more honelt labour of agriculture to the frcemen and citizens, who by this active courfc of life might be prepared for nuartial furvice; the tribus ruffice were for this reafon ettermed more honourable than the tribus uland. And now all perfons leing defirous of getting into the more creditable divifion; and there being feveral ways of accomplifing their withes, as by adoption, by the power of cenfors, or the like; that rultie tribe which had the moft wortliy names in its roll, had the prefe. rence to all others, though of the fame general denomination. Hence all of the fame great family, bringing themfelves by degrees into the qame tribe, gave the name of thoir family to the tribe they hosnoured; whereas at firit the generality of the tribes did not borrow their names from perfons but from places.

The fint affembly of the tribes we mect with is about the year of Rome $2 \sigma_{3}$, convened by Sp. Sicinius, tribunc of the commons, upon aecount of the trial of Coriolanus. Soon after, the tribunes of the commons were ordered to be elected here; and at laft, all the inferior macithrates, and the collegiate pricfs. The fame comitia form for the enacting of laws reB 1
lating:

Comitazi- hating to war and pence, amb all others propofed by tle tribunes and plebcian offiecrs, though they had not property the name of legrs, bue plebificita. They were gencrally convened by the tribures of the commons; but the fane privilge was allowed to atl the chice magritrates. They were confind to no place; and therefore fom ti:nes we ind them lield in the comitium; fonctimes in the campu; martius, and now and then in the capiol. The proceediags were in molt refpects anfwerable to thofe alicaly deferibed in the account of the other comitia, and therefore need not be infinted on. Only we may father obferve of the comitia in general, that when any candiuate was found to have moft tablets for a magill racy, he was declared to be defignel or clected by the frefulent of the affembly; and this they termed remusciari conful, protor, or the Jike; and that the lat fort of the comitia only could be held without the confent and approbation of the fenate, which was neceffary to the convening of the other two.

COMitLALIS morbus, an appellation given to the Epilersy, by reafon the comitia of ancient Rome were difolred if any perfon in the aifembly happened to be taken with this dinemper.

COMITTUMI, in Loman antiquiry, a large hall in the forum, where the Comitia were ordinarily held.

COMMAA, amoneg grammarians, a point or character marked thus (, ), ferving to denote a hort hop, and to divide the members of a period. Different ant thors define and we it differently. According to F . Buffer, the comma ferves to diltinguif the members of a period, in each of which is a rerb and the nominative cafe of the verb: thus, "That fo many people are pleafed with trifles, is owing to a weaknefs of mind, which makes them lue things eafy to te compreherded." Befides this, the comma is uied to dilitinguif, in the fame member of a period, feveral nounsfubtantive, or nouns-ajjective, or verbs mot united by a conjunction: thus, "Virtue, wit, knowledge, are the chief advantages of a man:" or, "A man never becones learned without tudying confiantly, methodically, with a guft, application, sce." If thofe words are united in the fame phrafe with a conjunction, the comma is onitied: thas, "the imaginativin and the judgment do mot alvays agree."

The ingenious autior of the tract De ratione itter. tuncendi, printed wih Voffurs's Element. Rhetor. Lond. $1 / 24$, lays down the nfe of a comma to be, to diftinguifh the fimple members of a period or fentence; i.e. fuch as only confilt of one fubica, and one definite verh. But this rule does not go thoughout ; the fane author intancing many particular cafes not yet inchaded herein, where yet the comma is advifable. See Punctuation.

It is a general rule that a comma ought not to come betwecn a nominative and a verb, or an adjective and fubltantive, when the te are not otherwife dispoined: thes, in the fentence, God multh wouth infante cuifam, a comma between God and culdo, or between infinite and wijficm, would be whind. But to this exceptions may occur; as when nut a fimble word, but a fentence, happens to be the nominative: thus, in the example firt above given, where the fentence that fo many penple are slayd ruith triffes, formis the nominative to the verb is, a comma at tijifs is 1 reper, both for the fake
of perficicuity, and as coinciding with a night natural Commaro paufe.

Comma, in mufie. Sce Interval. CUMMANDINUS (Frederic), born at Urbin in Italy, and deicended from a very noble family, in the 16 ch century. To a valt dkill in the mathematics, he had added a great knowledge in the Greek tongue, by which he was well qualitied to tranflate the Greek mathematicians into Latin: aceordingly he tranflated and publifhed feveral, which no writer till then had attempted; as Archimedes, Apollonius, Euclid, 2 c .

COMMANDRY, a kind of benefice or lised revenue belonging to a military order, and conferred on ancient knights who had done confiderable fervices to the order.

There are frict or regular commandrics, obtained in order, and by merit ; there are others of grace and favour, conferred at the pleafure of the grand mater ; there are aifo commandries for the religious, in the orders of St Bernard and St Anthony. The kings of France have converted feveral of the hoipitals for lepets into commandites of the order of St Lazarus.

The commandries of Malta are of different kinds; for as the order confilts of knights, chaplains, and bro-thers-fervitors, there are peculiar commandries or revenues attached to each. The knight to whom one of thefe benefices or commandries is given is called commanitr: which agress pretty near!y with the prepofitus fit over the monks in places at a ditance from the monalery, whofe adminiftration was ealled cledicy:in; becauf depending entirely upon the abbut who gave him his commifion. Thus it is with the finople commanders of Mata, who are wather farmers of the order than beneficiarits; paying a certain tributc or rent, called mojenfio, to the common treature of the order.

COMALELINA; in botany: A genus of the monogyaia order, blonging to the triandria clafs of plants; ard in the natural nithod ranking under the Gth order, Enfute. The corolla is hexapetalous; there are three neciaria, of a cruciform ingure, and inferted into their proper filaments. There are ten fyecies, all of them natives of warm climates. They are herbaceous plants, rining from two to four feet high, and alorned with bluc or yelhow flowers. Their culture differs in nothing from that of the conmon exotics.

COMAEMORATION, in a general fenfe, the remembrance of any perfon or thing, or the doing any thing to the honour of a pafon's memory, or in remembrance of any paft everit. Thus, the eucharift is a commemoration of the fufferings of Jefus Chrill.

COMMENDAM, in the ecelefialtical law, the trult or adminitration of the revenues of a bencfice, given either to a layman, to hold by way of depolitum for fix months, in order to repairs, \&c. or to an ecelefiaflic or benficed perion, to perform the pattoral duties thercof, till once the benefice is provided with a regular incumbent.

Anciently the adminiflation of vacant bifhoprics belonged to the nearean neighbouring bithop; which is Hill paactifed between the archbimopric of Lyons and the bithopric of Autun: on this account they wete called commiendutory lifhops.
This cullom appeas to te very ancient. S. Atha-

## dara,

Cummendatus.

Eemmest nathas fays of himfelf, according to Nicephorus, that
there had been given hina ia cormertam, i. c. in admaniftration, another church belides that of Alexandria whereof he was falted bilbop.
'I'he care of churches, it feems, which had no paftur, was committed to a bithop, till they were provided of an ordinary: the regillor of lope Gregory I. is full of thefe commiffons, or commendams, granted during the abfence or licknefs of a bithop, or the vacancy of the fec.

Some fay, that Pope I eo IV. firf fit the modern commendans un font, in favour of cectdiaftios who bad been expeted their benctices by the Saractis; to whom the adminitration of the vacant charches was cominted for a time, in expectation of their beine refored; though S. Gregory is fide to have ufed the fanc, while the Lombards defolated laty.

In a litte time the pratice of commendams was exceatingly abufed; and the reventes of monateries fiven to laymen for thetir fubtatence. The hithons allo procured leveral benctices, or coen bifoprics, in conmen. kum, which forved as a pretext for holing them all without directly violating the canons. Fart of the sloufe has becon retenched; but the ufe of commendams is Hill retained as an expedient to take off the incomfatibility of the perfon by the nature of the benchece.

When a parton is made bifor, his parfonage becones vacant but if the king sive him power, he may ftitl hold it is commendun.

COMMMENDATUS, one who lives under the protection of a great man. Commendai liomines, were perfous who, by voluntary homage, put themfelves under the protection of any fuptrior lord: for ancient homage was cither puedial, due for fome tenure; or ferfonal, which was by compulfion, as a hign of necet-
 tion; and thofe whe by volantary lomation, but thmo iuswh felves inder the protection of any man of puncr, were e nimen-

 depended on two feveral lorel, amd paid onc-habf of their homacre to cath; add fiboumm-nditi wate like under-tenants unta tixecommand of polons that were themfelves under the conmand of fome foperion lurd:
 relation to luct: depending hords. "this phrate fecms to be ttill in afe in the uf nal compliment "Coment ne to hach afinued," \&c. which is to ket him know, " I ans his humble fervans."

COMMENSURABIE, among geometricians, an appelation given to fuch grantitios ats are menfured by one and the fame common modure.

Commenserabse Numbers, whether iutegers or fractions, are fuch as can be meafored or divided by fome other number withont and remainder: fuch are 12 and 18, as being meafured by 6 and 3 .
 their fquares are meaturod by one and the fame fatece or fiaperficics.

Commansikntiar Surels, thofe that being reduced to their leat terms, become truc ligumaje quantitics of ther kind; and are therefore as a rational yrantity to a rational one.
 etrature, an illubation of th: didicuit on obsore patfages of an author.

Commatitary, or Commenturies, likewife denotcs a kind of hillory, or memoirs of ecrtain tradaclion, wherein the author had at contiderable hand: fuch are the Commentrics of Citar.

ISan operation by which the weath, or work, cither of individuals or of focietits: may be exchanged by a fet of men called meithants, for an equivalent, proper for lupplying every want, without any interruption to induitry, or any check upon confumption.

## Char.I. History of Commerce.

## § 5. Gencrat Fijfory.

In is a point as yet undecided by the leamed, to What nation the invention and fift ithe of commerce betonged; fome attribute it to one people, fome to another, for reafons that are too long to be difcuffed bere. But it feems moft probable that the iuhabitants of Arabia were thofe that firt made long voyages. It mult be allowed, that no country was fo happily feated for this purpofe as that which they inhakited, bring a peninfula wathed on three fides by three far mous feas, the Arabian, Indian, and Perfin. It is alfo ecrtait, that it was very carly inmbited: and the firtt notice we have of any confiderable trale refers it to the Immatlites, who were lettled in the hither part of Alabia. To them Jofeph was Cold by his brethren, when they were roing down with their ca-
mels to Egyph with fpicery, balon, and myrri, it may feem ftrange to infer from hence, that commerce was already practifed by this mation, tince mention is here made of camels, or a caravan, which certainly implies an inland trade: and it mut be likewie atm lowed, that bahm and anyrrh were the commodities of their country. But whence had they the fpicery? Or low came Arabia to be fo famous in ancient times for fpices? Or whence procecded that millake of many great authors of antiquity, that fpices actually grew there? Moti certainly, becaufe thefe people dealt in them; and that they dealt in them the lirlt of any nation that we know of, appears from this very inflance. Strabo and many other grood authors aflure us, that in fucceeding times they were very great traders; they tell us paticularly what ports they had; what prodigions magarines they kept of the richet kinds of goods, what wonderful wealth they obtained; in what prodigions magnificence they lived, and into what excefles they fell in refpect we their expences lor carving, bailding, and Itatues. All this !!uws that they were yery great traders: and it allo thows, that they traded to the Eatt Indies; for from thence only they could have their fpices, their rich gums, their frect-feented woods, and thei ivory, all which it is

131:2
exprefily
exprefsly faid that they had in the greatelt abundance. This thetefore proves, that they had an extenfive and flourithing commerce; and that they had it earlier than any other nation, feems evident from their dealing at that time in fpices. Befides, there is much lefs difficulty in fuppoling that they firll difcovered the route to the Indies, than if we aferibe that difcosery to any other nation: for in the firt place they lay noarcil, and in the bext they lay moll conveniently; to which we may add, thirdly, that as the lituation of their country naturally inclined them to navigation, fo by the hidp of the monfoons they might make regular royages to and frem the Indies with great facility; nor is it at all unlihely that this difovery might be at firlt owing to chance, and to fome of their veffels being blown by a ftrong gale to the oppolite coatt, from whence they might take the courage io return, by obferving the regularity of the winds at certain Seafuns. All thefe rcafons taken together feem to favour this opinion, that commerce flourihed firt among them; and as to its confequences in making them rich and bappy, there is no difpute about ihem.

We find in the records of antiquity no nation colebrated more early for carrying all arts to perfection than the inhabitants of Egypt; and it is certain alfu, that no art was therc cultivated more early, with more afiduity, or with greater fuccefs, than trade. It alpears fiom the foreroing inftance, that the richeft commodities wire carried there by land; and it is no lefs certain, that the moft vahuble manufactures were invented and brought to perfection there many ages before they were thought of in other comatries: for, as the learned 1)r Warburton very jufly obicives, at the time that Jofeph came into Egypt, the people were not only poffetted of all the convoniences of life, but were remarkable alto for their magnificence, their politends, and even fur their luxury; which argues, that traffe had been of long itanding amonglt them. To faty the truth, the great advantages derived from their country's lying aloug the Red Sea, and the many benefts that accrued to them from the Nile, which they very emphatically called The River, or The River of Egyt, and of which they knew how to make ail the wies that can be imagined, gave them an opportunity of carrying their inland trade not valy to a greater height than in any comtry at that time, hut even higher than it has been carried any where, China only exespted; and fome people have thought it no trivial argument to prove the defcent of the Chinefe from the Egyptians, that they have exactly the fame fort of genius, and with wonderful indultry and care have drawa fo many cuts and canals, that their country is alnolt in every part of it navigable. It was by fuch methods, by a wife and well-regulated government, and by promoting a firit of induftry amonglt the people, that the ancient Egyptians became fo numerous, fo rich, fo powerful; and that their country, for large cities, magnificent Itructures, and perpttual abundance, became the glory and wonder of the old world.

The Phomicians, though they poficfed only a narrow thip of the coant of Aria, and were furrounded by nations fo poserful and fo werlike that they were rever able to cxtend themfics un that fide, became famous, by erecting the firf naval puwer that makes

## E R C E.

any figure in hittory, and for the raifing of which they took the moft prudent and effectual medfures. In order to this, they not only availed themfelves of all the creeks, harbours, and purts, which nature had betlowed very liberally on their narrow tenritory, but inproced them in fuch a manner, that they were no lefs remarkable for their llrength than confiderable for their conveniency; and fo attentive they were to whatever might contribute to the increafe of their puser, that they wore nut more admied for the vat advantages they denived from their commorce, than they were formidable by their Heets and armies. They were likewife celebiated by antiquity as the inventors of arithmetic and atronomy ; and in the lait mentioned fcience they muth have been very coniderable proficients, fince they had the courage to undertake long voyages at a time when no other nation (the' Arabians and Egyptians excepted) durik venture farther than their own coats. Dy thefe arts 'Pyre and Sidon became the mof famous marts in the univerfe, and were reforted to by all their neightourz, and even by people at a confiderable diftance, as the great ilorehoules of the world. We Jearn from the Scriptures how advantageons their fremathip and elliance became to the two great kings of Ifrad, David and Solomun; and we fee, by the application of the hater for architects and artits to Hiram king of Tyre, to what a prodigions height they had canied mantfactures of every kind.

It is very certain that Solomon made ufe of their affitance in equipping his fleets at Elath and Eciuageber; and it is ve y probable that they put him upon acquiring thofe poric, and gave him the bert hints of the amazng advantages that miglit be detived from the poffefion of than, and fiom the commerce he might from thence be able to cany un. Thafe ports were mort commodionfly fitmaed on the Arabian gulph; and from thence his sifels, manued chicfly by Pheraicians, failed to Ophir and Tharis, whereever thofe places were. Some writers will neuds have them to be Mexico and Peris, which is centeninly a wild and extravagant fuppofition; others belicie that we are to losk for Ophir on the coatt of Africa, and Tharfs in Spain ; but the noof probzble apinion is, that they were both feated in the Eath Iodiuso By this adventurous navigation he brought into hins country curioflies not only unfeen, but mhatard of before. and riches in tuch aburdance, inat, as the Scripture finely expreffes it, "He made Filver in Jerufatem as fones, and cedar-thees as fycamores that grow in the plains." The metaphor is very bold and emphatical; but when we confijer that it is recorord in this HiItory, that the return of one voyage only to Ophir produced 450 talents of gold, which makes $51,3=8$ pounds of our Troy weight, we cannot doubt of the immenfe profit that accrued frum this commerce. It is alfo obfervable that the queen of Sheba, or Saba, which lies in that part of Arabia before mentioned, furprifed at the 1 cports that were fpread of the magnificence of this frince, made a journey to his court on purpofe to fatisfy lielfelf, whither fame had not exaggerated the fact ; and from the prefurts the made him of $12 c$ talents of godd, of ficess in great abundance, and precious itones, we may dicem the true reafon of her curiofity, which procteded from an opi-
nion that no country eould be fo ich as her own. And there is another circuniflate vely rematabie, and which feems flrongly to fortify what we have ad. vanced in the begianing of this foction; it is added, " neither were there any fuch fices as the quen" of Sheba gave to king Solomon;" which feems to intimate, that the Arabians had perferated farther into the Indies than even the fleets of this fumus prince, and brought from thence other ipices (perha!!s nutmegs and clow-s) than had ever been aeta befure. It was by his wifdom, and ly his theaty appliction to the aits of peace, ali of which mutually fupport cach other, as they ate dild diven on by the wheel of commeice, which cupplies every want, and converts every fuperfuity into merchandite, that this monarch tailed his tubjecrs to a condition much duperior to that of any of their neighbours, and rendered the land of If. rael, while he governed it, the glory and wonder of the Lafl. He made great acquifitions without making wars; and his fucceffor, by making waıs, lof thote acquifitions. It was his policy to keep all his people employed; and, by employing thein, he provided equally for the extenfion of their happinets, and his own power: but the following kings pufued other meafures, and other confequences attended them. The trade of Judea funk almott as fudserily as it role, and is procefs of time they loft thole parts on the Red Sea, upon which their Iadian commerce depended.

The whole trade of the univerfe became then, as it were, the patrimony of the Phonicians and the Egypians. The latter munopolized that of the Indies, and, together with her conn and nannfactues, brought fuch a prodigious balance of wealth continually into the country, as tuabled the ancient monarchs of Exypt to compafs all thofe na morable works that in fpite of time and barbarous conquerors strain the monuments of their wildom and power, and are lite to remain fo as long as the world lublifts. The Phecnicians drew from Egypt a great part of thufe rich commodities and valuable manufactures which they exportcd into all the countries bctween their own and the Mediterranean fea; they drew likewife a raft refort to their own cities, even from countries at a great diflance; and we need ouly look into the prophtets Ifaiah and Ezeckicl in order to be convinced that thefe governmento, founded on trade, were infinitely more glorions and more table than thofe that were erected by force. All this we find likewife confirmed by profane hiftories; and by comparing thefe, it is evident, that the induatry of the inhabitants of this finall country tiumphed over all obfacles, procured the greatelt plenty in a barsen foil, and immenfe riches, where, without indull ry, there muft have been the greated indigence. It is true, that old Tyre was dellroyed by Nebuchacnezzar, but not till the hat flowrithed for ages; and even then fhe fell with dernity, and after a refillance that ruined the army of the Great Conqueror of Afia. Out of the afhes of this proud city the great finit of its inhabitants produ:ed a Phenix, little, if at all, inferior in beauty to its parens. New Tyre was fituated on an illand; and though her bounds were very narrow, yet the became quickly the mifteff of the fea, and held that fupreme dominion till fubdued by Alexander the Creat, whoma
no power could refill. The fraggite the made, howacel, though unfuccafofu, vas great, and very much to the homar of ber imhabitants: it inall be owned, that the Greck liero found it rave dinatult to nater this lingle place, them io overconie the whele power of Periz.

The views of the Macedonian prince were keyond compration mare extemfe thati his conquats; and Whanca conliders A!cxander's plan of power, and enters ineo it thornughly, will think him more a politician than ine was a comyurror. He framed in his own mind an idea of univerfat monarth, which it was indered inpollible to accumphth; but the ye y notion of it dues him far greater homor than ail his nie tories. He thomght of placing 1 is capital on Arahia; and of difyofug thiogs in fuch a mannor, as to have commanded the moft remote parts of the Indies, at the fame time that he maintaine! a connestion with the molt diftant cumerics in Eunope. He was for making ufe of terce to acquire, but he very well knew, that commerce only cond preferve an empire, that was to have no other limuts than thofe which nature had affignei the world. He defired to be mafter of all; but at the fame time he was willing to be a wife and gracious maffer, and to place his happinefs is that of his people, or ratlier in making all the nations of the earth but one people. A vall, an extravagant, an impracticable felume it was, of which he hived not lony enough to draw the outlines; but the fample le left in his new city of Alexandria fufficiently thows how jutt and how correct his notions were, and how true a judgement he had formed of what might be effected by thofe methods upon which he depended. That city, which he might be faid to defign with his own hand, and which was built, as it were, under his eye, became in fucceeding times all that he expected, the glory of $\mathrm{E}_{\mathrm{s} \text { ypt }}$, and the centie of commerce for feveral ages.

While Tyre was in the height of her glory, and had no rival in the empire of the fea, flue founded her noble colony of Carthage on the cualt of Africa. The fituation of the city was every where admirable; whether confidered in the light of a capital, of a ftrong fortrefs, or of a comnodius port. It was equally diftant from all the extremitics of the Mediterranean fea, had a very fine country behind it, and was mot in the neighbourtood of any powet capable of reltraiming its commerce or its growth. It is almolt inexpreffible how toon its imabitants became not only numerous and wealthy, but porent and fornidable. Dy degrees they extended themelelves on all fides, conquered the bett part of Spain, and erected there a new Carthage; the illands of bicily and Sardinia, or at lealt the bell part of them, fulunitud likewife to their yoke. Their conquatls, however, were inconfiderable in extent, when compared whth weir navigation. On one fide they flrethed as tor wetward as Britain; and the scilly iflands, whith are uow to inconficterable, were to them an Indie:, the routc to which they uled the utmoll istiftry to conceal. On the wther hand, they difcovered at great part of the coalt of fffica, the Carary flomds; and tome there are v to believe they fift found the way to America. Whik they contined themfelves to trade, and the arto which be longed thersto, their yowes bat comtinually increa. fung:
 finit of mation beniked athe old maxims of fugality and dabour, their acquibitons remained at a tand. 'he Romans bugat to grow juahns of their naval Pown, which it cott them two obsinate wars of fo fears cumamatace to humble. When the wasat leagth indtroyd, her rery mins were majetic: for at he burimang of the third futal Punic war, thes city con. tamA $7=0,000$ inhalitants alune, and had 300 cities in Sfrica tander her domimon. Such was the empire of Cathace, mifed entirely by comamere; and to which, if the had been conteat to have applied her. foll with the fome teadiofs in hem hiskell proferity as in her eary iegimings, these is no conbt the hat preferved her ficedom much lunger than the did; for as thrift, and difigence, and rood finth, are the pillars of of conme cial itate ; So when thefe are unce flaken, it is ut maly natural that fee foond decline, the masverallento.

The Ftolemics, who were the fucedfors of Alexande. in Egypt. entered detply intu that hero's foheme, and seaped the benetit of his wife citabithment. D'tokomy Philadeiphnc, by encouraging tade, made his fubjects immenfly rich, and himfelf inespreforly fontrinl. Yre are told by an ancient author, that he h:d 120 gallies of war of an e omous lize, and upwanls of +000 other verth, forall and great. This worls! apyear incredible, if other wouders were not rekated of him, which feen to caplain and contirm thele. The raiful a new city on the coalt of the Red Ser; he was at an inmenfe expence in opening harbouns, confructing quays, in maing inns at proper ditances on the rod, and ia cuiting a canal from fa to fea. A prince who comprothended the importance of commone to a degree that infaced hin to dare fuch expences as thele, might have what treafare, What ammis, "hat feects he plafed. In his time, Alexandria appared in ponp and plendor. She owed her lith to Alexander; but it was Ptolons, who caught a double portion of his matter's fpirit, which railed her to that magnincence that ages could not deface. Wemay guefs at what the was in her ghong, hy what we are tok was the produce of her cultoms, which fell litele fort of two millions of ont money amually; and yet we camot fuppofe that I'toleny, who underfood trade fo well, wond cramp it by high duties, or exuravagant impolitions. When the revence of the prince from a fingle port was fo great, what muit have beco the riches of his fubjucts!

But what fhows us Alewandria in the highett point of light, is the eredit fhe naintaned after Egypt funk from an empire into a province. 'The Romans themfibss were thack with the majefy of her appearance; and though illl then they had litule regarded trafic, vet they were not long before they comprehended the whamages of luch a port, and inch a mart as Alexambia; they contimed bre privikeses, they proteet d ler inhabitants, they took wery meafure poffWe to prature her comence: am this with fo good and ffict, that the aitually fulervel it, lunger than Rome herlelf could petenc her power. She followed, indeed, the fortune of the empire: and became ac hat dependent upon Conftantinupte, when its founder enowed thether the capital of the empire; and his
ficceflor found means to transfer alfo a part of the trade of Alcxandria to the fane pliare. Iet this city continued still to hold up her head, and though fhe lank under the barbarous power of the Arabs, yet they grew pulithed by degrees; by degrees the reco. rered fomewhat of her ancient pre-eminence: and though the never 1 ofe to any thing like her former luttre, yet the remained the centre of what little trade there was in the world; which is more than can be faid of almolt any place that has fatten under the Nohamnedan power.

When the Roman empire was over-sun by babarians, and arts and fiences funk with that power which lad cuhivated and protected them, commerce allo vinibly declined; or, to fpak with greater propriety. was overwhelmed and lott. When that irruption of Farions nations had driven the Roman peliey out of the sratett part of Europe, fome ilraghling people. cinher forced by necelfity, or lud by inclimation, took theter in a few traggling inands that lay near the coath of Italy, and which would never have beea thought worth inhabiting in a tine of peace. Theis was in the 6th centery; and at their dreftixas there they had cortainly nothing more in siew than hinge in a colenable fate of freedom, and acquiring a lubulernce as well as they coald. Thefe iflands being divided from each other by narrow chanaln, and thofe chan. nels fo encumbered by thathows that it was impolibl? for drangers to navigate then, thefe refugces fomm themfles tolerally fafe; and unitiag anoongl themfetres for the fake of improving their condition, ant angmenting their fecurity, they becane in the xth contury a well-fettled erovermment, and affumed the form of a republic.

Simple and mean as this rlation may appear, ye it is a plana and true acount of the rite, probrefo, and eflablibhment of the famons and potestrepanic or Venice. Hor beginnings were indead $\because$ erik and Jow ; but when the foudation "as once well laid, her growth was quick, and the increafe of her power amazing. She estended her commerce on all lides; and taking adralitage of the barbarons maxins of the Mohammedan momarchies, fre drew to herictf the profts of the Indian trade, and might, in fome fenfe, be faid to make Erypt a province, and the Saracens herfubjeets. By this means her trafic fwelled beyond conception; the became the common mart of all nations; her naval poner arrived at a prodigious height; and, making ufe of every favomble conj-cture, the ftretched leer conqueft not only orer the adjacent Tcrra Firma of Italy, but through the illands of the Archio playor, fo as to be at once miltrefs of the fea, of many fair and fruitful countries, and of part of the great city of Comantinople itfotf. But ambition, and the c!clire of londing it over her neighboms, brought upon her thode aits which firtt produced a decay of trade, and then a declenfion of power. General hituries indeed afcribe ihis to the league of Cambrav, when all the great powers in Europe combined againis this repullic; and in truth, from that pertod the finking oh her power is truly dated; but the Venetian writers very jufly obferve, that thourh this effect followal the league, yet there was another more la. tent, but at the fame time a more effectual caufe, which was, the falling off of their commerce; and
fley have ever fince been more indelted to their widdom than their power; the the prudent conceritug of their own weaknef, and taking adrantage of the errurs of their conmies, than th any other enfe, for their keeping up that part which they llill tar, and which had been loit long ago by any chler nation but themfelves.

At the fame time that Venice rofe, as it were, out of the fea, another republic was crectud on the erant of Italy. There coubl not well he a worfe fituation than the narrow, marhy, umprofitalle, and unwholsfome iflands in the Adriatic, except the rocky, barem, and inherpiatle fhows of Liguria: and yet as comnerce railed Venice the Rich on the one, fo fle erateed (enoathe Piond on the other, In pipite of ambitions and warlite neighours, in fpite of a comberd and tuproducing country, and, which were fill greater impediments, in fipite of perpetual factions and fucceffive revolutions, the trade of Genoa made her rich and gereat. Tix mecchants traleal to all comentics, and throve by carrying the commodities of the one to the other. Hur fleets hecme formidable; and, bedides the aljaecnt illand of Cortica, the made later and inportant conquefts. She fixed a colsony at Calln, and was; for fome time in poffeftion of the coalls on both fides of the Black Sea. That emulation which is natural to meighbouring nations, and that jealoufy which rifes from the purfuit of the fame miltrefs, commerce, begat continual wars hetween thefe vival republics; which, after many ublinate and bloody latthes, were at laft temonated in fasou: of bonice, by that famous riatory of Chioze gained by her doge Andrew Contarini, fronn which time Genoa neser pretended to be miluefs of the fea. Thefe quarels were fatal to both; hut what proved more immediately deftruative to the Genofio, wis their araice, which induced them to abandon the fair protits of trade for the fake of that vile methoo of tequing wealth by vifury.

But we muft now look to ano her part of the world. In the midule age of the German cmpac, that is, ahost the middle of the 13 th century, there was formed a confederecy of many maritime citics, or at lealt , fities mot far from the fea. This confederacy follely regarded commence, which they endeatomed to pronote and extero, by intereling therein a great number of perfors, and endeavouring to profit by their oifferent views and different lights. Though the dites of Gemary hedd the princigal rank in the Tentonic Manfe, they did not however forbear afociating many other cities, as well in France as in Englind and in the low countries; the whole, however, without lurting the authoity, without progudice to the rights, of the fuvereign on whom they depended. This confederacy hat it laws, its ordinances, and its judgments, which were obferved with the fame refpect as the maritime code of the Rhodians, who pafing for the aioleft feamen in all antiquity, their conltitutions were obferved by the Greeks and Romans. The Tcutonic Hanfe grew in a floort time to fo high a ranke in power and authority by the immenfe riches it aequircd, that princes themfelves rendered it a fincere homage from principles of eftem and admiration. Tllofe of the nonth principally had frequent occalion for their credit, and borrowed of them coniderable lums. The
grand maters of the Tentmic erver, who wate at
 confunators of the sizhts and privitesen of the Jathe: all fucsechal, not colve to, b, h heoond their wible; and Germany, fhamed with their pendeds, hoobad
 does on certain tate phonts, thoght met of has own

 contuderacy; they exemberither wetis in c.ate of fliguback from a! demand. whetoxver from the admimalty, or from private perfors; they forbede ans dilmbarace to their navisaion a.t all times, and (ren when liance was at war with the comperor, or lac princes of the north. In line, during the ebonle ot thote umaply wars which were Rylue Crojoudes, the Eianke was fignatly conlulted, and trave alsays puilfant tuccours money and in mips to the Chrittians "rported by intictels. It is afomilhiner, that entes at fo great a dillance foon cach other, fuhject to different kings, fonceimes in open war, but always jualons of their roghta, fhould be ahde to confederate and live wo erether in follnict an union. But when this mion lad rumered thon very sich and powerful, it canot feem at all trange, that on the ous hand they grew arogant and owerbaning, took upon them not only to treat with fovereigins on the foot of equality, but even to nake war with them, and more than once with finecefs. It will, on the other hand, apuca thill kets ferange, that fuch behavicur as this awakened varions prinecs io a mon particular vew of the dangers that fuch a learge mirist padice, and the advantages that vould naturally flow to their refpective fates, by recoromata their trode thas made over, at leat in tome part to cther:, entirely to thomelses; and thefe, in lew wurds, were the caulis of the gradual daclenforn of the Hanfatic alliance: which, lowner, is wot totally ditalved at this day; the citics of Luberk, Humburn, and Lremen, manaining lificient marks of that frkidor and dignity with which this condederacy was ence adorned.

We mut now turn our eyes to Portugal and Spain, whare in the drace of about 50 years there happened atrain of events which gradaally led on to fucin ditareres as changed the whole face of affairs in the commereial world, and gave to the howledge of later ages what for fome the ufand years had bech kejet lecret from all mankind, we mean a perfote and chttinct notion of that teraqueons gobe which they inhabit. The king dom of Pentugal was fmall, but well cultivated, very poptolous, and beffed with a vaiety of good ports; all which, however, had food them in litte head, if they had not had a fucceflion of wife princes, who, inltead of involving themlelves in war with their acighbours to gratify their ambition, endeavoured to extend the happinefs and wealth of their fuljects, and by fo doing their own power, in the fofter and more fuccefsful method of protecting ants and feiences, encomraging induftry, and favouring trade. 'T'his, with the convenient fituation of their country, in the beginning of the 15 th century, prompted fonce lively fpirits to attempt difcovenies; and thefe, countenanced liy an heroic young prinee, puthed on their cndeavonts with fuch fuccers, that ftep by flep the coath of Africa was furveyed as far as the Cape of Grood liope, to which they
they gave that mame. The point they had in riow was a new routc to the Dall Indies, which Vafqueze de Gama happily diforered; and in a thort frace of time Portngal, from one of the lealt confiderable, gress to be one of the richedl powers in Lurope, ginied prodigious dominions in Alia and Africa, and raifed a naval powcr fuperior to any thing that had been feen for many ages before.
See Colveri- But while this was doing, Chrittopher Columbur, a bus (chrijo- Genoefe of great capacity, though of almolt unknown pher.) original, who had been bred to the fea from his youth, and who had carefully thudied what others made a trade, formed in his mind the amazing project of countcracting experience, and failing to the lidies by a weft courfe. He offered this project to the Portuguefe, by whom it was conlidered and rejected as a chimera. He propofed it aftervards to other ilates, but with no better fortune; and at latt owed the difcovery of the New Wurld to the high firiti of a heroinc, the fanous Ifabclla queen of Cattile, who almolt at her own expence, and with very little comnteanace from her huband, who yet was Ayled Fordinund the $I T / 2$, furnifhed the adventurous Columbus with that poor fquadron, will which at once, in fpite of all the difficulties that the enry of his officers, and the oblinacy of his mutinusis crew, threw in his way, he perfected his defign, and hide open a new Indies, though in reality he aimed at the difcovery of the old. Neither was this noble effort of his matehlefs underftanding defeated; for afier his deceafe, Ferdinand Magellan, a Pontuguefe, propofet to the emperor Charles V. the difcovery of a paflage to the fipice inlauds by the South Seas, which was what Cotumbus aimed at; and though Magellan lived not to return, yet in one voyage the difcovery was perfected. It is inconceivable almoot low many and how great bencifis accrued to Europe from the fe dfeoveries; of which, however, it is certais, that the Purtugucfe made a very indifferent, and the $S_{p}$ miards much worfe, ufe; the former making daves of, and the latter rooting out, the natives. This, as it was a mon marrateful return to divine Providence for fo high a blefling; fo it might have been eafil) forefeen it would prove, as experience has fhown it did prove, highy prejudicial to the ir own interels, by depopulating very fine conatries, which have been thereby turned into defarts: and though on their firt difcovery infonite treafures were returned from them, which ware coined in the mints of Spain ; yet by an chlinate purfuit of this falfe policy, the Spanilh ifrunds in the Welt Indies are now brought fo low as in be barce worth keeping. The a fiquences that matuadly followed on the difcovery of a padtage by the Cape of Good Hope, and of a fouth part of the glctue in the wetern hamifphere, were, as it fas been already hinted, the caufe of an eatire chanse in the hate of Europe, and produced, not only 1a Poitral ane ipain, Lut in mollother nations, a defire of viming thefe remote parts, of efabithing colonis, of fetting mandactues on fout, of exportins and inpontirs commoditics, and of raifing, "Etet'ing, ampatacting now maufacturcs. By this me:ns, as the reder canmet bint perceive, not only particular nat mo Lrought abuth figmel advantages to themicles, but Europe in general received a lalling N 85.

## E R C E.

and invaluable bencfit: for its patentates made thenfolves furnidable, and even terible, in thofe diftant parts of the carth, where the fome had hardy reahid before. It is howerer true, that this has mot been canicd on as high as it might lave been; for though there was room enough for cery nation to have liad its hare, and thongh it might be demontra. tad that the grood of the whole would have contributed fufficiently to the profit of every Aate, the fubjecta of which had engaged in this traffic; yet, inllead of profecuting fo natural and fo equitable a meafure, they have taken a quite contrary courfe; and by decrying, attacking, and deftruying each other, have veiy much leffenced that prodigious reverence which the Araties, Africans, and Americans, at lirit had for the inhabitants of Europe.

The naval power of the Portugnefe received an incurable wound by falling under the power of the Spaniards: and though human poliey would have fuggefted, that this alune mult have raifed the latter to the monopuly of commerce, and the univerfal dominion of the fea; yet the sery purfuit of a defiga fo vifibly detrimental to the interett of nankind, proved very quickly their ruin alfo. For the Spaniards, from the natural haughtinefs of their temper, milled by the boundlefs ambition of their princes, and endeavouring to become the lurds of Europe, forced other nations in their own defence to make a much quicker progrefs in navigation than otherwife they could have done: For the Engliht and Dutch, who till this time feemed blind to the adrantages of their fitnation, had their eyes upened by the injuries they received; and by degrecs the pation of revenge infpired them with defigns that poffibly public fivirit lad never exsited. In nort, the pains taken by Spain to keep all the riches that flowed from thefe difeoveries to herfelf, and the dangerous, detuftable, and defructive purpoles to which the applicd the immenfe wealth that howed in upon her from them, produced effects directly oppofite to thofe which the propofed, and made her enenies rich, great, powerful, and happy, in preportion as her commerce dwindled away, and as her naval power funk and crumbled to pieces, incercly by an improper difpliy, an ill-managed exertion, and a wrong appliction of it.
It was from lence that the inhabitants of the Seven Provinces, whom her oppreftion had mate poor, and her feverities driven mad, became firt frec, then poteat, and by degrees rich. 'Thcir dillteales taught them the neculaty of ctabl thing a moderate and equal government; the mildnefs of that government, and the Eleflings which it procured to it fulgeets, raifed their number, and elerated tit ir hopes. The confequences became quichly wifble, and in a fhort fpace of time amazing both to fricolds and cucmies: every fin. ing village improved into a trading-town; their littie towns grew up into large and maguificent citios; their inland buronghs wece filled with manufature: and in lefs than half a century the dittofied States of Holland bccame high and mighty; nay, in fpite of the danger and expences which attended a war made all that time astinalt a fupcrior force, thefe people, furrounded with camics, loaded with taxes, expoled to perfenal fintice, and to a thenfand viher difadrantages, grew if to fuch a ftrength as not unly made
the Spaniards defpair of reducing them any more under their dominion, but inclined them to wifh, and at haft forced them to leek, their friendhip.

This, atleall as far as cither ancient or modern hiftories inform us, was the quickeft and trongef of all the productions of commerce that the world has ever feen. For it is out of difpute, that the republic of the United Provinces owes her freedom, her power, and her wealth, to indultry and trade entirely. The greateft part of the country is far from being fertile; and what is fo, produces not enough to fuffice the tenth part of its inhabitants for the tenth part of the year: the elimate is rather tolerable than wholefome; and its havens are rather advantageous from the difficulty of entering them, than from their commodioufnefs in any other refpect. Native commodities they have few or none; timber and maritine fores are entirely wanting; their country cannot boatt fo much as of a coal-mine; and yet thete provinces, upon which nature has bettowed fo litte, in confequence of an extenfive trade, are enriched with all things. Their Atorehoufes are full of corn, even when the larvelt in com-countries fulls; there is no commodity, how bulky foever, or however fcarce and hard to come at, which may not be had from their magazines. The mipping of Holland is prodigious; and to fee the quantities of naval flores with which their yards and ports abound, aftonifhes thofe who are unacquainted with the vigour of that caufe which produces this abundance. But above all, the populoufnefs of this country is the greatelt miracle. That men fhould refort to a Canaan, and defire to live in a land flowing with milk and honey, is nothing ftrange; but that they fhould make it their choice to force nature, to raife palaees, lay out gardens, dig canals, plant woods, and ranfack all the quarters of the earth for fruit and Gowers, to produce an artificial paradife in a dead plain, or upon an ingrateful heath in the midat of fogs and Itanding lakes, would, in fo critical an age as this, pafs for a fable, if the country did not lie fo near us, as to put the truth of it out of queltion.

## § 2. Britifl Hifory.

We may eafly coneeive, that foreign commerce by the natives of this ifland mult have been a work of time; for men think firlt of neceflaries, then of conveniences, and lafl of fuperfluities. Thofe who came originally from the continent might have better notions of things; but as it mult be prefumed that either fear or indigence drove them hither, fo it is eafy to apprehend that fucceeding generations mult for fome time fink much below their anceftors, in their notions of the commodities of life; and, deriving their manners from their circumflances, become quite another fort of people. But thofe on the oppolite continent, knowing that this ifland was inhahited, and baving the we, though in ever fo imperfect a degree, of veffels, and of foreign traffic, canse over hither, and bartered their goods for the raw commodities of the Britons, till by degrees perhaps they taught the latter to make fome improvement in thofe flight leather and wicker boats, which they ufed for paffing their own rivers, and creeping along their coatts, till at laft they ventured themfelves over to Gaul, and entered upon fome kind of corrcfpondence with their neighbours. All this is fo deducibie from the laws of Vol. V. Pari I.
nature, that we might have divined thus much by the light of reafon, if we had not the commentarics of Ciefar to guide us, and to $l l$ rengthen by the authority of hiftory the faess that might loave been found out by the force of rational conjecture.

Things were precifcly in this fituation when the Romans invaded lbritain; and there is no doubt that our anceltors falling under the power of that empire, and under its power at a time when with refpeat to arts and fciences it was in a moff fourifhing condition, was a great advantage to them; and though fron their love of civil liberty, whiel, when under the direction of realon, is the moft natural and laudable of all paffions, they made a long and vigorous, and in fome fenfe a noble and glorious refiflanee; yet by degrees they caught the manners and cuttoms of their conquerors, and grew content to be happy rather than free. With learning and politenefs the Romans itatroduced foreign commerce; and according to the nature of their poliey, as they mace high roads through the ifland, eflablifhed colonies in proper places, and fixed flanding camps, which were a kind of fortrefles, where they thought proper ; fo they were no lefs carcful with regard to narts or emporiuns for the conveniency of traders, and of which what they found is uneertain : but that they left many, is without queltion ; and amonglt the refl London, which is net more famous for her prefent extentive trade, than venerable for her unrecorded antiquity.

When the Romans unwillingly left Britain, and the Britons as unwillingly made way for the Saxons, a new deluge of barbarity overfowed this ifland: almol all the improvements of our civilized conquerors were defaced ; and, upon the ettablithment as it were of a new people, things were all to begin again. This neceffarily took up a great deal of time: and before they were in any tolerable pollure, the Saxons found themfelves dittreffed by frefi fwarms of batharians. Yet there ftill remains fome evidences of their having been acquainted with, inclined to, and, if their cireumflances would have permitted, moft certainly would have entered upon and carried foreign commerce to a great height. We have authentic tellimonies, that Alfred the Great formed projects of valt difcoveries to the North, as he actually lent perfons of great prudence and abilities into the Eall; and the euriofities which they brought home were for many ages preferved in the treafury of the church of Salifury.

As for the Danes, they were not long onr matkens: but as they became fo by a maritime force, and as their comentrymen had eftablifaed themelves not only on the oppofite thore of lramee, but in other parts of Lurope; fo it is reatonable to behere that they held fome correfpondenec with then from honce; ard that, if their dominion had latked longer, this might have been better regrulated, and productive of many advantages. But they had foon to do with their brethren in another way: for the Normans, mon of the fame race, but better eftablifhed in another country, difpoffeffed them here; and partly under eolour of right, partly by fonce, flected that monarehy, which, not without various alterations and changes, fublit; even to our times, and to the fobtiftuce of which, with the hetp of thofe changes and alterations, we owe that happy conftutuon under which we live; that univerfal inprovement which adorns the face of C c
our country; that domenic trade which nourihes fo numerons a people, by plentifelly rewarding their incultry; and that extenfive commerce which is at once the fource of our weal hand the fupport of our liberty.

It cannot be expected, that, in a work like this, we fould attempt to trace the progrefs of trade through every reign, how how it was encourared and protected, or difcountenanced and checkeõ; what occafions were luckily feized, or what oppartunities unforumately lot. It may be fufficieot for us, after what has beeo already faid, to obferve, that the opinion commonly entertained, of our having litcle or no trade before the reign of queen Elizabeth, is very far from being well founded.

In fact, the reign of that prineffs was great and glorious, in whatever light we confider it ; but it was mott fo in this, that, under Providence, it became great and glorions by the wifdom and prudence of the queen and her mioitters. The Englith mation never was in fo defperate a condition as at her acceffion. The crown was in debt, the treafury empty, the nation involved in a foreign war directly araing her own interefs, her coats naked; in a woid, without credit abroad, and without conecrd at home, no feithed religion, the great men fplit into f Ctions, and the common people diftracted and dejected. Sad circumances thefe! and yet from hence arofe the grandeur of that reign, and the eltablifment of our commerce. The queen found lierfelf obliged to act with great caution, to derive affitance from every quarter, to employ it faithfully, and to promote to the utnot of her power the welfare of her fubjects, whom nothing but the public fpiritednefs of her gin. vernment could enable to grow rich enough to fupport the neceflary expences of the crown. It was this gave a popular turn to her councils. She encouraged lee futjects to arm againt the Spaniards, that they might be accuftomed to the fea, and acquine that knowledge in navigation, with which, till theo, they had been unacquainted. She pafted many laws for the puhlic good, erected feveral companies, and faw that thofe companies purfued the ends for which they werc erectel; in fhort, he did every thing that could be expected, during the whole courfe of her reign, to excite and encotrage induftry at home, and to enable us to make a proper tigure abroad. In a word, fhe furnifhed us with thook and credit, put us upon improving our commodities and manufactures, brought the art of fhip building amongt us, filled our ports with able feamen, fhowed a juft refpect to Englifh merchants, reduced Ireland fo as to reoder it beseficial to Britain, and approved our fending colonies into America; and thus the feeds of Britith walth were fown in her time, though the havect was reaped in the days of her fucceffors. See the articles Coalery, Colony, Fisheries, Manufactures, Shipping, and Trade.

## Chap. II. Principles of Commerce.

## § 1. Origin of Trade.

The mott fimple of all trade is that which is carsied on by bartering the neceffary articles of fublittonce. If we fapgofe the carth free to the firt pol-

## E R C E.

feflor, this perfon who cultivates it will firt draw from it his fond, and the furplus will be the object of bater: he will give this in exchange to any one who will fupply his other wants. This naturally fuppofes both a furplus quantity of fcod produced by labour, and alfo free hands; for he who makes a trade of agriculture cannot fupply bimfelf with all other nectlluites, as well as food; and he who makes a trade of fupplying the farmers with fuch neceffaries, in exchange for 'is furplus of food, cannot be employed in producing that food. The more the neceflities of man increafe, the more frce hands are required to fupply them; and the more free hands are required, the more furplus food mat be produced by additional labour, to fuppiy their demand.

This is the leat complex kind of trade, and may be carricd on to a greater or lefs extent, in different countics, according to the difierent degrees of the wants to be fupplied. In a country where there is no mon $\lrcorner$, nor any thing equivalent to it, the wants of mankiod will be contined to few objects; to wit, the removing the incoiveniences of huoger, thirtl, cold, heat, danger, and the like. A free man, who, by his indutry, can procure all the comforto of a fimple life, will tyjoy his reft, and work oo more: and, in genetal, all increafe of work will ceafe, fo foon as the demand for the purpofes mentioned comes to be fatisfied. There is a plain reafon for this. When the free hands have procured, by their labour, wherewithal to fupply their wants, their ambition is fatisfied: fo fom as the hufoandmen have produced the ncceffary furplus for relieving theirs, they work no more. Here then is a natural ftop put to indultry, confequently to bartering.

The next thing to be examined is, how bartering grows into trade, properly fo called and undertood, according to the definition given of it above; how trade comes to be extended among men; how manufactures, more ornamental than wifful, come to be eftablified; and how nen come to fubmit to labour, in order to acquire what is not abfolutely neceffary for them.
This, in a free fociety, is chiefly owing to the introduction of money, and a tafte for fuperfluities in thofe who poffers it.

In ancient tiwes, money was not wanting; but the tafte for fupenfluities not being in proportion to it, the fpecie was locked up. This was the cafe in Europe four hundred years ago. A new tafte for fuperfluity has drawn, perhaps, more money into circulation, from our owo treafures, than from the mines of the new world. The poor opinion we entertain of the riches of our forefathers, is founded upon the modern way of eftimating wealth, by the quantity of coin in circulation, from which we conclude, that the greateft part of the fecie now in our hands mull have come from America.

It is mure, therefore, through the tafte of fuperfuity, than in confequence of the quantity of coin, that trade comes to be eftablifhed; and it is only in confequence of trade that we fee induffry carry things in our days to fo high a pitch of refinement and delicacy. Let us illuftrate this, by comparing together the different operations of barter, fale, and como merce.

When reeiprocal wants are fupplied by bater, there is not fine farallelt occation for money: this is the moft fimple of all combinations.

When wants are multiphed, bartering becomes more difficult : upon this money is introduced. This is the common price of all things: it is a proper cquivalent in the hands of thofe who want, perfectly calculated to fupply the occafions of thole who, by induitry, can rctieve them. This opcration of buying and feltinss is a little more complex than the formet; but titl we have here no idea of trade, becaule we have not in. troduced the merchant, by whofe indultry it is carried on.

Let this third perfon be broughe into play, and the whole operation becomes elear. What before we called evants, is here reprefented by the confumer; what we called induftry, by the manufaciurer; what we called money, by the meechant. The merchant here reprefents the money, by fublituting credit in its place; and as the money was invented to facilitate barter, fo the merchant, with his credit, is a new refinement upon the ufe of money. This renders it ftiel more effectual in performing the operations of buying and felling. This operation is trade: it relieves both paries of the whule trouble of tranfportation, and aijulling wants to wants, or wants to money; the merchant icprefents by turns both the confumer, the manafacturer, and the moncy. To the confumer he appears as the whole body of manufacturers; to the manufactures as the whole body of confumes ; and to the one and the other clafs his credit fupplies the ufe of money. This is fufficient at prefent for an illultration. We now return to the fimple operations of moncy in the hands of the two contractiug parties, the buyer and the feller, in order to flow how men come to fubmit to labour in order to acquire fuperfluities.
So foon as moncy is introduced into a country, it becomes an univerfal object of want to all the inhabitants.

The confequerce is, that the free hands of the fate, uho before ltopt working, becaufe all their wants were provided for, laving this new object of ambition before their eyes, endeavour, by refinements upon their labour, to remove the fmaller inconve. mienees which refult from a fimplicity of manners. People, who formelly knew but one fort of clothing for all feafons, willingly part with a litule money to procure for themfelves different forts of apparcl properly adupted to fummer and winter, which the ingenusity of manufacturers, and their defire of getting money, may have fuggelted to their invention.

Indeed th fe refinements feem more generally owing to the indutiry and iuvention of the manufacturers (who by their ingenuity daily contrive means of foftening or misting inconveniences, which mankind feldom perecive to be fuch, titl the way of removing them is contrived), than to the tane of lexury in the rich, who, to indulge their cafe, engage the poor to become induhtious.

Let any man make an experiment of this nature upon himfelf, by entering into the firt fhop. He will no where fo quickly difcorer his wants as there. Every thing lee fees appears cither neceffary, or at lean highly convenient; and he begins to wonder how he could
have been fo long without that which the ingenuity of the workman alone had invented, in order that from the novely it might excite his delire; for perlaps when it is bought, he will never once think of it more, nor ever apply it to the ufe for which it at firt appeared fo neceffary.

Here then is a reafon why mankim labour though not in want. They becone defirous of poffoffang thic wery influments of luxury, which their avarice or ambition prompted them to invent for the ufe of others.

What has bend faid reprefents trade in its infaney, or rather the materials with which that great fabric is built.

We have formed an idea of the wants of mankind multiplied even to luxury, and abundantly fupplicd b; the employment of all the free haids fet apart for that purpofe. But if we fuppofe the workman himfelf dif. pofing of his work, and purchating with it food from the farmer, cloaths from the clothier ; and, ingeneral, fecking for the fupply of every want from the hands of the perfon directly employed for the purpore of relieving it; this will not convey an idea of trade according to our definition.
Trade and commerce are an abbreviation of this long procefs: a fcheme invented and fet on foot by merchants, from a principle of gain, fupported and extended anong men, from a principle of gencral utility to every individual, rich or poor, to every fociety, great or frmall.

Infled of a pin-maker exchanging his pins with 50 diferent perfons, for whefe labour he has vecation, he fells all to the merehant for money or for credit; and, as oceafon oflers, he purciufes all his wathe, either directly from thate who fupply then, or from other merchants who deal with manufacurers in the fame way his merchant dealt with him.

Ancolher alvantage of trade is, that induftrions people in one part of the country, may fupply cultomers in another, though diflamt. They may ettablith themfelves in the moft conmodious places for their refpective bufnefs, and help one another reciprocally, without making the dillant parts of the country tuffer for wan of their labour. They are likewite expofed to no avocation from their work, by feeking for cuf. tomers.

Trade produces many excellent advantages; it marks out to the mannfacturers when their branch is under or ovenfocked with hands. If it is underflocked, they will find more demand than they can anfwer : if it is overtocked, the fale will be flow.

Intelligent men, in every profeftion, will cafily difcover when thefe appearances are accidental, and when they proceed from the real principles of trade.

Polls, and correfpondence by letters, are a confequence of trade; by the means of which merchants are regularly informed of every augmentation or duminution of indultry in every branch, in every part of the country. From this knowledge they regulate the prices they offer; and as they are many, they ferve as a check upon one another, from the principles of competition.

From the current prices, the manufacturers are as well iuformed, as if they kept the correipondence themflues: the fatefman feels perfectly where hands Ccz
arc
are wanting, and young people deftined to induftry, obey, in a manner, the call of the public, and fall naturally in to fupply the demand.

Two great allidances to merchants, efpecially in the infancy of trade, are public markets for collecting the work of fmall dealers, and large undertakings in the manufacturing way by private hands. By thefe means the merclants come at the knowledge of the quantity of work in the market, as on the other hand the manufacturers learn, by the fale of the goods, the extent of the demand for them. Thefe two things being juftly known, the price of goods is eafily tixed.

Public fales ferve to correct the frall inconveniences which proceed from the operations of trade. A fet of manufacturers got all together into one town, and entirely taken up with their induftry, are thereby as well informed of the rate of the market as if evely one of them carried thither his work; and upon the arrival of the merchant, who readily takes it off their hands, he has not the leatt advantage over them from his knowledge of the itate of demand. Tnis man boih bi:ys and folls in what is called rulsolefule; and from hin retailers purchale, who dillibute the goods to evesy confumet throughont the country. Thele latt buy from wholefale merchants in every branch, that proportion of every kind of merchandize which is fuitable to the demand of their borough, city, or province.

Thus all inconveniences are prevented, at fome additional cof to the confumer, who mut naturally reimburle the whole expence. The dillance of the manufacturer, the obfeurity of his dwelling, the caprice in felling his work, are quite removed; the retailer has all in his thop. and the public buys at a current price.

> § 2. Hew the prices of Goods are detcrminad by Trath.

Is the price of goods, two things mult be confidered as really exiting, and quite different from one another; to wit, the real value of the commodity, and the profit upon alienatiom.
I. The firlt thine to be known of any manufacture, when it comes to be fold, is, how mach of it a perfon can perform in a day, a week, a month, according to the nature of the work, which may require more or lefs time to bring it to perfection. In making fuch eftimates, regad is to be had only to what, upon an average, a workman of the country in general may perform, without fupponing him the beft or the worft in his profetfon, or having any peculiar advantage or difadvantage as to the place where he works.

Hence the cafon why fome people thrive by their inclully, and others not; why fome manufactures homidi in one place, and not in another.
II. The fecond thing to be known is, the value of the wokman A hbbllence, and neceflary expence, both for lupylying his perfonal wants, and prowiding the inftrments betonging ta his profeftion, which mat be taken upon an average as above; except when the nature of the work uqaices the frefence of the workmon in the place of confurption; for although feme tades, and almon every manufacture, moy be carried on in places at a ditlanee, and therefose may fall under one generad regulation as to prices; yet others there

## E R C.

are, which, by their nature, require the prefence of the workman in the place of confumpion; and in that cafe the prices mult be regulated by circumatances relative to every particular place.
III. The third and laft thing to be known, is the value of the materials, that is, the firf matter employed by the workman; and if the object of his induttry be the manafacture of another, the fame procefs of inquiry mult be gone through with regard to the tirlt as with regard to the fecond: and thus the molt complex manufactures may be at laft reduced to the greate: fimplicity.

Thefe three articles being known, the price of manufacture is determined. It cannot be lower than the amount of all the three, that is, than the real value; whatever it is higher, is the manufacturer's protit. This will ever he in proportion to demand, and therefore will fluctuate according to circumitances.

Hence appears the necellity of a great demand, in order to promote flouriming manufactures.

By the extentive dealings of merchants, and their contlant application to the fludy of the balance of work and demand, all the above circumftances are known to them, and are made known to the induftrious, who regulate their living and expence according to their certain profit.

Employ a workman in a country where there is little trade or induftry, he preportions his price always to the urgency of your want, or your capacity to pay; but feldom to his own labour. Employ another in a country of trade, he will not impofe upon you, unlefs perhaps you be a ilranger, which fuppofes your being ignorant of the value; but employ the fame workman in a work not ufual in the country, confequently not demanded, confequently not regtilated as to the value, he will proportion his price as in the firt fuppofition.

We may therefore conclude, from what has been faid, that in a country where trade has been eltablifed, manufactues mult fourin, from the ready fale, the regulated price of work, and the certain profit refulting from indultry. Let us next inquire into the confequences of fuch a fituation.

## § 3. How foreign Trade ofens to an indufrious Pegp.fy and the Confequences of it to the MTerchants sulo jet it on foct.

The firlt confequence of the fituation defcribed in the preceding fection is, that wants are eafly fupplied for the adcquate value of the thing wanted.

The next confequence is, the opening of foreign trade, under its two denominations of palfive and active. Strangers and pcople of diftant countries, finding the difficulty of having their wants fupplied at home, and the eafe of having them fupplied from this country, immediately have recourfe to it. This is paffive trade. The active is when merchants, who have extcuted this plan at home with fuccefs, begin to tranfport the labour of their countrymen into other regions, whied either produce, or are capable of prodircing fuch articles of confumption, proper to be manufactured, as are moll demanded ai home; and confeguently will meet with the readiett fale, and fetch the largeft profits.

Here then is the opening of forcigntrade, under its two denominations of active and paffive.

What then are the conlequences of this new commerce to our merchants, who have left their homes in queft of gain abroad?

The firf s, that, arriving in any new country, they find themfelves in the fame fituation, with regard to the inkrabitants, as the workman in the country of no trade, wi h regard to thofe who employ him ; that is, they proportion the price of theit goods to the cacen nefs of acquiring, or the capacity of paying, in the inhabitants, but never to their seal value.

The firlt pofits then, upon this trade, muft be very confiderable; and the demand from fuch a country will be ligh or low, grat or fmall, according to the fpinit, not the real wants of the people: for thefe in all countries mull irf be fupplici by the inhabitants themfelves, before they ceafe to labour.

If the people of this not-trading country be abondantly furnifhed with commodities ufeful to the traders, they will eafly part with them, at firlt, for the inlluments of luxuty and eafe; but the great profit of the traders will infenfibly increafe the demand for the productions of their new correfondents; this will have the effect of producing a competition between themfelves, and thereby throwing the demand on their fide. This is perptually a difadvantage in trafic; the moft unpolined nat ons in the wold quickly perceive the effects of it ; and are taught to profit by the difoovery, in tpite of the addrefs of thofe who are the moft expert in commerce.

The traders will therefore be very fond of falling upon every method and contrivance to infpire this people with a talle of relmement and delicacy. Abundance of fine prefents, conffling of every inftrament of luxury and fuperfluity, the bell adapted to the genius of the prople, will be given to the prince and kadm; men anong them. Workmen will even be enuphed at home, to ftudy the tatle of the thrangers, and to captivate their defires by every poflible means. The wore eager they are of prefents, the more lavih the traders will be in beftowing and diverfifying them. It is an animal put up to fatten; the more he eats, the fooner he is fit for flaughter. When their tafe for fuperfluity is fully formed, when the relifh for their former fimplicity is fophitticated, poifoned, and obliterated, then they are fure'y in the fetters of the traders, and the deeper they go, the lefs poflibility there is of their getting out. The prefents then will die away, having ferved their purpofe: and if afterwards they are found to be continued, it will probably be to fupport the competition againt other nations, who will incline to thare of the profits.

If, on the contrary, this not-trading nation does not abound with commodities ufful to the traders, thefe will make little account of trading with them, whatever their turn may be; but, if we fuppofe this country inhabited by a laborious people, who, having taken a talle for refinement from the traders, apply themfeives to agriculture, in order to produce anticles of fubfaltence, they will folicit the merchants to give them part of their manfactures in exchange for thofe ; and this trade will undoubtedly have the effect of multiplying unaters in the tuatiog uation. But if food canuct be
furnithed, nor any other branch of production found out to fupport the correfpondence, the talle for refincment will foon die asay, and trade will fop in this quarter.

Had it not been for the furs in thole countrics ad. jacent to Hudfon's Bay, and in Canada, the Eusupeans never would have thought of fupplying inftumenta of luxury to thofe nations; ame if the inhabitatis of thofe regions had not taken a tafte for the iuftuments of luxury fumifhed to them by the Emopeans, they never would have become fo indefatignble nor fo dexterous hanters. At the lame time we ate not to buppofe, that ever thefe Americans wond have come to Eurs pe in quelt of our manufactures. It is, therefors, owing to our merchants, that thele nations are becunce in any degree fond of refmement ; and this tafte, in all probability, will not foon exceed the propertion of the productions of their country. Fom thefe teginnings of forsign trade it is eafy to trace its increale.

One ftep towards this, is the eftablifting correfpondences in forcign countries; and the fe are more or lefs neceffary in proportion as the country where they are ettablitherl is more or lefis polifled or acquainted with trade. They fupply the want of polts, and peint out to the merchants what proportion the prodietions of the country bear to the demand of the inhabitants ior manufactures. This ermmunicates an idea of com. merce to the not trading nation, and they infenlibly begin to fix a determmed value upun their own productions, which perhaps bore no determined value at all before.

Let us trace a little the progrefs of this refinement in the favages, in order to how how it has the effect of throwing the demand upon the traders, and of ereacing a competition among them, for the productions of the now conatiy.

Experinuce fhows, that, in a new difcovered country, merchants conlantly find fume artiche or other of is productions, which runs out to a great account in cormmere; and we foe that the longer fuch a trade lublitts, and the more the inhabitants take a tafte for European manufactures, the more thsir uwn produc. tions rife in their value, and the lefs prolit is made by trading with them, even in eales where the oade is car. ried on by companies; which is a very wile inflitution for one reafon, thar it cutsuff a compctition between our merchants.

This is the beft means of keeping prices low in favour of the nation; however it may work a conirary effect with refpect to individuals who mat buy from there monopolies.

When companies are not enablifed, and when trade is open, our merchants, by their eagtnels to profit by the new trade, betrdy the fecrets of it; they enter into compctition for the purchafe of the foreign prodace; and this raifes prices, and favours the commeree of the moll ignorant favages.

## § 4. Confequences of the Introduction of a paritie foreinn Trade among a People ablu live ios Simpiaity and Iollenefs.

We now fuppofe the arrival of traders, all in one intereft, wih inftuments of luxury and refinement, at a port is a country of great fimplicity of manners, abudamly

## E R C.

abundantly provided by nature" with great advantages for commerce, and peopled by a nation capable of adoptinc is tafte for fuperfuities.

The firlt thing the merchants do is, to expofe their gnods, and point out the advantages of many things, cither agreeable or ufeful to mankind in general, fuch is wines, fpirits, infruments of agriculture, arms and ammunition for hunting, nets for fifhing, manufactures for clothing, and the like. The advantages of thefe are prefently perccived, and fuch commodities are eagerly fought after.

The natives, on their fide, produce what they moft efteem, generally fomething fuperfluous or ornamental. The traders, after examining all circumftances, determine the object of their demand, giving the leat quantity poffible in return for this fuperfluity, in order to imprefs the inhabitants with a high notion of the value of their own commodities; but as this parfimony may do more hurt than good to their intereft, they are vely generous in making prefents, from the principles mentioned above.

When the exchange is completed, and the traders depart, regret is commonly mutnal ; the one and the wher are forry that the fuperfluities of the country fall thort. A return is promifed by the traders, and aflurances are given by the natives of a better provifion another time.

What are the firit confequences of this revolution?
It io \%vident, that, in order to fupply an equivalent for this new want, more hands mult be fet to work than formerly. And it is evident alfo, that this augmentation of indultry will not effentially increafe numbers: Why? Becaufe the produce of the indultry is, in this cafe, intended to be exported. But, if we can find out any additional confumption at home, even implied by this new trade, it will have the effect of augmenting numbers. An example will make this plain.

Let us fuppofe the fuperfluity of this country to be the flins of wild beafts, not proper for food ; the manufacture fought for, brandy. The brandy is fold for furs. He who has furs, or he who can fpare time to bunt for them, will drink brandy in proportion: but there is no reafon to conclude from this fimple operation, that one man more in the country mult necelfarily be ful, or that any augmentation of agriculture mult of confequence enfue from this new traffic.

But let us throw in a cicumflance which may imply an additional confumption at home, and then examine the confequences.

A poor creature who has no equivalent to offer for food, who is milerable, and ready to perifh for want of fubfiftence, goes a hunting, and kills a wolf; he comes to a farmer with the fikin, and fays, You are well fed, but you have no brandy; if you will give me a loaf, 1 will give you this kin, which the frangers are fo fond of, and they will give you brandy. But, lays the farmer, I have no more bread than what is fufficient for my own family. As for that, replies the other. I will come and dig in your ground, and you and I will fettle our account as to the fimall quantity I defire of you. The bargain is made; the poor fellow gets his loaf, and lives at leatt; perhaps ho marries, and the farmer gets a dram. But had it not Leen for this dram, that is, this new want, which was guichafed by the indutry of this poor fullow, by what
argument could he lave induced the farmer to part with a loaf?
Here the fentiment of chanity is excluded. This alone is a principle of multiplication ; but as truc it is, on the other hand, that conld the poor fellow have got bread by begging, he would not probably have gone a hunting.

Herc then it appears, that the very dawning of trade, in the mon mpolifed countries, implies a multiplication. This is enough to point out the furt Atep, and to connect the fubject of our prefent inquiries with what has been already difcuffed in relation to other circumfances.
So foon as all the furs are difpofed of, and a tafte for fuperfluity is istroduced, both the traders and the natives will be equally interelted in the advancement of induttry in this country. Many new objecta of profir for the firft will be difcoveled, which the proper employment of the inbabitants, in reaping the natural advantages of their foil and climate, will make effectual. The traders will the refore endeavour to let on foot in?ny brancles of induttry anong the favages, and the allurements of braudy, arms, and clothing, will animate thefe in the purfait of them.

When once this revolution is brought about ; when thole who formerly lived in fimplicity become indultrious: manners put on a new lace.

That is to fay, we now find two trading nations inflead of one, with this difference, however, that as hitherto we have fuppofed the merchants all in one intereft, the compound demand, that is, the competition of the buyers, has been, and muft fill continue on the lide of the natives. This is a great prejudice to their intereft : but as it is not fuppofed fuficient to check their indultry, nor to rettrain their confumption of the manufactures, let us lere examine a little more particularly the confequences of the prineiple of demand in fuch a fituation; for although we allow, that it can never change fides, yet it may artmit of different modifications, and produce different effects, as we fhall prefently perccive.

The merchants we fuppofe all in one interef, confequently there can be no competition amung them; confequently no check can be put upon their railing their prices, as long as the prices they demand are complied with. So foom as they are raifed to the full extent of the abilitics of the uatives, or of their inclination to buy, the merchants have the choice of three things, which are all perfectly in their option; and the preference to be given to the one or the other, depends entirely upon thenfelves, and upon the circumftances we are going to point out.

Firtt, they may fuppere their ligh demand; that is, not lower their price; which will preferve a high ellimation of the manufactues in the opinion of the inlabitants, and render the profits upan their trade the greatef pomble. This part they may peffibly take, if they penceive the natives doubling their diligence, in order to become able, in time, to purchafe conliderable cargoes at a high value; from whicis fuppolition is implied a fe ong difpotition in the people to become luxurious, fince nohing but want of ability prevents them from conplying with the highelt demand: but till another circumttance muft concur, to engage the merchants not to lowet their price. The
great proportion of the goods they feek for in return, muft be found in the hands of a few. This ill be the cafe if flavery be ellablifhed; for then there mult be many poor and few rich: and they are commonly the rich confumers who propartion the price they offer, rather to their delires, than to the value of the thing.

The fecond thing which may be done is, to open the door to a great demand; that is to lower their prices. This will fink the value of the manufactures in the opinoon of the inhabitants, and render profits leís in proportion, although indted, upon the voyage, the profits may be greater.

This patt they will take, if they perceive the inhabitants do not incline to confume great quantities of the merchandize at a high value, either for want of abilitics or inclination: and alfo, if the profits upon the trade depend upon a harge confumption, as is the cale in merchandize of a low value, and fuited chiefly to the cceafons of the l-wer fort. Such motives of expediency will be fufficient to make them neglect a high demand, and peffer a great one; and the more, when there is a likcthood chat the confumption of low- priced goons in the beginning may beget a tatte for others of a higher value, and thus extend in general the tafte of fupeifuity.

A third part to be taken, is the leaft politic, and perhaps the moft familiar. It is to profit by the competition between the buyers, and encourare the rifing of demand as long as poffible; when this comes to a ftop, to make a kind of auction, by firll hringing down the prices to the level of the highefl bidders, and fo to defcend by degrees, in proportion as demand finks. Thus we may fay with propriety, that demand commonly becomes grear, in proportion as prices fink. By this operation, the traders will profit as much as ponible, and fell off as muchiof their goods as the prefits uill permit.

But this plan, in a new difcovered country, is not polific, as it buth difcovers a coretoufnefs and a want of faith in the merchants, and alfo throws open the fecrets of their trade to thofe who ought to be kept ignorant of them.

Let us next fuppofe, that the large profits of our merchants thall be difcovered by others, who arrive at the fame ports in a feparate intereft, and who enter into no combination which might prevent the natural effects of competition.

Let the fates of demand among the natives be fuppofed the fame as formerly, both as to height and greatnefs, in confequence of the operation of the different principles, which might have induced our merchants to follow one or other of the plans we have been deferibing; we muft, however, thill fuppofe, that they have been careful to preferve confiderable profits upon every branch.

If we fuppofe the inhabitants to have increafed in numbers, weath, and tafte for fuperfuity, fince the laft voyage, deraand will be found rather on the rifing hand. Upon the arrival of the merchants in compttition with the former, both will offer to fale: but if both fand to the fainc prices, it is very natural to fuppofe, that the former dealers will obtain a preference: as, ceteris paribus, it is always an advantage to know and to be known. The laft comers, therefore,
have no other way left to counterbalance this advantarge, but to lower the ir prices.

This is a new phenomenon: here the fall of prices is not voluntary as fornerly; por conferted to from expediency; not owing to a failure of denaral, but to the influence of a new principle of comancrec, to wit, a double competition, which we fhall now examine.

## § 5. Of doable Competition.

Whan competition is much Aronger on one fide of the contract than on the other, it is called fimple. This is the fpecies of empetition which is implish in the term bigh demand, or when it is faid that demand raifes prices.

Double compectition is, when, in a certain degree, it takes place in both fides of the contract at once, or vibrates alternately from one to the othcr. This is what reflrains prices to the adequate value of merchandize.

The great difficulty is to diffinguifh clearly between the principles of demand and thafe of compection: here then follows the principal differences between the two, relatively to the effects they produce feverally in the mercautile contract of buying and felling, which we here exprefs fhortly by the word contrad.

Simple demand is what brings the quantity of a commodity to maket. Many demand, who do not buy; many offer, who do not feli. This demand is called great or finall; it is faid to increafe, to augment, to fwell; and is expreffed by thefe and other fynonimous terms, which mark an augmentatinn or diminution of quantity. In this feecies, two people never demand the fame thing, but a part of the fame thing, or things quite alike.

Compound dernand is the principle which raifes prices, and can never make then fink; becaufe in this cafc more than one demands the very fame thing. It is folely applicable to the buyers, in relatic to the price they offer. This demand is called bigh or low, and is faid to rife, to fall, to mount, to fink, and is expreffed by thefe and other fynonimous terms.

Simple competition, when between buycrs, is the fame as componad or bigh dionand; but differs from it in fo far, as this may equally take place among fellers, which compound demand cannot; and thicn it works a con-. trary effect: it makes prices fink, and is fynonimons with low demand: it is this competition which overturns the balance of work and demand.

Double comperition is what is underfto to take place in almoll every operation of trade; it is this which pervents their exceffive rife of prices; it is this, which prevents their exceflive fall. While double competition prevails, the balance is perfect, trade and indultry flourifh.

The capital diftinetion, therefore, between the ternis demand and competition is, that demand is contantly relative to the buyers: and when money is not the price, as in barter, then it is relative to that fide upon whicla the greateft compecticioz is found.

We therefore fay, with regard to prices, demand is bigh or lozu. Withrecrard io the quanti'y of merchuntize, demand is great or fuall. With regard to comptetition, it is always called great or fmell, frong or sueck.

Competilion is, with equal propricty, applicable to

## C O M M E R C F.

both parties in the contract. A comperition among buyers is a proper expreffion; a competition among feilers, who have the merchandize, is fully as eafily underftood, though it be not quite fo Ariking, for reafons which an example will make plain.

You come to a fair, where you find a great varicty of every kind of meachandize, in the poffeflion of different merchants. Thefe, by offering their goods to fale, conflitute a tacit competition ; every one of them wifhes to fell in preference to another, and at the fame time with the beft advantage to himfelf.

The buger begins, by cheapening at every fhop. The firt price afled marks the covetoufnefs of the feller; the firft price offered, the avarice of the buyer. From this operation competition begins to work its effects on both fides, and fo becomes double. The principles which infuence this operation are now to be deduced.

It is impoffible to fuppofe the fame degree of eagernefs, either to buy of fell, anong feveral merchants; becaufe the degree of eagernsfo is exactly in proportion to their vitws of profit; and as thefe mult neceffarily be influenced and regulated by diferent circumftances, that buyer, who has the beft profpect of felling again with profit, obliges him, whofe profpect is not fo good, to content himfelf with lefs; and that feller, who has bought to the beft advantage, obliges hin, who has paid dearer for the merchandize, to moderate his defire of gain.
It is from thefe principles, that competition among buyers and fellers mult take place. This is what confines the fluctuation of prices within limits which are compatible with the reafonable profits of both buyers and fellers; for we mult contantly fuppofe the whole operation of buying and felling to be perfomed by merchants; the buyer cannot be fuppofed to give fo high a price as that which he expects to receive when he diftributes to the confumers, nor can the feller be fuppofed to accept of a lower than that which he paid to the manufacturer. This competition is properly called coulle, becaufe of the difficulty to determine upon which fide it ftands; the fame merchant may have it in his favour upon certain aticles, and againgt him upon others; it is continually in vibration, and the arrital of every poll may lefs or more pull down the heary fcale.

In every tranfaction between merchants, the profit refulting from the fale mult be exactly diftinguifined from the value of the merclandize. The firt may vary, the laft never can. It is this profit alone which can be infuenced by competition; and it is for that reafon we find fuch uniformity every where in the prices of goods of the fame quality.

The competition between fellers does not appear fo itriking as that between buyers; becaufe he who offers to Bale, appears only paffive in the fult operation; whereas the buyers prefent themfelves one after another; they make a denand when the merchandize is refufed to one at a certain price; a fecond either offers more, or does not offer all: but fo foon as another feller finds his account in accepting the price the firlt had refufed, then the firlt enters into competition, providing his profits will admit his lowering the timet price; and that compctition tabes place amorg the $N^{\circ} 86$ 。
fellers, until the profits upon their trade prevent prices froith falling lower.

In all markets this competition is varying, though infentibly, on many oecafions; but in others the vibrations are very percepible. Sometimes it is found Arongett on the fide of the buyers; and in proportion as this grows, the competition between the fellers diminifies. When the competition between the former has raifed prices to a certain ftandard, it comes to a Aop; then the competition changes fides, and takes place among the fellers, eager to profit of the highelt price. This makes prices fall; and according as they fall, the competition among the buyers diminifhes. They ftill wait for the loweft period. At lait it comes; and then perhaps fome new circumftance, by giving the balance a kick, difappoints their hopes. If therefore it ever happens, that there is but one intereft upon one fide of the contract, as in the example in the former fection, where we fuppofed the fellers united, you perceive, that the rife of the price, occafioned by the competition of the buyers, and even its coming to a ftop, could not poffibly have the fflect of producing any competition on the other fide; and therefore, if prices come afterwards to fink, the fall mult have proceeded from the prudential conliderations of adapting the price to the faculties of thofe who, from the height of it, had withdrawn their demand.

From thefe principles of competition, the foreftalling of markets is made a crime, becaufe it diminifhes the competition which ouglt to take place between different people, who have the fame merchandize to of for to fale. The foreftailer buys all up, with an intention to fell with more profit, as he laas by that means taken other competitors our of the way, and appears with a fingle interet on one fide of the contract, in the face of many competitors on the other. This perfon is punithed by the itate, becaufe he has prevented the price of the merchandize from becoming juftly proportioned to the real value; he has robbed the public and enriched limfelf; and in the punihment he makes reflitution. Here occur two queltions to be refolved, for the fake of illutration.

Can competition among buyers poffibly take place, when the provilion made is more than fufficient to fupply the quantity demanded ? On the other hand, can competition take place among the fellers, when the quantity demanded exceeds the total provifion made for is ?

We think it may in both cafes; becaufe in the one ard the other, there is a competition implied on one fide of the contract, and the very nature of this competition implies a poffibility of its coming on the other, provided feparate interells be found upon both fides. But to be mere partieular :

1. Experience thows, that however jutly the proportion between the demand and the fupply may be determined in fact, it is till next to impoffible to difcover it exachly, and therefore the buyers can only regulate the prices they offer, by what they may reafonably expect to fell for again. The rellers, on the other hand, can only regulate the prices they expect, by what the merchandize has coll them when brought to market. We have already fhown, how, under fuch circunftances, the fereral interefts of individuals affect each other, and make the balance vibrate.
2. The proportion between the fupply and the demand is feldom other than relative among merchants, who are fuppoled to buy and fell, not from neceflity, but from a view to profit. What we mean by relttive is, that their demand is great or finall according to prices; there may be a preat demond for grain at 35 s. per quarter, and no demand at all for it at 40 s ; that is, among merchants.

It is chential to atered to the fmallof circumfance in matters of this kind. The circumblance we man, is the difference we ford in the effect of comperition, when it takes place purely among merchants on both files of the contact, and when it happens, that either the confumers mingle themfelves with the merchantbuyers or the manufacturers, that is, the furnithers, mingle themfelves with the merchant-fellers. 'l'his combination we fhall illultrate by the folution of another quellion, and then conclude with a few reflections upon the whole.

Can there be no eafe formed, where the competition upon one fide may fulsfl, without a poffibility of its taking place on the other, although there mould be Exparate interefts upon buh?
'l'he cafe is hardly fupporable anong merchants, who buy and fell with a view to profit; but it is abfolutely fuppofable, and that is all, when the direct confumers are the buyers; when the circumtlances of one of the partics is perfectly known; and when the competition is fodreng upon one fide, as to prevent a polibility of its becoming double, before the whole provition is fold off, or the demand fatisfied. Let us have recourfe to examples.

Grain arriving in a fmall quantity, at a port where the inhabitants are flarving, produces fo great a competition among the confumers, who are the buyers, that their neceffity becomes evident ; all the grain is generaliy bouglt up before prices can rife fo high as to come to a thop; becanfe nothing but want of money, that is, an impofibility of complying with the prices demanded by the merchats, can reftrain them: but if you furpofe, cven here, that prices come natu. rally tu a top; or that, after fume time, they fall lower, from prudential conflemations; then there is a pultibility of a competition taking place anong the fellers, from the principles above deduced. If, on the contrary, the it (p) is not natural, but occafioned by the interpofition of the magiflate, from humanity, or the like, there will be no competition, becaufe then the principles of commerce are fulpended; the fellers are reftrained on one lide, and they reftrain the buyers on the other. Or rather indeed, it is the magillrate, or compafion, who in a manner fixes the price, and performs the office of both buger and feller.

A better example tlill may be found, in a competition among fellers: where it may be fo ftrong az to render a comra dity in a manner of no value at all, as in the cafe of an uncommon and untxpected dranght of fifh, in a place of fmall conumption, when ur preparations have heen made for falting them. There can be then no competition among the buyers; becaufe the market cannot lat, and they find themetres enticly maters, to give what price they pleafe, being fure the fellers mult accept of it, or iofe their merchaldize. In the firft example, humanity commonly fops the activity of the principle of competition; in

Voz. V. Part $L$.
the other, it is tlop red by a coitain theree of fair dealing, which forbids the accopting of a nerchandize for nothing.

In proportion thencore as the rifing of prices can nop demand, or the fasking of prices can increafe it, in the fane proportion will compktition prewent cither the rife or the fath from locing carried begord a certain length: and if fuch a cafe can be put, whate the rining of prices cannot Aop demand, nor the lowering of prices augment it, in luch cafes double eompetition has no effect ; becaufe thefe circumfanes sunite the moit feparate interells of buyers and fellers in the mercantile contract; and when upon one fide there is no feparate intereft, these can then be no cumperition.

From what has been faid, we may form a judgment of the various degrees of competition. A burk not worth a hilling, a fin of a few pounds weight, are often fold for confiderable furns. The buyers liere are not mexchants. When an ambufur leaves a court in a hurry, things are fold for leis than the half of their valuc: he is no merchant, and his fituation is known. When, at a public market, there are found confumera, who make their provifion; or manufacturers, who difpofe of their goods for prefert fuhfillence; the merchants, who are refpectively upon the opputite ide of the contract to thefe, profit of their comptitun; and thofe who are refpectively upon the fame lide with them, fland by with patience until thev haw hanhed their bulinefs. Then maters cume to be entrits on between merchant and merchant, and then prohtis may rife and fall, in the propurtion of quati y to di-mand: that is to fay, if the provifion is left than the fomand, the eompetition among the demanders, or the rife of the price, will be in the conpound proportion of the falling thort of the commodity, and of the proffect of felling again with proftr. It is this combination which regulates the competition, aut keeps it within bounds. It can affect but the profis upon the tanfation: the intrinfic value of the commodity thands immoveable: nothing is ever fold below the ral valte; nothing is ever boughat for more than it may probably bring. We mean in general. Wtacreas, fo foon as confumers and needy manufacturers mingle in the operation, all proportion is lat. The competition between them is ion llrong for the merchants; the batance vibraten by jerks. In fuch markets menchans flum appear : the principal objects there, are the fruit, and productions of the earth, and atticles of the firth nocerity for life. not manufactures itrietly fo called. A puor fullow often fells to purchafe beead io reat; nor to pay what he dideat white he was employed in the work he difpofes of. The confumer often meafures the value of what he is about to purchafe, by the weight of his purfe, and his defice to confume.

## § 6. Of avoat is callial Erpence, Profin, and Lafs.

The termextyon, when fimply expreffed, withomt any particula: ith ion, is alwas undedrond to be relative to mosicy. This kiad is dittiagnifhed under the three heads ot prizute, public, and national.

1. Private expuce is what a private perfon, or private fuciety, lays o t, wither to provide artickes of confumption, or forne ining more permanent, which may be conducive to their caft, innenience, or advantage. 13 d

Thuz

Thus we fay, a large domefic expence, relative to one who fpends a great income. We lay, a merchant has been at great expence for magazines, for living, for clerko, \&o". but never that he has been at any in buyines gonds. In the fame way a manufacturer may expend for building, machines, horike, and carriages, but never for the matter he manfactures. When a thing is bought in order to be fohl again, the fum employed is called money atuancel; when it is bought not to be fold, it may be faid to be cospended.
2. Public expecice is the employment of that money which has becn contributed by insividuals for the carrent fervice of the llate. The contribution, or gathering it together, reprefents the effects of many articies of private expence; the laying it out when colleeted, is pubilic expctace.
3. National exppuce is what is expended cut of the country; this is what diminithes national wealth. The principal ditinction to be here attended to is between public expence, or the laying out of public money, and national expence, which is the alienating the nation's wealth in favour of Arangers. Thus the greatelt public expence imaginable may be no national expence ; becaufe the money may remain at home. On the other hand, the fmallell public, or even private expence, may be a national expence; becaufe the money may go abroad.

Profit and lofs is divided into foffive, relulive, and compound. Poffitive profit implica no lofs to any body ; it refults from an angmentation of labour, indully, or ingenuity, and has che clicet of fwelling or augment. ing the public grool.

Pofritive lofs implies no profit to any body; it is what refults from the ceflation of the former, or of the ef. fects refulting from it, and may be faid to diminif the public good.

Relative froft is what implies a lofs to fomebody; it marks a vibration of the balance of weakh between partics, but implies no addition to the geveral hock.

Relative lofs is what, on the contrary, implies a profit to fomeboly; it alfo marks a vibration of the halance, but takes nothing from the general fock.

The compound is eafily undertood; it is that fpecies of frofit and lofs which is partly relative and partly politive.
\$ 7. The general conforuences refulting to a trating Nation, upon the olening of un alive foreign Commerce.
A nation which remains paffive in her commerce is at the mercy of thofe who are active, and mult be greatly favoured indeed by natural advantages, or by a conitant flus of gold and filver from her mines, to be able to fupport a correfpondence not entirely hurcful to the angmentation of her wealdh.
When we look upon the wide field which here opens to our view, we are perplexed with tho great a valicty of objefts. In one part, we fer a decent and conely beginning of induftry; wealth flowing gently in to recompence ingenuity; numbers both angmenting, and crery one becoming daily more uffel to another; agriculture propostionally extending itfelf; no violent revolutions; no exorbitant profits; no infolence among the rich; no exceffive mifery among the poor ; multitudes employed in yroducing; great economy upon

## E R C.

confumption; and all the inflruments of lnxury, daily produced by the hands of the diligent, going out of the couniry for the fervice of Atrangers; not remaining at home for the gratification of fenfuality. At latt the augmentarions come infenfibly to a fop. Then thefe rivers of wealch, which were in brik circulation ther, ${ }^{2}$ gh the whole world, and which returned to this tading mation as blood returns to the heart, only to be thrown out again by new pulfations, begin to be oblruked in their consfe; and flowing abroad more nowly than before, come to form flagnations at home. Thefe, impatient of reftraint, foon bult ous into domeflic circulation. Upon this cities fwell in magnificence of buildings; the face of the country is adorned with palaces, and becomes covered with groves; luxury fhines triumphant in every part ; inequality becomes more triking to the eye; and want and mifery appear more deformed, from the contral : even for + tune grows more whimfical in her inconflancy; the beggar of the other day now rides in his coach; and he who was born in a bed of ftate, is feen to die in a goal or in an alms-houfe. Such are the effiects of grear domellic circulation.

The Itatefman looks about with amazement ; he who was wont to confider himfelf as the firl man in the fociety in every refpect, perceives himfelf, perhaps, eclipfed by the luftre of private wealth, which avoids his grafp when he attempts to feize it. This makes his government more complex and more difficult to be carried on ; he mult now avail himfelf of art and addrefs, as well as of power and force. Ry the help of cajuling and intrigues, be gets a litcle into debt; this lays a foundation lor public credit, which, growing by degrees, and in its pragrefs affuming many new forns, becomes, from the moft tender beginmings, a molt formidable monfer, ftriking terror into thofe who cherifhed it in its infancy. Upon this, as upon a trimaphant war-horfe, the ftatefman gets aAride; he then appears formidable a-new; his head turns giddy; he is choaked with the dut he has raifed; and at the moment he is ready to fall, to his utter allonifment and furprife, he finds a tlrong munied interel, of his own creating, which, intlead of fwallowing him up as he appreliended, flies to his fupport. Through this he gets the better of all uppofition, he ehablifhes taxes, multiplies them, murgayes his fund of fublitence; either becomes a bankrupt, and rifes again from his aflies ; or if he be lefs andacious, he Itands trembling and totiening for a white on the brink of the political precipice. From one or the other of thefe perilons fituations, he begins to difcover an endlefs path, which, after a multitude of windings, flill returns into itfelf, and continues an equal courfe through this vall labyrinth.

It is now full time to leave off rhapfody, and return to reafoning and cool enquiry, concerning the more immediate and more general effects and revolutions produced by the opening of a foreign trade in a nation of indultry.

The firt and inolt fenfible alteration will be an incieafe of demand for manufacturers, becaufe by fupplying the wants of flrangers, the number of confumers will now be confiderably augmented. What again will fullow upon this, mult depend upon circumHances.

If this revolution in the fate of demand mould prove too violent, the confequence of it will be to raife demand; if it thould prove gradual, it will increafe it. This dittinction is well underfond, and the confequence appears jult: for, if the fupply do not increafe in proportion to the demand, a competition will enfue anong the demanders; which is the common effect of fuch fudden revolutions. If, on the other hand, a gentle increafe of demand thould be accompanied with a propurtional fupply, the whole indultions fociety will grow in vigour, and in wholefome flaturc, without being \{enfible of any great advantage or inconveniency; the change of their circunHances will even be imperceptible.

The immediate dfects of the violent revolution will, in this example, be flattering to fome and difagreeable to others. Wealth will be found daily to augment, from the filing of prices, in many branches of imiutiry. This will encourage the indulhious claffis, and the idle confumers at home will complain. We have already dwelt abondantly long upon the effect refulting from this to the lower claftes of the perple, in providing them with a certain means of fubfittence. Let us now examine in what refpect even the higher claftes will he made likewife to feel the good effects of this general change, alhongly at firt they may fuifer a temporary inconveniency from it.

Farmers, as has been obfurved, will have a greater difficulty in finding fervants, who, intead of labouring the ground, will chufe to turn themfelves to manufactures. This we have confidered in the light of purging the lands of fuperfnous mouths ; but every confequence in this great chain of politics draws other confequences after it, and as they follow one another, things put on different faces, which affect claffes differently. The parging of the land is but one of the firt ; here follows another.
The defertion of the lands employed in a trifling agriculture will at firft, no doubt, embarrafs the farmers; but in a little time every thing becomes halanced in a trading nation, becaufe here every induftrions man mufl advance in profperity, in fpite of all general combinations of circumptances.
In the cafe before us, the relative profits upon farming mull foon become greater than formerly, becaufe of this additional expence which mull affeet the whole clafs of farmers; confequently, this additional expence, inflead of turning out to be a lofs to either landlord or farmer, will, after fome little time, turn out to the advantage of both ; becaufe the produce of the ground, being indifpenfably neceflary to every body, mult in every article increafe in its value. Thus in a flort time accounts will be nearly balanced on all hands; that is to lay, the fame proportion of wealth will, catcris puribus, continue the lame among the induftrions. We fay among the induftrious; for thofe who are either idle, or even negligent, will be great lofers.

A proprictor of land, inattentive to the caufes of his farmer's additional expence, may very imprudently' fuffer his rents to fall, inflead of affiting him ou a proper occafion, in order to make them afterwards rife the higher.

Thofe who live upon a deternined income in mo
ney, and who are nowife emphoved in traffi", no: in any fchome of indultry, will, by the augmentalion of prices, be found in worfe circumkances than befure.

In a trading nation every man muft turn his talcuts to account, or he will mufoubtedty be left behind in this univerfal cmulation. in which the mofl induftrous, the mult ingenious, and the molt firgal, will conitantly carry off the mize.

This confileration ought to be a fpur to every body: The richelt inen io a trading nation have no fucurity againlt porerty; we mean proportiond puverty; for though they dimmifh notling of their in come, yet, by not increaling it in proportion to others, they lufe their rank in wealth, and from the frit chafs in which they flood they will flide infentibly down to a lower.

There is one confiquence of an additional beneficial trade, which raifes demand and increafes wealeh; but if we luppofe no proportional augmentation of fupply, it will piove at beit but an airy dram which latts for a moment; and when the gilded foene is pafed away, numberlels are the inconveniences which arefon to follsw.

We fhall now point out the naturad confequences of this augmentation of wealth drawn from forcign nations, when the fatefman remains inattontive to increafe the fupply both of food and manufactures, in proportion to the ausmentation of mouths, and of the demand for the protuce of indulliy.

In fuch a rituation profits will dally fwell, and every fchene for reducing them within the bounds of moderation, wiil be looked upon as a hurtful and unpopular meafure: be it fo; but let us examine the confequences.

We have faid, that the rife of demand for manufactures maturally increafes the value of work: now we muft add, that under fuch circumflances, the augmentation of riches in a countiy, either not capable of improvement as to the loil, or where precautions have not been taken for facilitating a multiplication of inhabitants, by the importation of fubfitence, will be productive of the moft calamitous confequences.

On one fide, this wealth will effectually diminifh the mafs of the food before produced; and on the other, will increafe the number of ufelefs confunters. The firlt of thefe circumftances will raife the demand for food; and the lecond will diminith the number of ufeful free hands, and confequently raife the price of manufactures: here are thortly the outlines of this progrefs.
the more rich and luxurious a people are, the more delicate they become in their manner of lising ; if they fed on bread formerly, they will now feed on meat ; if they fed on meat, they will now feed on fowl. The fame ground which feeds a hundred with bread, and a proportional quantity of animal food, will not mantain an equal mumber of delicate livers. Food mall then become more fearee ; demand for it rifes; the rich are always the frongelt in the market ; they confume the food, and the poor are forced to Ptare. Here the wide door to moden diftrels opens; to wit, a hurtful competition for fubliftence. Farther, when a people become rich, they think lefs D d 2
of cconomy; a number of ufelefs fervants are hired, to become an additional dead weight on confumption ; and when their farving countrymen canot fupply the extravagance of the rich fo cheaply as other mations, they either import intruments of foreign luxnry, or feek to cnioy them ont of their own connery, and therelay make reflitution of their sains.

Is it not therefore evident, that if, before thiners cone to this pars, additional fibsilkence he not provided by one srethod or other, the number of inhabitants mult diminith; although riches may daily increafe by a balance of additional matter, fuppofed to be bronght inio the commiry in confequence of the hitherto beneficial forcign trade? "Ihas is not all. We fay farther, that the benclicial trade will latt for a time only. For the infallible confequence of the rife of prices at home will be, that thofe nations which at dirt confunce yom manufatures, perceiving the gradual increafe of their price, will begin to wook for themfles ; or finding out your rivals who ean fupply them cheaper, will open their doors to them. Thele again, perceiving the great advantages gained hy your traders, will begin to fupply the market; and fince every thing mult be cheaper in countries where we do not fuppofe the concurrence of all the eircumitances mertioncl above, the fe mations will fupplant you, and be enricheel in their turn.

Hese comes a new revolution. Trade is come to a Itop: what then becomes of all the hands which were fonnerly employed in fupplying the foreign demands?

Were revolutions for fudden as we are obliged to reprelent them, all would go to wreck; in proportion os they happen by quicker or flower degrees, the inconveniences are grater or fmaller.

Prices, we have faid, are made to rife by competition. If the competition of the ftrangers was what raifed them, the diftrefs uppon the manufacturers will be in proportion to the fuddennefs of their deferting the market. If the competition was divided between the flrangers and the home confumers, the inconveniences which enfue will be lefs; becaufe the defertion of the ferangers will be in fome meafure made up Ly an inereafe of home-contumption which will follow voon the fall of prices. And if, in the third cafe, the nutives have been fo inprudent, as not only to fupport a competition with the Itrangers, and thereby difgult them from coming any more to market, but even to continue the competition between themfelves, the whole lofs fuftained by the revolution will be national. Wealth will ccafe to augment; but the inconveniences, in place of being felt by the manufacturers, will only affect the late; thofe will continue in affluence, extolling the generotity of their countrymen, and defpifing the poverty of the ftrangers who had enriched them.

Domeltic luxury will here prove an expedient for preferving from ruin the induftrious part of a people, who in fubfiting themfeles had enriched their country. No change will follow in their condition; they will go on with a painful affiduity to labour: and if the confequerces of it become now hurtful to one part of the tate, they muft at leaft be allowed to be effertially neceffary for the fupport of the other.

But that luxury is no neceffary concomitant of fo-

## E R C

reign trase, in a nation where the true principles of it arc undertood, will appear very plain, from a contraft we are now going to point ont, in the example of a modern flate, renowned for its commerce and frugality. 'The country is Holland

A fot of induftrious and frugal people were affem. bleal in a country ly nature fubject to many inconveniences, the remowing of whi heceffarily employed abundance of hands. Their fituation upon the continent, the porer of their former makers, and the am. bition of their neighbours, obliged them to keep great bodies of troops. Thefe two articles added to the numbers of the communty, without cither enriching the thate by their labour exportcd, or producing food for themflves or countrymen.

The fcheme of a commonweath was calculated to draw together the induttrions; but it has been oill more uffful in fubfiting them: the republican form of guvernment being there greatly futdivided, vells anthority fufficient in every part of it, to make fuitable provifion for their own fubfitence: and the tie which unites them, regards only matters of public concern. Had the whole been governed by one fortrign, or by one council, this important matter never could have been effectuated.

It would be impoffible for the mon able minifter that ever lived, to provide nourithment for a country fo extended as France, or even as England, fuppofing thefe as fully peopled as Holland is; even although it thould be admitted that a fuficient quantity of food might be found in ether countries for their fubfittence. The enterprife would be too great, abufes would multiply; the confequence would be, that the ininabitants would die for want. But in Holland the cafe is different : every little town takes care of its own imhabitants; and this care being the object of application and profit to fo many perfons, is accomplithed with fuccels.

When once it is laid down as a maxim in a country, that food muft of neceffity be got from abroad in order to feed the inhabitants at home, the corn-trade becomes confiderable, and at the fame time certain, regular, and permanent. This was the cafe in Holland: as the inlabitants were indufrious, the neceflary conSequence has been, a very extraordinary multiplication; and at the fame time fuch an abundance of grain, that, inflead of being in want themfelves, they often fupply their neighbours. There are many examples of England's being fupplied with grain from thence; and, which is Aill more extraordinary, from the $1 e-$ exportation of the very produce of its own fruitful foil.

It is therefore crident, that the only way to fupport induftry, is to provide a fupply of firbfiftence ${ }_{3}$ conftantly proportional to the demand that may be made for it. This is a precantion indifpenfably neceffary for preventing hurtful competition. This is the particular care of the Iutch: fo long as it can be effectual, their ftate can fear no decline; but whenever they come to be diftreffed in the markets, upon which they depend for fubfiftence, they will link inta ruin. It is by mere dint of frugality, cheap and parfimonious living, that the ravigation of this induftrious people is fupported. Conftant employment, and an accumulation of almot imperceptible gains, fill cheir
their cofirs with wealh, in finte of the large outgoings to which their own proper nourifhment yearly furces them. The large profits upon induftry in oller countries, which are no proof of erenerofity, bat a filtal effect of a fcanty fubdiftence, is far from dazoliug their eyes. They foldom are found in the litt of competitors at any fureign port; if they have their cargo to difpofe of, they wait with pleafure in their own veffels, conluning their own provifuns, aud at lait accept of what others have left. It may be faid, that many other circumances concur in favour of the Dutch, betides the article of fublitence. Without diffuting this matter, it may be ohfervel, that if a computation be made of the hands employed in providing fillifituee, and of thofe who are everally taken up in fupplying every other want, their numbers will be found nearly to balance one another in the mon luxurious countries. From this we may conclucle, that the article of food, among the lower clafers, inul bear a aery high proportion to all the other articles of their
confunption; and thatefore a dimiution upon the price of fubfiltence, mutt be of infinite confequence to manufaturers who are obliged to buy it. From this confuleration, let as judge of the confequence of fueh augron ntations upon the price of gron as are faraliar to us; 30 or fo fer art. Fems mothing. Now this aurmentation operates upon ww-thirds, at leat, of the whole expence of a labouring man: let any one who lives in tolerable affuence make the appliation of this to hionfolf, and cxamine how he womb manage his affirs, if, by accideats of rains or winds, his expences were to rife 30 per cert. without a polfibility of reAtraining them; for this is unfortunately the cafe with all the lower claffes. From whence it may be concluded, that the kecping food cheap, and till more the preferving it at all times at an equal ftanda:d, is the fountain of the wealth of Holland; and that any hortful competition in this article mult beget a difurder which will affect the whole of the manfacturers ef a flate.

## $\mathrm{C} O \mathrm{M}$

Commercy
1
Cominna- duchy of Bar, with the dit'e of a principalty, and a
tory. magnificent catlle. It is feated on the river Menfe, in E. Leng. 5. 24 . N. Lat 48. 20.

COMMERSONIA, in botany: A genus of the pentagynia order, belonging to the pentandria clare of plants. The calyx is a monophyllous, five-parted, corolliferous perianthin, with therp ovated fegments; the corolla has five linear petals; the Atamina are five very fhort filaments at the bafes of the petals; the penicarpiun a globular, hard, quinquelocular nut, with two orated feeds ia each divifion.

COMMINATION, an office in the liturgy of the church of England, appointed to be read on AhhWedueiday, or the firf day of Lent it is falkituted in the room of that gally difistine in the primitive church, by which (as the introduction to the office exprefles it), "fuch perfons, as thood convicted of noqoriuls fins, were put to open penance, and punithed in this world, that their fouls misht be faved in the day of the Lord; and that others, admonificd by their example, might be the nore afraid to offend." This difcipline, in after ajes, degetrerated, in the church of Rome, into a formal eonfetion of fins upon Afh-Wedncflay, and the empty ceremony of furinkling athes upon the heads of the people. Our reformers wifly rejected this ceremony, as mere fhadow and how ; and fubfituted this office in its room, which is, $A$ denumciation of God's anger and judgment nsaingl finners; that the people, being apprized of God's wrath and indignation againt fin, may not, through want of difciptine in the church, be encouraged to follow and purfue them; but rather be moved to fupply that difcipline to themfelves, and fo to avoid being judged and condemned at the tribunal ef Gud.

COMMINATORY, an appellation given to whatever threatens punifiment, or fome penalty. Thus, in France, when an exile is enjoined not to return under pain of death, it is deemed a comminatory penalty ; fince, if he do return, it is not Africtly executed;

C O M
but a fecond injumetion is tail on him, which is more Conmingez than comminatory, and, from the day of the date thereof, imports wath without remedy.
COMMINGES, a proviace of France, 45 miles in length, and 15 in breakth; bounded on the north by Gafouny, on the fouth by Catalonia, on the ealt by Coufcians, and on the weft by Bigorra. Its principal trade conits in cattle, mules, and com. St Bertrand is the capital town.
COMMINUTIION, denotes the breaking, or rather grinding, a body to very fmall particles.
COMIMIRE (John), a celobrated Latin poet, born at Anbuife in 1625 , entered into the focicty of the Jefuits, and taught polite literaturc and divinity. He died at Paris in ryoz. We have a volume of his Latin puems, and a collection of his pofthumous works. His odes and fables are more particularly admitra.
COMMISSARY, in the ecclefiallical $1_{\text {rw }}$, an officer of the bithop, who exercifes firitual juridiction in phaces of a diocife fo far from the Epifeopal fee, that the chancellor canaot call the people the the bihop's principal conifitory court, without giving hem too much inconveniency.

Conesiss.ati-Court, in Scotland, a court originally conftituted by the bihops for excenting in their name an ufurped jurifdiction; and was anciently called the bi/bop's court, curiad Chriffianitutis, or confiflotial court. This court was modelicd by quecn Mary at the Reformation, and continues till this day.
Commasary, in a military fenfe, is of different forts.
Commissary-Gencral of the Muffers, an officer appointed to muker the army, as often as the general thinks proper, in ordcr to know the ftrength of cach regiment and company, to reccive and infpect the mufter-rolls, and to keep an exact flate of the ftrength of the army.
Conmissart of Horfes, an officer in the artillerys appointed to have the infpection of the artillery-horfes, to fee them muftered, and to fend fuch orders as he

COMMISSION，in common law，the warrant or letters patent，which all perfons exerciling jurifdiction have to empower them to hear or determine any caufe or luit，as the commiffion of the judges，

Commisson of Bankrutity，is the commiffion that iffues from the lord chancellor，on a perfon＇s becom－ ing a bankrupt within any of the fatutes，directed to certain commiffoners appointed to examine into it， and to fecure the bankrupt＇s lands and effects for the fatisfaction of his creditors．Sce the article Bask－ RUPT．

The proceedings on a commifion of hankrupt may be divided，I．Into thofe which affect the bank－ rupt himfelf．2．Into thofe which affect his pro－ pelty． the finf place be a petition to the lord chancellor by one creditor to the amount of L．100，or by two to the amount of L． 150 ，or by three or more to the amount of L．200；upon which he grants a commif－ fion to fuch difereet perions as to him fhall feem good， who are then ftyled commifioners of bankrupt．The petitioners，to prevent malicious applications，muft be bound in a lecurity of L． 200 ，to make the party a－ mends，in cale they do not prove him a bankrupt．And if，on the other hand，they receive any money or ef－ fects from the bankrupt，as a recompenfe for fuing out the commifion，for as to receive more than their sateable dividends of the bankrupt＇s ettate，they forfeit not only what they thall have io received，but their whole debt．When the comminion is awarded and if－ fued，the commiffioners are to meet at their own ex－ peace，and to take an oath for the due exceution of their commifion，and to be alloreed a fum not exceed－ ing 2os．per．diems cach，at every fitting．And no com－ miffion of bankruptey thall abate or be void on any de－ mife of the crown．

When the commiffoners have received their com－ niffion，they are firf to receive proof of the perfon＇s being a trader，and having committed fome act of bankruptey；and then to declare him bankrupt，if pro－ ved fo ；and to give notice theneof in the gazette，and at the fame time to appoiut three meetings．At one of thefe meetings an election muft be made of af－ fignees，or perfons to whom the bankrupt＇s eftate fhall be affigned，and in whom it fhall be velled for the be－ nefit of the creditors；whicl，afignees are cholen by the major part，in value，of the creditors who thall then have proved their dobis；but may be originally appointed by the commininners，and afterwards ap－ proved or rejected by the creditors：but no creditor fhall be admitted to vote in the choice of afignees， whofe debt，on the balance of accounts，docs not amount to L．ro．And at the third meeting at far－ thefi，which muft be on the $42 d$ day after the adver－ tifement in the gazette，the bankrupt，upon notice al－ fo perfonally ferved upon him，or left at his ufual
place of abode，muft furrender himielf perfonally to the commilioners，and mult thenceforth in all refpects conform to the directions of the itatutes of bankrupt． cy；or，in defau＇t thereof，hall be guility of felony without benefit of clergy，and fhall fufier death，and his goods and efate thatl be divided among his credi－ tors．

In cafe the bankrupt abfonds，or is likely to run away between the time of the commiffion iffed and the lalt day of furrender，he may，by warrant from any judge or juftice of the peace，be apprethended and committed to the connty gaol，in order to be forth－ coming to the commifioners，who are alfo empower－ ed immediately to grant a warrant for feizing his goods and papers．

When the bankrupt appears，the commifioners are to examine him tonching all matters relating to his trade and effects．They may alfo fummon before them， and examine，the bankrupt＇s wife，and any other per－ fon whatoever，as to all matters relating to the bank－ rupt＇s affairs：And in cafe any of them fhall refufe to anfwer，or hall not anfwer fully，to any lawful quef－ －tion，or flall refufe to fubfribe fach their examina－ tion，the commiffoners may commit them to priton without bail，till they make and fign a full anfives； the commiffioners fyecifying in their warant of com－ mitment the queftion fo refufed to be anfwered．And any gaoler，permitting fuch perfor to efcape or go out of prifon，fhall forfecit L． 500 to the creclitors．

The bankrupt，upon this examination，is bound，up－ on pain of death，to make a full difcuvery of all his eftate and effects as well in expectancy as poffefion， and how he has difpofed of the fame：tugether with all books and writing retating thereto：and is to de－ liver up all in his power to the commifioners（ex－ cept the neceffary apparel of himfelf，his wife，and his chikden）；or，in cafe he conceats or embezzles any effects to the amount of L．20，or with－holds any book or writings，with intent to defrand his credi－ tors，he fhall be gruilty of felony without benefit of clergy．

After the time allowed the bankrupt for fuch difco－ very is expired，any other perfon voluntarily difco－ vering any pant of his eftate before unknown to the aftignees，fhall be intiled to five per cont．out of the effects fo difoovered，and fuch farther reward as the affignees and commiffoners fhall think proper．And any trutte wilfolly concealing the ettate of any bank－ rupt，after the expiration of 42 days，fhall forfeit L． 100 ，and double the value of the eftate concealed， to the creditors．

Hitherto every thing is in favour of the creditors； and the law feems to be pretty rigid and fevere againt the bankrupt；but，in cafe he proves honeft，it makes him full amends for all this rigour and leverity．For， if the bankrupt laith made an ingenoous difcovery， hath conformed to the directions of the law，and hath acted in all points to the fatisfaction of his creditors； and if they，or four parts in five of them in number and value（but none of them creditors for lefs than L． 20 ），will lign a certificate to that purport；the commimioners are then to authenticate fuch certificate monder their hards and feals，and to tranfmit it to the lord chancellor：and he，or two judges whom he fhall appoint，on oath made by the bankrupt that fuch cer－ tificate

## C O M

Comnis- tificate was obtained without fraud, may allow the fian. fame ; or difallow it, upon caufe thown by any of the creditors of the bankrupt.

If no caule be thown to the contrary, the certilicate is alluwed of course; and then the bankrupt is intitled to a decent and reafonable allowance ont of his effects, for his future fupport aml maintenance, ard to put him in a way of honct indutiry. This allowance is alfo in propertion to his former good behavicur, in the early difcosery of the ductine of his affairs, and therety giving his erediturs a larser dividend. For if his efiects will not proy cme hatf of his debts, or ros. in the pound, he is lefit to the diferetion of the commiffomers and affognees, wo hase a competent fum allowed him, not exccoting a por ant.; lut if they pay 10s. in the pound, be is to be illowed 5 per cent.; if 12 s . and Gd. When $7^{\frac{1}{2}}$ per event. ; and if I 5 s. in the pound, then the bankmint fhall be alluw. ed to per coat.; provided that fuch allowance do not in the firlt cafe execed L. 200, in tlee fecond L. 250 , and in the third L. 300.

Befrdes this altowance, he has alion an indemonty granted him, of being fice and difharged for ever from all debts owing by him at the time he became a bankrupt; even though judgnent thall have been ohotained againt him, and he hies in prifon upon a xecution for fuch debts; and, for that among vther purpoles, all proceedings on commition of bankrupt, are, on petition, to be entered on record, as a perpetual bar againft actions to be commenced upon this account : though, in gencral, the production of the certificate properly allowed thall be fuficient evidence of all previous proceedings. Thus the bankrupt becomes a clear man again: and, by the affilance of his allowance and his own induthry, may become a ufeful member of the commonwealth: which is the rather to be expected, as he camot be intiled to thefe benefits, but by the toftimony of his cralitors themelves of Lis honelf and ingenuous uifpolition; and mbefs his failures have been owing to misfortumes, rather than to mifconduct and extravagance.
2. As to the proceedings which affect the baukrupt's pronerty.

By virtue of the Itatutes before mentioned, all the perfonal eftate and efferts of the bankrupt are confolered as vefted, by the act of bankruptey, in the future affignees of his commiffoners, whether they be goods in actual puifefion, or debts, contracts, and other chofes in action; and the commilioners by their warrant may caufe any houfe or tenement of the bankrupt to be broke open, in order to enter upon and feize the fame. And when the aftignees are chofen or approved by the creditors, the commifioners are to alfign every thing over to them; and the property of every part of the eftate is thereby as fully vefted in them as it was in the bankrupt himfelf, and they have the fame emedies to recover it.

The prop.rty velled in the affignees is the whole that the bankrupt lad in himfolf, at the time he committed the firft act of bankruptcy, or that has been velted in him fince, befure liis debts are fatistied or agreed for. Therefore it is lifually faid, that once a bankrupt, and always a bankrupt: by which is meant, that a plain direct act of bankruptey once committed, cannot be purged, or explained away, by any fubfe-
quent condut, as a dubious equivocal act may be: but theit, if a commiffon is afterwards anarded, the comnmifion dad the property of the aftonece hat have a relation, or reference, back to the sith and orbinal act of bankuptey, Infonmeh that all tranfections of time bankropt are from that than alobntery moll and roid, either wifh regad to the alicumano of has proputy, or the reccipt of his dehts from fuch as are prisy io his bankmptey; for they are no longer his property, of his dibets, but thofe of the future aflignees. Andif an escention be fued out, but not forred and exceuted on the bankupt's effects till after the act of hank. routey, it is void, as agmat the afignees. But the king is uot bound by this fectitious relation, nor is withen the datutes of bamkrupts; for if, after the act of bankruptey committerl, and before the affirmment of his effects, and extent iflues for the debt of the erown, the grouds are bound thereby. In France this doctrine of relation is cartich to a very graat length; for there, every adt of a merchant, for 10 dars fuececdent to the ate of bankruptey, is prefumed to be fraudulent, and is therefore voil. Suat with us the law flands upon a more reafonable fouting: for as thete atets of bankratity may fometimes be fecret to all but a few, and it woukl be prejudicial to trade to carry this motion to its umolt length, it is provided by that. Iy Geo. II. c. 32. that to money paid by a bankrupt tu a lena fide, or real, ereditor, in a coulde of trade, everr after an act of bakkuptey done, thatl be liable to te refunded. Nor by tat. 1 Jac. I. c. 15. fall any dubur of a bankrupt that pays him his debt without knowing of his bankruptey, be liable to account for it abain. The intention of this relative power being only to reach frauculent tranfuctions, and not to diftrefs the fair trader.

The a保nces may purfue any legal method of recovering this property for vefted in them, by thair own authority; but camot commence a fuit in cquity, nor compound any debts ownag to the bankraft, nor refer athy matters to arbitration, without the confent of the creditors, or the major part of them in value, at a mecting to be hed in furfuance of notice in the gazette.

When they have got in all the effects they can rea. fonably hope for, and reduced them to ready money, the affignee's molf, within 12 months after the connmiffion iflucd, give 21 days notice to the creditors of a meeting for a dividend or dillribution; at which time they mult produce their accommts, and verify them upon oath, if required. And then the connmif. froncrs thall direct a dividend to be made, at fo mutis in the pound, to all creditors who have befure proved, or flall then prove, their debts. This dividend nulf be made equally, and in a rateable proportion, to all the creditors, according to the quantity of their debts; no regard being had to the quality of them. Mertgages, indeed, for which the creditor has a real fucurity in his own hands, are entircly fafe; for the commifion of bankrupt reaches only the equity of redemption. So are alfo perfonal debts, where the creditor has a chatel in his hands, or a pledge or pawn, for the payment, or has taken the debtor's lands or goods in execution. And, upon the equity of the Itat. 8 An.c. + (which directs, that upon all exectitions of groods being on any premifies demifed to a ten fiot. $\underbrace{\text { firot. }}$
$\qquad$

[^7]

[^8]

 . -

Commif nant, one yen's rent and no more hall, if duc, be fion.
Commil firmer paid to the landlori) it hath alfo been held, that mader a commifion of bankrupt, which is in the nature of a flatute execution, the landlord fall be allowed his ar-
rats of rent to the fame amount, in preference to other ereditors, even though he hath neglected to diftrein while the groods remained on the premiffes: which he is otherwife intitled to do fur his entire rent, be the quantum what it may. lint otherwife judgments and recognizances (both which are debts of record, and therefore at other times have a priority), and allo bonds and obligations by deed or fpecial infrument (which are called debts by fpecialty, and are ufually the next in order), thefe are all put on a level with debts by mere fimple contract, and all paid pari fraflu. Nay, fo far is this matter carried, that, by the expreis provifion of the ftatutes, debts not due at the time of the dividend made, as bonds or notes of hand, payable at a future day, fhall be paid cqually with the reft, allowing a difcount or drawback in proportion. And infurances, and obligations upon bottomry or refpondentia, bond fule, made by the bankrupt, though forfcited after the commiffion is awarded, thall be looked upon in the fame light as debts contracted before any act of bankruptcy.

Within 18 months after the commiffion iffued, a fecond and final disidend thall be made, untels all the cffects were exhaufled by the lirlt. And if anv furplus remains, after paying every creditor his full debt, it fhall be reftored to the bankrupt. This is a calfe which fometimes happens to men in trade, who involantarily, or at leafl unwarily, commit acts of bankruptey, by abfconding and the like, while their effects are more than fufficient to pay their creditors. And if any fufpicious or malevolent creditor will take the adrantage of fucb aets, and fue out a commifion, the bankupt has no remedy, but mult quietly fubmit to the effeets of his own imprudence: except thit, upon fatisfaction made to all the creditors, the commiffion - may be fupenfeded. This cafe may alfo happen when a knave is detirous of defrauding lis creditors, and is compelled, by a commifion, to do them that juitice which otherwife he wanted to evade. And therefore, though the ufual ruke is, that all intereft on debts carrying intereft thall ceafe from the time of iffuing the commifion, yet in cafe of a furplas left after payment of every dide, fuch interdt thall again revive, and be charceable on the bankrupt or his reprefentatives.

Commesson of Lhmect, iffues out of the court of chancery, whether a perfon reprefented to be a lunatic, be fo ar mot. See Lunicy.

Comarsson of a einds, a court at Ediaburgh, which rame in phace of a committe of the Scottifh partiamont, for crecting new parifhes, and valuing teinds for the fupport of the clergy. It is velled in the Lords of fetmon. See Law, a clix. 1 I.

Commsstom-Offars. Sec Ofricers.
Comamsion, in commerce. See Pactorage.
COAMMLSSIONER, a perfon authorifed by commifion, ketters patent, or other lawful warrant, to cxamine any matters, or exsecute any lawful commiffion.

Noso.

Commisstonar intioe General Affimbly of the church of Scetland. See Assembly (General).

Commissioners of the Cufloms. See Customs.
Comaissioners of Excife See Excise.
Commisslongrs of the Navy. See Navy.
Lords Commissioners of the Tretary. See Treasury and Exchequer.

CCMMISSURE, a term ufed by fome authors, for the fmall meatufes or interftices of bodies; or the little clefts between the particles; efpecially when thofe Fanticles are broadifh and flat, and lie contiguous to one another, like thin plates or lamellie. The word literally figmifies a joining, or connecting of one thing to another.

Commssure, in architecture, sic. denotes the joint of two dlones, or the application of the furface of the one to that of the other. Sae Masonery.
Among anatomifts, commiffure is fometimes alfo ufed for a future of the cranium or flatl. See Suture.

COMMITMEN「, in criminal law, is the fending to prifon a perfon who hath teen guilty of any crime. This takes place where the offence is not bailable, or the party cannot find bail ; mull be by proper warrant, containing the caufe of the commitment; and continnes till put an end to by the courfe of law (fee 'Prat) ; imprifonment being intended only for fate cultody, and not for punifhment (See Arrestment and Bate). In this dubious intersal between the commitment and trial, a prifoner ought to he ufed with the utmolt humanity; and neither be loaded with needlefs fetters or fubjected to other hardfhips than fuch as are abfolutely requilite for the purpofe of confinement only: though what are fo requilite muft too often be left to the diferetion of the gaolers; who are frequently a mercilefs race of men, and, by being couverfant in feenes of mifery, fteeled againt any tender Menfation.

COBMMTTEE, one or more perfons to whom the conlideration or ordering of a matter is referred, either by fome court, or by the confent of parties to whom it belongs.

Conmitfes of Parlioment, a certain number of members appointed by the houfe for the examination of a bill, making a veport of an inquiry, procefs of the houfe, Eve. See Purmiment.

Sometimes the whole houfe is refolved into a committc; on which occation each perfon has a right to ipeak and reply as much and as often as he pleafes: an expedient they watly have recourfe to in extraordinary cales, and where any thing is to be thoroughly canvaffecl. When the houfe is not in a committee, each gives his opinion regularly, and is only allowed to fpeak once, unlefs to eriplain himelt.

The fanding committees, appointed by every new parla:acnt, are thof of privileges and elections, of religion, of grievances, of courts of juftice, and of trade; though only the former act.

COMMIXTION, in Scots law, is a method of acquiring property, by mixing or blending together different fubfances befonging to diflerent propictors. See Lav, Part III. Neckii. 8 .

COMMODATE, Commonatum, in the civil jurifprudence, the loan or free conceffion of any thing moveable or immoveatle, for a certain time, on con2
 dition

Commir. fioner II C. mmodate. $\xrightarrow{-}$

## $\mathrm{C} O \mathrm{M}\left[\begin{array}{llll}19 & \mathrm{C} & \mathrm{O} & \mathrm{M}\end{array}\right.$

Conn:odi- dition of reforing again the fame individual affer a with centian term. 'the commodate is a kind of loan:
oppofer to proper, pecultar, \&e. Thur, the earth is faid to be our common mother ; in the finf or grolden age all things were in contmon, as well as the fon ant clenents: the name animal is common to man and beadt; that of fubllance ter body and fpirit.

Common, Communia, (i. e. qual atomes funtivet), in law, figuities that foil, the ufe whereof is common to a paticular town or lordhip; or it is a profit that a mar. hath ia the lund of another perfon, ufally in common with others; or a right which a perfon hath to put his cattle to pature into ground that is not his own. And there is not only common of palture, but alfo common of pifcary, common of cflovers, common of turbary, \&c. And in all eafes of common, the law doth much refpect the cultom of the place; for there
 mowt:

Common Coumit. See Councit.
Comaron hazu, that body of haw received as mules in thele kingdoms. before any flatute was chactesf in parliament to alter the fame. See Law, Bat IT. $n^{-} 36$.

Common-rlace Book, is a regifer of what things occrir, worthy to be noted, in the courfe of a man's thinking or Atudy, fo difpofed as that among a number of lubjects any one may be catily found. 'The adyantages of making a common-place book are many : it not only makes a man read with accuracy and attention, but induces him infenfibly to think for himfolf, poravided he confiders is not fomuch as a regiter of fentiments that drile him in the eanfe of ceading, but as a regiter of his own thoughts upon various fub. jects. Many valuahle thoughts occur even to men of no extraodinary genius. Thefe, without the affit ance uf a eommon-place book, are gencrally lot both to himelf and otliers. There are varicus method of arranging common-place books; that of Mr Locke is as good as any that have hitherto been contrived.

The frof page of the book you intend to take down their common-lace in, is on ferve as a kind of indas to the whole, and to contain references to every place or matter therein: in the commodious contrivance of which index, fo as it may admit of a fuffecent corvia or variety of materials, withont any confution, all the fecret of the methed confits.

In order to this, the firtt page, as already mentioned, or, for more room, the two firit pages that front each other, are t - be divided, by parallel lines, into 25 rqual parts; whereof every fifth line is to be dillisguithed by its colour or other circumbanee. Thefe lincs are to be cot perpendienlanly by others, drawn from top to bottom; and in the feveral fatecs thereof, the feveral letters of the alphabet, both capital and minufcle, are to be duly wrote.

The form of the lines and divifons, both horizontal and perpendicular, with the manner of witing the letters therein, will be conceived from the following fpecimen; wherein, what is to be done in the book for all the letters of the alphabet, is here thown in the hind four, $A, B, C$, and $D$.

Ee
C.memor.

The index of the common-place book thus formed, matters are ready for the taking down any thing therein.

In order to this, confider to what head the thing you would enter is mont naturally referred; and under which one would be led to look $f r$ fuch a thing : in this head, or word, regard is had to the initial letter, and the firfl rowel that follows it ; which are the characteriflic letters whereon all the we of the index depends.

Suppofe (e. gra) I would enter down a paffage that refers to the head beculy. $B$, I confider, is the initial letter, and $e$ the firl yowel: then, looking upon the iadsx for the partition $B$, and therein the line $e$ (which is the place for all words whofe firt letter is $\ell$, and fint vowel $e$; as bendy, benfaconce, browh, brouling, blemifess), and linding no numbers already down to direct me to any page of the book where words of this characteriftic have been entercd, I tum forward to the firt blank page I find (which, in a freth book, as this is fippofed to be, will be page 2 d), and here write what I have occafion for on the head lonaty; begiming the liead in the margin, and indenting all the other fubfervient lines, that the had may thand out and thow itfelf: this done, I enter the pase where it is wrote, cia. 2 , in the index $i$ : the fpace $B B_{c}$; from which time, the clafs be becones wholly in poffeffion of the 2 d and 3 d pages, which are configned to letters of this characteritic.

Hal I found any paxe or munber already entered in the fpace $B$ e, I mutt have turned to the page, and have wrote my matter in what room was left therein: fo, if after entering the palfage on beanty, I fhould have occation for benevolence, or the like, finding the number 2 aiready poffeffed of the fpace of this charactelitic, I begin the paffage on benerolence in the zemainder of the page, which not cuntaning the whole, I carry it on to page 3 d, which is affo for $b e$; and add the number 3 in the index.

Commay Pleas is une of the king's courts now held contantly in Wefminfter-hall, but in former times was moveable.

All civil caufes, as well real as perfonal, are, or were formerly, tried in this court, according to the Atrict law of the land. In perfonal and mixed actons it has a concurrent jurifuration with the king's bench, but has no cognizance of pleas of the crown. The actions bclonging to the court of common pleas come thither by uriginal, as arrells and outlawries; or by privilege, or attachment for or againt privileged perfons; or out of inferior courts, nut of record, by pone, ricordari, acculas all curian, writ of falle judgment, se.

The chief judge of this court is called lord rhief juffice of the comnon plears, who is alfited by three other judges. The other officers of the coart are the cughs brevium, who is the chief clerk ; three prothonotaries, and their fecondaries; the clerk of the warrants, clerk of the effoins, if filazers, $f$ exigentors, a clerk of the juries, the chirographer, the clerk of the king's filver, clerk of the treafury, clerk of the fal, clerk of the outlawries, clerk of the inrulinent of fines and recoveries, and clerk of the errors.

Cosnow:-Prace is the liturgy in the chureh of England: (See Liturgy.) Clergymen are to ufe the public form of prayers preferibed by the Book of Common Prayer; and refuing to do fo, or uling any other public prayers, are punithable by that. I Eliz. c. ii.

Соммо,, in grammar, denotes the genter of nowns which are equally applicable to both feses: thus, parerit, "a parent," is of the common gender.
Common, in geometry, is applied to an angle, line, or the like, whicle belongs equally to two ligures.

Consuan Divifor, a quantity or number which exadly divides two or more other quantitis or numbers, without leaviay any remainder.

COMIONALTY, the lower of the two divifions of the civil hate. See CunL Siatio.

The commonalty, hat the molility, are divided into feveral degrees: and as the lords, though diferent in rank, yet all of them are peers in refpect of their nobility; fo the commoners, though lome are gratly fuperiur to othere, yet all are in law commonaity, in reipest of their want of noinitity.

1. The firl name of diguity next beneath a peer was anciently that of vidumes, vice-ifunini, or athorfors: who are mentioned by our anciant lawyers as oni manunc dignitatis; and Sir Edward Coke fpeaks highly of them. Yet they are now quite out of ufe; and our legal antiquarians are not aspeed upon even their original or ancient uffice.
2. Now, therefore, the firlt perfonal dignity after the nobility is a knight of the order of St George, or of the garter, fird inflituted by Edw. III. A. 1). $13+t$.
3. Next (but not till after certain official dighities, as privy-counfellos, the chancellors of the exchequer and duchy of Lancafter, the chirf juitice of the king's bench, the mater of the ruht, and the other Eing lifn judges), fullows a kuight cumertet ; who indeed, by thatuies; Richard II. Hat. 2. c. fo and I4 Richord II. c. 11. is ranked nest after barons; and his precedence before the younger fons of vifcounts was confirmed to him by order of King James I. in the tenth year of bis reign. But in ordcr to intite him to this rank, he mult have been created by the king in purfon, in the

## $\mathrm{C} 0 \mathrm{MI}\left[\begin{array}{lll}219\end{array}\right] \mathrm{C} O \quad \mathrm{M}$

Cemmoral fich, wader the royal banners, in time of open war; sy, elfe he ranks after
4. Baronets: whoare the next in order: which tide is a dignity of inheritanee, ereated by letters patent, and uftally defcendible to the iffue-male. See Baronets.
5. Next follow kirghts of the Buth. Sce B.atit.
6. The lalt of the fe inferior nobility are knights lotchelors; the mon ancient, though the lowent, order of knighthood amonglt us. See Bachelor.
7. The above, with thofe enmenerated under the article Nobility, Sir Edward Coke fays, are all the names of dignity in this kiugdom; cfquires and gont/emen being only names of worfloip. But before thefe lat the heralds rank all colonets, ferjeants at law, and doctors in the three learned profenions.
8. Efquires and gentlemen are confounded together by Sir Edward Coke; who obferves, that every efquire is a gentleman, and a gentleman is delined to be one gui arma gerit, "who bears coat-amour;" the grant of which adds gentility to a man's family: in like manner as civil mobility anong the Romans was founded in the jus imaginum, or having the image of one anceltor at lealt who had borne fome curule office. It is indeed a matter fomewhat unfettled what conkitutes the diftinction, or who is a real efquire; for it is not an eltate, however large, that confers this ank upon its owner. Camden, who was himfllf a herall, ditinguifhes them the molt aecurately; and he reckons up four forts of them: aft, The eldell fons of knights, and their eljeft fons, in perpetual fuccedfion. 2dly, The eldeft fons of younger fons of peers, and their eldeft fons, in like perpecual fucceffim: both which fpecies of efquires Sir Henry Spehman intitles armigcrimatitizi. 3 dly , Efquires created by the king's leiters patent, or other invelliture ; and their chdeft foms. 4thly, Efquires by virtue of their office; as jullices of the peace and others who bear any office of thatt under the crown. To thele may be added the efquices of the knights of the bath, each of whom conflitutes three at his infallation; and all forcign, nay, lrith peers; for not only thefe, but the eldedt fons of peers of Grat Britain, though frequently titular lords, are only efquires in the law, and muit be fo named in all legal proccedings.
9. As for gomilenen, fays Sir Thomas Smith, they be mae good cheap in this kingdom: for whofoever ftudieth the laws of the realm, who fludneth in the univerfies, who profeffeth literal fciences, and (to be thort) who can live idly and without manal labour, and will hear the part, charge, and coantenance of a genkman, lie fhall be called malter, and fhall be taken for a gentleman.
10. A yeomam is lic that bath free land of 40 s . by the year; who is thereby qualified to ferve on juries, sote for knights of the hire, and do any other act where the law requires one that is protus of lagalis Lomo.
11. The reft of the commonalty are toadefmen, artifocirs, and lalourers; who (as well as all others) mult, in purfuanee of the datute i Henry V. c. 5. be dyled by the name and addition of their eflase, degree, or mytcry, in all actions and other legal proccedings.

COMMONLiR, or Gentleman-Commoner, in the univerfites: a fudeut entered in a certain ramk.

COMMONS, or Fouse of Commons, a denomina. Common. tion given to the luwer houfe of parliament. Sec Par- Commong. hiament.

The commons confilt of all fuch men of any property in the kingdom as have not feats in the houfe of lords, every one of whom has a voice in puliament, either perfonally or by his reprefentatives. In a free flate, every man, who is fuppofed a frece agent, ought to te in fome meafure his own grover nor ; and therefore a branch at leaft of the legiflative power hould refide in the whole body of the people. And this power, when the territories of the fate are fmail, and its citizens eafily known, fhould be exerciled by the people in their aggregate or collec. tive capacity, as was wifely crdained in the petty republies of Grece, and the frlt rudiments of the Roman flate. But this will be highly inconvenient when the public territory is extended to any conficerable degree, and the number of citizens is inereafed. Thus when, after the focial war, all the burghers of ltaly were admitted frece citizens of Rome, and each had a rote in the public affemblies, it became impoflible to dillinguifh the fpurious liom the real voter, and from that time all clections and popular deliberations grew tumultuoss and diforderly; which paved the way for Marius and Sylia, Pompey and Cefar, to trample on the liberties of their country, and at lalt to diffolve the commonwealth. In fo large aftate as ours, therefore, it is sery wifely contrived, that the people thould do that by their reprefentatives which it is impracticable to perform in perfon; repefentatives chofen by a number of minute and feparate dilfricts, wherein all the voters are or may be eafily diltinguifhed. The counties are thercfore reprefented by knights, elected by the proprictors of lands; the cities and boroughs are repefented by citizens and burgeffes, chofen by the mercantile or fuppofed trading interett of the nation; much in the fame manner as the burghers in the dict of Sweden are chofen by the comporate towns, Stuekhom fending four, as Lowion dues with us, other cities two, and fome only one. The number of Englifl reprefentatives is 513 , of $S \operatorname{cots} 45$; in all $55^{8}$; and every member, though chofen by one particular dillict, when elected and retmened, ferves for the whole realm: for the end of his coming thither is not particular, but general ; not barely to advantage his condituents, but the commonwalth; to advite his majelty, as appears from the writ of fummons, "de communi contilio fuper negotios quibufdam archuis at urgentibus, regem, fatum, et defealionem regni Anglise to ecelefixe Angheanx concernentilus." And therefore he is not buund, like a deputy in the United Provinces, to confult with, or take the advice of, his conflituents upon any particular point, unkeds he himfelf thinks it proper or prudent fo to do.

The peculiar laws and cuftoms of the houfe of commons relate principally to the raiting of taxes, and the elections of members to ferve in parliment. See Taxes and Elections.

## Jualors Commons. See College of Civiliuns. <br> Prutur of the Commons. See Jroctor.

COMMONTY, in Scots law, fometimes fignifies lands belonging to two or more common proprietors ; fometincis a heath or muir though it hould beE e 2
1)

Common long in property to ore, if there has been a promifcuwealth ous poffeflion upon it by paturage ; and the a 1695 , mentions commonties belonging in property to the king and to royal boroughis. Gee Law, Pat IlI. $\mathrm{N}^{\circ}$ elxuv. $\mathrm{i}^{5}$.

## COMMIONWEALTH. See Republic.

COMMOTE, an ancient term in Wales, denoting half a cantred, or hundred; coutaining 50 villages. See Hundren. Wales was ancienty divided into three provinces ; each of thefe fubdivided into cantreds, and every cantred into two commotes or hua. dreds. Silvefter Girald, however, tells us in his itinemry, that a commote is but a grarter of a hundred.

COMPIUNES, in botwar, the nane of a class in Linneun's mothodus Calvina, confifing of two phants which, like tearel and dand=hon, have a calya on fow-er-cup common to many fowers or horets. Thefe are the aggregate or compound fowters of other lyftems.

COMMUNLBLS 1 ocis, a Latin term, in frequent ufe among phitof, phical, de. writers; implying fome mediun, or wean relation, between feveral places. Dr Keil fuppofes the ocean to be one quarter of a mile deep, commuribiss locis, q. d. at a medinm, or takiag one place with ancther.

Commanbus Anmis, has the fame import with regard to years, that communtus lois has with regard to places. Mr Deinam oblerves that the depth of sain, conmainitus amis, or one year with another, were it to Itagnate on the eath, would amomen in Townley in Lancathire, to $4^{2 \frac{1}{2}}$ inches; at $U_{p m i n t l e r}$ in Effx, to $19 \frac{1}{4}$; at Zurich, $32 \frac{2}{4}$; at Pifa, $43 \frac{1}{4}$; and at Paris to 19 inches.

COMMUNICATING, in theology, the act of receiving the facrament of the eucharit. Thofe of the reformed, and of the Creek chureh, communicate under both kinds; thofe of the Romith, under only one. The oriental communicants receive the fpecies of wine by a fpoon, and anciently they fuckud it throurt a mpe, is has been obierved by leat. Rheanus on Tertultian.

COMMUNICATION, in a general foufe, the act of imparting fomething to another.

Communication is alfo mfed for the cornection of one thing with another, or the paffare from one place io another: thus a grallery is a communication between two apartments.

Communication of motion, the act whereby a body at reft is put into motion by a moving body ; or, it is the acceleration of motion in a body already moving.

Limes of Communcation, in military matters, trenches made to concimue and preferve a fafe correfpondence between two forts or polts; or at a fiege, between two approaches, that they may relieve one another.

## Canal of Comanncatron. See Canal.

COMMUNION, in matters of religion, the being united in doctrine and difcipline; in which fenfe of the word, different churches are faid to hold commu. nion with each other.

In the primitive Chrikian church, every bithop was obliged, after his ordination, to fend circular letters to fureign churches, to fignify that he was in communion with them. The three grand communions into which the Chriatian church is at pretent divided, is
that of the church of Rome, the Grcek church, and the Proultant church: but originally all Chrihians were in communion with each other, having one common faith and difeipline.

Communion is alf, vied for the act of communicating the factament of the eucharilt, or the Lord's fupper.

The fourth council of Lateran decrees, that every belicver fhall receive the communion, at laft, at Eafter; which Cems to import a tacii delire, that they mould do it oftencr : as, in effect, they did it much oftener in the primitive days. Gratian, and the matter of the fentences, prefabe it as a mak for the laity, to commumicate three times a-year, at Eater, Whitfuntide, and Chrithmas. But in the 1 zth century, the pratice was erot on foot, wever to approach the cuchanit exevpt at Eafter; and the conncil thought fit to engoin it lien by a law, lett their colduefo and remimetis thould go farther till. Sind the comeil of Trent renewed the fame iugucion, and recommended feequent communion without enforcing it by an exprefs aecree.

In the niath century, the communion was fill received by the laity in both kinds; or, rather, the fpecies of bread was cipeed in the wine, as is owned by the Romanifts themielves. (Acta SS. Benedict. Sxe. III.) M. de Marca ubferves, that they received it at fift in their hunds, Hitt. de Bearn. and believes the commanion uader onc kind alone to have had its rife in the Wett under pope Urban Il. in 1096, at the time of the conquelt of the Holy Land. And it was more folemuly enjoined by the comench of Conftance in 1414. The twenty-eighth canon of the council of Clemont enjuins the communion to be received under both kiuds, ditlinetly; adding, however, two exceptions; the une of neculfity, the other of caution, ni/fi fer neceffurtem $\mathrm{F}^{5}$ cautelam ; the firt in favour of the fick, the fecond of the ablemious, or thofe who had an averfron for wine.

It was formerly a kind of canonical punifhment, for clerks guilty of any crime, to be reduced to lay communion, i. e. only to receive it as the laity did, viz. under one kind.

They had" another punifment of the fame nature, though under a different name, called foreign communion; to which the canons frequently condemned their bilhops and other clerks. This punifment was not any excommunication, or depolition; but a kind of fulpenfion from the function of the order, and a degiadation from the rank they held in the church. It lad its name becaufe the communion was only granted to the criminal on the foot of a foreign clerk, i. e. being reduced to the loweft of his order, he tools place after all thofe of his rank, as all clerks, \&c. did in the churches to which they did not beloug. The fecond council of Agda orders every clerk that abfents himfelf from the church to be reduced to foreign communion.

Combunow Serzice, in the liturgy of the church of England, the office for the adminill ration of the holy facrament, extracted from feveral ancient lisurgies. as thofe of St Bafil, St Ambrofe, \&c.

By the lat rubric, part of this fervice is appointed to be read every Sunday and holyday, after the morn. ing prayer, even though there be no communicants.

## Crmnus.

 nía.Commus COMMUNITY, denotes a fosicty of men living nity in the tame place, under the fame laws, the fame reComanion gulations, and the fame cuttoms.

COMMUPAl'ION, in law, the change of a penalty or punifment from a greater to a kef ; as when death is cormuted for banithment, \& $\&$.

COMNENA (Ann) daughter of Alexus Comnenus emperor of the Eatt ; memorable for her great leaning and virtue, and for her Hillory of the life and actions of her tather, which is highly eftemed. She flourifhed about the year 1 ti7. The hittory, which is in 15 books, was firtt publithed very imperfect!y by Hednelias in 1610 ; and ifterwards primed in the collection of the Byzantine hiltorians, with a diflufe and incorrect Latin vertion by the Jefuir Poffanus, but with excelkent notes by the learned Du Frefte.

COMO, a ftrong and populous iown of Italy, in the duchy of Mhan, and in the Comaicu, with a bifhop's fee. It was taken by the Imptrialitis in 1706 , and is feated on a lake of the fame name in L. Long. 8. 57. N. Latt. 45,45 .

Como, the luke fo called, is the larget in Italy. It is fituated in the ducliy of Midan in the Comafio, on the confines of Swiferland and the Grifons. It is 88 miles in circumference, yet is not above 6 miles over in any part.

COMORA illands, lie between the north end of the ifland of Madagafcar and the coalt of Zanguebar, from 10 to 15 degrees fonth latitude. Authors differ greatly with regard to their number, fome fpeaking of three, oulhers of five, and fome of eight of thefe iflands. They all abound in horned cattle, fheep, hogs, and a variety of fruits common in warm countries. They are faid alfo to produce a kind of rice which turns of a violet colour when boiled. The moft remarkable of t!en, and which the Europeans are beft acquainted with, is the iland of Johanna. See that article.

COMORIN, or Cape Comorin, the moft foutherly promontory of the Hither India, lying north-weft of the ifland of Ceylon.

COMORRA, a handfome and large town of Lower Hungary, and capital of a territory of the fane came. It is fo well fortified, that the Turks cond never take it. The greatelt part of the inlabitants are Hungarians or Ruffians, who are very rich, and are of the Greek religion. It is feated on the river Damube, in the ifland of Sihut. E. Long. 18.25. N. Lat. 47.50.

COMOSA, in botany, from Comar. An order of plants in the former editions of Limneus's Fragments of a Natural Method, confiting of the fpiked willow or fpirea frutex, dropwort, and greater meadow. fweet. 'Thefe, though formerly diftinct gemera, are by Linneus collected into one, under the name of $\sqrt{f}$ iraa. The flowers growing in a head, refemble a bufl, or tuft of hair, which probably gave rife to the epithet Comofa.

COMPACT, in philofopliy, is raic of bodies which are of a clole, denfe, and heary icxure, wilh few pores, and thofe very fmail.

Compact, in a legal fenfe, fignifies an agreement, or contract ftipulated between feveral parties.

COMPANION, one with whom a man frequently converfes.

As the human mind cannot always he on the Companioze flretch, nor the liands always emply yed in labour, recreation becones both agreable and necafiary. Ot all recreations, that of the company of a few choten componions mult be allowed to be the molt many and mofl improvinge : hut as th thof hours of recreation we ate moll in danger of being millad, being geacrally at fuch feafons more off our guard than wful, the greatell care flould be taken in making choiee of which to affuciate with; for according to our choice of them, both on character and difpolition will nective a tincture, as waters pafing through minuals partake of their tafle and efficacy. This is a truth fo umiverfally received, that it is become a proverb both in the natural and moral world, 'That a man is known by lis company. As by chemiltry we learn, that difoudant mixtaces produce nothing but broil and fermontation tiil one of them gets the alcendency of the reft; fo from Ceriptue we learn, that two cannot waik toge ther except they be agreed. From which we may fee, how impolithle it is for any one to be thonglat a perfon of real goodnefs and integrity, whilt he choofeth for his companions the abandoned and licentions.

By herding with tuch, he will not only lofe his character, but his virtue ; for whatever fallacious di. flinction he may be pleafed to make between the men and their vices, in the end the futt gencrally cualifies the lalt; and by ceafing to hate them he will foom learn both to love and practife them. In fhort, the fociety of fenfual men is peeutiarly enforing. The malignity of their contagion doth not appear all at once. 'l'lutir frolics firt appear harmleis; then, when partaken of $f_{2}$ they leave a longing relifh behind them ; and one apm pointment makes way for another, one expence leads on to a fecond; and fo time and fortune are walted away to very bad purpofe. Then one appetite craves, and another mult be gratified, till all become too im.. portunate to be denied; which verifies what the wifelt of men long fince faid, "That the beginning of fin is like the breaking forth of waters, which when it once maketh an entrance, carrieth all before it with rufhing impetuofity." Some pangs of remorle may be felt by" the infatuated creature on his fiflt degeneracy, and fome faint refolutions againt being feduced any more; which will no fooner be difcovered by thofe leaders to deltruction, but all arts will be ufed to aliure him back to bear them company in the broad beaten path to ruin. Of all which methods, none is more to be dreaded than raillery; for this is gencrally exercifert with all its force, and too often proves fatal. A: other method ufed to millead the joumy aovice not yet hackneyed in vice, and no lefs dangerous than $h_{1}=$ other, is to call evil good, and gond eval. Lult and fer. fuality muft pafs for love and gallantry; revenge and malice, for heroifm. But tleadinefs frould be thown, ly holding fuch pefts of fociety in derifion, and looking on them with contempt; by appearing unmoved by then ill founded banters, and unllung by their impions jeits.

Upon the whole, in order to efoape the dareser which attends the leeeping of evil company, let thofe you affociate with be perfons as carefully educated and as honetly difpofed as yourfelf; of a good moral character, not given to any known vice; whofe !ives are temperate, and whole expences are moderate; with
fuch

Comrany, fuch company as thefe, you will neither get difcredit, nor degenerate into excefs. You will be a mutual check to each other; and your reputation will be fo eflablifled, that it will be the ambition of others to be admitted members of your fociety. Select thofe for your companions who are men of good fenfe and undefanding; and, if puflible, who exeel in fome ari, feience, or accomplifhment; that $f$, , in the courfe of your acquaintance, your very hours of amufement may contribute to your improvement; and for the moll part fuch are open and communicative, and take as much pleafure in being heard as you to be informed. By purfuing fuch a conduet, you will be an ormanient and ufeful member of fociet $y$.

COMPANY, a collective term, underfood of feveral perfons affembled together in the fame place, or with the fame defign. The word is formed of the French comparnie, and that of companio, or companies, which, Chifflet obferves, are found in the Salic law, tit. 66. and are properly military words, underttood of foldiers, who, according to the modern phrafe, are comrades or mefs-mates, i. e. lodge together, eat together, \&e. of the Latin cum " with"', and fanis "bread." It may be added, that in fome Greck authors under the weftern empire, the word $x$ guvavis occurs in the fenfe of fociety.

Company, in a familiar or fafhionable fenfe, is ufed for an affemblage of perfons met for the purpofe of converfation, patime, or Cellivity.

The love of company and of focial pleafures is natural, and atiended with forme of the fureeteft fatisfactions of human life; but, like every other love, when it proceeds beyond the limits of moderation, it ceafes to produce its natural effect, and terminates in digunfful faticty. The foundation thone and the pillar on which we build the labric of our felicity, mull be laid in our own hears. A mufement, mirth, agreable variety, and even improvement, may be fometimes fought in the gaiety of mixed company, and in the ufual divecions of the world; but if we found our peneral happinefs on thefe, we fhall do little more thas raife cattles in the air, or build houfes on the fand.

Toderive the proper pleafure and improvement from company, it ought is be me, and to confift of perfons of character, refpectabl buta for their morals and their underfandings. Mixed and undiftinguifhed focity tends only to diffipate cur ideas, and induce a lavety of principles and practice. The pleafure it affores is of a coarfe, mixed, noify, and rnode kind. Indeed, it c'momonly ends in warinefs and difgut, as ever: they are ready to confers who yet contantly purfucie it, as if their chicf good confitted in living in a crowd.

Among thofe. indeed, who are exempted by their circumitances frien profefiomal art ficial employments, and who profofed! devete themelves to a life of pleafure, little el fans to conflitute the idea of it, but an urceafing foceffin of company, public or private. The dr -fs, and other circumitarces preparatory to the enjoyment of this pleafure, farce! y leave a monent for reflec: Diy after day is fpent in the fame toilfome roa \& alis alsit is formed, wheh renders difipation nectlier to contere. One week without it would probably miduce a luwnefo of finits, which night termi-
nate in derpair and fuicide. When the mind has no Company, anchor, it will fuffer a kind of hipwreck; it will fink in whitpools, and be dafhed on rocks. What, indeed, is life or its enjoynents without fettled principles, landable purpofes, mental exertions, and internal comfort? It is mercly a vapour, or, to drop the language of figure on fo ferious a fubject, it is a flate worfe than non-entity, fince it poffefles a retlefs power of action, productive of nothing but mifery.

It is recommended, therefore, to all who wifh to enjicy their exittence (and who entertains not that wih? ), that they fhould acquire a power not only of tearing, but of taking a pleafure in, temporary folitude. Every one mant, indeed, fometimes be alone. Let him not repine when he is alone, but learn to fet a value on the golden moments. It is then that he is enabled to fady himfelf and the world around him. It is then that le has an opportunity of feeing things as they are, and of removing the deceitful veil, whichalmolt every thing allumes in the bufy fcene of worldly employments. The foul is enabled to retire into herfelf, and to exert thofe energies which are always attended with fublime pleafure. She is enabled to fee the dependent, frail, and wretched tate of nan as the child of nature; and incied by her difcovery, to implore grace and protuction from the Lord of the univerfe. They, indeed, whe fly from folitude, can feldom be religious; for religion requires meditation. They may be faid to " live without God in the world," not, it is true, from atheilkial principles, but from a carclefnefs of difpefition; a truly deplorable ftate, the conicioufnefs of which could not fail to cloud the gaicty of thofe halcyon beings who fport in the funfline of unremitted pleafure.

There is no doubt bet that man is made for action, and that his dutics and pleafures are often mot numerots and moft inportant amidt the buly hum of men. Many vices, and minge corrupt difpoftions, have been fottered in a folitary life. Minkery is not favourable to human nature or human happincis; but neither is unlimited diffipation.
In fhort, let there be a $\int_{\text {weet }}$ interchange of retirement and affociation, of repofe and activity. A few hours fpent every day by the votaries of pleafure in ferious meditation, would rendes their plealure pure, and more unmixed with mifery. It would give them knowledere, fo that they would fee hew far they might advance in their purfuit withont danger; and refolution, fo that they might retrent when danger approached. It would teach them how to live, a knowledge which iadeed they think they purfefs already; and it would alfo teach them, what thoy are offen tos litile folicitons to lam, how to die.

Company, in a commencial funfe, is a fociety of merchauts, mechanies, or other caders, joiad tegether in one common intereh.

When thece are only two or three pined in this manner, it is called a partnerflip; the term compuny being reflrained to focieties curfiturg of a corfisurable number of members, afficiated together by a clanter obtained from the prince.

The mechanics of all corporations, or towns incorporated, are thus crected into cunpanirs, which bare charters of privileges and largz imnumities.

Confany fems more farticularly appropiated to thofe:

Company. thofe grand afociations fet on foot for the commerce of the remote parts of the world, and vented by charter with pecular privileges.
When companics do not trade npon a joint fock, but are obliged to admit any perfon, properly qualified, upon paying a certain fine and agrecing to fiubmit to the regulations of the company, aich member trading upon his own ftock and at his own rik, they are cilled Resralard Comphins. When they trade upon a joint flock, each monber tharing in the comnon prolit or lufs in propurtion to his flate in this ftuek, they are called Foint-getac' C'ompanies. Such companics, whether regulated or joint-ltock, fonetimes have, and fometimes have not, cxclutive priviluges.

However injuions companies with j int-itock, and incorporated with exclufire privileges, may at this time be reckoned to the nation in general, it is yet certain that they were the general parent of all our foreign commance; private traders being dicourged form bazarding their fortunes in Coreign countries, intil the method of traftic had bets firt iettiad ty juint-llock companics. But fince the chade of this kingdom and the mumber of traders have increated, and the methods of affurance of hipping and merchandize, and the navi. gation ta all ${ }_{\text {f }}$ ats of the krown world, hawe become ! miliar to un, the companies, in the opinimo of nolt men, have been tooked upon in the light of monepolies; their privileges have therefore bealdefenci fiom time to time, in order to faverr a fice aud genead trade: and experience tas hown, that the trade of the nation has advanced in propontion as nornopelies have been diferorased. In thout, as all reltriets ns of tradeare found to be hurtful, nothing can be mote evidnt, than that no company whatoever, whetier they trade in a junt ho $k$ or only under iefulation, can he for the pullic rood, except it anay be ediy for all or any of his mejelty's futiects to be admited into all or any of the taid companies, at any time, and for a sery incoulderab'e fine.

1. RegelatenCompanies refembie, in every refpect, the corporations of trades, to common in the citits and towas of all the different countries of Europe; and are à furt of enlarged monupolies of the farac kinl. As no inhatitart of a town can exercile an incorporated trade, without frit cbanmy his frecdom in the corpuration; fo in nout cafes no fubject of the Ilate can lawfuly carry on any branch of foreign trate, for which a regulated company is cttablithed, without fritt becoming a member of that company. The monopoly is more or kis trict according as the terms of admifion are more or lefs difficult; and according as the directors of the company lave more.or lefs antlority, or have it more or lefs in their power to anamge in fuch a manner as to conflue the greater part of the trade to themfelves and their particular friends. In the moft ancicnt regulated con panies the privileges of apprentict hip were the fanc as in other corporations; and iatitled thie perfon who had fored his time to a member of the company, to become himfelf a bember, either without paying any fine, or upon faying a much fmaller one than what was cxacted of cther people. The ufual corporation fpirit, wherever the haw does not reftrain it, prevails in all regulated companiscs. When they hase been allowed to act according to their natural genius, they have always, in or-
der to confine the competition to as furall a number Conipany, of perfons as perfible, cindeavoured to fuiject the trade to many bundentome regulations. Whan the law has reftrained them fiom doing this, they have becom attogether ufdefs and infigniticant.

The regulated companis for forcign commerce, which at prefent lidifle in (Bnat Dritain, arc, The Hamburgh Compuy, The Ruli.a Conpany, the Eattland Company, the Turkey Company, and the African Cumpany:

1. The Ihamburgh Company is the olleth trading etla. blinment in the Ringdom; thongh not alvays known by that name, nor reflatincd to thofe narrow bounds under which it is now confined. It was tirit called the Compary of marciounts Trading to Calais, Hollunds, Zealand, Erabont, and Flamicrs: then it acquired the general title of AIrehumt-alvonturers of Englumt; as being compofed of all the Englith merchants who traded to the Low Comatries, the Bahic, and the German ocean. Laltly, it was called the Compary of Mowhant-alventurers of Eng hand trewhing to Inamburgho.

This company was lirtt incorporated by Edward I. in 12,1 ; and ellablihed again, by charter, in 1406, mader tike rign of king Homs IV. It was afterwards confirncel, and augmented with divers privileges, by many of his fucceluors. Before the charter of Henry IV. all the Englifi merchants who traflicked out of the realm, were left to their own difcetion, and mannged their atfairs with foreigners as might be mult for their reipective interefls, withont any regand to the general commerce of the nation. Heury, whersing this difuder, endeavoured to remedy it, by uniting all the meschants in his dominions into one buly; wherein, without lofing the liberty of trading each for himedf, they might be groverned by a com. pany thill fubbilling; and be fubject to regulations, which Ahomld fecure the gen ral intereft of the national commerce, without frejulice to the interell of particulars. With this vicw, he grantal all the merchants of his thace, particulaly thofe of Calais, then in his hand, a porser of alfociating themblies into a body pulitic, with director; and governors, both in England and abrovel; whold aftublies, both for tie dircction of bufads and the deciding of controverfies anong merchant:; make liws; prifif delinquents; and impofe mocuate duties and taxes un merehandizes, and merchants, to be empluyed in the fersice of the corporation. Thefe few articles of the chanter of Henry IV. were afterwards much andmented hy Henry VII. who firt gave them the title of Mar. chani-chutertarers to Culdis, Hollund. S.e. gave them a ponver of prochaiming and continuing free fais at Ca lais; and ordered, that to be reputal a member of the fociety, each perfun pay twenty marks ilersing; and that the leverid members hlould atend the general meeting, or comrs, appuinted by the directurs, whether at hondon, Calain, on dewnere.
A p.tition being made to quecen Elizabeth, in a 56 to for an explanation or centan articles in the charter of Henry V11. and a contimation of the rel granted ly other kings ; that princefs, by a charter of the fanc year, declarss, that to end all dijputes, they hall be incorporated anew, under the title of the Comprany of Mretiont-adiventurers of Easiciald; that all who were members of the furmer company fhould, if they de..

Company. fired it, be admitted menbers of this; that they flould have a common feal; that they hould adnit into their fociety what other perfons, and on what terms, they pheafed, and expel them again on mifthehaviour ; that the city of Hamburgh and neighbouring cities thould le eqpated within their grant, together with thofe of the Low Countries, \&c. in that of the former company; that no member thould namy out of the kingdon, nor purchafe lands, $\& \mathrm{c}$. in thy city heyond fea; and that thofe who do, shall be, ifyo fato, excluded for ever. Twenty-two years after this firft charter, queen Elizabeth granted them a fecond; confirming the former, and further granting them a privilege of exclufion; with a power of erecting in each city within their grant a flanding council.

The sevolutions which happened in the Low Countrics towards the end of the fixtectith century, and which laid the foundation of the republic of Holland, having lindered the company from continuing their commerce with their ancient fiecedom; it was obliged to turn it almoft wholly to the fide of Hamburgh, and the cities on the Geman ocean: from Which change, fome people took occalion to change its name to that of the Hamburgh Company; though the ancient title of Mocolont-alecoturews is fill retained in all their writings.

About the middle of the laft century, the fine fer admiffion was fifty, and at one time one hnudred pounds, and the conduct of the company was faid to be extremely oppreffive. In $16+3$, in $16+5$, and in 1661, the clothiers and free traders of the well of England complained of them to parliament, as of monopulits who confined the trade and oppreffed the manufactures of the country. Though thofe complaints produced no act of parliament, they had probably intimidated the company fo far, as to oblige them to reform their conduct. The terms of admifion are now faid to be quite eafy; and the directors cither have it not in their power to fubject the trade to any burdenfome refraint or regulations, or at $k$ aft have not of late exercifud that power.
2. The Rufiuc Company was fivt projected towards the end of the reign of king Edward VI. esecuted in the firf and fecond years of Philip and Mary; but had not its perfection till its claater was confirmed by act of parliament, under queen Elizabeth, in 1566 . It had its rife from certain adventurers, who were fent in three veffels on the difeovery of new countries; and to find out a north-caft pallage to China: thefe, falling into the White Sca, and making up to the port of Archangel, were exceedingly weth received by the Mufcovites; and, at their return, fulicited letters pateat to fecure to themfelves the commerce of Rulia, for which they had formed an aflociation.

By their charter, the alfociation was declared a body politic, under the name of the Company of AEerch-aist-advocuraras of Ensland, for the difcovery of lands. Teraitorits, iflunts, E゙c. untnowh, or unfrequented. Their privileges were, to have a governor, four confuls, and twenty-four afillants, for their commerce; for their folicy, to make laws, inflict penalies, fend out thips to make difeoveris, take poffeffor of them in the king's name, fit up the banner royal of England, 2hnt them; and hatly, the exclufive prisilege of tra-

ding to Archangcl, and other ports of Mufcory, not Cormany yet frequented by the Englifh.

This charter, not being fufficiently guarded, was confirmed by parlianeut in the eighth year of queea Elizabetly; wherein it was nacted, that in regard the former mane was too long, they thould now be called Compary of Engli乃 MLerchants fur difovering new trades; mader which name, they fhonld be capable of acquiriny and holding all kind of lands, manors, rents, $\hat{i}$ a. not exceeding a hundred marks per ann. and not held of her majetty; that no part of the continent, ifland, harbour, \&c. not known or frequented before the fift enterprize of the merclants of their compan, fituated to the north, or north-wefl, or north-ealt of Luadon; nor any part of the continent, iflands, \&c. under the obedience of the emperor of Ruffia, or in the counthies of Ammenia, Media, Hytcania, Perfia, or the Cafpian fea, thould be vifited ly any fubjects of Eneland, to exercife any commerce, without the confent of the faid company, on pain of confifation. The faid company hall ufe no thips in lice new commerce but thefe of the nation; nor tranfont any clothe, ferges, or other woollen ftufs, till they have been dyed and prefled. That in cafe the company difountinue of itflef to untead commodities in the ruad of the abley of S. Nicolas, in Rufia, or fome other port, on the north coails of Ruffia, for the fpace of three years, the other fubjects of England falll be allowed to traffic to Nava, while the faid company difcontinues its commerce into Ruffia, only ufing Englith veffils.

This company fubfifted with reputation almont a whole century, till the time of the civil wars. It is faid, the čar then reigning, hearing of the murder of King Charles I. ordered all the Englifh in his ttates to be expelled; which the Dutch taking the advaintage of, fettled in their room. After the Reforation, the remains of the company re-eftablifhed part of their commerve at Archangel, but never with the fame fuccefs as before; the Ruffiams lecing now well accuttomed to the Dutch merchants and merchandize.

This compay fubitts ftill, under the circetion of a govenor, four confuls, and afillants. By the roth and inth of William III. c. 6. the the for admilion was reductel to 5 l .
3. The Exhluad Compony, was incorporated by queea Elizabeth. Its chartur is dated in the year 1579. By the liril article the company is erected into a bedy politic, under the title of the Company of Mor hazats of the Ealf; to confill of Englihnea, all real merchants, who have excreifed the bufinefs thereof, and trafficked thro' the Sound, befure the year 1568 , into Norway, Sweden, Poland, Lironia, Prulfa, Pomerania, Sce as alio Revct, Coningloerg, Dantzick, Copenhayen, \&c. excepting Narva, Mufcovy, and its dependencies. Moft of the following articles grant them the ufual prerogatives of fuch companies; as a feal, governor, courts, laws, se.

The privileges peculiar to this company are, that none finall be adnitted a member who is alleady a member of any other company; nor any ictail-deaker at all. That no merchant qualified be adritted without paying lix pounds thirteen thillings and lix-peace. That a member of another company, defining to renounce the privileges thereof, and to be received into.

[^9]
# C O M $\mid 225$ C O M 

Companys that of the Eaf, flall be adnittel sratis; proviled he procures the fame favour for a merchant of the Eat willing to fill his place. 'That the merchant-adenturers who never dealt in the liatt, in the places cxpreffed in the charter, may be receised as mombers of the company on paying forty marks; that, notwithftanding this union of the fidventurers of England with the Company of the Eatt, each fhall retain its lights and privieges. That they fall export no cloths but what are dyed and preficd, except a humdred pieces for ansum, which are allowed then sratis. This charter was conirmed by Charles II. in torze, with this adcition, that no perfon, of what quality foever, living in London, thould be achnitted a menber, unlefs he were free of the city. This company was complained of as a moncpoly, and firft curtailed by legal authority in 1572; and fince the declaration of rights in 1680 , exill only in ame; but fill continue to elcet their amual oficers, who are a governor, a deputy, and twenty-four allitants.
4. The Tur': or Levent Company, had its rife under quecta Flizabeth, in 1581 . Janes I. confromed its chater in 1605 , adding new priviliges. Daring the civil wars, there happened fome innovations in the government of the company; many perfons having been admitted nembers, not qualified by the charters of queen Elizabeth and king James, or that did not conform to the regulations preferibed. Charles II. upon his reforation, endearoured to fet it upon its ancient balis; to which cud, he gave dum a chater, containing not only a confrmation of their ohl onc, but alio fiveral new articles of reformation. By this, the company is erceted into a body politic, capablue of making laws, Sc. under the title of the Comprany of Mowhonts of Fivomand troling to the feas of the leemont. The number of natmbers is not limited, hat is ordinarily about theee handed. The principal qualifcation required is, that the candidate be a freman of London, and a wholefale mer hant, either by famly or by ferving an'apprenticethip of feven years. Thofe under twenty-five years of age pay $25^{1}$ flerling at their admifion; thofe above, twice as much. This tine was reduced by act of patiament, in 1753, to 201 . and the privilege of admifion extended to ceery Britihh fulject. Each makes oath at lis entrance not to fend any merchandizes to the Levant but on his own account; and not to confign them to any but the company's adents or factors. This reftriction is likewife enlarged by the above mentioned thatute.

The company has a court or board at Londun, which is compofed of a governor, deputy-governor, and fifteen directors or afiftants; who are all actually to live in: Londen or the fuburbs. They have afo a deputygovernor in every city ald port, where thete atre any members of the company. The affembly at Londen fends nut the refils, regulates the tariff for the price at which the Emropean merdandizes fent to the Levant are to be fold, and for the quality of thofe returned. It raifes taxes on merchandizes, to defray impofitions, and the conmon expuces of the company; prefents the ambafadur which the king is to kesp at the Porte, eltectstuo confals for Smyrna and Conflantimople, \&c.

One of the beft regulations of the company is, not to leave the confus, or even ambufiador, to lix the imVol. V. Part 1.
pofition on veflel. for defrayener the comman expences Company (a thing fatal to the companies of mott other nationa); bat to allow a peofon to the ambaffelor and confuls, and even to the chief ofecos, as fecertary, chaplain, interpreters, and jami\%aries, that there may not be any pretence for their raifing int fian at all on the merchants or merchandizes.

In extraondinary eafes, the confuls, and even the ambafiador, have recourfe to two deputies of the com. pany, refiding in the Levant; or, if the affar be ver: important, they affemble the whole hody. Jfere acie reguated the prefents to be given, the wogages to lne made, and every thing to be delliserated; and on $\mathrm{th}_{\mathrm{g}}$ : refolations here taken, the deputies appoint the treafurcr to furnith the moneys, \&c. required.

The ordinary commere of this company emoloys frum 20 to 25 wfils, carrying from 25 io 30 pieces of cannon. The nerchandizes exported thither are, coths of all kinds and coloors, pewter, lad, pepper, cochincal, and a great deal of fleer, wheh they take up at Cadiz: the returns are in raw flk, galis, cotralet:, wools, cottons, Norocen leather, athes for makins ghats and foap, and feveral gems and medicinal druy: The commerce to Smyma, Conflantionde, and Scilladeloon, is nue chloemed much lefs eomficlerable tidan that of the Eaft India company; lut is, doubtlefs, more advantageons to Eritain; becaufe it tabes ofir much more of the Britih mamfactures than the other, which is ehithy carried on in money. 'lhe places referved for the conmerec of this company are, all the ftates of Venice, in the gulph of Venice; the flate of Ragufa; all the lates of the grand leignion, and the ports of the Levant and Metiterranezn; eveepting Carthagena, Alicent, Darcelona, Valencia, Marfeilhes, Tonlon, Genoa, Leghom, Civita Vecelaa, Patemo, Melhna, Malta, Majuera, Minurca, and Corfica; and other places on the cuats of France, Spain, and Italy.
5. The Company of Merbonts trading to Afotion, culablithed in 1750 . Contrary to the former practice 1 ith regard to regulated companies, wlo were reckond unlit for fueh fort of fervice, this company was fub, jected to the ouldration of mantaining forts and gatifons. It vas txprefsly charged at firil witl; the indintenance of all the Jrition fonts and garrifons that lic between Cape Blanc and the Cape of (Good Hope, and afterwards with that of thole only which lie lutween Cape Rouge and the Cape of Good Hope. The act which eltablifnes this company (the a 3 d of ( coneed. c. 31.) feems to have had two ditinct objects in view; frif, to refrain efiectually the oppreffice an! momupolizing fpint which is natural to the divecons of arcato Lated company; and, lecondly, whoe thom an mach as pultible to give an attcution, which is not naturat on them, towards the mainteratace of firta and gamifons.

For the fint of the fe pupofes, the fane for admifion is limited to forty hillings. The company is labited foon tading in their corporace capasity, us upon a joint taok; from lorrowing moncy ypou © ©
 wheh nay be caried on licely from all places, and a all pafons being Jritih fuljecis, and paring the had. The socernasent is in a committe ot ane perfons whe mect at loundong Lat who are chofn on maty ly eme ri

## $\mathrm{C} O \mathrm{M} \quad\left[\begin{array}{lll}2: 6 & ]\end{array} \mathrm{C} O \quad \mathrm{M}\right.$

Company. freemen of the company at London, Britd, and Liverpool; thrce from cach place. No committec-man can be continued in offee for more than three years togeiher. Any committee-man might be remowed by the boad of tude and plantations: now by a committee of counct, after being heard in his own defence. The conmittee are fubid to export nerroes frome Africa, or to impost any African goods into Great Eritairs. Lut as they are charged with the maintenance of forts and gamfons, they may for that purpofe caport from Great britain to Africa goonds and btores of different kinds. Ont of the money which they thall receive from the company, they are allowed a fum rot caceeding eight lawded pounds for the falarics of their clerks and agents at London, Brillol, and Livenpool; the houf-rent of their office at London; and all otbur expences of management, commifion, and afency, in England. What remains of this fum, after defraying thofe different expences, they may divide among themfelves, as compenfation for their trouble, in what manner they think proper. "Ey this conllisution, it might have been expected (Dr Smith obfrres), that the fpirit of monopoly would have been effectually rettrained, and the firt of thefe purpofes Sufficiently anfwered. It would feem, however, that it had not. 'l'hough by the fth of George III. c. 20 . the fort of Sencgal, with all its dependencies, had been vefted in the company of merchants trading to A frica, yet in the year following (by the 5 th of George IlI. c. 4.4 ), not only Senegal and its dependencies, but the whole coaft from the port of Sallee, in South Barbary, : 1 Cape Rouge, was exempted from the jurifdiction of that companr, was relted in the crown, and the trade to it dechared free to all his majetty's fubjects. The company had been fufpected of reftraning the trade, and of eftablifing fome fort of improper monopdly. It is not, however, very eafy to conceive how, under the regulations of the 23 d George II. they could do So. From the printed debates of the houfe of commons (not always the moft authentic rccords of trath), it appears, however, that they have been accufed of this. The members of the committee of nine being. ahl merchants, and the govemors and factors, in their different forts and fettlements, being all dependent upon them, it is not unlikely that the later might have given peculiar attention to the confignments and commifions of the former, which would eftablifh a real monopoly."

For the fecond purpofe mentioned, the maintenance of the forts and garrifons, an annual fum has been allotted to them by parliament, generally abour 13,0001 . For the proper application of this fum, the committee is obliged to account ammally to the curfitor baron of exchequer; which account is afterwards to be laid before parliament. "But parliament (continues our author), which gives fo little attention to the application of millions, is not likely to give much to that of 33,0001. a year ; and the curfitor baron of exchequer, from his profeftion and education, is not likely to be profoundly nilled in the proper expence of forts and garrifons. The captains of his majelty's navy, indeed, or any other commiftioned officers, appointed by the board of admiralty, may enquire into the condition of the forts and garrifons, and report their oblervations to that board. But that board feems to have no di-
rect jurifuction over the committee, nor any authori- Company. ty to correct thofe whofe conduef it may thus enquire into: and the captains of his majelly's navy, befides, are not fuppofed to be ahways deeply learned in the feience of fortilication. Removal from an olice, which can be enjoyed only for the term of thee years, and of which the lawful emoluments, crou thang that term, are fo very farll, feems to be the utmonl pumifhment to which any commitre-man is hakle; for any fault, except direce malverfation, or embearlement either of the public money or of that of the company, and the fear of that punifhment, can never be a notive of fufficient weight to force a continual and carful attention to a bufincls to which he has no otlier intereft to attend. 'Jhe committee are accufed of laving fent out bricks and fones from Enghand for the reparation of Cape Coaft Calthe on the coalt of Gumea, a bufinefs for which parliament had feveral times granted an extraordinary fom of money. Thefe luricks and fones too, which had thus been fent upon fo tong a voyage, were faid to have been of fo bad a quality, that it was neceffary to mbuild from the foundation the walls which had been repaired with them. The fonts and garrifons which lie north of Cape Ronge, are not only manitained at the expence of the late, but are uader the immediaic gorermment ${ }^{5}$ the exceutive power; and why thofe which lic fouth of that Cape, and which too are, in part at leal, maintaned at the expence of the Hate, thould be under a diflerent govermment, it feema not very cafy even to imagine a good reafon."

The al ove company fucceeded that called The Roval African Comiany, which traded upon a joint fock with an exchutive privilege. Though England begon to trade to Africa as early as the year 1536, and fereral voyages were made to Gtiinea in 1588 , and fome following years, for the importation of gold and clephants tecth, nothing like a corpany was formed till the year 1588 , when queen Elizabeth granted a patent of exclufive privilege to certain perfons for ten years. In 16 I 8 , king James I. eftablifhed a company by charter, which was foon dilfolved. A nother company was erceted by charter of Charles I. in ifizi, which met with littlic fuccefs; but the demand for negroes in the Englifh American piantations increafing, a third company was eflablithed by a charter granted 1652 , in favour of the luke of York ; \{ecuring to him the coma merce of all the country, coalts, illands, \&c. belonging to the crown of England, or not poffefled by any other Chritlian prince; from Cape Blanco in $20^{\circ} \mathrm{N}$. Lat. to the Cape of Good Hope in $34^{\circ} 34^{\prime} \mathrm{S}$. Lat. The charter was foon after returned into the king's lands by the duke, and revoked, by confent of the parties affociated with him in the enterprize; in confequence of which, the fourth and laft exclufive company was eftablifhed and incorporated by letters patent in 1672 , under the title of the Royal African Company. A capital was foon raifed of 111,0001 . and this new company improved their trade, and incteafed their forts; but after the Revolution in 1689 , this trade was laid open. In 1693 , all private traders to Africa were obliged by fat. 9 and 10 Will. to pay ten per cent. in order to anlit the company in maintaining their forts and factories. But notwithlanding this heary tax, the company were fill unable to maintain the competition; their fock and crecit gradually declined.

[^10]
## C O M

## Company:

 $\xrightarrow{C+m}$in 1712 , their debts had become fo great, that a particular act of parliament was thought necedary, both for their fecurity and for that of their creditors. It was enacted, that the refolution of two-thieds of thefe creditors in mumber and value, flould bind the rett, both with regard to the time which fhonld be allowed to the company for the payment of their debts, and with regard to any other agreement which it might be thought proper to make with them cunceming thofe debts. In 1730, their aftairs were in fo great diforder, that they were altogether incapable of maintaining their forts and garrifons; the fole purpofe and pretext of their inflitution. From that year till their fimal diffolution, the parliament judsed it neceffary to allow the amnual fom of ten thoufand pounds for that purpole. In 1732, after having leen for many years lofers by the trade of carrying negroes to the Weft Indies, they at laft refolved to give it up altogether; to fell to the private traders to America the negroes which they purchafed upon the coatt ; and to employ their fervants in a trade to the inland parts of Africa for gold duf, elephants teeth, dyeing drugs, \&ec. But their fuccefs in this more confined trade was not greater than in their fomer extenfive one. Their alfairs continued to go gradually to decline, till at laft being in every refpeet a bankrupt company, they were diffolved by act of parliament, and their forts and garrifons vetted in the prefent Reguhated Company of Merchants trathing to Africa.
II. Jornt-Stock Companies, fablifhed either by royal charter or by act of parliament, differ in feveral refpeets, not only from regulated companies, but from private copartncries. I. In a private copartnery, no partner, without the confent of the company, can transfer his flare to another perfon, or introduce a new member into the compeny. Each member, however, may, upon proper warning, withdraw from the copartuery, and demand payment from them of his fhare of the common tock. In a joint-ltock company, on the contrary, no member can demand payment of his thare from the company: but each member can, without their confent, transfer his thare to another perfon, and thereby introduce a new member. The value of a mare in a juint-ftock is alway the price which it will bring in the market; and this may be wher grater or lefs, in any proportion, than the fom which its owner llands credited for in the foock of the company. 2. In a private copartatery, each partneix is bound for the debts contracted by the comprany to the whole extent of his fortune. In a joint-fuck company, on the contrary, each partner is bound only to the extent of his thare.

The trade of a joint-fock company is always manared by a conrt of directors. This court indeed is frequently fubject, in many refpeets, to the controul of a geneal court of proprictors. But the creater part of thofe proprietors fedom pretend to underltand any thing of the bulinefs of the company; and when the fpirit of faction happens not to prevail among them, give themafles no trouble about it, but reccive contentedly fuch half yearly or yearly dividend as the directors think proper to make to them. This total excmption from trouble and from rilk, beyond a limited fum, encouragcs many people to become adventurers in joint-Atock companies, who would upon no
account hayard the in fortunes in any private copart. Comasy. nery. Such companies, therefore, commonly didw to thenfeles moth erienter Encks than any private copartmery can boat of. The tomling torek of the South Sca company, at one time, amonnta to unworls of theirty-three millims eight homelnd thoufand porads. The dirctors of fuch companies, however, hetide the managers rather of other peoples money than of their own, it cannot weil be expected that they thould watch over it with the fane ansious vigilance with which the partners in a private copartnery frequently wath over their own. Like the ltewards of a rich man, they are apt to confider attention to fmall matters as not for their mafter's honour, and very eafly give themidves a difpenfation from having it. Negligence and profufion, therefore, mult always prevail, more or lefs, in the management of the affairs of fuch a company. It is upon this accomt that joint-ttock companies for foreign trade have foldom been able to mainain the competition againft private adventurers. They have, accordiogly, very feldom facceeded without an exclutive privilege: and frequently have not fucceeded with one. Withont an exclufiee privilerse they have commonly mifmanaged the trace. With an exclutive priverge they have both mifnanaged and confmed it.

The principal joint-ftock companies prefently fubfifting in Great Britain are, the Soub Sar and the Eali India companies; to which may be added, though of very inferior magnitude, the Hitifon's Bay company.

1. The South-Sia Compuny. During the long war with France in the reign of queen Ane, the payment of the failors of the royal navy being neghected, they received tickete inflead of money, and were frequentro obliged, by their neceffities, to fell thefe tickets to avari, ious men at a difcount of 40 and lometimes 50 per cosp. By this and other means, the debts of the mation maprovided for by parliament, and which amonated to 0,4.71,3211. fall into the hands of thefe ufurers. On which Mr Harley, at that time chancellor of the Exchequer, and afterwards earl of Oxford, propofed a foheme to allow the proprictors of thefe debts and deficiences 6 per cent. peir aimann, and to incorporate them for the purpofe of carrying on a trade to the Soutla Sea; and thes were accordingly incorporated under the title of " the Governor and Company of Merchants of Great Britain trading to the South Scas, and other parts of America, and for concouraging the Filh. ery," \&e.

Though this company feem formed for the fake of commerce, the minilly never thought lerioully, during the courfe of the war, about making any fettlement on the coall of Bouth America, which was what flatered the expectations of the people; nor was it ever carricd into exccution by this company.

Some other fums were lent to the govamment in the reign of queen Amme, at 6 per cent. In the thire of George $I$. the intereft of the whule was reduced to 5 for cent. and the company adancel two millions more to the somernment at the fame interett. Dy the thatute of the Gh of (reorge I. it was decheret, that they might redcem all or any of the redeemalde national debes; in contideration of which, the company were empowered to algoment their apid aconding to the sums they thould diteltarge : and for coabling them to raile fuch fums for purchafing amuities, ex-
clanging

Company. chenging for ready moncy now exchcquer bills, carrying on their trade, S.c. they might, by fuch means as they thould think proper, raife fuch fums of money as in a general court of the company thould be judged neceffary. The company were allo empowered to raife money on the contractz, bonds, or obligations under their common feal, on the credit of their capit.ll hock. Wut if the fub-governor, deputy-governor, or other members of the company, fhould purchafe lands or revenues of the crown upon account of the corporation, or lend moncy by loan or anticipation on any branch of the revene, cther than fuch part oaly on which a credit of loan was granted by parliament, fuch fub-governor, or other member of the company, thould forfcit treble the value of the money fo lent.

The fatal South Sea fcherne, tranfated in the year $1 ; 20$, was executed upon the lall mentioned Hatute. The company had at firlt fet out with good fucecfs, and the value of their thock, for the firt five years, had rifen fater than that of any other company; and his majetly, after purchafing 10,000 . thock, had condefeended to be their governor. Things were in this fituation, when, taking adrantage of the above flatute, the South Sea bubble was projected. The protence was, to raife a fund for carrying on a trade to the South Sea, and purchaling annuities, se paid to the other companzes: and propofals were printed and ditributed, thowing the advantares of this delign. The fum neceffay for carrying it on, together with the pronts that were to arife from it, were divided into a certain number of hares, or fubferiptions, to be purchafed by perfons difpofed to adventure therein. And the better to carry on the deception, the directors engafed to make very large dividends; and actually declared, that every rool. original itock would yieh 50 . for annen: which occationed fo great a rife of their Alock, that a fhare of 100 l. was fold for upwards of 8001. This was in the menth of July; but before the end of September it fell to 1501 . by which multitudes were ruined, and fuch a feene of ditrefs occaironed, as is fearecly to be conceived. But the conEequences of this infanons fehcme are too well known; moit of the diecetors ware feverely fined, to the lufs of mealy all their property; fome of them had no hand in the deception, nor gained a farthing by it; but it was agreed, they ought to have oppofed and mevented it.

The South Sea company never had any forts or garifons to maintain, and therefore were entirely exompted from one great expence, to which other jointslock companies for foreign trade are fubject. But they had an immenfe capital divided among an immenfe number of proprietors. It was naturally to be axplated; therfore, that folly, negligence, and profution, flould prevail in the whole management of their Afairs.

Their flock-jobbing fpeculations wcre fucceeded by mercantile projects, which, Dr Smith obferves, were not much better conducted. The firf trade which they engarged in, was that of fupplying the Spanin Widel Indies with negroes, of which (in confequence of what was called the Afiento contract granted them (ay the treaty of Utrecht) they had the exclulive prisilege. But as it was not expected that much profit wild be made by this trade: both the Poutuguefe and

French companies, who had cnjoyed it upon the fame C.miany. terms before them, having been ruined by it, they were allowed, as compenfation, to fend anmaally a hip of a certain burden to trade directly to the Spanifh Weft Indies. Of the ten royages which this annual hip was allowed to make, they are faid to have gained conliderably by one, that of the Royal Caroline in 1731, and to have been lofers, more or lefs, by almolt all the reft. Their ill fuccefs was inputed, by their faitors and agents, to the extortion and operelfion of the Spanifh goverament; but was, perhapa, principally owing to the profufion and depredations of thof very factors and dents; fome of whom ar: faid te have acquired great fortunes even in one year. In 1734, the company petitioned the king, that they might be allowed to difipofe of the trade and tumage of their amual fhip, on account of the little proat which they made by it, and to accept of fich cyuivaIene as they could cbtain from the king of spain.

In 1724 , this company had undertaken the whalefilhery. Of this, indeed, they had no monopoly; but as long as they carricd it on, no other Britili fubjects appear to have engaged in it. Of the eight voyages which their hips made to Greenland, they were gainers by one, and lofers by all the reft. After their eighth and lait voyage, wine they had fold their hips, fiores, and utenfils, they found that their whole lofs, upon this branch, capital and interett included, amomuted to upwards of L. 237,000.

In 1722 , th's company petitioned the parliament to be allowed to divide their immenfe capital of more than L $33,800,000$, the whole of which had been lent to govermment, into two cqual parts: The one half, or upwards of L. 16,900,000, to be put upon the fame footing with other government annuities, and noc to be fubject to the dabts contracted, or luffes incurred, by the direturs of the company, ia the profecution of their mercantile projeits; the other half to remain, as before, a trading flock, and to be fubject to thofe debus and loffes. The petition was too reafunable not to be granted. In 1733, they again petitioned the palianent, that three-fourths of their trading ltack might be turned into annuity flock, and only one-fouth remain as trading hock, or expofed to the hazards ailing from the bad management of their directors. Buth their anmity and trading focks had, by thistime, been reduced more than L. 2,000,000 each, by feveral different payments froim government; fo that this fourth amounted only to L. $3,662,784$, 8s. 6 d . In 1748 , all the demands of the company upon the king of Spain, in confequence of the Aifiento contrait, were, by the treaty of Aix-la-Chapells, given up fur what was fuppofed an equivalent. An end was put to their trade with the Spanih Well Indies, the remainder of their trading ilock was turned into an annuity fock, and the company ceafed ia every refipuct to be a trading company.

This company is under the direction of a governor, fubgovirnor, deputy governor, and 2 d directors; but noperfon is qualified to be gevernor, his majelly exceepted, unlefs fucl governor has, in his ownname andright, L. 5000 in the trading flock; the fub-governor is to have L.4000, the deputy-governor L. 3000, and a director L. 2000, in the fame itock. In every general court, every nember having in his own name and right L. 500 in . urading

2. The Eaft Irdin Company. The frrt, or as it is called the Old Eatt India Company; was ctablifhed by a chaterer from Queen Elizabeth in 1 foo ; hut for fome time the partuers feem to have traded with fe. parate flocks, though only in the thips belonging to the whok compray. Ia 1612, they joined their flocks into one common capital; and though their charter was not as get conimed by act of parhament, it was looked upon in that early period to be fulliciently valid, and no body ventured to interfere with their trade. At this time their ca ital amomint to about 1. - 10,000 , and the flates were as luw as L. 50 ; their trade was in general fuccefful, notwithitading fome beavy lofes, chiefly futained through the malice of the Dutch Eaft India company. In procefs of time, however, it came to be underitood that a roval charter could not by itfelf convey an exclutive privilege to traders, and the company was reduced to ditteds by reafon of the multitude of interlopers who carried off the molt of their trade. This continned during the latter part of the reign of Charles II. the whole of that of James II. and part of William III, when in I 693 a propofal was made to parliament for advancing the fum of $i .2,000.000$ to goverment, on condition of erecing the fubicribers into a new company withex clufive privileges. The old company condeavourch to prevent the appearance of fuch a formidable rival, by offering government L. 700,000 , nearly the amount of their eapital, at that time; but fuch were the exigencies of the fate at that time, that the larger fum, tho' at eight por cen:. interelt, was preferred to the finaller at one half the expence.
Thus were two Eat India Companies erected in the fame kingdom, which could not bat be very prejudicial to each other. 'Ihrough the negligence of thofe who prepared the act of paliament alfo, the new company were not obliged to unite in a joint-ftock. The confequence of this was, that a few private traders, whofe fubfcriptions fcarce exceeded L. 7200 , infitted on a right of trading feparately at their own rik. Thus a kind of third company was eftablihed; and by their muturl contentions with one another, all the three were brought to the brink of ruin. Upon a fubfequent occafion, in 1730 , a propofal was made to parlianent for putting the trade urder the manarement of a regulated company, and thus laying it in fome meafure open. This, however, was onpofed by the company, who reprefented in flong terms the mifchiefs likcly to arife from fuch a proceeding. "In India (they faid), it raifed the price of goods fo high, that they were not worth the buying ; and in England, by orenfoeking the market, it fark the price to fuch a degree, that no profit could be made of them." Here Dr Smith renarks, that by a more I lentiful fupply, to the great advantage and conveniency of the public, it muft lave reduced very much the price of India goods in the Englifh maket, cannot well be doubted; hut that it fhould have aifed very mueh their price in the Indian market, feems not very probable, as all the extraordinary demand which that competition could occalion, mult have been but as a drop of water in the inmenfe ocean of Indian commerce. The inereafe of demand, adds he, though in the becrinning it may fometimes

Wicult of Nations, vol. iit. $p$. 13.4.

Cmpnory company, and the revenue arifing from them, as of right belonging to the crown; and the company, rather than yitd up their tenitories in this manner, argreed to pay government a yearly fum of L. 400000 . They had before this gradually augmented their dividend from about dix to ten per cent.; that is, on their capital of L. $3,200,000$, they had raifed it from L. 192,000 to L. 320,000 a-year. About this time alfo they were attempting to raife it fill further, viz. from 10 to $12 \frac{2}{2}$ per corit. ; but from this they were prevented by two fucceffive acts of parliament, the defign of which was to enable them to make a more fpeedy payment of their debts, at this time eltimated at more than fix or feven millions Sterling. In 1769 they renewed their agreement with government for five years more, fipulating, that during the courfe of that period they fould be allowed gradually to augment their dividend to $12 \frac{1}{2}$ per cent. ; never increaling it, hewever, more than one per cent. annually. Thus their annual payments could only oe augmented by L. $6=8,000$ beyond what they had been before their late territorial acquiftions. By accounts from India in the year 1768 , this revenue, clear of all deductions and military charges, was ftated at $\mathrm{L} .2,0+8,747$. At the fame time they were faid to poffefs another revenue, ariling partly fiom lands, but chiehy from the cultons eftablifhed at their difirent fettlements, amounting to about L. 439,000. The protics of their trade, too, according to the evidence of their chairman before the toule of commons, amounted to at lealt I.400,000 per anmum; their accountant made it L. 500,000; and the lowett account itated it at leaft equal to the high. ett dividend paid to their proprietors. Nutwithtanding this apparent wealth, however, the affairs of the company from this time fell into diforder; infomuch that in 1773 their debis were augmented by an arrear to the ucatury in the payment of the L. $400,0 c o$ itipulated ; by another to the cuftomhoufe for duties unpaid; by a lavge fum borrowed from the bank; and by bills drawn upon them from India to the amount of more than L.i $, 200,000$. Thus they were not only oblifed to reduce their dividend all as once to fix per coni. but io apply to government for affitance. A particular aceount of this tranfaction is siven under the article Britan. Fereitmay bementioned in general, that the event proved very unfavourable to the company, as they were now fubjected to an interierence of government altogether unknown befure. Scvelal important alterations were made in their conltitution tothat home and abroad. 'The fettlements of Madras, Hombay, and Calcutta, which had hitherto been entircly independent of one another, were fubjected to a gover-nor-general, affited by a commeit of four affeffors. The nomination of the firlt governor and council, who were to refide at Calcutta, was affumed by parliament; the power of the court of Calcutta, which had gradually extended its jumifiction over the refl, was now reduced and confined to the trial of mercantice candes, the purpofe for which it was originally inflituted. InHead of it a new fupreme court of judicature was eftablifised, confiting of a chite jutlice and three judges to be appointed by the crown. Befides thefe alterations, the fock neceflary to intide any proprietor to vote at the general courts was raifed from $L_{1}, j 00$ to L.1000. To vote on this qualification, too, it was
necciary that he flould have pofifed it, if acquired Company. by his own purchale and not by inheritance, for at $\longrightarrow$. Jeall une year, inftead of fix months, the term requifite formerly. The court of 24 directors had before been chofen annually; but it was now enacted, that each director hould for the future be cholen for four years; lix of them, however, to go ont of office by rotation every year, and not to be capalale of being rechofen at the election of the fix new directors for the enfuing year. It was expected that, in confequence of thefe alterations, the courts both of the proprietors and directors would be likely to act with more dignity and fleadinefo than formerly. But this was far from being the cafe. The company and its fervants fhowed the urmolt indifference about the happinels or mifery of the people who had the misfurtune to be fubjected to their jurildiction. This indifference, tou, was more likely to be increaled than diminifued by fome of the new regulations. The houfe of commons, for inftance, had refolved, that when the L. I, 600,000 lent to the company by government fhould be paid, and their bond-debts reduced to L.1,500,000, they might then, and not till then, divide eight por cent. upon their capital ; and that whatever remained of their revenues and nett profits at home ficuld be divided into four parts; three of them to be paid into the exchequer for the ufe of the public, and the fourth to be referved as a fund, either for the further reduction of their bond-delts, or for the difcharge of other contingent exigencies which the company might labour under. But it could fearce be expested that, if the company were bad flewards and bad fovereigns when the whole of their nett revenue and profits belonged to themfelres, they would be better when threefourths of thefe belonged to other people. The regulations of 1773 , therefore, did not put an end to the rrotules of the company. Among uther inflitutions, it had been at this time enacted, that the prefidency of Bengral fhould have a fuperiority over the other prefidencies in the country; the falary of the chief jultice was fixed at $L .8000$ por annum, and thote of the other judges at L. 6000 each. In confequence of this act, Sir Elijah Impey, who was created a baronet on the occalion, fet lail, with three other judges, for India in the rear 1774. The powers with which they were invelted were very extraordinary. They had the title of His Majeity's Supreme Court of Judicature in India. Civil law, common law, ecchefaftical, criminal, and admaralty juridiction, belonged of right to them. They were empowered to try Eutopeans on perfonal actions, and to affefs damages, without a jury. Every native, either directly or indirectly in the Service of the company, or in their territories, was made fubject to their jurifiction, with a view to prevent the Europeansfrom eluding juftice under the pretence of employing natives in the commiffon of their crimes; fo that in fact they were abfolute lords and fovereigns of the whole country.

Such excefive and unlimited powers conferted on any fimall mumber of men, could not but be extremely dilagreeable to the Europeans, who had been accuttomed to enjoy a liberiy almolt equally monbonded before; nor was it to be luppaled that the judges, thms fuddenly raifed from the rank of fubjects to the height of defpotifin, would always ufe their power in an unexceptionable

## C O M $\quad\left[\begin{array}{lll}23 \mathrm{I}\end{array}\right] \quad \mathrm{C} \quad \mathrm{O} \quad \mathrm{M}$

Company. tionable manner. The defign of the eftablifmment was to preferve the commerce and revenues of the company from depredation, by fubjecting its fervants to the contrond of the court ; to relieve the fubject from oppreffion by facilitating the means of redrefs; and to fix a regular coule of juttice for the fecurity of liberty and property. Inftead of confidering the circumitances of the country, however, or the manners and cuftoms of the natives, the judges now precipitately introdnced the Bitifh laws in their full extent, without the lealt modification to render them agreeable to the Aliatics, who had been aceufomed to others of a quite different nature; nor did they even pay the leaft regad to the religions inftitutions or habits to which the Indians are fo obllimately attaclied, that they would fooner part with life itfelf than break through an article of them.

Befides this it was faid, that, on the fift arrival of the judges, they endeavoured to extend their authority heyond even what the Britith legiflature had allowed them. Hence they were frequently at variance with the council; and complaints of their conduct were repeatedly fent to England by the fervants of the company. Theie produced a letter in 1777 from the directars to Lord Weymouth, fecretary of tate for the fouthen depatment. In this they fatied, that the fupreme court of India had extended its jurifiliction to thofe whom it did not appear to have been the intention of the king or parliament to fubject to its authority. It bad alfos taken cognizance of matters which, they apprehended, belonged properly to other counts. That the judges confidered the criminal law of England as in force, and binding on the natives of Bengal, though utterly repugnant to the lawa and cu!toms by which they had hitherto been governed; and that the jurifdiction exercifed by the fupreme court was incompatible with the powers givea by parliament to the govemor-general and council, obflructed the adminilration of government, and tended to alienate the minds of the natives; all which they feared would prevent the eftablifh. ment of the government of India upon any fettled or permanent foundation.

This letter not having produced any effect, the difcontents of India, both in the Europeans and natives, continued and increafed. The decitions of the judges were fuch as by no means did them honour. A number of adventurers had alfo emigrated along with them, in hopes of enriching themfelves under the new conftitution. Some of thefe were of the loweft fort of people, who had rendered it in a manner inmpofible for them to remain in England on account of thtir vices or extravagance. Many fuch perfons had enrolled themfelves among the domeftics of the judges, or had become their immediate dependents; and fome of thefe were permitted to affume the characters of attorneys, court-officers, under-heriffs, and bailiffs. It may eafily be fuppofed, that people of fuch charaeters would find it for their interett to promote fuits in the fupreme court; and in this fome of them employed themfelves with great fuccefs. The confequence of all this was, that on the 4 th of December 1780, a petition was prefented againlt the fupreme court by a great number of Britifh inhabitants in the kingdoms of Bengal, Bahar, and Orixa. In this, somplaint was made of the indifcriminate mas-
ner in which the juderes of the fupreme court attempt- Company. ed to exercife the Englith laws in that country, at the fame time that they refufed the undoubted right of every Eritifh fubject, viz. that of trial by jury. They intreated the houfe "to refled on the inmumerable hardfips which mat enfue, and the univerfal confufion which muft be occalioned, by giving to the voluminous laws of England a boundefs retrofective po:ver in the midt of $A$ lia, and hy an application of thofe laws made for the freeft and moft enlightened people on earth, the principle of whofe conflitution was fourded on virtue and liberty, to tranfactions with the natives of India, who had, from time immemorial, lived under a defpotic government founded on fear and reflaint. What muft be the terrors of individuals to find their titles to property, and their tranfactions with the natives previous to the eftablifment of this court of judicature, tried by the Alandarl of the Enghith law, and by men educated under its form3, and unavoidably imbibing its prejudices, when no fuch laws could be known to or practifed by natives or Europeans then refiding in the country, and that at a time when thete were few perfons of legal knowledge in the country to advife or affill them? No tyranny could be more fatal in its confequences, than that a court, invefted with all the authority of one of the furf courts in Engiand, fhould alfo poffers undefined powers and juridiction, of which its judges wore the fole interpreters, and at fuch an immenfe diftance fiom the mother country. T'bis was in truth the fisuation of the Britilt lubjects in India at that time; for the judges of the fupreme court could at pleafure determine on the denomination of a civil jury, the degree of guilt in. curred by any offence, the Itatute by which it fhould be tried, what penalties hould be inflicted, as well as who were and who were not amenable to the jurifdiction of the court.
" Beinles their other powers alfo, the judges of the fupreme court were allowed to fit as a court of chancery, and in that capacity to revife, correct, refcind, or confirm the decifions paflid by themfelves as a court of law; and, by another part of their conftitution, they were allowed to fop execution in criminal cafes until his Majelly's pleafure was known. The petitioners conceived, that there mult be fome findamental error in that inditution, which required a more than ordis nary degree of temper, integrity, and ability, to carry its purpofes into execution; and they did not hefitate to deelare, that to adminiter the powers appertaining to the inflitution of the fupremc court, without committing flagrant acts of injufice, and doing great detriment to the public, required mure equity, moderation, difcernment, and enlightened abilities, than they could hope to find in any fet of men." J"bey concluded with earneltly foliciting parliament, that a trit! by jury might be granted to the Britilh fubjects in Bengal, in all cafes where it was eftablimed by law in England; that the retrofpective powers of the fupreme court might be limited to the time of its eftablifhment in Bengral; that it fhould be defined beyond the power of diferetional diftinction, who the perfons were that properly came under the juridiction of the court, and who did not; that it fhould be exprefsly declared what fatutes fhould, and what fhould not, be in force in Bengal; that diftinct and feparate judges

## C OM [ 232$]$ C. () M

Compere for the law and cquity fites of the court hould be appointed; and that a power of deduys executions in criminal cofe; untl his Majoly's feafure was known, fromble hoden in the governor and council.
Tll is petition wa, foon followed by another figned loy Warrea Haitings, Efq; govenor-genemb, Philip Franeis and Edward Wheeler, Efq; counfllors for the movernment ard prefdency of Fort-William in Bengat ; in which they reprefented, "that, though the juriflitation of the fuprene court of judicature at Calcutta, as well as the powers granted to the governorseneral and council, wore dearly limited ly partiament and the king's letters patent, yot the chief juftice and judges of that court had exercifd anthoriity over perfons not legally within their juridiction, and had illegnally and improperly advifed and admitted frits nomant the governor-general and courcil; that they had attempted to executc their writs upon natives of high rank in the kingdom of Bengal, who were nut within their juriddiction: the governor and council therefore had found themfelves under a neceffity of uplofing them, and of affording protection to the cuuntry and people, who were placed under the ir own immediate infpection, and freeing them from the terrors of at new and ufurped dominion. They had even been obliged to male ufe of a military force, in order to refift the proceedings of the judges and their officers: And they declaied, that no other conduet could have favd thofe proviaces and the interelts of the company, or of the Britih nation it felf, from the ruin with which they were threatened. 'They alfo declared themfelves to be of opinion, that the altempt to extend, to the inhabitants of thefe provinces, the jurifdiction of the fupreme court of judicature, and the authority of the Englith law, which were ftill more intobrable that the law itflf, would be fuch a conftraint on the minds of the peophe of thofe provinces, by the difference of fuch laws and forns from their laws, that they might at lef infame hem, notwithfanding their known mildnefs and patience, into an open rebellion." The petition was concluded, by foliciting an indemnity from the lecral confequences of the refiftance they had been obliged to make to that court.

While the Bitioh were thus exprefing their difpleafore againk the conduct of thefe judres, the matives were thrown into the utmol conflernation and defpair by the ade of oppeffion and violence committed by them. A profecntion for forgery lad been commercel argant Nundomar, a bramin of the firlt rank in J engal. The cime was mot capital ty the laws of Indoftan, and had leen committed mary years before; yet with the vtmont cruelty and injullice was this man condemned and executed on the Britif tatute, by which forgery is made capital ; a taqute which, at the conmifion of the crine, he had weer heard if, nor could ever dream that he would be fubjectel :o its power. What rendered this execution the mac remarkable was, that, at the very time when tharge of forgery was brought again!t him, Nundconar lad betu employed in cahibiting :an accuhtion want lif Hattings. This, together with the hurif in which the court were to have him fort to death (for the court refufed to cllow him a refpite till his Mrjefy's fleafure was know, made the native craclade, that he was exccuted, not on account of the nios 8.
foggery, but for laving wentured to prefer an accula- Company, tion agtimat an Englifh gracernor. In other refpect; they were terrilied to fuet a dearee, that many of then ran into the river on feeing a bramia prit io death with fuch circumflances of ignominy.

The alarn excited by the execution of Nundcomar was kept up by fref decinions of the fupreme court. Among thofe the Jatna caufe, as it is commonly called, was one of the moll remabable. An adventurer, named Shahaz Decy Cawn, had come from Cat bul in Pulia to Bengal, where he entered himfelf in the fervice of the company, and was preferred th the command of a body of horfe. Ilavigg gained a competent fortune, and obtained from the Mugul a grant of lands called an Lllumstaw in the province of Bahar, he retiral from the army, and fettled in Patna. About this thine, when adianced in ycars, he married a wonan of low rank, named Nadara Begum, by whom he had no children. His bwother, Allun Deg, came likewife to Patna; and on his leaving the place lume time after, committed the care of one of his foms, named Betader Beg, to his bruther thahaz Beg Cama. On the death of the latter in 1706 , a lifpute enfued concerning the inheritance betwixt the widow and Dehader Deg. The widow having taken pointlion of the whole property of Shahaz, the nephew, as adopted fon and heir, gave in a petition to the provincial conncil at Patna, on the 2 d of Jmury 1772 , fetting forth his claim. In this petition he flated, that the widow was removing and fecreting the cffeets of the deceafed; and concluded with a prayer, that orders thould be given to prevent their remuval; to tecover fuch as had already been carried away: and that the cadi or Jndian judge thonk be directed to afeertain his right. As the parties were Mahonetants, the council of courfe referred the caute to the cadi and two mufties, the proper oficers for deternining it according to the eltablithed laws of the country. Thefe having inquired into the matter, reported, that the title-deeds, on which the widow pretended to found her right, appeared to be forged; and that, even if they had appeared in the life-time of Shahaz, they were ltill informal, on account of a point of the Mhometan law, which reçuircs, that to make dceds of gift valid, pofefion flould be cntersd into at the time of executing or delivering them over ; but that, as no poffelion of this kind had been given, the ctate ungt to be divided according to the Nahometan law: viz. one-fow th to the sife, and three-fourths to the nephew, as the reprefentative of his father, Allum Beg, who was confidered as the more immediate hair of the deceafed. This decifion was confirmed by the council of Patna, with the following exception in favour of the widow, that the heir at law fook pay leer unefourth of the rents of the ulturnghaw, or royal grant, for her fupport during life. The widow, however, refufed to fubmit to the decifion, or to deliver up the etheio of her hufband; in confequence of which compulatery methods were ufed; when, by the advice of fowe Enolim lawyers, an action of trefpais was brought, accorliag to the law of England, againlt the cadi and two mufties for their proceedings agant her, laying the damages at about 66,0001 . Sterling. This procefs being brolight bifurc the fapreme court, was by them condueted in fuch a manaer as maft entail everlaaling $\pm$ infamy

Company. infany on the actors. They began with obliging the cadi and mufties to find bail in no lefs than $+0,000$ pounds for their appearance, which was immediately given by the council at Patna. The fupreme court then having entered into the merits of the caule, and decided the matter in the molt rigorons manner, according to all the forms of Englifh law, affeffed the cadi and muflies in damages no lefs than 30,0001 . Sterling. Their houfes and effects were feized by the fleriff's officcrs, and publiely put up to fale: the cadi, who was upwards of 60 years of age, and had been in office for many years with great applaufe, died on his way to the common gaol at Calestta, to which the nephew and two mufties were conveyed, being a diftance of no lefs than 400 miles from their former refidence at Patna. A fuit, however, was commenced againt the widow, on account of having forged the title-deeds by which the claimed her hufband's eltate; but it was fupprefied on aceount of fome informality.
Another decifion, by which the fupreme court likewife incurred muth cenfure, was that againt Jasgernaut, the principal public officer of a Malometan comt at Dacca. The action was brought at the intigation of an Englifh attorncy, in behalf of one Khyne, a fervaut or meffenger, who had been fined and impritioned for a mifdemeanor, in which Jaggernaut had concurred in virtue of his office as judge of the Nisamut (the name of the Mahometan court juft mentioned). The heriff-officers attempted to arrcit the judge as he fat on the tribumal; which could not fail to produce much difurbance. Jaggernaut, with his officers, denied the authority of the fupreme court over the Nizamut, and refufed to comply with the writ. The Inglith theriff-officers proceeded to force; and a violent foufte enfuing, Jaggernaut's father was wounded in the head with a fivord by one of the under-heriff's attendants, whike his brother-in-law was very dange3ounly wounded with a pitol bullet by the under-fheriff himfelf. 'The immediate confíquence of this was an abfolute refufal of the judge to take cognizance of any criminalmatters; and this was intimated in a letter from the conmeil at Dacta to the Englifl governor and council of India; wherein they declared that all criminal jutice was at a iland.

The faprome court, having proceeded in this arioitany an! oppofive manner for fome time, at lengeh attemptes? to extend their junistiction over the hereditury Zomindars of lengad. Thefe are a kind of tributary lords, or great landholders, who are anfwerable to the company for the revences or rents of the difiricts; and excepting the eircumfance of remittige their revenucs to the company, have not the leat connection with the Englill in any refpect. At the time we fealk of, howerer, a writ, upon an action of debt, was ifferd out to anefl one of thefe Zemindars in his palace. Timely notice, lowever, was given, by one of the conapany's collecturs, of this attempt to the governor and conmil, and application made to protect a man of fuch quadity from the difrrace of an arrett. They being unammouty of opinion" that the Zemindar was not within the junifaction of the court of Calcutta, defired him to pay no regard to the writ. The court, hewser, determined to enforce their procefs by a writ of Gequeftation; upon which the naFob. T. Part I.
tives, who are fupernitioully attached to thein Zemin- Compane dars, whe in his defence, and infulted the theriff's of. fiecers. The latter having olitained a reinforcement, the Zemindar's palace was entered by 86 men anned with bludgeons, cutlafis, and munkets; the apmemere: of his women, atherss hed inviolathy facred by the Aliatics; was brotwn open; his temple profuned; and the imatre, which was the olject of his vorflip, par iato a bafket, and canried of with fome common himber. 'llis roufed the attention of the govemor and council: who, from a full conviction of the rumons tendency of thefe proceedings, determined at latt to appofed force by force. Thy accordingly fent a party of military to apprephend the fheriff's people, and they were all conducted prifoners to Caleutta. The judges ordered attachments againt the officer who commanded the troops, and againt two other fervants of the company; whle the governor and comeit endeavoured to juftify their proceedings, by writing to England as already menti ned.

Befides all this, the natives themfelves teftified their difapprobation of the conduct of the fupreme court in very flrong terms. A petition to his Britannic majelty was fent by the natives of Patna; in which are the following remarkable paffages: "When the ordinances of this court of judicature were iffued, as they were all contrary to the cultoms, modes, ufages, and inllitutions, of this country, they oceationed terror in us; and day by day, as the powers of this coust have become more ettabhthed, our ruin, uncalinefi, dithonour, and diferedit, have accumulated; till at lafl we: are redoced to fuch a fituation, that we confider death to us as infinitdy prefurable to the dread we entertain of the court : for from this court no credit or chanacter is left to us, and we are now driven to the laft extremity. Several who poffefed means and ability, deeming fight as their only fecurity, have banihed themfelves from the country; but bound as we are by poverty and inability, and fettered by the dearett ties of confanguinity, we do not all of us poff is the means of flight, nor have we power to abide the oppreffon of this court."-" If, which Gud forbid! it flould of happen, that this our petition flould not be accepted, and thould be rejested at the chamber of autiono: thofe amonetl us who lave power and ability, difearding all afiection for our familics, will ty to any quarter we can; whilt the remainder, who late no mean. or ability, *iving themfelves up with pions refignation to their fate, wiil it down in expectation of dath."

Theie repeated complaints could not but be taken notice of in parliment. On the 12 th of February 178:, General Sinith made a motion in the houfe of commons, that the petition from the Britifh inhalitants of Bengal, Buhar, and Orifha, thould be taken into confideration by a felcet committec, confifting of 15 perims, choton by ballot. In the introduction to his motion, the thated briefly the bad conduct of the fupreme court in tlie paticulars already related; and concluded, that the allairs of Bengal required the immediate attention and conideration of partiament. The matter was accordingly debated; when, after various propofals, a motion was at length made by General Smith, for have to bring in a binl "to explain and amend to much of an act paffed in the $13^{\text {th }}$ year of his prefont majely, for the better regulation of the Eat

## C O MI [ 234$] \quad \mathrm{C}$ O M

Company. India company, as atlated to the adamintration of juthice in Bengal ; and alfo to indemnify the governor and conncil of lengal for having refited by force of ams the excention of an order of the fupreme count of judicature in that kingdom." Leave was accordingly given to bring in the bill. The houfe having refolvel it felf into a committee, Lord North obferved, "that it had been mucla his wifh that an ayreement for the renewal of the company's charter had been made in an amicable manner; and that voluntary propofitions Aould have come frem themfelves, offering terms for the benclit of the exclufive trade and the territorial acquifitions. No fuch terms, howaver, had been propofed, nor any a arreement made. A negociation had indeed taken place between hin and the chairman and deputyochairman; but the propofitions made by them were iucther fuch as the public might expect, nor had the company any right to them. With regard to the tentecrial poffeflions, he was clearly of opinion, that they of right belonged to the public ; though how far it rimht be proper to allow the revenue of them to acmain in the polielion of the company was quite annther matter. In lis upinion, it would be proper to aldow it to remain in their hands as long as they pofdeffed an exclufive trade, but he never would confent to forego the claim of the pulic. He made a motion, thenefore, that it was the opinion of the committee, that three-funths of the furplus of the net profits of the Fant hidia company, ever fince the company's bund-debt was redaced to L. $1,500,000$, and the company's dividends had been eight दer cent. fer anmum, belong to the public; and that l.. 600,000 in lieu theteof, and in difcharge of all chaims on the pat of the puthi, te paid into his majetty's exchequer by intalments, in fuch manner, and at fuch times, as thall be egreed on." This propuff wa., vehementy eppofed by the minority. Mr Burse callid th the daing effort of a miniter determined on rapine and plurder, without regard to truth, honour, or jaltice. Mr Ihufiey reprobated the idea of taking L. 600,0 oco from the company in their circumfances at that time. He produced a paper full of arithmotical calculations, which he read to the houfe; afierting that they contained an exa:Ct flate of the anount of the company's exports and impert:, the exjences cof their trade at lome, and the balance of profit of each year, for many years patt, diHtinguilhing the teritorial from the cormercial income and expences. From thefe fo thowed, that the commescial and ternitorial revenues of the company had, upon an average for 15 years, couftituted a fum equivalent to a proportion of 16 per comt.; that 9 per went. of this had arifer from the commercial profite accruing to the company; and thenefore, that there had not bech $\$$ per cent. divided upon that part of the perfits to which the publichal any clain or pretenfon. The acceffon of territorial poffefione, lie obferved, had brought along with it additional experces; and the public had aheady received a very large thare of the company's prolits. Ho declared it to be his opinion, that the company flould ahoalys make it a rule to give as ample and fuil relicf to the public burdens as their fituation would allow; and if they did this, he faw no eafon why the minifter fhould uxpect any more. Mr Dompiter reminded the houfe of the confequences of violating the Ameriean chartors; and added, that to
tear from the company hy force what was not flipula- Company ted in any aft of parliament, would be a breach of public faith difgraceful to the mation, and fuch as would damp the fpirit of enterprize and adventure which haui been productive of fuch happy effects.Notwithftanding thefe remonfrances, however, the bill was at laft paffed into a law; only with this mitigation, that the company hould pay only $1.400,000$, inftead of $L .600,000$ demanded originally by the minifter. Another bill was alfo paffed the fame year, in confe. quence of the motion made by General Smith. This act declared, that the governor-general and council of Dengal were not fubject to the jurifdiction of the fupreme court, and indemniticd the former for the reliftance they had made to the orders of that court. It enacted alio, that mo petfon thould be fubject to the jurifiction of that court on account of his being a landholder or fromer of land in the provinces of Pengal, Bahar, or Orixa ; thet no judicial officers in the comitry courts fhould be liable to adions in the firpreme conrt for their decifions; and the two mufties, with Behader Beg, who were then in prifon, in confequence of the decilion of that court in the Patna canfe, were ordered to be fet at liberty.

The delbates on this fubject were atturded with themof violent charges againt the miniter, and affertions the mof humiliating and difgraceful to the Britih nation. Mr Townfhend affirmed, that it was from the miniter's fereening the delinquents who canc from india that a!l the evilo in that quarter had originated; and if matters were fuficred to go on in that country as they had done for fome time paft, the conduct of the Critim in the Faft maties muf be viewed in a light Atil more deteftable than that of the Spaniards in America. It was reportcal, that the naboth of Areot had fueral nembers in the houfe of commons! If it were trae, that by ferding over a fum of money to England he could feat eight or ten menbers in that honte, then Mr Townfend declared, that in his opinion they were the moft abiect and contemptille beings in the world.-- The bill for requlating the powers of the fupreme court, alfo, though fo cirivently founded in reafon and jultice, did not pafs without oppolition, particularly from Mr Dunning; who was thought on this occafon to have allowed his regard for his friend Sir Elijah Impey, the chicf jufice, to bias hiin too much.

The regnlations jurt mentioncd did not yet put an end to the tronbles of the Lafl India company, nor allay the furment which had been fo effectually excited. Their affairs were ftill a fubject of parliamentary difcuffion; and in the month of April 1782 , a motion was made by Mr Dundas, then Lord $\Lambda$ dvocate of Scotland, for taking into confideration the fevcral reports concerning affairs, which had been made by the fecere committee appointed to inquire into them during the laft and prefent fefion of partiament. In his fpeech on this occafion, he remarked, that the opinion of Lord Clive had been againt keeping too extenfive a territory in that country. Inflead of this, he had reftored Sujah Dowlah to the poftefion of his country; conlidering the Britifh territories in Hindoftan, with thofe on the coals of Coromandel and Bombay, as fufficient for all the purpofes by which this country could be benefited; but inftead of adhering to the masims of found policy

Compary laid down by his Lordhip, they had beconce fo antbitions of extending their territories, that they had inwhind themflues in a war with almolt all India. He then confidered the finances of the company. The revenue of Bonbay, he faid, foll flom of the neceffary civil and militaty cltablifhnent by L. 200,000 a-year, which was annally drawn from liengal. With regad to that of Madras, it appeared, on an average of 12 years, from 1767 to 1779, What there had beve eight zears of war and only four of jeace; and that, duriur the whole time we war, the revorat had wot beca able to fipport the civil and militery ctlablihnsents; thou fh, in time of peace, it was able to do marly one-hanf
 the Eat Lafia fatcraents; beet finh had bun the expunces of the Nalmata war, that the counmo-general had bean obl: ged to comeact a very large detre, infomuch that it was drabefol whether the incoshments for Finglad houla be wacliy or partially fulpaled. Nir Ihathys, he [aid, hat in mens infances prowed himFalf a very muiturious ferant: but he wihed that svery one of the ir fervants wodd cordiler himite as hound in the firt phace to prove a fithfol flevad to the company; not to fancy that he was an Allander or Aurengicbe, and prifer frantic military exptuits to the improvement of the tavie and comeracree of his country.-General Smith obfered, that by the evidence produced to the committer, it apperred that the re had beca a variety of great abufes in inda. Sir Elijah 1 mpey, lis majety's chief jaftice in that country, had fo far deregatel from the chamerer of ij judge, as to accept of a place from the company; by which means the was brought wader their controul, and confeguently athowed limfolf to be deprived of that independence which he ought to polids as a judre. Jutitice had been fo partially adminilered, that feveral worthy and refpectable perfons had been impeifoned, fome had been ruined, and others died in jail. From all which confiderations he moved, that the aftirs of the conipany onght to be talken into confideration by a commintee of the whole hurfe. Some hints were thrown ont Ly Mry Dundas, that the territorial poffefions in the Eat outht to be taken from the eompany matirely, and pat under the dinction of the crown; hut this was oppofed by Mer Fox, as fumihing mimifers with fuch ample means of corruption and undue infuence, as might overthow the conllitution entirdy. For this reafon, he thouglit it would be mimre prudent to leave the appointment of its owa fer*ants to the company; but at the fame time to kcep a vatclifui eye orer them, in order to be able to punifh and remove thofe who fhoud be found delinguent.

The houfe having refilued itfelf into a committee, a motion was madt by General Smith, "That Warren Frantings, Efq; governor-gencral of Bengal, and Sir Elijah Impey, the chief jultice, appear to have been concerned, the one in giving, the other in receiving, an office not agreeable to the late act fur regulating the company's affairs: which unjutifiable tranfaction was attended with circumitances of evil tendency and example." Refolutions were alfo pafied for afeertaining more diftinetly the powers of the governor-gencral and conncil of Bengal ; and votes of cenfure againt Laurcnce Sulivan, Efi; chairman of the Eall India
company, for having neglected to tranfinit $t$ I India an
at for explanmen and amendins the act for rerulation the affars of the company, and for the relief of cortaim purfons imprifoned at Calcuta. Among the namber of this gembeman's tranfordons, alo, was his impofing an oath of feerecy on Mre Witkes, one of the company's clerks; and efpecially his refraning him from giving information to a fole commitree of the hurfe of commons.

Nif Dumds having made feveral motions tom? ing to criminate Sir Thomas Ramboht, fommel:guvernen of Bongal, a bill was broustht in, ah?
 rime, Efq; from goine ont of the knirdom fo: the
 An adarels wats alfo prelente! to the kinsa regucllans hina to recal Sir Elijah Imper form Ludia, in order to anfor for high crimes and mifdemouners. A momber of other refolutions was now patiol hy the home, in comfequence of motions by Mr Dondas, and which Were foumded un the repurts of the Secset Com. nattee. fimonr thefe it was refolved, "That the conder of the Court of Directurs of the Eal India Company, which have conveyed to their fermant: abroad a prohbituy condemation of all fonemes of conqualt and udargememt if dominion, by proferibins certain rules and bomdarics for the operation of their military force, were fomded no lefs in wifdom and poliey than in jutice and moderation. That every thanfreflom of ahele orders, without evident necefity, by any of the feveral govemments in India, has been hishly reprethenble, and tended in a gecat degree 10 weaken the fumce and influcace, and to dimimith the intucuce of the company in thofe parts. That every interference of the company as a party in the domedic or national quarels of the country powers, and all new engagements with them in offentive ailiance, ha:e been wifely and providentially forbiden by the company in thia commands to their adminitimations in ladia. That every unnceeflary deviation from the rules fhould be leverely reproved and punithed. That the maintenance of an inviolable character for moderation, good fith, and forupuluns regard to treaty, ought to have been the fimple grounds on which the Britith government fhould have endaroured to elta. Llith an extenfive influence, fuperior to that of other Europeans; and that the danger and diferedit ariting from the forfeiture of this preennintace, could not be compenfated by the temprory huceefs of any plan of violence and injultice. That fhowd any relaxtion take: place, without fufficient caufe, in thofe prineigles of good government on the part of the directors themfelves, it would bring upon them, ia a heavier degree, the refentment of the legillative power of their country. That the conduct of the company, and their fervant in India, in varous intances frecified, wats contrary to pulicy and good faith; the company's fervants, in their prefidenej of Mombay, had been ginilty of notomious intances of difobedicace to the orders of theiremployers, particularly in forming an allimee with Rat gobah, or Ragonaut Row: that they had modertakin, without any adequate military force, or certainty of a fuificient revenues, and withont proper commenication with the fuperior govenment upon which they wore to depend fur faction and fuppurt, to rematate the G g 2
whrper

Cimfary ufurper above mentioned, and thereby to involve themSelves in a war with the ruling minifters of the Mahratta flate, while Ragobah himfelf was not in the mean time able to give the company any fecure poffetion of the grants he had made to them for the purchafe of their affifance. That it was the opinion of the houfe. that all the difalers in which the Britifh empire in the Ealt were involved, hai proceeded from the unjuttifable manner in which the Malrattas had beentreated, and the conduct of the Madras prefidency in other reipects fpecified. That it is the opivion of this houfe, that it muft be reckoned among the additional mifchiefs arifing chiefly foom the improvident war with the Mahratas, that the military force of the Carnatic had been weakened by reinforcoments fent to the Malabar coaft : that the Bengal guverument had been under a neceflity of fupporting, on their contines, the army of a power confederated againtt them (A) : that they had been under the neceffity of fuing for the mediation of the fame power; had fubmitted to a refufal, and purchafed at laft an uncertain, becaufe apparently an unauthorifed, treaty, on moft extravagant and difhonourable conditions, with Chimnasce the rajah of Beran's fon : and, finally, that being burdened with the expences of a variety of diftant expeditions, while their allies were in diftress, and their tributaries under opprefion, there was alfo an alarning deficiency in the refources of revenue and commerce, by the accumulation of their debt, and the reduction of their infeftment. That it was the opinion of the houfe, that an attempt made by the government-general, in the becinning of lanuary 1781 , to form an engagement of alliance, offenfive and defenfive, with the Dutch Eat India company, in the manner tated by the proceedings of their council, was unwaranted, impolitie, extravagant, and unjut.

Thefe fevere cenfures extended even to the directors themfelves, whofe conduct on fome occalions was declared to be indefenfibie, as well as that of their fervants and agents. It was alfo refolved, "That Warren Haflings, Efq; governor-general of Bengal, and William Hornoy, Efq; pretident of the council of Bumbay, having, i: fundry intances, acted in a manneer repugnant to the honour and policy of this nation, and thereby brought great calamities on India, and enormous expences on the India company, it was the duty of the directors to purfue all legal and effectual theans for the remoral of the faid governor-general and prefident from their offices, and to recal them to Eritain."

The commons having thus feriouny entered into a zonfideration of Eall India affairs, foon found fill more abundant reafon for cenfure. It was difcovert.d, that corruption, fraud, and injuftice, had pervaded every department. It had become an object with the fervants of the company to opprefs the natives by every polfible method. They monopolized every article of trade, and feemed to have no other principle of commerce but kawlefs vilulence: the Court of Directors fent out infructions; but for the moll part without my effect. Though the delegated adminiftration of

India ought to have preferved the frictef obedience to Conipany. that of Britain ; yet, being at fo great a diflance from the feat of fupreme authority, and being poffefled of endlefs means of allufe, it had become corrupt in an exireme degree. Intead of being fulbfervient to government at home, the adminiftration of India afteted independence. The maxims of Mr Hallings were arbitrary; and he fuemed to have no inclination to obey. Fe treated with fovereign contempt the authority of the Court of Divectors; and the confulion produced by the difputes between them were fortered by the body of India proprictors, who were difpofed to act as a check upon the dirctors. The neceffity of new regulations in the government of India was univerfally admited; and a bill for zais purpofe was accordingly brought in by Mr Dundas. His propofitions were, that the governor and council of Bengal thould have a controulins power and jurifdiction over the inferior prefidencies of India; and he was of opinion, that the governongeneral fhould be insefted with a power to act even againit the will and opinion of the council, whenever be hould imagine that, by fo doing, he could contribute to the public good; though, in thefe cafes, he alone thould be refponfible for the event. With regard to the inferior governors, though he did not think it proper that they fhould be authorifed to act contrary to the advice of the comacil, he was of opinion, that they ought to have a right of negativing every propofition, until application was made to the governur-general and council of Bengal. With regard to the Zemindaries, and other tenures of land, he obferved, that when Hindoftan had been conquered by the Moguls, a tribute was impofed upon the Zemindars; and while they continued to pay this tribute, they accomited themfelves to be the real proprietors and mafters of the lands they pollefled. Thie people called Ryots, to whom thefe Zemindaries were let out, confuered themfelves likewife as fecure in their poffefions, while they performed the articles of their refpective cuntracts. Of late, however, thefe rights had been infringed; and the Mogul came to confider limfelf as the abfolute mater of all the foil of Indoftan: which maxim he was inclined to dettroy, and ereft upon it another, that might fecure the land-holders in their property. He propofed to fecure the nabob of Arcot and rajah of Tanjore in their territories, by making an act of parliament in favour of the later; but was of opinion, that the debts of thefe princes ought not to be too nicely inquired into, as the greatel part of them originated in corruption. He was clearly of opinion, however, that Governor Hattings ought to be recalled; and that fleps ought to be taken to prevent the court of proprietors from prefuming to act in contradiction to parliament. Lord Cornwallis appeared to be the molt proper fucceffor to Mr Haltinges. His perfonal honour, and that of his ancefors, were pledges for his good behaviour; and being independent in his fortune, he could have no view of repairing his ettate out of the fpoils of India; and from his profeffon, he could add to the character of governor that of.
(A) The powe: herc alluded to was Movdajee Boofla, Rajah of Derar. See Indosras.

## $\begin{array}{llllll}\mathrm{C} & \mathrm{O} & \mathrm{M} & {\left[\begin{array}{lll}237 & \mathrm{C} & \mathrm{O} \\ \mathrm{M}\end{array}\right]}\end{array}$

iCompany. commander in chicf; he would not, however, infilt on his name being filled up in the bill, as that woukd relt more properly with government.

Mr. Hatlings was defended by Governor Johntone, who endeavoured to ridicule the arguments and propolats of M1r Dundas. He whferved, to the ho. nour of the former, that he had been able to conclude a peace with the Mahrattas; and while he enlarared on his takents for megociation, he admired the refourees with which he had fupplied the expences of the war. It ought to be confidered, that Mr Hattings wras in a fituation the mold diflicult, and that no man cond have fultained it with more fortitude and ability. His enemies had dealt in infinnation and inveckive; but when the hous of trial eame, they would hind that their charges would be refuted with equal eafe. He was defended allo by. Mr Dempller, who advifed the houfe feriouly to think before they paffed a vote for the removal of Mr Hatings. His exertions had been extraordinary; and it would then be as ridiculous to fuperfede him, as it would have been to reeal General Elliot, when the Spanilh batteries were playing againt Gibraltar. He was not, however, an advocate for all the meafures of Mr Fallings; his errors might be numerous: but no renfure of him fhould be eftablithed before they were pointed out and explained.

Mr Dundas having now obtained lave to bring in his bill, another was moved for by Sir Hemry Iletcher, "That leave be given to bring in a bill to wifcharge and indemmify the united company of merchants trading to the Eatt Indien, from all damages, interest, and loffes, in refpect to then not making regular payment of certain fums due to the public, and to allow farther time for fuch payment; to enable the company alfo to! ${ }^{\text {r rrow }}$ a certain fum of money, and to make a dividend to the proprictors of four por cent. at midfummer $1783 . "$ He endeavoured to how, that the public had derived very confiderable advantages from the company; that their dividend had been L. 8, 4s. annually during the time of peace, and L. 7, 15s. per cent. during war; they were by no means in a ftate of infolvency, as fome members had endeavoured to prove, their prefent applieation proceeding only from a temporary embarrafiment. A new difpute took place eoncerning Mr Hallings, who was warmly attacked by Mr Burke, and defended by Governor folantone. The former enlarged on the bloodhed, ravages, and rapacity, which had taken place in India. The eftablifhed fyftem of the fervants of the company, he faid, was rapine and robbery. The Mahratta war was occafioned by their refufal to be robbed; the famine at Madras was occafioned by the mifconduct of the Englih government in India; and he fet forth in ftrong colours the manner in which the Indian princes and princefles had been plundered. He inftanced, that Mr Hatings had raifed L. 800,000 in Bengal by private loan; and ufed it as an argument, that the company had ceafed to exilt, and that their commerce was mothing more than an inttrument for procuring immenfe fortunes to individuals, totally defitute of confcience or principle.

All this was exeufed by Governor Johntone. Ile regarded the fum of L. 800,000 as merely trifing, when the number of civil and military fervants on the Bongal government was comfodered. The famine a:

Madras was owing to the modes of war vimeln prevail- Company. ed in the Eaft; as the enemy there mataed their courfe by defolation. He eoncluded with cenfuring the manner in which Mr Ihaftings had been froken of; and infifed that his high reputation ought to have guarded him from fuch infults. Mr lburke replied by an intimation of his delign to injuach Mr I fattings on his retarn; whom he eatled the gratert delincquent that had ever rivhated in ladia the rights of humanity and jultice.

It was ubicred by Lomel John Caveridim, that the tenitoril acquilitions of the company wern a froitful fonce of gricuance; and it would have been mone For their adrantage to hase confined themelves to their oridial character of merchants. ifowever, as the teriterial aceutitions had been obsined. it was proper to take means tor their prefervation; as utherwife they would not revert to the natives, but fail into the hands of our matural enemics the French.

In the lioufe of peers the eaule of the company was ably dofmed by Earl Fitowillian. He mantaned, that their gitation was deficrate, and bankuptey inevitable, unde sulief was initimly aflorded. A repont of their being in an infolvent thate had gone abroad; and nothing was bettor ealculated to preferve and fupp it their cedit than a lage dividend faretioned by act uf parliement. The expenditure on their fettlements had far execeded their revenue ; of confequence their fervants had drawn bills, which they were mable to anfiver without a temporary fuppiy. Thas the exithence of the company might be dad to depend on the bill; and he laped no objections could be raifed flrong cnough to dellroy it.

On the irth of November 1583, Mr Fox propofed his celebrated Ealt Iudia bill, which for fome time attracted the attention of the mation at large in a very confoderable degree. By this it was intended to take from the India propricturs and directors the entire adminitration of their territurial and commercial aflais. It rook from them alfo their houfe in LeadenhallArect, together with all books, papers, and documents, vetting the entire manarement, the appointment of all olfictrs and fervants, the rights of peace and war, and the difpodal of the whole revenue, in the hands of certain eommiliwners. Thefe were, in the firft infanec, to be appointed by the whole legillature, but afterwards by the crown; and were to hold their offices by the fause tenure as the judges in England, viz. during their good behaviour; and could be removed only by an adurefs from one of the houfes of parliament. 'They were required to come to a decifion upon every queUlion within a limited time, or to aflegn a fpecific reafon for their delay. They were never to vote by balIot ; and, almolt in every cafe, were to enter the reafon of their vote in their journals. They were alfo to fubmit, once every lix months, an exach itate of their accounts to the court of propictors; and at the begiming of every feflion, a fate of their accounts and ettablilhments to both houfes of parliament. Their mazber was limited to leven; but they were to be aflited by a bodicl of nine perfons, each of them poffeffed of L. 2000 company's tlock; who, as well as the comminoners, were to be appointed in the frote intance by pathament, and ever afterwalds by the court

© ryar: ihe pherace of any hise commiffoners, and were dife mand cuatified firm fitions in the houfe of commons. The whole fyitem of govemment thus propofed, was to continme for the fpace of three or live yeuts.

This was accompanicd with another bill, the profofied delign of which was to prectude all arbitrary and defpotic proceedings from the adminitration of the company's teritorial porfolions. By this the powers of the corcmor-gencral and fupreme council were afcertaned move eractly than had hitherto been done; it deprived the govemor-genemal of all power of actinge independent of his council; proferibed the dele. fation of any twof ; and dectard every Britian power in the Eall incompetint to the acquinton ox axchange of any taritory in bllulf of the comonry, to the acecdim to any trent of pattition, the hiof ont of the comeany's troops, the appointing to othice any jerfon removed for midemeanour, or to the hiring Gut any froperty to a civil forvant of the company. Bry thes allo monopolies weae enticly abolnted; and illergal profent; rocoverable by any ferton for his fule bencfit. The principal part of the bill, however, related to the Zemindars, or native landholders, who wete now to be fecured by every foffible meats in the podifion of their repeciive inlecritances, and defoid. ed in all cafes from oppreition. Iattly, a wode was prefented for teminating the difputes betwen the nabob of Areot and the rijeh of Tanjour ; ditqualifying every perfon in the fervice of the company from fitting in the Ifonfe of Commons during his continuance in their lervice, and for a cortain ipecifed time after his demiffion.

During the courfe of the dibates on this bill, Mr Fox fet forth the affairs of the company as in the mut defperate fituation. They had allal lav, he faid, the year before, tu borrow L. 500,000 upon bunds; had pecitioned for L. 300,000 in exchequer bills; and for the fufpenfion of a demand of L. 700,000 due to govemment for cuftoms. He took notice alfo, that, according to an aft of parliament flill in force, the directors could not, by their own authurity, accent bills to the anount of more than L. 360,000 ; under which circumitances it would no doubt furprife the houf to be informed, that bils wele row coming over for acceptance to the amonast of L. $2,000,00 \therefore$. It was evidently, thenfore, and imilifulably ncentary, that government theold interfere in the aftairs of the company to fave them from certain bankuptey. He flated their aetual debt at no lefs than L. I $1,200,000$, while their fock in hand Jid nut exceed L. $3,200,000$. There was therefore a deficiency of $L, 8,000,000$; a molt alarming fum when compared with the compaמ.'s capital. Unkefs lipeedily anited, therefore, they mult inevitably be ruined; and the ruin of a company of merchants io extenfive in their concerns, and of fich importance in the eyes of all jurope, could not but give a very fevere blow to the national credit. On the other hand, the requibe aflifance was a matter of very extenfive conideration. It would be abfolately neceffary to permit the acceptance of the bills to the sbove mentioned amount; and to do this without regulating their affirs, and reforming the abufes of their forernment, would only be to throw away the public :money.

The conduct of the company"j fervants, and of the
company ivfld, was now arraigned by Mr Fox in the Companto noll lexere terms; and their mifeonducts were point. al ont under the following heads:

1. With regard to Mr Ifattings.-The chaiman of the committee had moved in the honfe of conmons, that it was the duty of the company to recal that gentleman; to which motion the houte had agread. In obedience to this refolution, the directors had agreed that Mr Haftings hould be recalled: but fupponing this to be a mater rathur beyond their juridicliun, they lad fubmitted their determination to a conl:t of proprictors, who refcinded the refolution of the directurs ; and after this the whole affair came to be lat before the hoafe of commos. In the mean time every thing was anarcliy and confution in the Eatt, owing to this unfethled conducz with regard to the governor: as the whole continent had been made acquainted with the refolution of the houle for recalling him, while that of the proprictors for continuing lim in his office was kept a fecret. The proprictors lead affo been guilty of another contradiction in this refoet, as they had roted thei thanks to Mr Hatain fur ins conduet in India. Hence inf Fox was led to comment on the nature of the eompany's connećtions with their fermants abroad, as well as on t!e ehameter of the company themflucs. Amoner the former, he faid, there were a few, who, being propritaurs themfelves, endeavened to promote the trade of the company, and increafe its revenues. The views of the ref wex othemife directed; and from the differeace in ifuculation between the two parties, thie former were inclined to fupport that governor who enabled them to make large dividends; and who, for that reafon, after having peculated for his own adrantiage, was obliged to du the fame for the benefit of the proprictors. The latter, thenefore, could not better gratity their withes, than by fupporting a governor who had in his power fo many opportunities of providing for his friends.
2. The next charge was againft the fervants of the company, whom he acculed of a regular and fyttematic difubedience to the orders of the proprietors. 'The fupreme council of Bengal, he faid, had refolved, in oppolition to Mr Haltings, to fend two gentlemen. M" Fuwke and Mi Brifow, the one to refide with the Nabub of Oude, the other at Benares. Mr Haitings, however, refufed to fend them: the directors hranmited the molt politive orders to carry the vote of the fupreme council into execution ; but till Mr Haftings difobeyed; alleging in his defence, that he could not employ perfons in whom he had ne confidence. Afterwards, however, Mr Haftings feemed to contradict himfelf in a very curious manner. He granted Mr Fowke a contraćt, with a commifion of 15 per cent.; which, he obferved, was a great fun, and might operate as a temptation to prolong the war. " Lut (added he) the cntire confidence I have in the integrity and honour of Mr Fowke, amounts to a full and perlect fecurity on that head."

To this IUr Fox added fome other inflances of a fimilar kind; but though he fupported thefe and the projected bill with all the argument and cloquence for which he is fo remarkable, he found it impollible to make his feheme agrecable to the majority of the howe. The ftrongelt opponent was Mr William Pitt,

Eompany. Who infited chiefly on the two following topics. 2. It infringement, or rather amihilation of the company's charter; and, 2. 'ihe new and unconditutional influence it tended to creatc.-He owned indeed, that India food in need of a reform, but not fuch a one as broke through wery principle of jultice and reafon. The charter of the company was a fair purchafe fiom the public, and an equal compat for reciprocal advantages between the proprictors and the nation at large; but if it was infringed in the manner propofed by the bill, what fecunity could other trading companies have that they howld not be treated in the fame manner? nay, what fecurity cauld there be for Magna Clarta itfle? The bill, he faid, momed to a confifcation of propesty. It had been fuggefted indoed, that it was not a bill of disfanchifement, becank it did not take from the proprictors their right to an exclulive trate; but this was not the only franchife of the proprietors. A freehold might have a franchite annesed to it, the latter of which might be taken avay, and yet the property of the former remain; in which calc it could not be denied that the frectinlders would have great caufe to complain. The cafe was catctly parallel with the lndia flock. Perfors poffeflid of this to a certain amount, were intitled to a vote upon every important queltion of the company's affairs; and on this account the purchafe-moncy was more contiderable. But, by the bill in queftion, this priviluge was to be taken away; which plainly amounted to a diffranchifment.

The great objection to this bill, however, foemed to be a fufpicion that it was a feheme of Mr Fox to gratify his own perfonal ambition as a miniller, he bein: at that time fecretary of fate. On this account be was deferted even by the patriotic members, who, upon former occations, had fo frenuoutly fupported his caufe- Mr Dundas accufed him of atiempting to create a fourth eftate in the kingdom, the power and infaence of which might uverturn the crown and fubvert the conltitution of Britain. A fetition was prefented from the proprictors, and another from the directors of the company, reprefenting the bill as fubverfive of their charter, and confifating their property, without either charge of dinquency, tridi, or conviation. They prayect, therefore, that the acts of delinquancy profumed againt them might be Itated in writiog, and a reafonable time allowed them to celiver in their anfwer; and that they might be leeard by counfel againt the bill. About the fume time the directors gave in a ftate of the company"s affaris, dif. fering in the molt extraordinary manner from that given by Mr. Fow. In this they reprefented the creditor fide of the account as amounting to L.I.1,311,17.3, and they brought themfelves in debtors to the amount of L. $10,3+2,692$ : fo that of confequence there was a balance in their favour of L. $3,568,481$. This was vehemently contefted by the fecretary, who faid he could bring objections to the ftatement of the directors to the amount of more than L. $12,000,000$ Sterling. He then entered into a particular difcuftion of the articles ftated in the directors account, and made good his affertion. Oljections to his method of calculation, however, were made on the part of the company ; fo that nothing could certainly appear to the public but that the company were at that. time much
 fupportad by government.

Nr Iose now procecded to a particular rcfetation of the arguments broushatagant the bill ; in which indocd he difplayed an altonithine fores of argument ard acutenefs of reifoning. The objection drawn from the valicity of the company's chaiter, he fot aFhe, by hoosing that the company had abofed the ir power, and that it was therefore neceffary to take it from them. This he faid always had been the cali, and mult be the cafo, in a fiee nation; and he hrought the example of Jomes II. Who, on acconnt of the ubute of his power, hat been cleprivel of it by the 11 tion at large. The cafe was the fame with the con. pany. They had mirde a bad ufe of their power, am? therefore the nation at large onght to deprive tha of it. It had been objected by the country gentlemen, that the bill angmented the influense of che emons too much; and by Mr. Dundas, that it reduced it t: nothing. Both thefe objections, he faid, were overturned by the circumfance of makiar the commilionat hold their ofince only during good behaviour. 'Thm:, when confions that they were liable to punifment it guilty, but fecure in cafe they faithfully difcharge! their trut, they would be liable to no feduction, bue would cxecute their functions with grlary to thamdives, and for the common good of their cunnty and of manhind. He then drew a comparifon betwist his own lill and that of Mr Dundas's ahready mentionct. The bill of the latter, he faid, had created a defpotic athority in one man over fome millions of his fellow-creatures; not indeed in England, where the remedy againt opprellion was always at liand; but in the Eat Indics, where violence, rrand, and mifchis every whereprevaited. Thus the bill propofod by M Ir Dundes afforded the mont extenfive latitule for malvernaion, while his own grarded againt it with every poffble care; as was inthanced in its confiling in no integrity; trulking in no chavaler; and annesing refpontibilaty not only tse every abtion, but cren to the inadion of the powers it created.

After having expatiatud for a confiderable time, the fecretary was feconded by Mír Burke, whofe force a gratory was cheffy dimefted, as indeed it wfrally ha: beea when fyeaking of India affurs, on the momitrous abufe of the company's pouce in that quarte. Efe affirmed that thoce was not in India a fingleprince; fate, or potentate, with whom the company had comc into conscit, whom they bad not fold; that there was not a lingle treaty they hat! ever made which they had not brokn: and that there was not a fingle prince or fate that had erer put any contidence in the company who had not been mined. With regard to the firt article, Mr Burke inilanced the fale of the Grear Mogul bimflef; of the Rohillas; the nabob of Bangal; the polygars of the Mabratta empire: Ragchah tho pretender to that empire; and the Suoah of Decan. -The fecond article was proved by a review of the tranfactions from the beginning to the end of the Mahratta war. With regard to the third, viz. the ruin of fuch princes as put any confidence in the company or their fervants, he defired them to look into the hiftory and lituation of the mabob of Onde. In the jear 1779 , this country had been vilited by a famine; a calamity which had been known to rclas the feve-

## C O M

compang. rity even of the moll rigoous government; yet in commthas already been given. In this bill he began company, this fituation the prefident of Bengal had put an ahfolute negative upon the reprefentation of the prince; adding, that perlaps expedients might be found for affording him a gradual relief; but their effict mult be dillant. This diftant relief, however, never arrived, and the country was ruined.

Our limits cannot allow a particular detail of the charges againt the company on the one hand, or the defences on the other. In general, it mult appear, that fueh fevere and heavy charges could not be advanced without fome foundation, though perhaps they may have been confiderably exaggeated by the orators who brought them. The picture drawn by Mr Burke on this oecafion indeed was fhoeking. "The Alabs, Tartars, and Perfians, had conquered Indoftan with valt effurion of blood; white the eonquefts of the Encligh had been acquired by artifice and fraud, rather than by open force. The Afiatic conquerors, however, had foon ahated of their ferocity; and the thont life of man had been fulficient to repair the watte they had occafioned. But with the Englinh the cafe had been entirely different. Their conquelts were ftill in the fame fate they had been 20 years ago. They had no more fociety with the people than if they fill refided in England; but, with the view of making fortunes, rolled in one after another, wave after wave; fo that there was nothing before the eyes of the natives but an endlefs profpeet of new flights of birds of prey and paffage, with appetites continually renewing for a food that was continually watting. Every rupee gained by an Euglifman in India was for ever loft to that country. With us there were no retributory fuperttitions, by which a foundation of charity compenfated, for ages, to the poor, for the injuftice and rapine of a day. With us no pride erected ftately monuments, which repaired the mifchiefs pride had occafioned, and adorned a country out of its own fpoils. Eaghaud had erected no churches, no hofpitals, no palaces, in fchools (the trifing foundation at Calcutta excepted); England had built no bridges, made no high-roads, eut no navigations, dug no refersoirs. Every other conqueror of every other defcription had left fome monument either of Itate or beneficence behind him; but were we tu be driven out of India this day, nothing would remain to tell that it had been poffefled, during the inglorious period of our dominion, by any thing better than the ouran outang or the tiger!"

All this cloquence, however, was at prefent entire$1 y$ ineffectual, and the bill was tinally rejected : much confuion and intercation enfued, which terminated in a change of minifiry and diffolution of parliament. On the 2 th of May $17^{8}+$ a petition from the company was prefented to the houfe of commons, praying for fuch relief as the nature of their aftairs might feem to demand. This was followed on the zith of June by a bill for allowint the company to divide fore per cont. for the hailf year concluding with midfumen 1784. Shis having paffed, after fume dehate, a new bill was propofed be Mr list fur relicuing the company in the mean time, and regulating their attairs in time to come. A bill to this purpofe had been brought in during the laft fultion of the fomer pariament by the fane gente man, which he withed to bring to a somparifon with that of Mr Fox, of which an ac-

[^11]and military government of India, or, in other words, the imperial duminion of our territorics in the Eat. onght to be placed under other eontroul than that of the merchants in Leaden-hall ftrect; and this controul conld be no other than the executive branch of the contitution. The commeree of the company, however, ought to be left as free from reftrictions as poffible; and, latlly, eapricious effects from the government of India upon the conftitution of Britain, were to be earefully avoided. A controul in the executive branch of the legiflature over the government of India lad indeed heen eflablifhed by the regulation bill of 1773 ; but the former interference of minifters had not been beneficial, becaufe it had not been active and vigilant. He now propofed, therefore, that a board fhould be inflituted exprefsly for the purpofe. This board was to be appointed by the king, and to confift of the fecretary of tate for the home department, the chancellor of the exchequer, and a certain number of the privy council. To this board the difpatches of the company were to be fuhmitted, and were not to be fent to India until they were counterfigned by them. To prevent quetions. concerning the commercial and political concerns of the company, it was propofed, that the difpatches upon the former fubject thould be fubmitted to the board; and that, in cafe of any difference, an appeal hould be made to the king in council. Though he (Mr Pitt) had not thought proper to accept of the propofal of the company to yield the appointment of foreign comacils to the crown, he was neverthelefs clearly of opinion, that the commaneler in chief ought to be appointed by the king. He propofed alfo that this commander fhould have a rote in council next to the prelident; that the king fhould be empowered to beHow the reverfion of his ofice; that the king might recal the governor-goneral, the prefidents, and any members of their comeils. He yiclded the appointment of all officers, with the fingle eeceptions he had Itated, to the count of directors, fubject, however, to the apprulation of the king; and that, in cafe of a negative, the directors hould proceed to a fecond choive, and fo on. He depriced the court of proprietors of their privilege of refeinding or altering the procecdings of their conrt of diretors; and with refuect to the foreign gonemment, he was of opinion, that their authority thould eompuife in it a conliderable difaetion, accompanied with the reftraint of refponfilinty. He propufed, that there thonld be a revifion of the eftahbments in Ludia with a view to retrenchmats; that appointments, hound take place by gradation; and that a new and fummary tribunal hould be erectod for the trial of offences committed in that country. With regard to the Zemindaries, though he could not lelp paying a compliment to Mr Fox, on his intention of returing them to their proper uwners, be yet thought that a gencal and indiferiminate rellitution was as bad as an indiferimatate confifcation. He therefore propofed, that an inquiry floould be inflituted for the purpofe of reftoring fuck as had been irregularly and unjutlly deprived, and that they fhould in time to come be fecured againf riolence.

In the biil of $1-8+f$ fow alerations were made: and thife

## C O M $\quad\left[\begin{array}{lllllll}24 \mathrm{I}\end{array}\right] \quad \mathrm{C} \quad \mathrm{O} \quad \mathrm{M}$

Compang; thefe uniformly tended to enlarge the powers of the board of controul. They were permitted, in cafes of emergency, to concert original meafures, as well as to revife, correct, and alter thofe of the directors. In matters relative to peace or war, where fecrecy was a principal object, they were allowed to fend their orders directly to India, without any communication with the directors; to the commander in chief, without any communication with the prefidencies; and the number of perfons conftituting the different councils of Bengal, Fort St George, and Bombay, was determined. -The governor-general and council of Bengal were to have an abfolute power to originate orders to the inferior prefidencies, in fuch eafes as did not interfere with the directions already received from Britain; adding a power of fufpenfion in cafe of difobedience. The flupreme council were forbidden, unlefs any of the Indian princes fhould have firt commenced or meditated hoftilites, to euter upon war, or form an offenfive treaty, without orders from home. The infetior councils were forbidden in all cafes to form alliances; and in cafes of urgency, were commanded to infert a provifional claufe, rendering the permaneney of the alliance dependent on the confirmation of the governor-general.

Various falutary regulations were propofed concerning the behaviour of the company's fervants, againft whom fo great complaints had been made. Inquiry was ordered to be made by the different prefidencies into the expultions that might have been made of any of the hereditary farmers, and of the opprefiive rents and contributions that might have been extorted from them; and meafures were direEted to be taken for their relief and future tranquillity. A fimilar examination was ordered into the different eftablifhments in the Indian fettlements; a report of which was to be laid annually before parliament. The company were prohibited from fending out a greater number of cadets or writers than what were abfolutely neceffary; and it was likewife provided, that the age of fuch as were fent out, fhould not be lefs than 15, nor more than 22 years. It was likewife provided, that promotions fhould be made in the order of feni $\cdot$.ty, unlefs in extraordinary cafes; for which the pretidencies fhould make themfelves fpecifically refpopfibte. Crimes committed by Englifl fubjects in any part of Tndia, were made amenable to every Britifh court of juftice, in the fame manner as if they had been committed in Bricain. Piefents, unlefs fuch as were abfolutely ccremonial, or given to a counfellor at law, a phylician, a furgeon, or a chaplain, were abfolutely prohitited, under the penalty of contifation of the prefent, and an additional line at the difcretion of the court. Difobedience of orders, unlefs abfolutely receffary, and pecuniary tranfactions prejudicial to the interelts of the company, were declared to be high crimes and mifdemeanors. The company were forbidden to interfere in favour of any perfon legally convicted of any of the above ctimes, or to employ him in their fervice for evcr. The governors of the different prefidencies were alfo pernitted to imprifon any perfon fufpected of illicit correlpondence, and were ordered to fend them to England with all convenient fpeed. Every perton ferving, or who flould hereafter ferve, in India, was alfo required, on his riturn to England, to give an exact accome, upon oath, to the court of exchequer, of his property, within two Vor. V. Fart I.
months after his atrival; one copy of which was to be Company. kept in the court of exchequer, and the other at the India-houfe. The board of controul, the conrt of directors, or any three of the proprictors whofe llock flould amount together to 1000 l . were allowed to move the court of exchequer to examine the validity of the account. In cafe of an apparently well founded aecufation, the court of exchequer were allowed to examine the party upon oath, and even to imprifon him until the interrogatories propofed to him flould be anfwered. The whole property of a perion who thould neglect to give in fuch an account within the tine limited, or who thould have been guilty of a miireprefentation in that aecount to the amount of 2000 l. Aterling, was ordered to be confifcated; ten per cent. to be paid to the accufer, and the remainder to be equally divided between the public and the company. Every perfon who had once been employcd in India, but had afterwards relided in Europe for five years, muleis fuch refidence had been exprefsly on account of his health, was declared ineapable of ever being forit out to India again.
As a farther curb on the company's fervants, the attorney-general or court of directors was anthonifed to file an information in the court of King's beneh againt any perfon for crimes committed in India. That court was empowered alfo to imprifon or admit the accufed to bail inmediately. It was then ordered, that within 30 days a certain number of pecers thould be chofen by the houfe of lords, and of the members of the houfe of commons by that houfe, to conllitute a court for the trial of the accufed. The court was finally to confift of three judges appointed by the crown, four peers, and fix members of the houfe of commons; and the accufed had a right to a peremptory challenge. From this court there was no appeal: and it was enpowered to adjudge the party incapable of ever ferviug the company; to punifl by fine or im. prifonment; and in order to proportion the fine to the property of the convict, the court of exchequer might, at the requifition of the attorney-general, or of the company, examine him upon oath concerning the fum he was worth. A refufal to anfwer wens to be punifhed with conffeation of property, and imprifonment during pleafure.

With regard to the treatment of delinquents in $\mathrm{In}^{-}$ dia, Mr Pitt olferved, that at that time we had it not in our power to punifh them. Either a new procers mut therefore be inflituted, or ofic nces, equally hocking to humanity, and contrary to every principle of religion and juftice, muft be perniticd to contime uncheeked. Eivery perfon therefore wha went hureafter, would know the predicament in which he flood ; :nd would undertand, that by fo doing he arereed to sive up fome of the mort valuatle privitegse of an Enin hilhman: yet in this he would do wo more than a very numerous and honomalle body of men, the militars: did daily, without the leat helitation, or the falluat impeadhent of their character.

This bill, fotromendous in its appearance to the company's fervants, was vehemonty yopofed by the minority. Mr Erancis obferved, that it weut upon two principles, eiz. the abufe of power abrow, and the want of it at home. To senudy thefo, Sifi lite had propofed to augment the pewer :broad, and to Hb
ciiminth

## $\mathrm{C} O \quad \mathrm{O}$ $242] \quad \mathrm{C} \quad \mathrm{O} \quad \mathrm{M}$

ionno. himinith the at home. Fie condemed the mimited power of the commifioner, and erm pretended to fuppole that there muit have bern fome miftake in the fluctare of the chanfe; it being impoffible to think ihat it was intended to fet ainde the divectors at home and the government abrowl, in order to throw the whole power into the hands of a military eommander. Though he approved of the cluufe by which fehemes of conquen and extenfon of terntory were condemmed, he remarked, that it was effentially defective in other refpeets; as alluding to facts and ofinees which were ant deferibed, and to erimimals whom, fo far from punifhing, it did not venture to defcribe. With refeect to the affir of prefents, he confefled tiat his opimion was wher forgular. Fe was for an andimited prohifition tomen in high fations; but in the or-jinary
 wore ufeful, without giving romm for any jut rpprebenious. The govenment of latia, at it wat wow confituter, was a government of fovour, and not of jultice; and noting would be done for the natives malds the perfons who forwarded their alfairs were gratitied. In the mean time, howerer, the exception in tavour of prefents of chemomy was founded upon idea, which he knew to be folacious, and was even raterated to render the prolibition itfelf ufelefs and jnetactu... For the purpofe of receiving prefents of ceremony, all oceafons wond be fufficiently folemin. He warmly ceafored alfo the power of imprifonment fiven to the refpetive prefidencies, and he condemned the intitution of the new cont of judicature as unneculaty, whitra: 5, and daugerous.

Hy Mir Fox the bill was fo highly diapproved of, that he objected to the houfe going into a committere avon it. He endeavoured to thow, that inflead of diminiming, it was calculated to increare the calamitics of the Eats; and inltead of reforming, to perpetuate the abufes fo much complained of. The board of control., he faid, provided for a weak government at lome by a divition of power; and if there were a receipt ar a nothum for making a weak government, it was by giving the power of contrising incalures to one, and the nomination of the perfons who were to exeeute them to another. The negative given to the commiffoners operated as a complete aminilation of the company, and the chartered rights formel vaunted of. The bill was a feheme of dark and delufive art, and took away the rights of the eompany by flow and gra. dual fap. The firlt ftep was orginally to contrive meafares without the knowledge of the company; and the next, to convey orders fecretly to India, at the bery time perhaps that the commiffoners were openly giving countenance to orders of a quite different tendency fent from the directors. With regard to the new tribunal, he confidered it as in truth a fereen for delinquents: fince no man was to be tried but on the aecufation of the empany or of the attorncy-general ; in which cafe be had only to coneiliate government in order to remain in perfect feearity.

The ofpofition of Mr Foz's party againit this bill proved as fruitlefs as their effor th had been in favour if the other. The houfe divided on the fpeakers Jeaving the chair; when the metion was carried by a majority of 215 . Still, however, all patts of the bill were wamly dobated. In the comte of converfation
unon this fubject, Mr Dempter expreffed a wifh that Compary the king could be requefled to fend over one of his fons to become fovercign of that country. We might then enter into a federal union, and cajoy all the benefits that could be derived from the inmabitants of the Eatt by Europeans, viz. thofe of comencrec. 'The claufes relative to the native prinees and hereditary famers were all withdrawn at the motion of Prir Dundas; and under the head of prefents, the exception in favour of thofe of ceremony was withdrawn. That elatife, which infited on all perlons returning from India to five an accont of the value of their ehates ppon oath, was fevercly ceufured by Mr Demplter and Mr Eden; and after fomm debate was entire. ly withdrasa, as was alfo the iclea of making the perfon take thic oath when required by the bard of cons. iuchi. Mr Pitt then propofed, that periors who hat pated five years in Indid, and accumulated no more than L. $j$ con for that tinc, or disulbe tat fum for the nest five years, fhond be esempted from all profecution on the fcore of their fortuncs. But on a furggeltion by Mr Atkinfon, that, in cafe of ficknefs, it might not be practicable for a perfon arriving from India to give in an accomet upon oatio in the fpace of two months; on which fuggeltion, a power was granted to the emurt of exchequer for extending the term from tine to time as they fhould think proper. It had been the original idea of the chaneellor, that this juridiction hould take place in twelve months; and it had been objeceed, that thas perfons would be deprived of the trial by jury, without time being granted them to choofe whether they would fubmit to the eondition. Mr Pitt now moved, that no account upon oath fould be required of any perfou who thould arrive from india before the arft of Jamary 1737 . This mendment was likewife cenfured by oppofition, as holding out an indemnity to peculators, and a waming for them to return within the atligned period. It was remarked by Mr Sheridan, that by the bill before the houde, a perfon who took the oath would be liable all his lifetime to a profeeution for perjury. He could therefore make no fetclemer of his fortune; he could not fell or mortgacre his eltate, as nobedy would have any thing to do with a property which was itill liable to contelt and forfeiture. This reprefentation produced another amendment, limiting the commencement of a profecution to the period of three years. The claufe prohibiting the return of any perfon to India under certain conditions, was alfo mitigated by two amendments from the enancellor ; one of them exempting the officers of the king from its operation; and the other permitting the reftoration of any perfon with the confent of the directors, and three-fourths of the court of proprietors.

With thefe amendments the bill finally paffed the houfe of commons on the asth of July. On being cawried up to the houfe of lords, it met with a very rigorous oppoition; the principal fpeakers againt it being Lord Stormont and the Earl of Carlifie. The fommer animadvented upon the prineiple of feniority eflablimed by it; which he faid was particularly ilifuited to the eritical polure of affairs and our prefent itnation in India; and lue afferted, that had fueh a claufe been in effect at the time that Lord Clive firfo entered into the compary's fervice, thue would no:

## C O M

Conpany, have been an inch' of the teritorial pofidfoms at prefent betonging to this country. It would damp the ardour of emulation, check the rifing fpirit of the youth now in Afia, and that at a time when the mofl extraordinary talents were meceflary to raife us from our inaufpicions and ruined condition. He objected alfo to the power of recal in the board of controul; which, he fiud, was by no means a fuflicient check upon the company's fervents in India. The ditlance of time and phace, he faid, were fo great, that a reeal from India could not have the leat effeat. But thefe remonftrances had very little weight with the houfe; the bill being finally puffed on the 2th of Augut.

Some years after this, however, a deelaratory law was found necefliay, in confequence of a controverfy which had arifen between the board of controul and the company. It had been refoned, in the month of Octuber ry, $\mathrm{S}_{7}$, when his Majetly had mafon to be alamed, and to lock with more than common ansiety to the fafety and prefervation of every part of the Briti:h dominions, to fend ont fonr adłtional regiments for the better protection of our Indian polliffions; nor was the defign taken up as a temporary, but with a wiew to a permanent, citabliflment of his Majelly's troops in lndia. At that time, no unwillinghefs to receive the regiments on bead the company's haps, and provide for their fupport in India, had leen intimated by the conrt of direfors; but, on the contrary, the meafure had been contidered as a wife one, and the fuggetion of it had given univerfal fatisfaction. Since, hovever, the threatening glorm had been difperfed, far difierent fentiments prevailed. Some of the directors, at leaft, were of opinion, that unlefs they made a sequifition to government for further military anilance, they had it in their option to bear, or to refufe to bear, the expence of any additional regiments of his Majefy's amy which might be fent to India; and this opinion feemed to be, in a oreat meafure, grounted on the af of 178.8 , by which the Eaft India company were bound to pay for fuct of his Majuth's troup as had, by their teguifiten, heme fent to India. This idealnd been much agisated without doors, and the directors had thought proper to confult difercat comend of uminence on the fuljeet.

In this bufinefs two quitions naturally atole - Fink. Whather the king had a night of fund his trones to any part of his dominions? mat, fecondy, If he fent then to India, who unght to defray the expence? That his Majetty had an undoubted riyht, by his royal procat ve, to direct the diftribution of his amy, :oo twe could, with any colour of reafon, difpute. The onI! pwint, therfore, which oficed itfeth for difenfion vials, whether, il his Mayetly, by virtue of his prerogative, thought proper to fend foum alditional regiments th Imdia, the expence of funding them, and their furport, waght to be provided for out of the revemies of India, which they protected? It was certanly the opinion of miniters, that by the agt of $1-8,8$, the authority and power of the court of directors, touching the military and political concerns of India, and aifo the collection, manarement, and application of the renenes of the territorial poffifions, was transferred to the board of controul, which might direct the appropriation of thefe revemues in tixe manner that to them
thould appear to be moll for the pubice advantage; (ompane. Lut as dunbis had been cotertained liy others, and the opinims of counfel, comtimengethof doubts, had bera tahen, all of which had gone abroad into the work!, it was confidered as a necellany mature to call uthea the different brameses of the legilhatare to remove those doubts in the roolt efcetual way by a bill. It was corainly very evidenr, that, on the pefent oceaton, the four regiments might, on board the compray's fhips, be fent out to India at a wery incomfderable cxpenec; whereas, if tranfposes had becu fectatly provided for that purpore, the expence mult have been enormons. To oblige the company, therefore, to pay the expence out of hacir Indian revenues, as had al ready been intimated to them by the commifioners of controul, the chancellor of the exclequer morat, on the 5th of Fubruary 1784, "That lave be given :n bring in a hill for removing any doubts wipecting the power of the commiffoners for the athats of India."

In explanation of this bill, and in anfwer to the remarks of opp:fition, Mr Fiet defred to remind the hoofe that he hal provoked the dienfion of the bill, and had earnefly loticital them to bring it to the tell of the moll fevere and ferupalow inveligation. Hic found that it wonld be difputed, whether by the af of 1784 the board of controui had any night of huperintendence over the revenue? Would it be cortendad that parliament meant to leave the fanances in the hands of the company, who had ben declared unfit to be truited wih then? Was it likely, that, when they provided for the better management of the political and mailisary conecris, they had paid no atten. tima to the circmance upon which there conceras inteparably dependad? The board of contronl had alredy proceeded to reduce the enormous eflablifinents in India; their right of interference in :lat refpert had never been quethoned; and what indeed would be the confenuence of cenving this right? The court of diectors, if they lad is in ther purer, an ticexiration of theie chater dew near, and it was dubtfill whether their monopuly wuld ly: 1enewed, would certanly make ir their fift objcit th fiell the amount of theis imports, and would neglect the care of the territorial and polusal atate of ladi. The duty of adminiftation was to luok, firt, to the profperity and happinefs of the natives; fecondy, to the fecurity of the ceratorial poffefi me: thid $\begin{gathered}\text { y, to the difcharge of }\end{gathered}$ the detrst due to the perfons who las advanced their mony, and cnabled the company te Itruggle with thair late difficulties; and, in the lat phee, to the commerialbencfit of the preprietors. Was it probab'e that the coure of directors sould ate upon that feale? Could it have been intended to confide in their diferetinn? It had been faid, that the powers attributed to the boand of controul were the fame in fubtance as had before been given to the fecretaries of 解e and the luads of the treafary. But the fact was other. wife. The cont of directors had been obliged in commanicate their difpaches previous to their going to India; but there was no obligation upon the tecretary of tate to give any directions concerning then. The refpoufibility had ordinarily refled, under the former government, with the court of diretoms; mader the prefent it was wholly vefted with the board of coatroul.

## C $\mathrm{O} \quad \mathrm{M}$

Company. An objection had been flated, that the declaratory bill conveyed to the king the power of maintaining an army without the consent of parliament. No propofition ( $\mathrm{Mr}_{\mathrm{I}}$ Fitt obferved) could be more adverle to his intencions than that which was thus imputed to him. Sut in reality the troopy in queltion had already been tecognited by parliament when they roted the entimate for raffine them; and the number of king's regiments lerving in India would alnays be to be afertained by the compuny belonging to cach, which remained in England for the purpofe of recruiting, and the expence of which would be to be provided tor by parliament.

Mr Pitt acknowledged, that it had been the object of the act of 1784 to affume the power of fuperintendence and controul, without affuming the power of patronage. In the pefient bill he declared, that every thing had been done which his undentlanding had fuggeited tor the diminution of pationage. The regrments in quellion belonged to the crown; and of courle it could nut be fuppoted that the fovereign could entirely depart from his prenogative of naning his own officers. But the king had acted with the moll gracis us attention to the cumpany, and to the merits of the officers who had grewa grey in their fervice; having relinquibed nearty half the patronage of the 1 egiments, and leaving the dipolal of the efe commiffions to the coult of directors. The company indeed alleged that they had 600 officers unemployed; but the king could not forget that he had 2800 officers upon hall pay, not periaps more mentorious, but certatnly not iefs fo, than thole in the cumpany's fervice, and many of whom had aftuatly ferved with diftinction in India. Such had been the forbearance he had thought it proper to exercife upon the lubject of patronage. But if, by the objection that had been flarted, it was intended to refer to the great pulitical patronage, this he fid not deny that he had at all times intended to alfume. Men who were refponlible tor the government of a comentry, ought undoubtedly to have the appointenent of thofe whom they were to entrult with the execution of their orders. But it would be admitted that the patronage lefi to the company was very connderable, when the great extent of thoir military effablihment was properly recollected. Mr litt added, that the objections that were flarted on this head would pofibly throw difficulties in the way of the confolidation of the two armies in India; an object on many accounts defirable, and which in tome way or other mult be attempted. If it fhould be thought tadifiable to make the whole amy royal, then undoubtcdly the patronage of the crown would be greatly inercafed. He believed, howevir, that the meafure was neceffary; and there was fcaucels any thing to which he weuld $n$ n $t$ affent, to remove the apprethentions of the nation refpecting the undue ufe of this patronage. For the bill now beture the houle, Mr Pitt protetiod bimfle ready to propnie clauies that thould annihilate trery fupicion of dangen.

The fpetch of Mr Pitt produced a favourande effect upon the country gentemen ; and the claufes which he hat alladed to being moved, were received without any debate. Thefe provided, That no king's troops, beyond the number whith was now propuled, fhould be fect to India under the authority of any critting law:

That no increafe of falary fhould be given to any of Compans the fervan:ts of the company, without the difpatches for that ${ }^{\text {purpofe being laid before buth houfes of par- }}$ liament thirty ding previous to their being fent; and that no gratuity thould be given, the propufal for which did not originate with the court of directors. A fourth claufe was added to thele by the minitter, which had not precifely the fame object : it direct. ed, that an account of the revenues and difburiements of the company fhould be laid beicre pantiament at a certainafligned period in the courfe of evcry year.

The bill was carried up to the houfe of lords on the $14^{\text {th }}$ of March, read a fift time on the following day, which was Saturday, and propofed for a fecond reading on the enfuing Monday. This precipitation was made the fubject of a pettion, offered by certain proprietors, and prefenied to the houle by the Duke of Norfolk, in which they requetted a delay of three days, till a general meeting could be held of the proprietors of the Eatt India company. To this fuggeftion it was ol.jected by Lord 'Thurlow and Lord Hawkefory, that the thips of the Eat Indra company were now detained in port at the enormous expence of three or four hundred pounds fer dien. by Lord Stormont and Lord Loughborough it was replicd, that no espence, however great, ought to weigh in the contideration of the pretent quetlion. The bill decided upon a mater of privaie right, and partiament could not juftly refufe to hear the petitioner: The houle divided upen the queltion, contents $3^{2}$, not contents 75. A motion of Lord Porchefter was rejected by a timilar najurity, for referring a quellion to the iwctive judges reipecting the true meaning and intent of the act of 1,84 .

The Duke of Richmond faid, that he was peculiarly cirenmitanced on the pretent occation, fince he had never been pleafed with any of the bills for the government of India that had yet been biought into parliament. He had ever been or opinion, that the concerns of the Eall were trulted in the beil bands when they were vetted in the company itfelf. He had oppoled the bill of 1783 , becaufe it Hagrantly violated the charter of the company, and placed an immenfe powe in the hands of a commifion, that was not refpomible, fo far as he could find, either to the king or the palliament. He had oppoled the act ot 5 为, becaule it gave to the crown an enormicus addation of power. But he could not admit that that act was in any degree fo violent and delpotical as the bill which preceded it. 'The declaratory meafure now under conlideration muft neccflarily have his complete approbation. It conlifted of two dittinct pats; its expofition of the akt of 178 f , and certain enacting claufes containing chtcks and reftraints upon the extentive patronage that the gorenment of the Eaf vaturally gave. To the former part he mult inevitably ayree. That the aEt of $1=8+$ gave to the board of controul complete authority, had ilways been his opinion. Fu: that realou he had oppoled it : but, entertaining that opinion, he muft jultly the prefent bill, which in his miad was a true declaration of the faet. He could not but equally approve of the rellrants that were propofed upon the exercile of patronage. Patronage was infeparable from power. But when he faw the

Company induftry witl which it wae himited, and miniters were tied down from the abufe of it; when he law that it was not to be ufed otherwife than for the good of the fervice, he could not view the prefent meature with the fame jealouly with which he was accultomed to regard propulitions for extending the power ol the crown.

The bill, however, underwent a fevere difenffion in this as it had done in the other houfe; but at longth fatfed.

In Mey following a petition was prefented to the houle of conmons by the company, Iating ecrain pecuniary embarrafmente which they appethended to take place on the fill of March 1790, owing to the arrears of the war, to the goverument claim of 1.500.000, to the debt incurred in China, and to the advances neceflary to be made for the purpotes of the China trade. In compliance with their petition, Mr Pitt moved on the following day that they foond be empowered to burrow a fom not exceeding L. $1,200,000$. He at the fane time obferved, that in all probability the company in 591 would have upwards of L. 3,000, 000 Sterting more than fuificient to dilcharge their debts. The mealure was canied thro' both houfes without oppoftion.
3. Hudfon's Bay Company. The van countries which furround Hudfon's Bay abound with animals whole furs and fkins ane excellent, being lar fuperior in quality to thofe found in kefs nothethy regions. In 1670 , a charter was granted to a company, which does not contilt of above nine or $t \in n$ perfuns, for the exclulive trade to this bay; and they have acted under it ever fince with great benefit to thmeles. The company employ four thips and 130 feamen. They have feveral forts, ede. Prince of Wha's's fort, Churchill river, Nelfon, New Severn, and Albany, which fand on the weft lide of the bey, and ane garrifoned by 186 men. The French, in May 1782 , took and detroyed thefe forts, and the fettlements, \&e. valued at 500,0001 . 'Ihey export commodities to the value of 16,0001 . and bring home returns to the value of $29,3+01$. which yiuld to the revente $373+1$ This includes the fithery in Hudfon's Bay. 'This commerce, frall as it is, afordo immenfe profts to the company, and even fome advantages to Creat Britain in general; for the commodities we cxchange with the fudians for their Hins and furs, are all manufactured in Britain; and as the Iudians are not very aice in their choice, fuch things are fent of which we have the greateft picnty, and which, in the morcancile phrafe, are drugs with us. 'Ilhough the workmanhip too happens to be ia many refpects fo deficient that no civilized people would take it off our hands, it may be admired among the Indians. On the other hand, the Rins and furs we bring from Hudfon's Bay, enter largely into our manfactures, and aftord us matcrials for trachig with many nations of Europe to great advantage. 'Thefe circumatances tend to prove inconteftably the immente benetit that womd rectound to Great Britain, by throwing open the trade to Hudfon"s Bay, lince even in its prefent reflained ftate it is fo advantageous. 'This company, it is protalle, do not find their trade fo adsantagevas now as it was before we got poffellion of Canada. The only attempi made to trade with La.
brador has been direeted towards the fiblef, the annual Company. produce of which exceeds 40,000 .

The above are the phincipal trading companies prefently fubfitiog in Grat Britain; but to the number might have beco added one of satl importance, the
 and putillanimous policy of the Englith minilly at the tins: For an account of which, fee the anticle D.srien.

> Gronkimb Complay. Sue Greenland.
> Eankirg Compantes. Sce Bank.

Of eftablifments fimilar to the above in other comn. tries, the folowing, belonging tothe Dutch and Fionch, may be mentioned as the molt important.
I. Duter Companice. 1. Their Eaft India com. pany had its rife in the nidat of the etruggle whech that poople land for their liberty : for the spaniands having forbidden all commerce with them, and fint up all their ports, necelity infpired fome Zealanders to feek a new north-cadt palfage to China.

This enterprize proving unfucedfful to three feveral amaments in 1594,1535 , and 1596 , a fecond company was formed, under the name of the Company of remote Parts: which, in 1595 , rook the ordinary route of the Portuguefe to the Indies, and returned in two years and a half's time with little gain but good hopes.

This company, and a new one juft eftablifhed at Amferdam, being united, equipped other flects; and thefe occalioned other companies at Amilerdam, Rotterdam, in Zcaland, \&e. infomuch that the flates foon began to apprehend they might be prejudicial to each other. Unior this concern, they called all the diree. tors of the feveral companies together, who all confented to an union, the treaty whereof was confinmed by the States in 1602 ; a very umarkable epocha, as being that of the molt fulid and celebrated citablihment of commerce that ever was in the world.

Its firlt copital was dix milions fix hundred thonfand guilders. It had fixty divetors, divided into feveral chambers ; twenty in that of Amfterdam, twelve in that of Zealand, fouteen in that of Delft and Rotterdam, and a like nmmber in thofe at Sluys and Horn. As each grant expires, the company is obliged to procure a new one, which it has already done live times fince the furt, paying a confictratle fum cach time. The laf application was in 1773 , when the company, after ftating that its trade had declined, fulicited the Aates-grencral to grant a diminution of the fum formerly paid for the renewal of the charter. Upon this reprefentation, their high mightianfes, in order to have time to inquire into the matter, prolonged the charter for three years, upon the old eitablithment ; and buding, upon examination, that the company lad really fudained great loifes, and its trade confiderably declited, they ated with the fpirit of a wife commercial commonweath, by complying with the company's requell. 'Elecy insefore, in 1776, granted thom at nuw chater for 30 years, on the fane terms as the former, on the immediate payment of $2,000,000$ of florins, intlead of 3,000,000 which they paid before, wh the fim of 3 fo,000 florins yearly; which annul.

 ral, whith the tate and felendor of a fuemeign piniace; makin: war and face with the eatem kings and emperowsit plafure.

The other more conflemalle factoriss are, Taiouam on the coatl of China, Nangitac in Japan, Nialacea, Gumat, Amboyn, Banda, Siam, Muhecas, \&c. Teveral on the eonatt of C'ommandel, and at Ifpulan, Cape of Good I Iopes, \&ec. in all, they mamber 40 factories and 25 fortrelies. 'I'hey have the whole nade of the fincery in their own hands.
 with an exchtive privilege to trake $-\frac{1}{}$ yars along the coalds of Africa, betwen the tropie of Cancer and the Cape of Good Hope; and in America from the fouth
 Butlan, that of I, Maire, or other, to the ftraits of Anian, both in the Norits and South Sea. The direstors are divided into bie chambers (as in the Eat India company), ont of which sy ate chofen for the general direction of aftirs. In 1647 , the company renewed its grant for 25 years; but it was farce able to hodd ont the term, on acconnt of its great loffes and expences in taking the bay of 'lodos los Santos, Fermambuc, and the greatelt part of Brath, from the Porteguefe. The weaknefs of this company, which had feveral times in vain attempted to be joined to that of the Eaf lndies, occalioned its difolution at the ex piration of its grat.

In 16\%, a new comprive compoided of the ancient pruprictors and their creditors, was fettled in the fime riohts and ellablithent with the former; and fald fubtite, though onnderably decaved. Their fird capital was about ix millions of for:ns. Its principal ctabithments are, one at Cape Verd, anathor on the Gold Coall of Africa, at 'L'ubago, Curaffao, Evc. in Americ:
11. French Companins. I. Their $E \rho$ ? India Comfory was eflablithed in Iorf, with an exclutive priviiege to trade for 50 yars in all the feas of the Eafl Indies and sonth Sea. No adrenturer to be adnitted witlont 1000 lives in flock; and fureigners "hu have 20,06 liveres in thuck tu be reputed areguirules.

The patent grants them the iland of Madagafoar ; and the xing to be at onc-ifth of the expence of the thoee firl armamenta, whout interet : the principal to be refended in ton jears; or, if the compary find it lofes on the whole, the lofs to fall on the king's fide.

The capital fund of the company, which was mottly formithed by the king, was foen on eight millions of lives, but was to have teen fifteen milhons.

In effect, though no moms were wanting to fapport the company, yet it thill drooper and thill Itruggted; till having fubleft ten years without any change in its form, and being no longer able to difharge its engraremente, there were new regulations concurted, but
to litte puppre. At length, thingz not buting difpo- Conspany,
 he exjected from the eld one, in 1 pos the mintiby allowed the: directors $\mathfrak{t o}$ treat wath the rich thaters of it Mako, and wehge to them their privilege nader certain conditions. In the hands of thefe ? at, the company began to dowith. Sec Iath Company, beton.

Its chice factory is at Pondicherry, oi the coat of Coromandel. This is the refidence of the directur-genual; the wher factories are inconderable. The merchamtizo whel the compaty briars into France are, fils, cottonn, frices, coffec, rice, falepetre; feseral limas of gums and drugs, wood, wax, printed calicoce, mulims, sic.
2. 'J'heir If'gl Kodia Company was ettahlifhed in 1604 . 'lheir charter gave then the property and kisuiny of Canada, Acadia, the Antilles iflands, Inc of Ciayenne, and the Tera Firma of America, from the river of the Amazons to that of Orvonoko; with an exclative privilege for the commerce of thofe places, as alfor of Senegal and the coafts of Guinea, fur fo ycun: only paying half the duties. The thock of the company was fo confiderable, that in lefs that fix monthe 45 refle were equipped; wherewith they took wofldifion of all the places in theis gant, and fotlod a comnerce: yet this only fubfifed nime years. In I6-t, the giant was revoled, and the comotrics above reunited to the king's dominions as before; the king remburling the actions of the adventurers. 'This revocation wats owing partly to the poverty of the company, wectioned by its lofles in the wars with Emrland, which had neceffitated it to borrow above a mil. lion, and oven to alienate its exclunse pribege for the confs of Guinea: and partly to its having in good meafure anfwered its end; which was to recover the commerce of the Weat Indies from the 1) atch, who had tom it from them: for the French merchants, being now acentomed to traffic to the Antilies, by permithiun of the company, were fo attached is it, that it was not doubted they would fipport the commerce after the difiolution of the compang.
 Ifstin favour of the Chevaher de la salle ; who hutving prejected it in 1660 , and being appoin.led governor of the fert of Frontignac at the moath of that riis $r$, travelled over the combers in the year $168:$ and retumed to France to folicit the dablithmat. This obtained, he fot fail for his new colony with four vetCols lowden with inhabitants, \&e. but entering the Cuph of Mexico, he did not, it fems, know the river that had colt him fo much fatigic, but fetted on another river monown, where his coluny perithed by degrees; fo that in : 685 there were not 100 pertons remaining. Making feveral expeditions to dind the Nifndippi, he was killed in one of them by a paty who mutinied aganit him ; wherene: the colony was difperfed and loth. M, Hiberville afterwards fueceeded better. Ile fomd the Miffilippi, built a fort, and fettled a Irench colony there; but he bein.s poifoned, it is fad, by the intrigues of the Spaniards, who fearcd fuch a naghbonr, in 1712 Mi . Crozat had the whole property of trading to the Trench temituries callad Lominana granted him for 15 years.
4. Compguy of the Wef. In 1717, the Sicur Crozat furendered his grant; and in the fame year a now

Company. company was erected ander tie sitle of Campany of the $W_{e f l}$ : to which, belides every thing granted to the former company, was added the commerce of heaver, enjoyed by the Canada company from the year 1706 , tut expining in 1717 . In this ellablutument, an equad view was lad to the finances and the commerce of the nation; and, accordingly, part of the conditions of its eflablithment regarded the fettlins a colony, a trade, Ee. the wher the vending part of the bills, called hilis of fote, which could no longer dibunt an hacir prefent foctiag. The former are no more than are wibal in fixh eitablifhments: for the latter, the actions are fixed at 500 livere, each payatle in bills of late; the attions to be ettecmed as merchandize, and in that Qatity to be boterte, fold, and tralfeckel. The bills of funt, when make the fand of the astions, to be convelted inta yealy ravenue. 'l'o put the linihiag hand to the company, in aplots fund was listei at an hunalded milions of heres; which being tilled, the caih was fict up.
5. In: tit ("ummay. The juncion of the former compint with thot of Canada was innmediately followed by its union with that of senegal, both in the ycar r-r8, by an arret of conmet ; which at the fanke time crinted the ne w company the commerce of beavers, and made it mitrefs of the negro or Gumea trade to the French colonics in Americio.

Nothing was now wanting to its perfection but an union with the Eaft India company, and with thole of Chima and St Domingo; which was effected, with the two fint in 1719, and with the third in 1720. This union of the Latt ludia and China company with the crompany of the Well, oceafioned an alteration of the name; and it was hencetorth called the Indiu Ciomsng.

The reafons of the urion were, the inability of the two former to earry on their commerce; the immonfe debts they latd eontracted in the Indies, efpecially the Satt company, complaints whereof had been fent to cout by the Indians, which diforedited the company fo that they derll not appear any longer at Surat; the litule care they took to difcharge their engetements; and their having tmanferred thein privilege io the private traders of St Malo, in eonfideration of a tenth in the prolits of the retums of their thips.

The ancisnt astions of the company of the Wett, which were not at par when this engraftment was projectul, lecfore it was completed, were rifen to 300 per cent.; which umexpected fuccefs gave oecafion to conchade then new actions of the united companies would not bear lefseredit. The coneourfe of fubferibers was fo great, that in a month's time there were above fifty millions fubferibed for: the firlt tiventy-five million attions which sere granted to the India company, beyond the hambed millions of fock allowed the company of the Wen, being filled as foon as the books viere opened ; to fatisfy the earnclencis of the fubferibers, the fook was increafed by leveral arrets to tiree bandred mithons. Credit thill increafarg, the newacions rofe to izon fer cent. and thore of the aneient eompany of the Wett to 1000 por cati.; an exorbitant price, to which no other company ever rofe. Its eondition was now So funrifang, that in 5719 it ofered the king to take a leafe of all his farms for nime years,
at the rate of three millions live humbed thomfand lives Company. por annam more than hat been given before: and allin to lend his majelly twelve hamedred millions of hives to pay the debts of the dute. 'There ofters were accepted ; and the king, in condideration heroot, granted them all the privileges of the fueral srant, of the companies unted to that company to the year 1770 : on condition, however, of difclanging all the debts of the old Eall India company, whont any deduction alt all. Tha loan of twelve handrel millions not being fufficient for the occafons of the date, was augmentul, three months afterwards, with thres humdred million; more; which, with the former loan, and another of one handred millions before, made fixtecn hundred mil lions, for which the ling was to pay interell at it. rate of three per cent.
'The Duke of Orteans, in February in20, dis the company the honomito prefide in thaci aflemby, where he made feveral propofals to the:rn on the pare of the king: the principal of thele was, that they flould take on them the charge and adminituration of the rosal bank. This was accepted of ; and MrIaw, compero!-let-general of the finances, was named by the kide inpector-general of the india compnyy and Lank united.
'This union, which, it was propofes, hould heve been a mutual help to both thole famous citablifhments, proved the fatal point from whence the fall of hoth commenced: from this time, both the bank bills anei the actions of the eompany began to fall. In ciflece, the fintt perimed abfolutely, and the other had been drawn along with it but for the prudent precautions taken for its fupport.

The firlt precaution was the revoking the offec of infpector-general, and thre obliging Mir Law to guit the kingdom: the ancient directors were difarted, and new ones fubtituted; aud, to lind the bottom if the company's affairs, it was ordered thety fhould give: an account of what they had received and diburfed, both on the aceount of the company and of the bask, which they had had the management of near a year. A. nother precaution to come at the late of the company was, by endcavouring to diftinguith the lavful actionaries from the Milhifippiestortioners; whofe immenve riehess, as well as thour ciminal addets in realisiugs their ations either into fpecie or merchandize, were become fo fatal to the flate; in order, if pollible, to feeure the hond adrenturers in thecir stock. To this end, an inquifition was made into their books, \&e. Wy perlons appointed by the king; and the new directur., or, as they were ealled, regiedeurs, began ferioufy in lools about for their eommerce abroad. Illeir affars, however, declined, and at length foms into a ruined and bankrupt thate about the year 1 7o 0 . The kisg immediately lifpeaded their exilutive privileges, and laid the trade to the eall open to all his fubjects; contigning, at the fame time, the afiairs of the company to the eare of the minitlry to adjuft and lettle. But the various fohemes which were then formed for the relora. tion of the old company, and the eltablimmont of a new one, were accompanid with fuch unfurmountable ditficultics, as to prove wholly ineffectual. Nor was the laving open of the trade attended immediately with the fucees that was expected; the merdiants being very how in engragim in it, though the king, by way of

Corrans. encouragement, lent them fome of his own fhips to convey their commodities to the Eaft ; and the garrifon and civil eltablinments continued to be fupported in their exitting form by the crown. The mealure, however, proved in time fucceffful; fo that for a courfe of ycars previons to 1785 , the annual importation from India was confiderably greater than daring any former period. But whether it were that they regarded this profperity as precarious; or that they aimed at a more extenfive fuccefs; or that they wifhcd , in imitation of Britain, for territoriat acquifitions in that climate, and believed an incorporated fociety the beft inltrument of obtaining them; the French court was induced to liften to propofals for ettabliding a new Eaft India company. Their privilege was for feven years, with the fpecial provifo, that years of war which might oceur in the interim fould be excluded from the computation.

In the preamble of the act of the 14 th April 1785 , by which the fcheme was adopted, it was alleged, "that the commodities of Europe not having of late years been regulated by any common tandard, or proportioned to the demands of India, had on the one hand fold at a low price; while, on the other, the competition of the fubjects of France had raifed the price of the objects of importation: that, upon their return home, a want of iytem and affortment had been univerfally complained of, the market being glutted with one fpecies of goods, and totally dellitute of another: that thefe defeets mutt neceffarily contimue as long as the trade remained in private hands; and that, on their account, as well as that of the capital required, the eitablithment of a new company was abfolutely neceffary."

Thefe reafonings did not appear altogether fatisfactory to the perfons principally interelted. France has been fo far enlightened by the difcuffions of the excellent witers the has produced upon quellions of politics and commerce, as not to be prepared to behold the introduction of monopolies with a very farourable cye. By many perfons it was remarked, that the argrunents of the preamble did not apply more to the trade of India than to any other trade; and that, if they were admitted in their entire foree, they were calculated to give a finifing blow to the fredom of commerce. The capital of the new company, which amounted to L . 830,000 , was ridiculed as altogether inadequate to the margitude of the undertaking. The privileges with which it was indulged were treated as enomons. The monopoly of Eatt India goods imported into France from any part of Europe, was granted to them for two years, ais well as the monopoly of Eat India groods imported irom the place of their growth. It was faid, that during that period they would fit out no adventures for India: that they hoped to obtain a prolongation of this ingurious indulgence; and that, of confequence, their incorporation was in reality a confinacy to perent all future communication butween France and the fources of commerce in Alia. A provifion in the act, directing that the prices of Eadt ladia goods in the illands of Mauritins and Bourbon fhould be regulated by a tarifi to be fixed by the count of Verfeilles, excited ithll londer exclamations. In this influee, it was faid, the firt principles of commerce were trampled upon in a manN87.
ner the moft wanton and ablurd. Inftead of fuffering Compangit to find its own level by the mutual collinion of the wants of one party and the labour of another, it was arbitrarily to be fafhioned by a power whofe extreme diftance mult neceffarily render its decifions ill-timed and inapplicable. The very mode in which the monopoly was introduced was a lubject of complaint. It Was determined by a rcfolution of the king in council ; a proceeding totally inadequate to the importance of the fubject, and which was to be regarded as clandertine and furreptitious. In all former inftances fuch meafures affimed the form of edicts, and were regiltered in the parliaments. It was the perogative of thefe courts to verify them; that is, to inquire into the facts which had led to their adoption. The injured parties had an opfortunity of being heard before the privilege affumed the form of a law ; not privately by the minileers of the fovereign, but publicly by-the mot conliderable bodies in the kingdom, and in the face of the nation.

The act of council eftablifhing a new Eaf India company, was followed on the tenth of July by another decharation, intended fill farther to promote their interell ; by which it was exprefsly forbidden to import cottons, printed linens, and mullins, except thro' the medium of the company. The arret proceeds upon the fame principles of monopoly as in the former inflance. It fets out indeed with a declaration, "that nothing can appear more defrable to the king, or better accord with the fentiments of his heart, than a general liberty, that freeing at once the circulation of commodities from every fpecies of reftraint, hould feem to make of all the people of the world but one uation with refpect to commerce." But it adds, "that the period of this liberty is not yet arrived: that it it mult either be, with refpect to the nations of Europe, unlimited and reciprocal, or that it cannot be admitted: that the revocation of the former indulgence refpecting cottons and linens was become neceffary on account of the opportunities it created for contraband trade; and becaufe the competition of the Eaft India company and private traders would occafion a furplus in the market, and the admiffion of foreign manufactures would decreafe and annilate the mational induftry."

The provifions that were made for carrying this law into effect were condidered as unjuit and fevere. The merchants poffeffing any of the prolibited commodities were allowed twelve months to difpofe of them; but upon the exprefs condition, that the commodities were to bear a itamp, importing that they were vendible only to a certain period, a circumflance that mult noceflanily depreciate their value. It was alfo enacted, that the houle of any trader might be entered by day or by night, at the folicitation of the directors, to fearch for prohibited goods, which were to be contifcated to the ufe of the company. Thefe kinds of vifi:s of the officers of revenur, hitherto unaurhorifed in France, were reprefented as ptculiarly obnoxious, wh.n they were made for the fule benefit of a privileged monopoly.

Company, in military affairs, a fmall boly of foot, commanded by a captain, who has under him a lieutcnaut and entign.

The

Conipary. The number of centincts or private foldiers in a compary is from 50 to 100 ; and a bittalion or regiment confilts of 9,10 , or 11 , fuch companies: we of which is always gremadiers, and polted on the right; wext them Itands the colonel's company, and on the left the light infantry company. a clarter party among themfles; the pinsipal con- Compons. ditions whercof ufiatly are, that certain whelo thath he acknowledged admiral, vici-admiral, and rear-admisal; that fuch and fuch fienals thall be obferved; that tho which bear no guns thatl pray fo much per conto of tha ir cargo; and in cafe they be ittacked, that what damages are fultaind thall be rinbured by the company in grencral. In the Mediterranean, fuch companies are called conforves.

## COMPARATIV.EAnatomy,

I$S$ that branch of anatony which confiders the fecondary oljects, or the bodies of other animals; ferving for the more acemate ditinctions of feveral parts, and fupplying the defect of human fubjects.

It is othervife called the anatomy of bouls, and fometimes zoniony; and atands in contratittinction to human andomy, or that branch of the art which confiders the human body the primary ubject of anatomy. Sce Anatomy.

## Introduction.

The ufes of The principal alvantages of comparative anatomy Compara. tive $\Rightarrow$ na tons $)$. knowledge of the different parts of auimals, to prevent our being inpofed upon by thofe authors who have delineated and defuribed feveral parts from brutes as belonging to the human body. Secondly, it helps us to mdertand feveral paffages in the ancient writers in medicine, who have taken many of their defcriptions from brutes and reafoned from them. The third and great ufe we reap from this fcience, is the light it cafts on feveral functions in the human economy, about which there lave becn fo many difputes among anatomits
In this view it is altogether needlefs to infift on thofe parts whofe nie is wfuaily undertlood when once their flructure is unravelled: Thas, for inflance, if we be acquainted with the action of the muffers in general, it will not be difficult to determine the uie of any particular mufcle whofe wigin and infertion is knuwn, if we at the fame tince contider the vanous connections of the boncs $t$, which it is fixed, and the different degree of mobility they have with refpect to ench wher. In the fane manner, if we know the we of the nerves in gencral, we can eatily anign the ufe of thofe ares. which are difributed to any" paticular pat. There is then no occation for a conptete olleol., gey, myolecy, se. of the fevcral animals we thall treat of, nor need we trivable orafelves about the Ahrecture of any ,f the parts, unlefs when it ferres to illaftrate fome of the fure-mentioned purpofes.

That the frite ufe we propufed from examining the flructure of the parts in brute is real and of confequence, is evident from looking into the works of fome of the carlift and greateft mallers of anatomy, who for went of human fubjects have often borrowal their deferiptions from other animals. The gicat Vefalius, although be jutly reproves Galen for this fault, is guilty of the fame himelf, as is plain from his delineations of the kioneys, uterus, the mufctes of the cye, Vol. V. Part ${ }^{\text {I. }}$
and fome other parts. Nor is antiquity only to be charged with this, lince in Wills's Anatomia Cercbri the plates of which were revifed by that accurate anatomit Dr Lower) thete are feveral of the pictuecs taken from different brutes, elpecially the dog, befides thofe he owns to be fuch. We thall give fevcral camplea of the fecond ufe in the fequel of the work.
'The animal kingdom, as well as the vegetable, con-The vaic. tains the moft furprifing variety, and the defeent in ty and uni. each is fo gradual, that the littic tranfitions and devia- frmity nbtions are almott imperceptible. The bat and bying- nervure. is fquirrel, though quadrupeds, have wings to buoy themfelses up in the air. Some birds inhatio the waters; and there are lifhes that have wings, and are not ftrangers to the airy regiuns: the amphibivus animals blend the terrethrial and aquatic together.

As there is then fuch a valt variety, it is not ouly ntedlefs, but impolfible, to condider all of them pirticularly. We thall take only fome of the moft remarkable genera; and hope, from what will be faid of them, any of the intermediate degrees may be underitood.

In treating of quadrupeds, we thatl divide them into Divifion of the caminvorous, i. $c$. thofe that feed indifferently on :avmalion of animal and vegetable fubfances, and granivorous: as th quadrus an inflance of thefe latt we thall take the ruminant P de, velakind. The fowls we fhall alfo divide into thofe that andinfinces, feed on graiu, and thofe that fed on forl andinfet so dillon gram, and thof diftinction we fhall make in treating of fithes, fhall be of thule that lave lungs, and thofe that hate them not. The firl indeed are with dificulty prochred, and at the fame time differ very litelc from chadruperts. The flructure of infects and worns is fo valy minite, what littic aflatance for the ends propofed by the prefent fubject lad been expected from their anatumical incelligation. As they contitute, howerir, ons of the great clafies into which animals are divided, and as cery advance in knowledge, with refpect to the flructure of any one animal, mult cither directly or indirectly calt fome lighit on the itrueture of fome part of every other, we have thought proper to add a few particulas concornisg them.

In mpuring into the fructure of different animale, we oughe to be previotily acquainted with the form of their body, manner of lift, kind of foul; or, in thor, with their matural hiflory; which will hat us to account for the reafon of their deffereat ftracture, and hence caplata tice detions of tice human hody. Of all thofe particulas a detail will be found :mder he titics of the different fuljucts in their alphabutical order. 1 i

Char. I. Anotom of Quadrutads.

Sect. I. Gemeral Obfervations.
A question has been tated by fome fanciful plilubupers, "Whether man is maturally a bect or a quancuf tr"' and mach ingenuity has been emploped it) (tablim the larew opimion. But it is preiuand that few of their raders heave been made converta to fuch an ofinion, and that mot many of ours will require nuch argument to perfuade them of thir erect deftination. It may thetefore fuffer to obferve, that this ercet pofition is beft aftapted to the confurmation of the hamar head, and the pondurous quantity of haman hrains:-that the articnation of the os acipmis with the fred veriebre of the neek, is different? conItructed from that of quadrupeds, with the obvious deforn that nan flowld be able to move his head in every direction with the greatelt facility :- that the loman fpecies (and alfo monkies) are dellitute of that Fong liganat or tendinous aponeuronis, wigarly valded facow, which quadrupeds poifess (as a lind of (A. 4 -hat ${ }^{\circ}$ ): to prewnt the head from finking to the caith; to which, from ito natural polition, it mutt be vory prone:-and that our eves and ears are, fortmane1., not placed as thofe of the quadruped. The axis of the humas rye is nearly permenticular with a vertical fuction of the head; whereas, in the bate creation (the larger ape excepted), the polition of the eyes forms an acute anme:- nature has alio furnined cher a aimals with a falf nforium ocult, a mufce which the orat attitule renders medief, thourh highly necefiary in the fonme; confoquently, whuever thes the tepperimert wid fond that, in the irclined direction, boils his eyes and his ears are in the mult unfarourable fitwation politble for quick hearing or extenfive vifom. In fate, the fhape, breadtl, ferength of the vertcbre of the back and loins, are all coincicut with the creft atitude of the truak.

Abl quadrupeds have a cowening of hair, wool, Sc. to defend them from the inguries of the weather, which varies in thicknefs according to the featon of the year and difference of the climate: thus in Rutha and the northern counties. the furs are very thick and warm. while the hittle Spanih lup-cors, and Barbary cows, have little or no hair at all.

The cutis and cuticula in quadrapals are difored much in the fame vas as the laman, why more laftic ; immediately under this, there is a very thin cortencous mufcular fuhbnoce called pomsentus carncyis, which is common to all combupeds, the porcine hind excopted: this mircipatly coners the trank, furvine to frivel the kin, in order to dive of inficte, thar tails and heacis not being iufficicut for this prepole, while their extremities are emploged in then fupport a: drogrefion.

## 8

Why mor quadrupces want da.

6
to matse their thorax proportionally narrower than the loman. This. fmail ditance of their anterior extremities is sery neceflary for their uniform progrefion : mities is wery necelary for their uniform progrehom:
apes indeed and fquirrels have clavicles to allow them a more finl ufe of their extremitics in climbing; but when they walk on all-fuurs, they move but indifferently.

## Sect. 1l. Of the Orang Outiang.

While fone philofophers, as above noticed, have endeavoured to lewh man to the rank of quadrupals, others have attempted to elevate ceatain of the blate creation to the fame claf with their reputed lerds. The orang outany i, miged by 1 immens as coneneneros with man, (See Homo); and lone theorill, have even condidered him as the origrinal theck of the human race, pretending that lue has been the mon of the aoods for many ages before fordons were ever thought of. His clams to humanity are fomeded on his heins able to walk upright occationaliy, being furmifhed with a competent hate of matics requinte for the purp fe. The form of his heart, langs, beatt, brains, intelines, are imitar to the fe of man the cactua has afo its aremel. vermiformis: he can it upriglit with great eafe; flows more defyrn in his phans than his afucintes in the for retts; and can handle a tlick on occation with tolerable dexterity. His cioqualifations are he following:
 farther backward than in the human foceice, and the fockets of his lower $j$ we, made to receive the dentes inciones of the upper, indicate his relationhip to the mondey bred. He has alio thiteten rils on each tide; his arms, feet, aid tocs, are moch longer than thofe of the human feceics, cic and although his foot doces not fo chofey refemble a land as that of the ape, get the pollex fudis, or the great tue, is placed at a greater ditance from the otier tues, whath gives it the appearamee and ufes of a thumb. Thene diferences inniocate, that, athongh the ouran can uccahomally act the bifel, yet he is mach better qualifed to waik on his fure-fect, and to climb tres, tian the generality of the modern race of men. But an objection to his clams, fill weightity than any of the difirences!?utd above, arifes fiom his wat of jowb. For there is :o nation of men, however fatare, that is de.titute of fpeech; though individuats, fuluded from fucicioy, ray in time lof the faculty. No infances are known in which a company of ten or twelse men have been vithont a lagen fe; but upwats of thirty of the orang fpecies hane been found in a herd, without flowing the fmallet traces of this fachity. It has bubl higgeded by Roureat, that they may have bot tle porver from their werbect of uhang it ; but it is very hagular hat tirey alone foundi hfe this pown, and nit that race of men to whom thacy ate fappoted to be fon neniy nlated. This punt, !owewer, has been completely decided by the difooveries of proferion Camper; who in a paper in the Phiofophical Tranfactions $\dagger$ has demunfrased, by an anatomical ditiction of + Vol. nix. the organ of the woice, that articulation is rendered Part $i$. imponible in thefe anmai, in confequence of the truc-art. is ture of that organ. From the nature and fituation of thofe parts in the orang (as well as in the ape and in the monkey) he has proved, that no modulation of the voice refembling luman fpeech can he produced in thefe creatures; becaufe the air, paring through the
of Cua- rime sloutilis, is immediately lof in two ventricles or hollow bags in the neck (which are fometimes muited into one), with which all thefe amimals are farnithed, and which have a communcation with the mouth through the faid rime or hit; fo that the air mult return from thence, without any furce or melody, within thic throat and month of thefe creatures.

We may hint obferve of this anmat, as imped of mont qua ingien, that its lays are mech thmer in promertion to te thank than in ram, the length of whene ter s duruls entively on the temath of his inderion extemites; however, tu bal ence this, the trumk of he anmal is proportionaly loneer and fimaller, his fpince mure flexible, by which be is :'a at each llap to bsing his poAtwior extremitics neaner to his anteriur. His comnown teguments are much ak kin to thole of other quadupeds, ouly they alluse little or no phare for fwat: fut when lie is over-hated, the inperfurous matter finds an exit ly the falisary glands, for he lolls ont his sungue and gavers plemifully. We are rot, huwever, to huphfe, that hecaufe a dueg dues not fweat, he has no iufenfible perpiration. 'That a dog perpires is cridut, becante one of thefe anmals can trace another is the feent of his footlleps; which could not happon if a large quantity of perfpirable matter was not conitantly going off. mifechipy- the rectus is infertal flemy iato the os pubis.
bling the hurian in its mape, is fomewhat differently fitmated. It lics more longitudinal, as indead all the other vifcera do, to acconnomate thentitves to the fhape of the cavity in which they are contained; that is, its inferion orifice is mach fatther down with refpect entricuto the fuperior thas the human: by this mans the grofs food has an calier pallase into the durdenum. Agrin, the fundus of the haman Atrmach, when diftemed, Atands aimut disecily forwads, which is occalioned by the lithe oncnum tying it fo chofe down to the bavk-inme, ace an it; wo orifices: hat it not beias fined in that riamer in the don, the fun lus remans always putatior: this atho anfwers wery well the mape of the dinientit cavities, the dilitance betwixt the cardia and funcm, bengegrater than that betwixt the two fides. It lems to be much larger in proportion th the bulk of the animal than the luman, that it might contain a eqreater quantity of food at once: which was very necefinay, fiace this anmal canmot at any time get its fuitenance as men do. The turtillion is not to larye, nor is there any coartion forming the antron IVill fit, as is the flomach of man. It is contiderably thicker and mone mulcular than ours, for breaking the conetion of their focd, which they fwallow without fulicient chewing. Hence it is evident the force of the thomach is tue fo gleat as fome wuth have it, nor its contraction io viulent: otherwife that of dogs would be undoubedly wounded thy the tharp bunes, \&e they always take down; for the contraction here is ftll greater than in the human Almach, which is mach thinner. The ruge of the tunica villofa are neitiner fo large, nor itudted tranfuerfely, as in the human, but go from one oritice to the other: the reafon of which difference is, perhaps, that they might be in lefs danger of being hurt by the hard fubAlances this creature frequently feeds upon; and for the fame reafon there is not the like coarction at their pylorus.

The interines of this animal are proportionally much tureftincs. fhorter than onns; for the food which thefe creatures mutlly ufe, foon diffolves, and then putrifies; on which account there was no occafion for a long tract of inteltines, but on the contrary that it hould be quickly thrown out of the body. The fame is to be obferved of all the carnivorous animals. Thac mufcular coat of the inteltines is alfo thicker and dronger than the human, to protrude the contents quickly and accurately.

The valvulx conniventes are lefs numerous, and in a longitudinal direction; and the whole tract of the alimentary canal is covered with a dime, which lubricates the intelines, faves them from the acrimony of the excrementitious part, and facilitates its paflage.

The duodennn differs conliderably in its fituation Duod:muno from the human. For in man it frit mounts from the pylorus upwards, backwards, and to the right-fide; then paffes down by the gall-bladder; and, marehing over the right kidaey and fuperior part of the phatis mufcles, makes a curvature upwards; and pafin's over the back-bone and vena cava inferior, to the left hypochondrium, where it gets through the omentum, mefentery, and mefocolon, to commence the jejunnm, loing firmly tied down all the way, the biliary and pancratic ducts enteriug at its mot depending part: Whercas, in the dog, the duodenum is fixed at the pylorus to the

Or Qua. $\xrightarrow{c r u p a}$

4
Jejunum.
concave furface of the liver, and hangs loofe and pendulous with the mefentery backwands into the cavity of the abdomen; then turning up again, is tixed to the tack bone, where it ends in the jejunum; the bile and pancreatic puice are poured into it as the molt dependine part. Therefure the fame intention feems to have leen had in vitw in the fermation of this part in both, viz. the giving the chyle, after the liquors of the liver and pancreas are poured into it, a difadvantagenus courfe, that fo it might be the more intimately blended with the lumours before its ertry inos the jegunum, where the laftesls are very numerous: And thos, by reafon of their difcent purne, the fame defign (thu' $\mathrm{b}_{\mathrm{y}}$ a very different oider of the parts) is brought about in both.
The other fmall guts are much the fame with ours, only florter. The yreat quts are alfo fhorter and lefs capacious than in the human body; and we take it for a general rule, that all animals that live on vegetable food, have not only their fmall guts eonfilerably home er, but alfo their great gits more capacious, then inth creatures as feed on other aninals. Hince man, from this form of his inteltines, and that of the teeth, feens to have been originally defigned for feeding on vegerables chicfly; and till the molt of his food, and all his drink, is of that clafs.

The reaton of this difference feems to be, that as animal focd is not only much more eafily reduced into chyle, but alfo more prome to putrefaction, too long a remora of the juices might occation the worft confequetces. So it was neceffary that their receptacles fhould not be toe capacious; but on the contrary, being fhort and narrow, might conduce to the Feafonable difchange of their contents. Whereas vegeiable food being more difficultly diffolved and converted into an animal nature, there was a necefficy for fuch creatures as fed on it to be provided with a long intefinal canal, that this food in its paffage might be confiderably retarded, and have time to change its indoles into one norre agreeable to our nature. Befides which there is another advantage which accrues to man in particular, from baving his great guts very capacions: for as he is a rational being, and montly employed in the functions of fucial life, it would have been very ineonvenient as well as unbecoming for him to be too frequently employed in fuch ignoble exercifes; fo that, laving this large refervoir for his freces alving, he can retain them for a confiderable time without any trouble.

The afpondix vermiformis juftly enough deferves the name of an inteflinum crecim in this fubject, though in the human body it does not; and it has probably been from the largenefs of this part in this and fome other animals, that the oldeft anatomitts came to reckon that fmall appendicle in man as one of the great guts. On its internal forface we obferve a great number of mucous glands. As all thefe throw out fime, their principal office would feem to be the procuring a fufficient quantity of that matter for the purpofes above mentioned. Still, however, there feems to be fome unknown ufe for this organ in other animals: for the appendicula vermiformis in then is either of great fize or of great length. In a rat, it is rather larger than the flomach; in others, as fwine, and fome of the ani.
mals which live on vegetables, ic has long convolutions, fo that the food mull be lodged in it for a long time. Thus, probably, fome change tokes place in the food, which requires a cenfiderable time to eficenate, and, though unknown to us, may andwer sery ufeful parpols to the animal.

The crien las no lougitudinal ligaments; and confequenty this gut is not purfed up into dificrent bags or cells as the luman: nor dues this inteline make any cicular turn round the abdomen ; but paffes directly acrofs it to the top of the os facrum, where it gcts the name of reflum.

At the extramity of the intefinume ritum, or verge of the anus, there are found two bags or pouches, which contain a moft abominable fetid mucus of a yellow collour, for which we know no ufe, unlefs it ferves to lubrieate the frained extre - $t$ y of the rectum, and defend it againt the afperity of the fieces, or to feparate fome liquor that might othen wife prove hurtful to their bodies. There is nothing analogous to thofe faes in the human fubject, unlefs we reckon the rucilayinous glands that are formd mode frequent and largett atom the lewer part of the rechum.

The mandery is condiaerably longer than in the hil- 19 man body; that, in his horizontal fituation, the inteftines may reit fecurely on the foft cuifion of the abdominal mufcles. The fat is here difipoled in the fame way, and for the fame reafon, as in the omentum. The intertices betwixt the fat are filled with a fine membrane. Inftead of a great number of glandulx vagse to be found in the human mefentery, we find Pancra: $s$ the glands few in number, and thofe are clofely con- fellii. nected together; or there is only one large gland to be obferved in the middle of the mefentery of a dog, which, from its imngined refemblance to the pancreas and the name of its difcoverers, is called pancreas Ajellii; but the refemblance, if there is any, depends chiefly on the connection, the flructure being entirely different. The reafon why this in man is as it were fubdivided into many fimaller ones, may polifibly be, that as the guts of a human body ate proportionally much longer than thofe of this creature, it would have been inconvenient to have gathered ail the latea primi generis into one place; whereas, by collecting a few of thefe veffels into a neighbouring gland, the fame efiect is procured much more eafily. Whether the food in this animal needs lefs preparation in its paffage through thefe glands, is a matter very much unknown to us; though it is certain that forne changes really do take place.

The pancreas in man lies acrofs the abdomen, tied down by the peritonreum; but the capacity of this creature's abdomen not allowing of that fituation, it is difpofed more longitudinally, being tied to the duodenum, which it accompanies for fome way. Its duct enters the duodenum about an inch and a half below the ductus communis

The fpleen of this animal difers from ours very much, both in figure and fituation. It is much more oblong and thin, and lies more according to the length of the abdomen, like the pancreas. Though the Spleen of this creature is not firmly tied to the diaphragm (which was neecflary in our erect polture to hinder it from falling downwards), yet by the animal's prone potition,
of Qua- tion, its pofterior parts being rather higher than the mufcle, and is as effectually fubjected to an alternate preffure from its action as the homan fipleen is.
The buman liver has no fifiures or divifions, malefs you flafe to feckon that frall one hetwixt the two aple, where the karge vetils eater: Whercas in a dog, End all other creatures that have a hage fexion in their Spine, as lions, leuparsts, cats, \&e. the liver and lungs are divided into a great many lobes by deep fections, reaching the large blo d-veftels, which in great motions of the back-bone may eally thufle over one anuther; and $f$, ate in mach idf danger of being aorn or bruifed, than if they vere fomed of one entire piece, as we really fee it is in horfes, cows, and fuch criatures as have their back bone thif and immoveble. There is liere no formentum lolum connceting the liver to the diaphrasm, which in our hation was neceflary to kecp the vifeus in its place: Whereas in this creature, it natmally gravitates forwande, and ley the horizontal puition of the minald is in no danger of preflang againt the vena cava; the puenciting of which is one nfe generally affegnel to this ligarache in man. Had the liver of the dig loen thus connuated to the diaphragin, the refiriation mult neceflarily lave foffered; for, as we thall fee afterwands, this mafcle is here moveable at the centre as well as at the fides: Int in man the liver is fiard to the diaphagm, noflly at its tudinous part ; that is, where the pericardium is fixed to it on the other hice; fo that it is in no daser of imperting the refoiration, beirg fufpended by the mediafinum and bones of the thorax. In confequance of this wfens beine divided into fo many lubes, it follows, that the hepatic ducts cannot purfibly join into one common thunk till they are quite out of the fubllance of the liver; becanfe a branch comes out from every tobe of the liver; all of which, by their union, form the hepatic duct: whence we are led to conclude, that the hipato-cytic ducits, mentioned by former authors, do nut exith. The gallbladder ittelf is wanting in feveral aninals, fuch as the deer, the horfe, the afs, \&e.; but in phace of it, in fuch animals, the hepatic duct, at its beginning, is widened into a referioir of contaterable fize, which may anfwer the fame purpufe in then that the gallibladder does in others

We come next, after having examined the chylopoietic vifcera, to difcoure of thofe organs that ferve for the fecretion and excretion of urine. And firft of the kidneys: Which in this animat are fituated much in the fame way as in the human fubject; but have no fat on their inferior furface, where they face the abdomen, and are of a more globular form than the human. The teafon of thefe differences will ealily ap. pear, if you compare their fituation and pofture in this animal with thofe in a man who walks crect. They are placed in this fubject in the inferior part of the body, fo are not fubject to the prefluire of the vifcera, which feems to be the principal caufe of the fat nefs of thofe organs in us, and perhaps may likewife be the caufe of our being more fubject to the flone than other animals. Hence there is no reed of any cellular fubtance to ward of this pieflure where there would neceffarily be fat collcected; but the fuperior part of their kindneys is pretty well covered with fat, lett they
fhond fuffer any compreffion from the action of the ribs and fipine.

In the intemal fructure there is fill a more confiderable diference: Fur the fupsilio do not here fend out fingle the feveral sutali toiniferi; but being all united, they hang down in fom of a loofe penduleus flap in the midele of the pelvis, and form a kind of feptam modium; fo thet a dog has a pelis formed within the futhance of the kidney. The only thing that is property analogons to a pelvis in man is that fac or dlatation of the ureters furmed at the union of the dufus urbituri. The extormal part of the kidncy of a dog fomewhat refenbles one of the lobes of the kidney of a human fotus: but in a human adult the appearance is very difierent; becanfe, in man, from thec continual prefure of the furromeding vifera, the lobes, which in the foxtus are quite diltinct and feparated, concrcte, but the original cortical fublance is ttill procerved in the internal parts of the kidney. The raton of thefe praticulaities may probalhy be, that the lifuors of this animal, as of all thote of the carniverous kind, being much more acrid than thofe that live on vegetable $f$ on l, its urine mul indine much to an alkalefency, as indecd the facel and tafte of that fiquor in duas, cats, hopards, \&c. evidently flow, being fetid and pangent, and therfore not convenient to bu long retained in the body. For this end it was proper that the feceming organs thould have as litthe impeciment as poflule by preflure, \& c . in the performing their function; ; and fur that defign, the mechanifra of their kidieys leems to be excellently adapted: We have moft clegant pictures in Euilachius of the kidneys of brutes, delineated at fach, with a view to thow iefalius's error in painting and defcribing them for the human.

The ghandule of caffild atrabliariz are thicker and Capfulx an rounder than the human, for the fame reafon as the rrabilisra. kidncys.

The ueters are more mufular than the human, becaufe of the mavemalle parige the urine has through them: they enter the bladder near its fundus.

The bladder of wine differs confderably from the $\mathrm{V}_{\mathrm{f}} 27$ human; and firt in its furm, which is pretty much naria. pyadmilal or preriform. This shape of the dog's blatder is tihewife common to all quadrupeds, except the ape and thofe of an erect pollure. In man it is by no means pyriform, but las a large fac at its poiteriur and inferior pait: this form depends entirely on the urine gravitating in our erect poture to its bottom, which it will endeavour to protrude; but as it camnot yied before, being contignous to the os pubis, it will naturally tretch out where there is the leall refillance, that is, at the polterior and lateral parts; and were it not fur this fac, we could not fo readity come at the bladder to extract the flone cither by the leffer or lateral operation of lithotumy. Molt anatomitts have delineated this wrong: fo much, that I know of none who have juflly painted it, excepting Mr Cowper in his Myptonia, and Mr Buaty. It las certainly been. from olferving it in brutcs and young chidrea, that Whey have been led into this mittake. Tle faine canfe, viz. the gravity of the urine, makes the bladder wo a different furm in brutes: In their harizontal pufition the cervix, from which the urethra is continued, is Ligher thair ite fandua; the usine mult therefore
of Rax didud and diate the moul depending part by its druict． Wじirsht．

As to its commer，it in fattencd to the abdominal mufles by a procefs of the peritoneum，and that mem－ brane is cstended quite cuer it：whereas in us its du－ pelior and palderior parts are only cusered by it：hence in man alone the ligh operation of lithutomy can be performed without hazarl of upening the cinity of the abdomen．Had the peritoneam been fperad over the Whader in its whole extent，the weight of the vifera in our erect pofture wolld have fo bore reon it，that they would not have allowed any cuntider ble quantity of uefine to be collucted there；hut we muft have beth obliged to disharge its conten＇s too fremumbly to be conflent with the functions of a focial lim：Whereas by means of the peritomum，the mine is now collect－ ed in fufficient quantity，the vifiera but gravitating this way．

Is mary be taken for a general rule，that thofe crea－ thees that feed upon anmal－food have their blader more mufeutar and enndiderably ftrunger，and lefs ca－ pacious，than thrie that live on regetables，fuch as horfes，cows，fwine，sc．whof bladder of wrine is per－ fuctly membranons，and very large．This is witly adapted to the nature of their food：For in the fe finft， as all their juices are more aerid，fo in a particular manner their mine becomes calted；which，as its re－ mora might be of very ill confequence，mut neectari－ Iy be quickly expelled．This is chietly edrected by its fimulating this rifeus more forongly to contract，and f）to difcharge its contents，though the irritation does not altogcther depend upon the ftretehius，but likewife A $\mathrm{m}^{32}$ ans：anifes from th：quality of the liquor．That a Rimulus Ir ved ：o is one of the principal caufes of the excretion if amine， beatrin－we karn from the common fahine diurtie medieines cipal caufe of the eva． cursion of the bladder that are given，which are diffolved into the ferum of the blood，and carricd down by the kidneys to the bladder：The fame appears hikewife from the appli－ cation of cantharides；or without any of thefe，when the parts are made more fenfible，as in an excoriation of the bladder，there is a freguent dehere to make wa－ tor．Aceordingly we find thete animals cuacuate the ir urine much more frequently than man，or any other creature that lives on regetable food．And if thede creatures，whofe finds have already a tendency to pu－ infaction，are expoled to hoat or hunger，the liquids mult for a confiderable time undergo the actions of

33
Cautes al－ figne 1 for tlee rá ie： canina，\＆c the contaning veffels，and frequently perform the courfe of thie circulation，without any new fupphes of food；by which the fluids becoming more and more acrid，the ercature is apt to fall into feverim and pu－ trid difeafes：And in fact，we find that fatal and me－ lancholy diRemper the robies canint，adpina，笑 $-i$ ．fre puen in thefe animals；whereas thofe that feed on ve－ fictatle food fildom or never constract thofe difeafe＇s but by infection．

That the caufes commonly affgned for the rabies canina ate infufficient to produce it in dogs and other anmals of that kind，is denied in a differtation on this difeafe by Dr Heyform．That heat is infufficient，le prows from the difafe being totally unknown in South America，where the heat is much greater than in this conntry．Putrid allment he aho fays is then in great quantity by dogs withont any inconvenience；and as it feems in this flate to be moit argrecable to them，
the rabies camina cannot with any probnility be aferi－ bed to it．As to want of water，he olfferves that the difeufe often originates among dogs that are plenti－ $\underbrace{\text { drupects．}}$ fully fuppliad with that ekment，while otbers lung de－ pitied of it have romained perficlly free．In hort， Dr Exytham tutally denies，not only the eficacy of the caules commonly affigned for the rabies canin：， but the nature of the dillemper itfef；and conjectures that the caule of it is not a futreficmy but an aikitity of the fluids．

Their if pinatic aefols are within the peritonemm， $\mathrm{Vafa}_{1} \mathrm{i}_{1}$ er－ which is Pread over them，and from which they have matica． a membrane like a mefentery，fo hancr loofe and pert－ dutous in ahe abdumen：whereas，in us，they are eme tained in the cellus part of the peritoneun，which is tenfely fretched over them．At their paffage out of the lower bedly，there appears a plain perforation，or holes hence the suiflt fermbies the human foetus．And from obferving this bernia or in cuadrupeds，has arifen the falfe notion of bermia on ruature． rupture among authors．This opening，which leals down to the tenticle，is of mo difadrantage to them， but evidently would have been to us ；for from the weight of vir vifera，and our cominually gravita－ ting upon thefe holes，we mut have perpetually labour－ ed under enteroceles．This they are in no hazard of， fince in them this pafiage is at the highet part of their belly，and，in their horizontal polture，the vifera can－ not bear ugon it：And，to prevent even the limalledt ha\％ard，there is a loote pendibus femihnar flap of fa？； which ferves two ufes，as it buth hiaders the intetines from gettins into the pailage，and allu the confe of the Aluds from Uiing hlopped in the whels，which is feerred in us by the cellular fubatanee and tenfe peri－ toneum ：And it may be worth while to obferve，that this procefs remains almont unaltered，even after the animal has been almoll exhaufted of fat．

There is next a paffage quite down into the cavity where the tedticles lie．Fiad the fame fructure ob－ tained in man，by the contant drilling down of the li－ quer which is fecerned for the lubricating of the guts， we thoukd alwors have laboured under an hydrocele； but their polture fecures them from any hazard of this kiad：indeed your very fat lap－dogs，who confequent－ ly have an urergrown omentim，are fometimes trou－ bled with an epiploctle．

The fororm is fhorter and not fo pendulous as the human in all the dog kind that want the refouls．fom：－ males，that the feed at each copulation might the foon－ er be brought from the telles，thus in fome meafure fupplying the place of the anflump fominales；for the The vef courle of the feed through the anfa defercmia is thus cula femi－ fhortened，by placing the fecerning veffels nearer the nales，how excretory organs．Perhaps its paffage is likewifefupiliedi quickened by the muicular power of the vafa deferen－ tia，which is Atronger in this creature than in man． The want of ewficulut femineles at the fame time ex－ plains the reafon why this ereature is fo tedious in eo－ pulation．But why thefe bodies are abfent in the dog kind more than in other animals，is a circumftance we know nothing of．

The thature of the tepicles is much the fame with the human；as are hifewife the corpus pyamidale，ra－ ricuian，or faminifum，and the epaliynis or escre－ tory veffel of the telticle．The rafa deferentia enter

Of Qua- the abolomen where the blood-veficls come out; and, palfing along the "pper part of the bladder, are infent. ed a little below the bulbous part of the ureth".

The prepminm has wo mufles fixed to it : one that arifes from the fphincter ani, and is inferted all along the prais; and this is colled rotrwor proput: But the other, whofe ofice is directly cont mary to this, is cotaneons; and feoms to take its on iz in fom the mufeles of the abdomen, or rather $t$, be a frodiation of their tumica carnola. The conpora corternta rife much in the fame way as the homan: but the fe foon terminate : and the ritt is fipplied by atrangular home, in the inferior part of which there is a rame exconvted for ludgings the urethrn. There are mon the penis two prowimerant bubmus ilefog fulatuces, refmbline the glens fenis in man, at the lack of which are two veins, which hy the ercolmors feris and wher pants are compreffed in the dime of enntion; and tha circalation
 bodics. After the ponis is thus fivelled, the vergina by its contraction and fuolling of its compers civanufum, which is confamably gicater thon in other arnmals, gripes it clofely; and io the mate is keqt in action fome time contray to his will, till time he given for bringing a quantity of feal fufficent to impleanate the female: and thus, by that oryefinus vemas of the female organs, the want of the re, hothe fumimate ane in fome meature fupplicu. But as it "ould I e a very neafy pollure for the derg to fuppont hindelf foldy ap. on his hinder feet, and for the biech so furpurt the weight of the doy for foloner a time; therefure, as foon as the bulburs budies are fufficiently thled, he ecte of and twans averle to her. Had, then, he penis been pliable as in other animals, the wretha mult of neceftity have been compreffed ly thistwiling, and confequently the confe of the feed intercepted; but this is wife. ly provided araint by the urethra's being formed in the hollow of the bonc. After the cmition of the feed, the parts tum floceid, the circulation is rellures, and the Lulbons parts can be cafly extracked.

The profata feems here divided into two, which are Froportionably luger than the homan, and afford a greater quantiry of that liquid.

The uforus of multifarous animals is little elfe lut a contimuation of their vagina, only feparated from it by a fmall ring or balve. From the iuteres two long callats mount uron the hins, in which the fatus are lodged: thele are divided into different facs, which are drongly confrictu'betwixt each fuetus; 弓゙t the fe coarchinas gise way in the time of birth. From thefe go out the thate Follopianu, fo that the ovaria come to lodge pretty near the kieneys.

We ought next to exmme the ftructure of the thorax and its contents. liut folt it may not be amifs to remark of the deuflyogen in its natural fituation, that it is in ginerd more bofe and free than the human; which is owing to its connection with the neighbouring parts in a different manner from ours. The human diapbragm is conaceted to the pericardium; which again, by the intervention of the mediaftinum, is tical to the fternum, fpine, \&c. but here there is fome difance between the diaphragm and pericardium. We obferve further, that its middle part is much more moveable, and the tendinous parts not fo large. And indeed it was neceffary their diaplorag hould be fome-
what ! rofe, they making more ufo ci is in dimulta re. Fpiration than mon. Mhiswe may ubfree by the fromg. heavimy of the thats of an horfe or due wisen out of breath; which cornetpurss:es the rimin of the ribs in us.

 tisa, which in tham is the haghed part of their h dies, whroby their yomes get at thea without tim ineonvenicuec of knac!ing: Nusethedef, when the erentures are of mo gratat fize, and the a treaß harge, an in theerp, the youngons are obligud to tahe this jothure. In inuitiparous animals, they mut hase a getat number oin nipI'se, that their ficual youner one may have roun at the fame time, and thede dipotith wer both thomas atheatumen; and hh ereatureseremorally lie down when the bouns are whe fuckied, that they maty give them the moll favomable liturtion. From this it does nut apparato be from any particula litnefo of the vethels at cert in plaves for giving a proper nourihnant to the chith, that the brialls ate fop placed in wenen as we timl then, but really from that hation being the mont convenicat both for mother and infant.
'The firmam is vely harrow, and contifls of a great stornum. nurner of imall bones, nowable wery way; which almay laripens in creatmes that have a great anoblity in ticcir fince: The ribs are Itraighter, and by no me:un $f$ convex as the human; whercby in refuinotion the motion forward will very little catare their therax, which is compenated by the greater mobility of their diaphragm: fo our thoras is principaly cmatged accordin to is breadn and depel, and theirs according to its length. The want of clavicles, and the confequent fallong in of the anterior extremitios upoat the chent, may cuntributefumewhat to the draightnefs of the ribs.

The meftafinum in this creature is prettr broad. The pericadium is not here contiguvas to the dia tum. phorem, but there is an inch of difance betwist them, in which place the finall loike of the langs lodges and by this means the liver, \&ic. of this anmat, thonth continually prefling apon the diaphram, yet candue diftirl the heart's motions.

The hems is fiturted whits porint almon direchly downvards, according to the creature's maluen, and is but very little inclined to the leathle. Iti point is much haper, and its hape more concida, thon the human. Hore the names of right and loft ventricles areproner eanagh, though not fo in the luman; whin ought rather to becalled arterior and petaiur, or fape
 confidernie length within the thotas, haviar neat the whok length of the heart to run over ere it aret, at the fonus Laractianus daxer. In men, as foon as it pierecs the diaphragm, fof foon it cneers the perburdium, which is firmy andached to it, and immediately gets into the finus Loweriaus; wheld fans, in the lluman fubjeex, by the obligue fituation of the heart is alnoll contigruons to the diaplragm : and by this we difoover, that fereal authors lave taken their del neations of the human heart from brutes; which is eafily detected by the fhape and lituation of the lacart, and Jong vena cava, within the thorax. This was one of the fualts of the curious was-work that were hown at London and Paris, which were plainly taken from a cow.

This fituation of the heart of the creature agrees beft whin the thape of its thoman, which is lower than the abdomen.

The eqrefs of the large blood-veflits from the heart is fomewhat different from the human: For here the right fubchavian comes off firit: and as a large trunk runs fome way upwareds before it gives off the left carotid, and fplis into the canotid and fuloclavian of the right fide, then the left fubclavian is fent off. So that neither here, properly fpeaking, is there an aorta ajeendias, more than in the limman; but this name has probably been impofed upon it from obferving this in a cow, where indeed there is an afcending and defcending aorta.

From this fecialty of the diflubution of the veffels of the right fide, which happens, though not in fo great a degree, in the hmman lubject, we may perhaps in fome meafure account for the general greater ftrength, readinefs, or facility of motion, which is obfervalle in A mewani- the right arm. Upon meafuring the dides of the vefcal account fels, the furface of the united trunk of the ritht fubof the fajerior froneth of the night arm, l E , clasian and carotid is lefs than that of the left fubch. vian and carotid, as they are feparated. If fo, the refiftance to the blood mot be lefs in that common trunk than in the lefe fubclovian and carotid: But if the refittance be faraller, the abfolute force with which the
blood is fent from the heart being equal, there muft necelfarily be a greater quantity of blood fent through them in a given time; and as the 1hength of the mufcles is, cateris purilus, as the quantity of blood fent into thens in a given time, thofe of the right arm will be flronger than thofe of the left. Now children, being confcious of this fuperior atrength, wefe the right upon all occafions; and thus from ufe comes that great difference which is fo obfervable. That this is a futicient caule, feems evident from fact ; for what a diffe:cnce is there betwiat the right and the left arm of one who has played ameh at tennis? View but the ams of aldackinith and kes of a fooman, and you will foon be comsi ced of this effect arifigg from nfing them. But if be any accibent the right am is kept from action for fore time, the other from heing ufed gets the betler ; and thote people are keft-handed: For it is not to be imarimed, that the fmall odds in the original formation of the velels fhould be futiecent to retif the cifot of ufe and habit (infamees of the eontary ocem (rery day) ; it is comerg for ont prefent argument, that where no mans are ufod to oppule it, the odes are lufficht whemine the date in favour of the right. Now b-caufe it is natmal to begin with the kig comeponding to the hand we have mott purar of, this is this what gives alfo a fuperiority to the 2isht locr.

Thes diffrence is not peculiar to man, but is Rill mone difmable in thofe creatures in whon the fane raechmifin does obtain in a greater degree. Do but Wheme a dog at a trot, how he benrs foward with his right hide; or hook at him when a-feraping up any thing, and you will prefently fee that he wes his right ranch ofence than to boues his left foes. Something anakgrous to this ta3y be oblerved in horfes. It has been the opinion of wime anatonifts, that teft-handed people, as well as thofe dittinguthed by the name of combidator (who we both hands alike), have the two carotid and futulaian attries coming off in $\mathrm{N}^{\mathrm{O}} \mathrm{B}-\mathrm{F}$
four dialinet trunks from the atch of the aorta: but no appearance of this kind has ever been oblerved in fuch bodies as have been examined for this purpofe; thongh indeed thefe have been bat few, and more experience might throw greater light on the fulject.

The diymus of this cetature is proportionably much larger than ours: whercas the glandula thyroidea is much olandula much lifs, and is divided into two diftinct parts, or thyroidea. there are two feparate glands; which is not the cafe in man. The reafon of this difference is anknown, as is likewife the ufe of the gland itfelf. It is generally remarked, that thefe two glands do thus ahways fupply the place of each other; that is, in fuch animals as have a large thymus, the glandula thyroidea is fmaller, and vice verfa. Hence we are natmadly led to aferibe the fame ufe to both, wiz. the feparation of a thin lymph for diluting the chyle in the thonacic duct before it be poured into the blood; then if we confider the different formation of the thorax in both, we fhall readily aecount for the variety in the bulk of thefe two glands. Refpiration being chitfly performed in man by the widening of the chetl, the lungs at every infpiration mult prefs upon the thymus, and confequently diminifh it: but the diaphragm yielding more in the durgs infpiration, this gland is not fo much preffed by the lungs, and fo will be larger; and henee the glandula thyroidea will be proportionably lefs. Again, from the polture of this creature, we thall fee that it was mueh more convenient for a dog to have the moft part of the diluting lymph fupplied by the thymus, tince the neok being frequently in a defecuding pollure, the lymph of the thyroid gland would have a very difaduantageous courfe to gret to the thoracie duet: whereas in the human body, the thymus is really below the lacteal canal, where it makes its curvature before it opens into the fubelavian; and confequently there is a neceffity of a conliderable thare of the dilutiag hquor being furnithed by the thyroid gland, which is lituated much ligher; fo that its lymph has the advantage of a perpendicular defcent.

We may here obferve, that the thoracic duci in a dog Ductus has no curvature before it enters the fubelavian vein, thoracicug. the horizontal pofition of this animal allowing a favourable enough courfe to the chyle, fo as not to need that turn to force its paflage ints the blood. It may like. wife be obfered, that fach animals as walk horizontally have the yalves of the thoracic dact fewer in number then whens. The horie has only a fingle pair; while, on the contrary, the ape refombles man in having feverel valves. 'Thus the lymph is not only forwarded in its pafige, but the weight of the colmm is diminithed. 'The laners of this creature are divided into more numerous lobes, and deeper, than they are in man, for the fame reaton as the liver. The left hide of the therux in this animal beas a greater proportion to the right than in man; the one being nearty as three to two, the other as four to three. In quadrupeds, as well as in man, the lungs are elofely applied to the containine parts; ahthough this has been denied by fome. We look on it as a general mle, that all quadrupeds, as having occation to erather their food from the ground, are provided with longer neeks than man: but as a long neck not omly gives the advantaje of too loner a lever to the weight of the head, butalio, when the animal is gathering his food, makes the brain in danger 2

Neck.
of Quadru- of being oppreficed wich too great a quancity of blood, $\underbrace{\text { peds. }}$ by the liquor in thefe arteries laving the advantage of a defcent, while that in the veins mift remount a confiderable way contrary to its own gravity; it was therefore necelfiry that a part of the length of the neck
is ariculted with the cricoid cartilage, whicit forves to Of Qundruraife it from the tima, though not fo ftrongly luat that it may witl a fmall foree be clapped down again. p © d .

It may be afled, however, Why the uvula is want-rhe uft of ing here, and not in man? This feems to be, that the uvulam guadrupeds, who fwallow then food in an larizon-mat. tal fitnation, have no occation for an uvala, thengh it is neceffary in man on account of his eacer litha. tion.

In the upper part of the pharyn: , belind the cricoid cartilage, there is a pretty large gland to be foond, which ferves not only for the feparation of a mucous liquor to lubricate the bolus as it paffes this way, but alfo fupplies the place of a valve, to hinder the food from regurgitating into the mouth, which it would be apt to do by reafon of the defcending fituation of the creature's head. In man, the mufcle of the epiglothis is wanting, its place being fupplied by the clalticity of the cartilage.

The afophages is formed pretty much in the fanme way Dofophaas the human. Authors indeed generally allege, thatgis, quadrupeds have their gullet compofed of a donble row of fuiral fibres decuffating one another; but this is peculiar to -uminating amimals, who have occafon for fuch a decutiation of fibres. The action of thefe you maty eatily cbforve in a cow chewing lace cud.

The nofe is generally longer than in man, and its cx. O. pan of ternal patage much narrower. The internal flucture fand. is alfor bett-r adapted for an acute fonclling, having a larger convoluted furface on which the membermis fixideriona is foread; and this is to be offerved in moll quadrupeds, who have the offa fongiofa commonly large, and thefe too divided into a erreat number of exeeflively fue thin lamelle. The fenbibity feems to be increafed in proportion to the furface; and this will alfo be found to take place in all the other fentes. 'The elephant, which hats a head pretty large in puoportion to its body, has the gratelt part of it taken up with the cavity of the note and fromal Comes; which latk extend almoll over their whole head, and leave but a fmall cavity for their brains. A very nice fenfe of fmelling was not fo abfolutely neceffary forman, who has judgment and experience to direct him in the choice of his food; whereas brutes, who have only their fenfes, mult of necdity have thefe acute, fome having one fenfe in greater perfection than others, according to their different waty of life. We not only conclude is foriori foom the large expanded membrana fhaderiana, that their fenfe of froelling is very acute, but we find it fo by cows and horfes dittinguifing fo readily betwixt noxious and whold fome horbs, which they do principally by this fenfe.

The external ear in difierent quadrupeds is differentl) framed, but alwars calculated to the creature's manncr of life. In thape it commoaly refembles the obioue fection of a cone from near the apes to the batis. Hares, and fuch other animals as are daily expuled to infults from beats of prey, have laresears direfed backwa:ds, their eyea wannime them of any durger before; rapacions animals, on the other hand, have their ears placed directly forwards, as we fee in the lion, cat, \&e. 'The flow hounds, and other inimals that are defigned to hear mut difinetly the founds coming from below, have their cars hanging downwads; or their cars are flexible, becaufic the nove K! , their
of puadr－their head for the mof part with greater dificulty than peds．
 man．Man，arrain，who meft equally hear founds co－ ining from all quarters，but efpecially fuch as are fent from ahont his own height，has his external ar placed in a vertical manner，fomewhat turned forward．In foort，wherever we fee a feceialty in the make of this organ in any creature，we thall，with vely little retlec－ tion，difoover this form to be more convenient for that creatore than another．The animal alfo bas the power of directing the cone of the ear to the funorons body withont moring the head．There are fome diflerences to be obferved in the flucture of the intemal car in different animals：but we know lo way litale of the ufe of the particular parto of that organ in the laman fubject，that it is altogether impofible to aflign reafons

Momirana All quadruede lave at the internal canthus of the ロはじituns．

6
Rlukains sufe：fo－ stio． eye a thomar fom menbatac with a castilaghons ofge， which may be make to cover lone pant of the fre： and this is greater or lefs in different ammals an their cyces are more or lefo expoled to dargers in fearehing after their food．This memburna mitituns，as it is called，is not wry lase in this amimal．Cons and turfes have it fo large as to cover one half of the eye like a curtain，and at the fame time is tranparent enough in allow abundance of the rays of light to pafs through it．Withes have a coticle always over their eyes，as they are ever in donger in that incom－ lant flement．In this then we may alfo ubferve a lort of gradation，

All çuadropeds lave a feventh mofle beonging to the eye，called fufperforize．It furnounds almoth the whole uptic nerve，and is lixed intu the folerotic coat as the uthers are．Its ufe is to fultain the weight of the globe of the eyc，aral prevent the optic norve foom being too mach liretched，without ubli－ ging the four fraight mufles to be in a contianat cons－ taction，which would be inconvenicnt ：at the fame time this mufele may be bronghe to andit any of the Gher four，by caufing one paticular fortion of it to act at a tione．

The nest thing to be remarked is the figure of thee fust，which is diffrent in different animals，but always exactly accommodated to the ercoture＇s way of tife，as wedl as to the differnt fpecies of oljects that ate view－ ed．Mam has it circular，fur obvivas reafons：an ox has it oval，with the longelt diameter placed tranfverfe－ 1r，to take in a larger sicw of his ivod：cats，again， have thairs likewife oval，hut the Jonget diameter placed perpendicuknly；they ean either exclude a bright light altogeiher，or admit only as much as is necentary．＇The pnpil of different animals varies in widenefs，atcording as the internal organs of vifon are more or lefs acute：Thus cats and owls，who feck their prey in the night，or in dark places（and confe－ quently mut lave their eyes fo formed as that a few ratys of light may make a lively impreffion on the re－ tima），have their pupils in the day－time contracted in－ to a rery narrow fpace，as a great nomber of rays would opprefs their nice organs；while in the night， or where the light is faint，they open the pupis，and very fully admit the rays．In the fame way，when the retiua is inflamed，a great uacaber of rajs of light wouk occation a painful fenfation；therefore the pupil is contracted：oa the contrary，in ding pookle，or in
a begiming amaurofs，it is generally dilated，as the Of Quadru－ eyes on fuch ocealions are very difficnltly allected，and as it were infenfible．

The potterior part of the choroid coat，which is Tapcum called tapefin，is of different colours in different crea． tures．Fer oxen，feeding motly on grafs，have this menibrane of a green colour，that it may reflect upon the retina all the rays of light which come from objects of that colour，while other rays are abforbed：Thas the animal fees its food better than it dues other objects． Cats and owl have their tapetum of a whith colour； and for the fame reafons have the pupil very dilatable， and their organs of vifion acute：Aud we thall fiud， that all animals fee more or lels ditenctly in the dark， according as their tapetum approaches nearer to a white or black colour．＇Thus conse，who have it of a greyifh colour，diftinguith ohjects better in the niedt than man，whefe tapetam is cark brown；and whe，it is belicved，lies wortt in the dark of any crature：it beiner originally defoged that he thould but from all kinds of employment in the nisht－tine．The difference then of the colnom of the tapeetnm，as indeed the fabice of any other part in different ereateres，always de－ pends on fome particular admatage acerming to the animal in its peculiar manner of life from this lingu－ larity．

Wre fhall now proced to the brain，which we re－ mark in the firt place is proportionally much fmaller in all quadrupeds than the humare；hut，as in man，it is divided into ecrebrum and eerebellum，sud thefe two Farts bear nearly the fame proporion to one another as in us．There was no fuch occafoun for for great a quantity of brain in thofe ammals as in man；feemer in them all its energy is emplosed in their progretfion， whike man has a great watte of fpirits in the exercife of his reafon and intellectual faculties．And behdes al！ this，a great bulliy brain wond be inconverent to the le creatures，in fo far as it would add contiderably to the weight of the head；which having the adrantage of a long lever to act with，would requice a much greater force to funport it than now it dues；for the heads of the greateit part of quadropeds are not mear fu hayy as they wonld at fight feem to be，from the finus frontacs being produced a great way upwards to enlarge the organs of fomelling．

The pits in the anterior part of their kulls are much more conipicuous than in the human cranium；which may be occafoned by the depending polture of the fe creatures heads while they gather their food：the brain at this tine gravitating much on the bones while they are as yot foft，will gradnally make imprefinons upon them at thefe places where it rifes into eminences． This is prevented in man mally by his ereet po－ itare．

The falx is not near folarge in quadiupeds as in man，as they have little occalion to lie on either fide， and the two hemifpleres of the brain are in a great neafure hindered foom jutting againt one another in violent motions，by the brain＇s mimuating itfelf into the above mentioncd pits．

The fecund procefi of the dura mater，or tentoriam corebello fiser－xpanfum，is confiderahly thicker and Aronger in mof quadrupeds than in man；efpecially in fuch of them as are very fwift of foot，as liares and rabbits，and that moll when they are del．Thlis men－ brase

Pais．

Of Quadru-brane if gencarlly ofificd, wr we fard the place of it peils. fapplied by a bone, that it may the more elfectually kecp of the firperineunbent main from the cerebellam in their rapid motions, which otherwife would be of bad conlequence.
 low, and confil of a modnllary and cinctitious fubftance, and at lin fight appear to be the anterion vantrids of the buan producel: but in man they are farth, and without any difernible cavity. 'The reafon of this is pretty evident, if we confider how this animal's head is fituated; for the lymph contimally gravitatimy upon the inferio: fat of the ventrickes, may then clongate and produce them; but from this very interior part the olfacher newes rife, and are fent immodiately through the os ethmoides into the nofe. Dinne the ancients, thinking they were entinued hedlas into the nofe, believal they were the emunctories of the brain: in the brain of theep, which by its firm cosine is the beft finfect of any for fearching into the thrusture of this part, we evident] $y$ lee, that the name of the figmoid caty wats very properly apphicd by the ancients to the lateral ventricles of the bran ; which are really of a greater extent than they are ordmarily painted by the amatomits, reaching farthar backwards, and formards aguin moder the fubAance of the brain. The cortical and medullary parts, as well as the corphi callofum, are funilar to thofe $\therefore$ pasts in man.
SNates 'The raters and folles deferve this name much better hove than in the haman body, with refpect to cath other. 'l'hey are lamger in the quadruped; and honee we perceive that there is -10 great reafon hor aferibing the difiecent operations to any particular fize or lhape: of the fe parts. They are here aloo of diferent colour; the nuter heing of the cohom of the contical, and the tifes of the medullary lubslance of the brain; whereds in man they are both of one eokour. 'The realion of the fe diflerences, and others of the like mature to be met with, we fhall nut pretend to determine; for we have hitherto fich an imperfect knowledge of the bran itielf, that we are entiely ignomant of the sarions ufes of its different parts. Wre may in general conclucle, that the varying in one animal from what it is in another, is fitted to the creature's particular way - 6 of living.

Reve mira- The rete miralili Goleni, Gouated on each fule of the bie Guevi folld turciu, about which there has been for moch difpute, is very remakable in moll quadrupeds. This plexus of velfels is rothing elfe than a continuation of the intemal carotid arteries, which, entering the 隹ull, divide into a vat mamber of minute braches ranning along the fide of the filla turcica; and, aniting afterwards, are fpent on the hrain in the common way. Galen feems with jutice to fuppere, that this plexus of vefids ferses for daceking the impetuofity of the blood dettined for the brain.

The thructure of the brain differing lont very little in all quadrupeds, it will be needlefs to examine it in any other.

The next fpecies of quadrupeds we propofed to confider was the ruminant kind, of which we have an
example in a cow; and acomdingl, that take the for- Or Quatrutus of the animal in whon, that we maly fult wmank Feta. fome things that are peculiar to it in that fate, and of terwards proceed to cxamine its vifcera as a rammane amimal. Kith, then, as a futus. - Itowever, befoec we begin our eaquiry, it may be worth war ablervation, that from the ovarium fomething eflemially neceflat for the production of the fatus is derived, as uctlas in the human fuectics.

The form ol a cow's wherus differs from the human, in having two pretty large comua. 'luhis is common to it with other bates; for a bitch has two long cor- Corbidu uo nun uteri: But thete again dificr (as being multiparch; the and miparous) in this, that in the bitches comma the fartus are eontained; whereas here thee is unly pare of the ficumblines, beiner modely the allantois with the included liynor. The mulemar tibres of the uteres ate more eatily difcovered ; its intemal finface lian a great number of fyongy, olbong, protuberant, ghatabar bo dies tixed to it. Thete are compurd of veffels of the werus terminating lees. In ath impergated ntens, we can eatily prefs out of thean a chylous mucilaginona liquor; they are compufed of a grent many procelte (1, di rituli, and deep caserns, aufweling to ats mans eaverns and procelies of the placenta. "Thar relionblance hat necathoned the name of potaika to be given them : and hence it was that Hipporates was induced to bolieve that the fatus fucked in utero. 'The papille are found in all the difurent Rayes of life, in the varomes flages of pegranay, and likewife in the unim. pregrated thate. It is not eafy to determize whether Uter is if
 tation. 'l'he membranes, it is plain (by the 隹etch- tine of geo ing of the pants), mut be made chimer: but then it is as evident, that the vefels are at that time enhaged, unen which princip.ily the thicknefs of any part dipenda; for there feens to be as much gained the one Waty ens luth the other.
'The os utar' is cntirely faut up by a glatinous muchhainoms fiblance, that is common to the females of all crentures when with younf: by this the external air is excluded, which would foon make the liquors corrupt: it alfo prevents the inflamation of the membranes, and the hazard of abortion. Dy this means alfo the lips of the womb are kept from growing together, which utherwife they womb certanly at this time do. There are mucons glands placed here to feeen this gluten, which on the breaking of the membranes with the contained waters make a lapo that hubricates and wathes the parts, and makes them cafily yield. The firt of the proper involucra of the futus
is the chorion.

The choriou is a pretty froug firm membrane, on
51 Chosion. whofe extermal furface are difperfed a great many red Alelhy bodies of the fume number, lize; and itructure, with the papillie, with which they are mutnaldy imented. They have becn called cotyletones, from Kuruan, cot: leds, "cavity." This is greatly difputed bj fome as a nes." name very improper ; hut we think withont reabon, fince the furface that is connected to the papilhe is concave, though when feparated it appears rather convex. 'I'o Shun all difpute, they may be called preperly enouglt pho entala, lince they fore the fance ufe as the placenta in women. The feparation of thefe from the papille without any letcration, and our not beium alle

K k 2
of Quadru to injest coloured Tiquors from the vefils of the glane's of the uterus into the placentulix, feen to prove beyond a reply, that there can be here no amatomofes betwist the velfls; on their coats run a great number of veffels that are fent to the feveral placemulx, on the external fole next to the uterus; whereas in creatures that have but one placenta, as in the human fubject, cats, dogs, \&c. the adhetion is fome what inmer: The placentex are likewife joined to the papille in the cornua uteri. We thall neat give the hiftory of the allantois.

This is a fine tranfparent membrane conti yous to the forme:. It is not a general in:olucrun of the $f x$ tus in the mother, for it coversonly a frall part of the annios. It is matly ludged i.1 the comua uteri. In mares, bitches, and cats, it firrounds the amnios, being cyety where interpofed betwixt in and the chorion. th fhecp and goats it is the fame as in this animal; and in fwine and abbits it covers Aill tefs of the ammins. This f.ic is probally formed by the dilatation of the urachas, which is combeted at its other end to the fardus of the bladder, through which it receives its watents; and a great quantity of urinc is commenly fonm in it. The membrane is dubled at the extremity of the canal, to hinder the return of the wine back into the bladder. Its veffels are forecefievty fine and few, that we canot force an iniccid liquir farther tlan the beginning of thi: ceat. 'This menbrane is fo far analogous to the cuticuis, as not to be limble to corruption, or calily irritated ? y acrid liquors.
nios: which at firt is in a fmall quantity, afterwards of Ruadruincreafes for fume monds, then ayain decreafes; and reds. in a cow near her time, the quantity of this liquor is not above a pound. This membrane does nat enter the cormat ateri in this cratare, being confined to the body of the utsrus; whereas the allantois occupica chictly its corma. But for what further relates to the ftructure of the involucra, with the nature of the biquors contaired in them, we mult refor to the fecond volume of Medical Effays, fro a pase 121, whare you have the fum of all we know of this matter.

There are here two ecrice umbilicales, and but onc ia the luman fubjoct; beante the extron: branches coming from the leveral placentule colld not anite to foon as they wond have done had they come all fibna one calse as in the buman.

There is a finall 10 ond flefhy booly that fwins in the urine of this creature, mares, 政. whinh is the bato manes of the ancients. Severalide opiaions and whins have been entertained as to its uts; but that feems to be thill uknown, or how it is rematated or nomilined, for it has no connection with the fietus or placentula.

Haviag then confidered the feveral involucta of this animal in a fretus thate, let as next obrerse the feccialities in its inturnal thrasture pecnliar to a fetus.

The unbilical vein joins the voms protwoun in the vons minticothel Clifoniara, without fending of any batachalds as it Lues in the hamen futject. - This win ioon afte: Lirrh turas to a ligment; yet there are fone inflances where it has semaned pervious for ferat years after birth, and oecunod a hamomags: We nay s,

 this turns affoltenwards to a liganent. The ambilical arterico rife at acute anoles from the internal ilias, whatever fome may fay to the continy; thefe allo become impervious.

The phononary artery coming forn the right ventricie of the heart divides into two; the largent, called comblis outarifits, opens into the defeendirg aunta: the other divides into two, to ferre the inneg on each fide. The fromathen ovede is pheed in the partition betuixt parane.en the riantend left aumber. Oi Chalu-ing edges which leads into the fecond Itomach, from 1-k.t. thence an the thind, and alfo the fone:th: howeren,
the crature has a power to dircet it into : Wheh it will. Some tell ns, that the denk gocs into the fecond : but That might be eally determind hy making them dimk before flangher. "Inc fecond fomach, which is the ambrior and fmatler, is callut \%ersions, reticulam, hoprepeomb, the bonuct, or kinges-ionl. It contits of a grat number of cells on it intermal fuifice, of a reguBer pentagnal ignore, like to a homeyeand. Here the fond is farther macerated: from which it is protruded inte the thind, called. ... s or omalim, valan the maryflies, becaufe the inten nal furface rifes up into a great many phice on follds, and fratum fuper frotum, acourding w the leagth of this thomach. Some of the fe plica are farther produed into the sumach than others; A.e. fint two long uncs on cach fike, and within there two thonter in the midde, sic. There are mimbertes Elandur grains like millet-feds difper fed on its plicex, from which fome authors call this flomach the millet. From this it pales into the fourth, where names are Oergry, atomoflim, caille, or the red, which is the mame it commonly has becaufe of its colour. This much refembles the human ftomach, or that of a dog; only the inner folds or plicx are longer and hofer: and it may alfo be offerved, that in all animals there is only one digethere thmach, and that has the fame coagulating puwer in the fortus as the furth shomach in this animal; whence this might not improperty be called the only true ftomach. Chille firgities curdiced; and herce the French have given that as a name to this fourth ifomach, lecaufe any milk that is taken down by young calves is there curdled. It is this fumth fomach, with the milk curdled in it, that is commonly taken for making runnet; but alter the bile and pancreatic juice cater, this coagulation is not to be found, which thows the ufe of thefe lippors. There are other creatures which ufe the fame food, that have mot fuch a mochanifm in their digelfive orgats. Horfes, afis, \&ic. have but one flomach, where grals is macerated, and a liquor for their monihnent extracted, and the remainder fent out by the anus very little altered. From this diferent Aructure of the thomach in thefe creatures, a ruminant animal will be ferved with one-third lefs food than ancther of equal bulk: grafiers are fufficiently acquainted with this. The reafon is, that ruminating animals have many and frong difentive organs; ail their food is fully prepared, and almolt wholly convericd into chyle: But a horfe's flumach is nut fitted for this; fo that he requires a much greater guantity of food to extract the

## 95 fame nousifhment.

length in proportion to the hure of a confiderable this comtinns what we faid formely on the fudy; and the intellincen of a doer, vis that the kencth andere of city of the guts were different in different animals, accurding to the nature of their food.

Thie divochnom is formed bere much the fame way as on a dog, and the gereral intention kept in vicw with regard to the mixture of the hile and pancreatic lymph. The great guts licre hardly deferve that name, thicir diameter dificing very little from that of the fimall ones; but to componfatiothin, thy ase mach longer pro-
pontionally than a dog's are, being convolnted as the of Quadru. fimall guts are. The creun is very large and loug. The digetion of the cow, as well as fome other animak, is accompanied with a peceniar kind of ation called romination; the intention of which feems to be. that the food may be futifiently comminted, and this more fully atted upon by the Ilomadl: for it is wit obferved that a calf ruminates as long as it is fod ouly upon mink, though the action takes place ats foom as it bugins to eat folit food. Bat it is to be obferved, that as long as a calf feeds only mon milk, the food defectuls immediately into the fourth Somach (which, as has been already mentioned, feems only capable of performing the operation of digeltion) withont itopping in any of the firit three. The rumination does not takc place till after the animal has eaten a pretty large quantity: after which the lies down, if the can do it conveniently, and begins to chew; thongh the operation will take place in a itanding portere, if the can ut lie down. In this action a ball is obferred to rife from the flomach with great velocity, alnolt as it thot from a mulket. 'This ball the animal chews very accurately, and then fyallows it again, and for on abternately, till all the food the has taten has andergone this operation. This is ealily explained from the ilructure of the efophagus, which has one fot of fibres calculated for bringing up the grafs, and another for takisig it down.

By means of rumination, the cow extiacts a mas harger proportion of nowithment from her food then thofe animals which do not ruminate; and hence fos is contonted with much worfe fare, and fnaller quantities of it, than a hofe; hence allo the dung of cows, being much more exhanted of its fine parts than horfe-dunc, protes much inferior to it as a manure.
The fleen difiers not much gither in fugure or fituation from that of a dug; but it is a little more firm1 yixed to the diaphragn, there nut being here fo much danser of this vifeus"a being hurt in the flexions of the fpine.
The fiver is not fplit into fo many lobes in this creature as either in a man or des; which depends on the farall morion this ereature enjoys in its fpine, which made fuch a divition needlefs. This alfo confirms what rie formenly adranced on this head.

Their uffat urimuria is of a pyramidal thape. It is very large, and move mombranaceons: for the urine of thefe creatures not being fo acrid as that of camiworons animals, there wais no ficch occation for capelling it fu foom.

The male is provided with a boofe pendubus frotum:
 uyrans differ from thofe of a hiteh, mofly as to the minales. form of the comma uter:, which are lere contorted in form of a facil. In this, and all taniparous animals, they contain only part of the fecundines; but in bitches, and other multiparous animals, they run thraight up in the abcomen, and contain the foxtue themfives.

The fituation of the leart is pretty much the fame with that of a dog, only its point is rather flarper: In us, the heart beating continually againt the ribs, and both ventricles coing equally fat dows to the con-

Aitution

Or Fowis. Aitution of the aper, it is very obtufe : but hace the apex is made up only of the left rentrich; fo is more acute. formbing and affomding, though this divifon is illoumded either in a dog or man; and it has certainly been from this fubject that the older anatomits took their deferiptions when they made this divifion ; for here the aorta divides into two, the afeending and defeencling.

## Chap. II. Of Fowl's.

The next clafs of animals we come to confler are of the feathered kind; which are divided into the granionoros and curnionrous. But before we go on to confider the fuecraltics in the viliona of ewch kind, we mat offerve what both fpecies agtee in.

Shet. I. Of Fuzuls in gencral.
Fowls have a pasticular eovering of feathers diferent from all oflier creatures, but exactly well fuited to their manner of life: for it not only protects them from the inguries of the weather, but ferves them in their progreflion thoongh that thin aerial element they are for the mote part employed in ; and as fome fowls live much in the water, their feathers being continually befineared with an oily liquer, keeps the water from foaking into their fins, and fo prevents the bad of feets which it would infallibly atherwife produce.

Fowls have the flrongett mufcles of their whole boto buoy lamfelf up into the air like birds, even though he had proper machines in place of wings, malefs he were likewife provided with mufcles ftrong (nough for moving them, which he has not. In the next place, their wings are not placed in the middle of their bodies, but a groud deal further forwards; whenee it would at firlt vicw appear, that their heads would be erect, and their puflerior parts mol depending when raifed in the air: but by fretching out their heads which act upon the lever of a long neck, they alter their eentre of gravity pretty much; and alfo by filling the facs or bladders in the intide of their abdomen with air, and expanding their tail, they come to make the pofterior part of their bodies confiderably higher; and thus they fly with their bodies nearly in an horizontal fituatiom. Hence we find, that if their neeks are kept from being ttretched out, or if you cout away their tails, they become ineapable of fring any conliderable way.

The largenels of the wings in different fowls vanies according $t$ the vecalions of the ereatere. Thus birds of prey, who mult fly a conliderable way to provide their food, have large frong wings; whereas domestic birds, who find their nowithment alnot every where, have very flort and but finall wings. Their tail is of ufe in alifting to ruife them in the air, thourh the chief purpofe of it is to fuve as a rudder in ghidings their flight, whilit they ufe their wings as we do oars in putting forward a boat. The beft accome of this mamer of progreflion: of fowls is given by Alfonfus Borellus, in his treatife De Alotis Animatium; and in the Retigious Phitofopher we have Burelli's doctrine Atrippeci pretty mach of its mathematical form. The potterior
extremities are fituated fo far back, as to make us at firt think they would be in contimal heard of fallimer down forwards when they walk: but this is pecsened by their holding up their heals and neck, bo at to mive the centre of gravity fall upon the fect; and when the $y$ have occation for climbing up a tkeep place, they itretch out their heads and neclis forward, efpecially if they are fhort-legged, the better to preferve propery the balane of the body. Thas we may obferve a goole enterime a bars-fioor, where gencrally there is an alcending ilep, te tretch ont its neck, which before was raffed, and incline its body forwards. This is bughed at by the common people, who afolibe it to a pisce of folly in the goobe, as if afraid of knockiner its head againf the top of the door.

Carniv rous animats are provided with lerong erook. A peculior ed clas's fir the catching their prey: water-fowls ufe in the thims them for fwimming: and, principally for this purpofe, of fowis. lave a ftong firm membrane interpofed botwint the tors. 'There is a beautiful mechanifm to be obferved. i:1 the toes of fowls, which is of conliderable ufe to them. For their toes are naturally drawn together, or bended, when the foot is bended: this is owing to the fhortnefs of the tendons of the toes, which pafs over them, which is analogous to our heel ; and that the toes are fet in the circumference of a circle, as our frigers are: Hence, when the foot is bended, the tendons muit confequently be much thretehed; and, fince they are inferted into the toes, mult of necelity bend them when the foot is bended; and when the foot is extended, the flesors of the toes are again relaxed, and they therefore expanced. This is alfo of great uie to different kinds of fowls: thus the hawk defeending with his legs and feet extended, foreads hig talons over his prey; and the weight of his body bend. ing his feet, the toes are coutracted, and the prey is feized by the talons. This is alfo of great ufe to wa-ter-fowls: for had there been no fuch contrivance as this, they muit have lof as much time when they pulled their legs in as they had gained by the former Atroke; but, as the parts are now framed, whenever the creature draws in its foot, the toes are at the fame time bended and contracted into lefs fpace, fo that the reliftance made againf the water is not neal fo great as before: on the contrary, when they tretch their foot, their toes are extended, the membrane betwist them expanded, and confequently a greater refiftance made to the water. Again, fuch fowls as live mollly in the air, or have oecafion to fultain themfelves on branches of trees in wind ${ }^{-}$weather, and $\epsilon$ ven in the nighetime when afleep, while all their mufcles are fuppoled to be in a thate of relaxation: fuch have no more to do but lean down the weight of their bodies, and their toes continue bended withont any mufeles being in action; aurl whenever they would difentangle themfelves, they raife up their bodies, by which their feet, and confequently their toes, are ex. tended.

The roftrum, bill, or beak of fowls, is compofed of The varicty two mandibulæ; and, as in quadrupeds, the upper one in the heaks has no motion but what it poffeffes in common with of hiwh. the head. But parrots are an exception to this rule; Itsufos, \&ec. for they can move the upper mandible at pleafure: this is exceeding eonvenient, as it enables them to lay hold of whatever comes in their wisy. Carnivorous

Uf fowts. Sowls have their beaks long, fharp, and crooked; the domeltic fowls, fueh as the hen-kind, \&c. have Arong fhort beaks, commodioufly fitted to dig up and break their food ; the water-fowla, asain, have long or very hroad foom-like beaks, which is moll convenient for them. 'The flemum of fowls is much largen proportiomally than the luman, and has a ridac rifing in its midule for the more commodions origin of the mulcles that move the wings. It is alfo lefs moveable than curs; for had it been very moveable, a gatat deal of the force cmployed for moving the wings would at every contraction of the mufeles have been loft, or elfe fome other mufcles muf havecome in play to keep firm the fternum; but this additional weight would have been inconvenient for their progrefion.

What other things are moll remarkable in the fructure of the feveral vifeera, we fhall confider in that common domettic animal the cock or hen, and afterwards obfare the difference of their vifcera chytopuietica from a carnivorous fowl.

## Sect, II. Anutomy of the Domefic Cock.

Тноиgh this kind of birds live uponfood fomewhat fimilar to that of man, yet as they have no teeth to feparate or break down this food, we would expect to find fomething to cumpenf:te for the want of tecth, fomething remarkable in the organs of digetion: we

IC. 5 gus Ingluvies.
!「う
Tipiderai, lavefs : il 2 i.ternal Crface of all the w. vili=4 a:d verims of the humat body.

Chall therefore begia with thefe parts.

The cfoph rgns of this crature runs down its neek, fomewhat inclined to the right file; and termimates in a pretty large membranous fac, which is the inghuvics or crop, where the foon is macerated and diffolved by a liquor feparated by the glands, which are eaflly obferved every where on the internal furface of this bag. The effect of this maceration may be vory well oblerved in pigeons, who are functimes in danger of being fuffocated by the peafe, \&ec. they feed upon, iwelling to fuch an immenfe bulk in the ir ingluvies, that they can neither get upwar's a $r$ downwards if it be a favouite fow, it misht be preterved by opening the fac, taking out the peat, and fewing up the wound.
The fored getting out of thas tac goes down by the remaining pare of the cefop...gis into the ventriculus fuccenturiatus, or infualibulum Piycri, which is a contimuation of the aullet with more numerous glands, which teparate a liquor to dhate the food lifll nore, which at koreth gets into the true tomach or giz\%ard, revelriculus cullusus, which confits of two vety frong muicies coverd externally with a tendinous aponeurofis, and lined on the infide by a vory thok fim membrane, which we evidently difeover to be a production of the cuticula. This might have been proved in fome mealure if frime from taking notice, that this membrane, which in chicks is smly a thin Niglt pellicie, by des es turns thicker and antager the morealtrition it fufficr: but there is no ether animal. futhance, fo far os we kll, v, which grows move hard and thik by be ins fubjectal in atirition, excepting the curicuh Hence say be drawn fume kiad of proof of what has been affremed onerning the tunica vollya of the fumach and inteltines in the human body, viz. that it vas in part a contimation of tle cupidermis : :ay, all the l whow parts of the boly, even arteries, vins, \&ec. dee in to be lined with a producion of this membane, or one analogous to it. The ufe of the internal coat N'87.
of the flumach of fowls is to defend the more tender parts of that vifous from the hard grains and little ftones thole creatures take down. The ule of the givzard is to compenfate for the want of tecth; and it is well fitted for this purpofe from the great itrength it pultifics.
'lice digetion of the fe a aimals is performed menely by attrition, as is evinced by many experiments; and it is futher allited by the hard bodies they fwallow. We dee them daily take down condiderable numbers of thee moll folid rugged litele fints they find; and thefe can ferve for no other pupole than to help the thitura,tion of their aliments. After thefe pebbles, by becoming fmooth, ate unfit for this olice, they are thrown up by the mouth. Hence fowls that are long conlined, though ever fo well fed, turn !ean for want of thefe Itones to help, their digellion. This was put beyond all difpute by Mr Tanvy, who gave a fpecies of metal to an oftrich, convex on onc fide and concave on the other, but carved oa both; and opening the creature's body fome time after, it was found, that the carving on the convex fode was all obliterated, while the engraved character remaned the fame as before on the cuncave lije, which was not fubjected to the Romach's preflure: which could not have happened had digeftion been peiformed by a menftrum, or any other way whatloever; but may te cafly folved by allowing a timple mechanical prefluce to take place. We are, hovever, by no means to conclude from this, as fome have too rafily done, that in the human body digetion is performed by timple attrition; otherwife we may, with equal ftrength of riafon, by as good argunents drawn from what is obferved in fithes, prove that the aliments are diffired in our tomachas by the astion of a mentruun. Sut this method of reanoning is very faulty : nor enn it ever bring us to the tue folution of any philofophical or medical problem. It is very plain, fince the ftructure of the parts of the liuman flomach are fo very different from that of this creature, that it is foolinh and unreafonable to imagine both of them capable of producing the fame effects. At ench end of the ilomach, there are as it ware two particular facs of a different textare from the relt of the llomach, not confiting of ftrong mufcular fibres: they feem to be receptacles for the dones (Apecially at the end which is farthêt from the orifice), while the digeted aliment is protruded into the? intettines.

Spallamzani, bowever. has lately found, that pebbles are fot at all neceffry to the trituration of the food of thefe animals. At the fame time, he does not deny, that when pot in motion by the galtia mulcles, they are capable of prodaciag fome effect on the comtents of the ${ }^{2}$ moch: but is inclimed to believe, the: they are not fonwht for and $k$ leated by dedizn, as mirny luppor, but becuate they fequently haraen to be nived with the ford.

The dunhera besins pretty near the fane phoe at Dudenano whioh tam oph:ons ente:s; yet not dithendiret the vicimity of thefe toro tore, the aliments are in m) dancer of gettion cut before they ate perfectiy dierated, Ey reafor ot ap otrberance, or kinum nowizam. We'twixt the onfices; auh in thole creatures who have fuch a frong mucuna Awmach, it is a mater of grat indis. forence whether the entry of the celoplagus or pyloris
of Fowls. be higheft, provided that the entry from the eefophague does not allow the food to regurgitate, fince the force of the flomach can eafily protrude it towards the duodenum. This gut is mofly in the right fide, and hangs pendulons in their abdomen, having its tivo extremities fixed to the liver. 'The dufius choledochus enters near its termination, where it mounts up again to be fixed to the liver; and left, by the contraction of the inteflines, the bile flould pass over without being intimately blended with the chyle, that duct enters downwards, contrary to the courfe of the food, and contrary to what is obferved in any of the animals we have yet mentioned. But lill the gencral intention is kept in view, in allowing thefe juices the fairet chance of being intimately blended with the food.

The fmall guts are proportionally longer than thofe of carnivorous birds, for the general caufe already affigued. At the end of the illime they have two large intefina caca, one on each fide, four or five inches long, coming off from the fide of the rectum, and afcending: a a we find them containing part of the food: Thefe ferve as refervoirs to the feces; which, after fome remora, there regurgitate into what foon becomes the rectum; which, together with the excretories of urine and organs of generation, emptics it felf into the common cloaca. The fmall intetlines are comneted by a long loofe mefentery, which has little or no fat accompanying the blood veffels, there being no hazard of the blood's being ftopped.
116
Pancreas.
ry $\quad$ into this gut pretty near the bilary.
The fpleen. The fileen is here of a round globular figure, fitua-
folde pancreas in the creature hes betwixt the two folds of the duodenum, and fends two or three ducts into this gut pretty near the biliary. ted between the liver and flomach; and betwixt thefe and the back-bone it enjoys the fame properties as in other animala, viz, large blood-veffels, sce. All its blood is fent into the retra portarum, and has a perpetual conquaffation. It has no excretory, as far as we know. Their liver is divided into two equal lubes by a pellucid membrane, running according to the length of their body: and hence we may oblerve, that it is not proper to that bowel to lie on che right fide; which is till more confirned by what we obferve in filhes, where the greaiell part of it lies in the left fide.

The hape of their grall-bladder is not much different from that of quadrupeds; but is thought to be longer in proportion to the fize of the animal, and is farther removed from the liver.
120
Cor.
The principal difference to be remarked in their beart, is the want of the voclunde tricupides, and their place being fupplied by one flefly flap.
Fulm nee, The lungs are not loofe within the cavity of the thotheir flrac- rax, but fixed to the bone all the way; neither are ture and they divided into lobes, as in thofe animals that have a large motion in their fpine. They are two red foongy bodies, corered with a membrane that is pervious, and which communicates with the large veficles or aitThe ufe of bags that are difperfed over their whole abdomen; the vicicles which veficles, according to Dr Monro, ferve two very

domer. confiderable ufes. The one is to render their bodies fpecifically light, when they have a mind to alcend and buoy themfelves up when flying, by dillending their lungs with air, and alfo Araiten their trachocuaterin, and fo return the air. Secondly, they fupply the place of a mufcular diaplragm and flrong abdominal mulchs; Vol. V. Part I.
producing the fame effects on the feveral contained vifo of Fowls. ceta, as thefe mufcles would have done, without the inconveniency of their additional weight; and condu-

## 223 $c$ dis.

 cing as much to the exclufion of the egg and feces.1) Henter bath lately made fome curions difcove hragha, belat ries relative to there internal receptacks of air in the piid. bodies of birds. Some of them are lodged in the flefhy parts, and fome in the hollow bones; but all of them communicate with the luugs. He informs us, that the air-cells which are found in the foft parts have no comenuaication with the cellular membrane which is common to birds as well as other animals. Some of them communicate immediately with each other ; but all of them by the intervention of the lungs as a common centre. Some of them are placed in cavities, as the abdomen; others in the interlices of parts, as about the breall. The bones which receive air are of two kinds; fome of them divided into innumerable cells; others hollowed out into one large canal. They may be dillinguithed from fuch as do nut acceive air,
 by containing liztle oil; by having no marrow nor blood in their cells; by having lefs batduefs and firmnefs than others; and by the paflage for the air being perceivable.
The mechanifm by which the lungs are fitted for conveying air to thefe cavities is, their being attached to the diaphragm, and connected alfo to the ribs and fides of the vartebre. The diaphragm is perforated in feveral places by pretty large holes, allowing a free paflage of air into the abdomen. To each of thefe holes is attached a ditinct membranous bag, thin and tranfparent. 'The lungs open at their antelior part into membranous cells, which lie upon the fides of the pericardium, and communicate with the cells of the iternum. The fuperior parts of the lungs open into cells of a loofe net-work, through which the trachea and offophagus pafs. When thefe cells are diftended with air, it indicates pafion, as in the cafe of the turky-cock, pouting pigeon, \&c.

Thefe cells communicate with others in the axilla, and under the large pectoral muicle; and thofe witle the cavity of the os humeri, by means of fmall openings in the hollow furface near the head of that bonc. Latly, The potlerior edges of the lungs have ophiings into the cells of the vertebre, ribs, os factum, and other bones of the pelvis, from which the air finds. a paflage to the cavity of the thigh bonc.

Concenning the ufe of thefe cavitecs the docter conjectures, that they are a kind of appendage to the lungs; and that, like the bags contimued though the bellies of amplibious animals, they ferve as a kind of refervoirs of air. They affill birde daning their flight, which mult be apt to render frequent refpiration dillacult. He farcher infunates, that this coinftuetion of the organs of refpiration may affill birds in finging: which, he thinks, may be inferid from the long continuance of fong between the breathing's of a caparybird. On tying the trachea of a cook, the animat breatheel through a canula introduced into his belly; another through the os humeri, when cut acrofs; and a hawk through the oa femoris. In all : thefe calus the animals foon died. In the finf, the doctor ateribes the death 10 an infammation of the Lowels; but ia the lalt, he owns it was owing to difficule brcathing. I. 1

What
of Fowh. Whas truk place, however, was fufficient to fhow that - the animals really did bernthe threugh the bone.

Then we examine the upper end of the trach a, we obferve a rima slaticis with mulcolar fides, which may act in preventing the food or driak from palling into the luares; for there is no opigichits as in man and qua.

324

The tractea arteria, near where it divides, is wery much contracted; and their voice is principally owing to this coarctation. If you lifen attentively to a cock cuwing, you will be fenfible that the noife does not proceed from the throat, but deeper; nay, this scry Fipe, when taken ont of the body, and cut of a little after is divifion, and blown into, will make a fqueaking noife, lomething like the voice of thefe creatures. On each fide, a little higher than this contration, there is a mufcle ariting from their hernum, which dilates the trachea. The cattilages, of which the pipe is compofed in this animal, go quite round it; whereas in men and quadrupeds they are difcontinued for ahout onc-fourth on the back-part, and the iatermediate fpace is filled up by a membrane. Neither is the trachea fo firmly attached to their vertebrex as in the other creatures we have examined. This Aructure we hall find of great fervice to them, if we confider, that had the fame tructure obtained in them as in us, their breath wonld have been in hazard of being ttopped at evcry flexion or twilling of their neck, which they are frequenty obliged to. This we may be fonlible of by berding our necks confiderably on one fide, upon which we thall find a great traitnefs and difficulty of Greathing; whereas their trachea is bettur fitted for following the flections of the neck ty its loofe comection to the vertebre.

In. place of a mufoilar diaphragm, this creature bas nothing but a thin membrane conneeted to the pericadiam, which feparates the thoras and abdomen. But befides this, the whole abdomen and thorax are divided by a Iongitudinal membrane or meduffinum cornected to the lungs, pericardium, liver, fomach, and to the fat lying ever their fomach and guts, which is analogons to an omentum, and fupplies 335 its phace.
Iympharic 'The lympatic fyem in binds confifts, as in man, of Fyheri. laceal and lymphatic veffels, with the thoracic duct.

The lacteals indeed, in the Aricteft fenfe, are the lymphatics of the inteftines; and, like the other lymphatics, carry only a traniparent lymph; and inftead of one thoracic duct, there are two, which go to the jugular viins. In thefe circumftances, it would feem that birds difer from the human fubject, fo far at lealt as we may judge from the difiction of a gonfe, the common fubject of this inquiry, and from which the fullowing defeription is taken.

The lacteals run from the inteftines upon the mefenteric veffels: thofe of the duodenum pafs by the fide of the pancreas; afterwayd they get upon the caliac artery, of which the fapetior mefenteric is a branch. Here they are joined by the lymphatics of the liver, and then they form a plexus which furrounds the celiac artery. Here allo they reccive a lymphatic from the gizzard, and foou after another from the lower part of the cefophagus. At the root of the cxliac artery they are joined by the lymphatics from the glandule renales, and ncar the fame part by the lac-
teals from the other finall inteflines, which veffels accompany the lower mefenteric attery ; but, before they juin thofe from the duodenum, receive from the rectum a trmphatic, which runs from the hood velfels of that gut. Into this lymphatic fone imail refiels from the hidneys fiem to enter at the root of the cexliace artery. The lymplatics of the lower extremities prohably join thofe from the intelines. At the root of the caliac artery and contiguons patt of the aurta, a net-work is furned by the reflels above defcribed. From this net-work arife two thoracic ducts, of which one lies on cach lide of the fpiue, and ruas obliquely over the lungs to the jugular sein, into the infide of which it terminates, nearly oppolite to the angle forned by the vein and this fubclavian one. The thoracic duct of the left fide is joined by a hage lymphatic, which runs upon the afophygus. The thoracie ducis are joined by the lymplatics of the neck, and prohably by thofe of the wings where they open into the jugular reins. The lymphaties of the neck generally confiat of two large branches, on each fide of the mek, accompanying the blood-vefeds; and the fe two branches join near the lower part of the nock, and form a trunk which runs clofe to the jugular v cin, and opens into a lymphatic gland; from the oppotite fide of this gland a lymphatic comes out, which cads in the jugular vein.
On the left fide, the whole of this lymplatic joins the thoracic duct of the fatne file: but, on the right one, part of it goes into the infide (f the jugular vein a little above the angle; whilt another joins the thoracic duct, and with that duct forms a common trumb, which opens into the infide of the jugular vein, a little below the angle which that vein makes with the fubclavian. This fytem in birds differs mott from that of quadrupeds, in the chyle being tranfpuent and colourlefs, and in there being no wifib'e lymphatic glands, neither in the con: fe of the lacteals, nor in that of the lymphatics of the abdomen, nor near the thoracic duets.
The kincys lie in the hullow excavated in the fide Fi neyso of the back-bone, from which there is fent ont a bluifhcoloured canal ruaning along by the fide of the vas deferens, and terminating directly in the common elvaca. This is the ureter, which opens by a peculiar aperture of its uwa, and not at the penis. Fowls haring no aefica urinaria, it was thought by fome they never pafled any urine, but that it went to the nourihment of the feathers: but this is falfe; for that whitih fublance that you fee their greenih faces covered with, and which turns afterwards chalky, is their uriue. Let us next confider the organs of generation of both fexes, and firt thofe of the male.

The toflicles are lituated one on each fide of the The ${ }^{127}$ back-bone; and are proportionally very large to the of veneracreature's bulk. From thefe ruin out the vafa femini- tion in the fera; at fint Alraight; but after they recede farther ${ }^{\text {nale. }}$ from the body of the teflicle, they acquire an undulated or convoluted form, as the epididymis in man. Thefe convolutions partly fupply the want of refficule feminales, their cuition being at the fame time very fhort: Thefe terminate in the penis, of which the cock has two, one on each fide of the common cloaca, pointing direcily outwards. They open at a diftance from each other, and are very frmall and flort; whence they have efaped the notice of anatomits, who have often denied theis exitence. In birds there is no pruflate

U゙に 1 . organs of the male.
The rucomas sitellerum, leing analornus to the oraria in the homan fubject, are attached by a proper membrane to the beck-bne. This is very line and thin, and continued diwn to the uterus. Its orifice is averfe with refpect to the ovaria; yet notwithlanding, hy the force of the orgafons vencrear, it turns r and and grafins the vithlus, which in its pallage through this duct, called the infundibulum, receives a thick gelatinous liquer, fecreted by certain glands. This, with what it receives in the utcrus, compofes the white of the egrg. By this tube then it is carried into the uterus. The flell is lined with a membrane; and in the large end there is a bag full of air, from which there is no outct.
'The utcrus is a large bag, placed at the end of the infundilulum, full of wrinkles on its intide; here the egg is completed, rectiving its laft involucrum, and is at lalt pulled out at an opening on the fide of the common cloaca. Frum the teftes in the male being fo very large in preportion to the body of the creature, there muft neeefarily be a great quantity of femen fecerned; hence the animal is falacions, and becomes capable of impregnating many females. The want of the veficulc fomimalis is in fome meafure fupplicd by the convolutions of the vofin defirentit, and by the fmall diftance betwixt the fecerning and excretory organs. The two fenes contribute alfo very much to their thort coition; at which time the opening of the uterus into the cloaca is very much dilated, that the effect of the femen on the vitelli may be the greater.

A hen will of herfelf indeed lay eggs; but thefe are not impregnated, and yet appear entirely complete, except that the fmall black fpot, which comes afterwards to be the rudiments of the chick, is not here to he obierved.

After having obferved the contents of the abdomen and thorax, we next proceed to txamine the parts about the neck and head.

Thefe creatures, as was ohferved of fowls in seneral, have no teeth. Some, indeed, have an appearance of teeth: but thefe are only fimall proceifes or ferres rifing out from the mandible, without any focket, \&c. which would have been needefs, as they fwallow their food entire. But their tongue is made pretty firm, left it the ald be hurt by the tharp points of the grain they feed on. It is of a triangular tigure, and pointed befone: and as by their depending pollure their meat is in hazard of fatling out of their mouths, to prevent this there are feveral finall pointed papillx ftanding unt upon their tongue and palate, with their points inclined backwards, allowing an çafy paflage to the food, but hindering it to return.
We have here no volum fudutinum, woula, or epiglottis; and in place of two large holes opening into the nofe, there is only a long narrow rima fupplied with pretty ftrong mufeles, and fuch another fupplies the place of a gletti.. The creature has a powcr of thutting buth at pleafine; and the nature of their food feems not a nly to csempt then from the hazard of its getting into the nofe or trachea, but its harp points would lowe an arela, or erifottis, if they had any.

Hence we fee with "hat diffeculy thipe fuathere of Fowtor dough or orlice fort of frod that can be catly monder t-ras into any form. When we examine the apper ent of the trachea, we oble ve: at matateridis with mufahor fides, which mav ast in presenting the food or dink from pafting into the hange, fur there is no chighotio as in man and quadrupeds.

## $1 \because 2$

Their cremiun is nowe cellular and cavernous than Cramm. ours. By this means their heads are light, yut firong enough to refitt external binjuies; for the enlarying the diameter of bones contributes to their Itrength. By this cavernous cranium the organ of freeling is fuppofed to be confiderably colarsed; and further, finging birds, as is obferved by Mr Ray and Mr Derham, have this cavernous Atructure of the brain till more obfervable: and we are told that the cavity of the tympanum communicates with the cells: but this feems rather founded on theory than matter of fact. Their brain is covered witl the common membanes, but its external firface is not formed into fo many gyre or convolutions as ours. Its antcrior part is quite folid, of a cineritious colour, and fo far has a refemblance of the corporafirita as to give rife to the olfactury nerves. The whole of it appears to us as imperfect, and we can fearee determine whether there be any thing analogous to a thi:d or fourth ventricle: ncither the corpus callofiun, fornix, nates, or tchics, Ejc. can be obferved here; which parts therefore cannot be imagined as abfolutely ncceffary for the functions of life, fince we find the ce creatures perform them furificiently well. We may perlaps think thefe ferve a particular ufe in man, who is a rational creature; but then quadrupeds enjoy them in common with men. Thefe protuberances, \&e. feem rather to depend on the different difpofition of the feveral parts, being varioully connected and meeting in different directions in different places, than their being :bfolutely neceffary for any particular ufe; and the wfes that have been affigned to different parts of the brain by authors, feem to have no foundation but in the author's fancy.
'illeir organ of fmelling is very large, and well pro- The 33 vided with nerves; hence they have this fenfation very of fmeld. acute. Ravens and other birds of prey give a fure ing. proof of this, by their being able to find oni their prey, though conctaled from their fight and at a confiderable difance.

Thofer birds that grope for their ford in the waters, nud, \&c. have large nerves, which mu quite to the end of their bills, by which they find out and dittin. guifh their foud.

The antcrior part of the ir eyes (inftead of having the felerotic coat continued, fo as to make bear a fphere as in us) turns all of a fuddou flat; fo that hore the felerotic makes but half a fatere; and the comearifes up afterwards, being a portion of a very finall and di. flinet fptere : fo that in thefe ereaters there is a muen greater difference betwixt the flewotic and corma than in us. Hence their eyes do mot jat ont of their harls, as in man ani quadrupeds. As mot of the fe creatur, are continualy employed in hedges ant thickete, therefore, that their eyes might be focured from the fe irjuries, as well as from too mach hight when dying in the face of the fun, there is a vers dersunt mechanifin in their cyps. A mealmane rifa from the internal can-

Eyc.

Of Fowis, thus, which at pleafure, like a curtain, can be made to cover the whole eye; and this by means of a proper mufcle that rifes from the fclerotic coat, and palfing round the cptic nerves, tuns through the mufoulus oculi atiollens (by which however the optic nerves are not compreffed) and palpebra, to be inferted into the edge of this membrane. Whenever this mufele ceafes to act, the membrane by its own elarticity again difcovers the eye. 'This covering is neither pellucid nor opaque, both which would have been equally inconvenient; but, benur fomewhit tranfurent, allows as many rays to enter as to make any object juft vifible, and is fufficient to diecet them in their progreflion. By means of this membrane it is that the eagle is faid to look at the fun. Quadrupeds alfo, as we mentioned before, have a fmall

175 Bavile shoire: Its dietcriptron and uics. membrana niaitans.

Belides, all fowls have another particularity, the ufe of which is not fo well underftood; and that is, a pretty long black triangular purfe, rifing from the bottum of their eye juit at the entry of the optic nerve, and ftretched out into their vitreous humour, and one would imagine it gave fome threads to the crytalline. To this the French (who probably were the firft who took notice of it in their diffections before the Royal Academy) gave the name of bourfenoire. This may poffibly ferve to fuffocate fome of the rays of light, that they may fee objects more diftinetly without hurting their eyes. It has a connection with the vitreous, and feems to be joined alfo to the cryttalline, hmmours. If we fuppofe it to have a power of contraction (which may be as well allowed as that of the iris), it may fo alter the pafition of the vitreous and cry falline hmmours, that the rays from any body may not fall perpendicularly upon the cryftalline; and this feems to be neceffary in them, fince they cannot change the figure of the anterior part of their eye fo much as we can do: and as this animal is expofed often to too great a number of rays of light, fo they have no tapetum, but have the bottom of their eye wholly black on the retina; and in confequence of this, fowls fee very ill in the dark.
They have no external ear; but in place thereol a tuft of very fine feathers corering the meatus audifo-
rius, which ealily allows the rays of found to pafs them, and likewife prevents duft or any infect from getting in. An external ear would have been inconvenient in their palfing through thickets, and in flying, \&c. A liquor is deparated in the external part of the ear, or muatus auditorius, to lubricate the paffage, and further prevent the entrance of any infects, \&c. The membram tumpani is convex externally; and no mufeles are fixed to the bones of their ear, which are rather of a cartilaginous confifence: any tremulous motions imprefled on the air are communicated in thefe creatures merely by the fpring and elaticity of the fe bones; fo, probably, the membrane is not fo tretched as in the human ear by mufles. The femicircular canals are sery diftinet, and eably prepared.

Sect. III. Anutomy of a Carnivorous Bird.
We come next to the birds of prey, and for an example thall take a fannt or fmall hawk. The principal difference to be obferved in them, is in their chylopoietic vifcera, which may be accounted for from this difterent way of lifes

Immediately under their clavicles, you will obferve of squeous the cefophagus expanded into their ingluvies, which is Animals. proportionally lefs than in the granivorous kind, fince their food docs not fwell fo much by maceration; and for the fame reafon, there is a lefs quantity of a menftruum to be found here.

They have allo a ventriculus ficicenturiatus, plentiful- ventriculus 1 1. fored with glands, fituated immediately above their fuccenturiftomach, which we fee here is thin and mufculo-mem-atus.
branous, otherwife than in the granivorous kind: and this difference, which is almoft the only one we fhatl find betwixt the two different fecies of fowls, is eafily aecounted for from the nature of their food, which requires lefs attrition, being eafier of digeftion than that of the other kind; neverthelefs, it feems requilite it fhould be ftronger than the human, to compenfate the want of abdominal mufeles, which are here very thin.

The fame mechanifm obtains in this creature's duo-Intefina. denum that we have hitherto obferved. As being a carnivorous animal, its guts are proportionally fhorter than thofe of the granio orous kind; for the reafon lint given, viz. its food being more liable to corrupt, therefore not proper to be long detained in the body; and for that reafon it has no inteffina cact, of which the other fpecies of fowls have a pair. The difference in their wings, baeks, and claws, are obvious; and have been already in fome meafure obferved.

## Chap. Ill. The Anatomy of Aqueous Animals.

## Sect. I. Of the Amplibious Tribe.

Acueous animals are generally divided into fuch as have lungs, and fuch as want them. The firt fpecies differ io inconfiderably from an ox or any other quadruped, that a few obfervations may be fufficient to give an idea of their internal fructure; for this purpofe, we fhall firt examine that fpecies of them which molt refembles man in the internal Atructure, the tortoife.

1. Tortoife. The covering of this animal is com-Their fhell pofed of a fhell fo remarkably hard and firm in its tex-orcovering. ture, that a loaded waggon may go over it without ${ }^{\text {sc. }}$ hurting the fhell or the animal within it. In the young animal, this mell grows harder in proportion as its contents expand; and this creature never clanges its fhell as fome others do: hence it was neceflay for it to be made up of different pieces; and thefe are more or lefs diftinet in different animals. Their feet are fmall and weak; and they are exceedingly flow in motion.

It has neither tongue nor teeth; to make up for which, their lips are fo hard as to be able to break almont the lardeit bodies.

The alimentary canal very much refembles that of the former clafs.

The principal difference is in the circulation of the blood. The heart has two diftinct aurieles, without any communication ; and under thefe, there is the appearance of two ventricles fimilar in fhape to thofe of the former clafs: but they may be confidered as one cavity ; for the ventricle fends out not only the pulmonary artery, but likewife the aorta; for there is a paffage in the feptum, by which the ventricles communicate freely, and the blood paffes from the left

Of Aq:enus into the right one. From the aorta the blood reAnmats turns into the right auricle, while that from the pulmonary artery returns to the left auricle, from which it is fent to the left venticle, \&xc. fo that only a part of the blood is fent to the lungs, the reft going immediately into the aurta; hence the animal is not under the necefity of breathing fo ofter as utherwife it would be.
$\mathbf{1 4 2}$ Boodef- From the Lafe of the right ventilicle goes out the
feli. pulmonary artery and aorat. The pulmonary artery is fpent upon the langs. The aorta may be faid to be three in number: for the aorta finilta afcends through the pericardium in company with the pulmonary artery, and afterwards turns down, and fends off a confiderable branch, which fplits into two; one of which joins the right aorta, while the other is diftributed upon the liver, Itomach, inteftines, \&c. What remains of this aorta runs to the kidneys or pollerior extrmities of that fide. An aorta defeendens, Ex. after piercing the pericardiun, runs down and communicates with the branch already mentioned, is diftributed upon the right kidney and inferior extremity, and alfo upon the bladder and parts of generation. An aorta alcendens, after getting out of the pericardium, fupplies the fore-legs, neck, and head. The blood in the fuperior part of the body returns to the right auricle by two jugular veins, which unite after perforating the pericardium. From the inferior part, it returns to the fame auricle by two large veins; one on the right fide receives the blood in the right lobe of the liver; the other on the left lide receives the blood in the left lohe, and alfo a trunk which corrcfponds with the inferior vena cava in other animals. The pulmonary velfels iun in the left auricle in the common way.

The abforbent fyttem in the turtle, like that in the former clats, confitts of lacteals and lymphatics, whth their common trunks the thoracic ducts; but differs from it in having no obvious lymphatic glands on any part of its body, nor plexus formed at the termination in the red veins.

The lateals accompany the bloodnveffels upon the mefeotery, and form trequent networks acrofs thefe veffels: near the root of the mefentery a plexus is formed, which commonicates with the lymphatics coming from the kidneys and parts near the anus. At the root of the mefentery on the left fide of the fime, the lymphatics of the fpleen join the lacteals; and immediately above this a plexus is formed, which lies upon the right aorta. From this plexus a large branch arifes, which paffes behind the right aorta to the left fide, and gets before the left aorta, where it affils in forming a very large receptaculum, which lies upon that artery.

From this receptaculum arife the thoracic duets. From its right fide groes one trunk, which is joined by that large branch that came from the plexus to the left fide of the right aorta, and then paffes over the fpine. This trunk is the thoracie duct of the right lide; for having got to the right fide of the fane, it rens upwards, on the infide of the right aorta, towards the right fubclavian rein ; and when it has advanced a little above the lungs, it divides into braaches, which near the fame place are joined by a large branch, that comes up on the outhde of the aorta. From this part
upwards, thofe vefels divile and rubdivide, and are Of Aqueous aftewards joined by the lymphatics of the neck, which Anmos. likewife form branches before they join thofe from below. So that between the thoracic duct and the lymphatics of the fame file of the nock, a very intricate net-wurk is formed; from which a branch goes into the angle between the jugular vein and the lower part or trunk of the fubelavian. This branch lies therefore on the inlide of the jugular vein, whil another gets to the outfide of it, and fecms to terminate in it, a little above the angle, between that viin and the fubckvian.

Into the above mentioned receptaculum the lym. Loymian phatics of the flomach and duodenum likewife enter. tics. Thofe of the duodenum run by the fide of the pancreas, and probably receive its lymphatics and a part of thofe of the liver. The lymphatics of the llomach and duodenum have very mumerous anatomofes, and form a beautiful net-work on the artery which they accompany. From this receptaculum likewife (befides the trank already mentioncd, which goes to the right fide) arife two other trunks pretty equal in fize; one of which runs upon the left ide, and the other upon the right fide of the left aorta, till they come within two of three inches of the left fubclavian vein; where they join behind the aorta, and form a number of ' branches which are afterwards joined by the lymphaties of the left lide of the neck; fo that here a plexus is formed as upon the right lide. From this plexus a branch iffues, which opens into the angle between the jugular and fubclavian vein.
2. Scrpent and Crocodile. The circulation in thefe is Circublation fimilar to that of the turtle ; but we find only one ven- 17 derpents. tricle. The blood goes from the right auricle to the \&c. ventricle which fends out the pulmonary artery and aorta; the blood from the pulmonary artery returns to the lefeauricle, that from the aorta going to the right auricle, and both the aurieles opening into the ventricle.
3. Frog and Liward. Thefe differ from the former animals, in having only one auricle and a ventricle: and befides, the ventricle fends out a fingle artery, which afterwards fplits into two parts; one to fupply the lungs, the other runs to all the reft of the bodyfrom the lungs and from the other parts, the blood returns into the auricle.

## Sect. Il. Auatomy of Fi/acs.

## 146

Or thefe we may firt obferce, that they have a very" Cutimin, Atrong thick cuicle, covered with a great number of liknef, to fales, laid one on another like the: tiles of houfes. the human, This among other arguments is fuppofed to prove the human epidermis to be of a $\mathbb{C q}$ ramous ftructure: but the fiales refemble the hairs, wool, feathers, \&c. of the creatures that live in air ; and below thefe we obferse their proper cuticula and cutis.

The gencrality of fithes, particularly thofe flaped like the cod, hatdock, ©゚c. have a line running on each fide. 'Thefe lines open- externally by a number of ducti, which throw out a mucuus or flimy fubitance that keeps them foft and clammy, and feens to finve the fame purpofe with the mucous ghands or duets which swinming are placed within many of our internal organs. how pix-

In the nest place, thefe creatures have neither ante- formed. rior nor polterior extremities, an cuatrupeds and fowls; Several ufe3 for their progrefion is pertunter in a different way:monetal sirfionntab', s.c.
$2-9$
COMPARATIVEANATOMY.
Chap. IIf:
 puef they are prowided with machias, poperly comitbig of a areat number of clathic beans, comnected on whe another by firm mentuanes, and wh that of the fame texture ; their $f_{\mathrm{F}}$ ine is vely moveabe towards the pothrior part, and the hronget mufeles of their bodics are inferted there. Their tails are fo framed as to eontrag to a narrow fpace when drawn tugether to either fide, and to expand aguin when drawn to a llai yht line with their bodies; fo, by the affiltance of this broad tail, and the fins on their fides, they make their grogrefion much in the fame way as a boat with oars on its fides and rudder at is ftern. The perpendicular fins fituated on the fuperior part of their body keep them in apuilibrio, hindering the belly from turning uppermott: which it would readily do, becanfe of the air bag in the abdomen rendering their belly fpecificalIy lighter than their back; but by the refiftance thefe fins neet with when inclined to either fide, they are kept with their baeks always uppermot.

The bett aecount of this matter, we have in the treat:le before mentiund, viz. Borillus de Moth Animalium, cis 2 .

It may be next obferved, that thefe creatures have nothing that can be called a neck, feeing they feek their food in an horizontal way, and can move their bodies either upwards or downwards, as they have occafor, by the coneraction or dilatation of the airbas; a lonig neek, as is would hinder their progreffion, would be sery difadrantageous in the elemene they live in.

The automen is covered on the inferior part with a Wack-coloured thin meribrane refembling our peritoutum. It is divided from the thorax by a thin memtranous partition, which his no mufcular appearance; fo that we have now ieen two different forts of animals

Theie creatises are not provided with teath proper for becaking their aliment into fmill moreds, as the food they ule is eenerally finall libes, or othor animats that need no trituration in the mouth, but fpontancoufIs and graduatly difflue into a liquid chyte. Their teeth ferve to grafp their prey, and linder the creatures they have once catched from efcaping again. For the fume purpofe, the intemal cartilaginous bafis of the bromehi, and the two round bodies fituated in the poHerior part of the jaws, have a geeat number of tenterluoks bixed into them, in fuch a manuer as that any thing can eafily get down, but is hindered from getting bact. The wate that is necedfarily taken in atong with their food in too great quartitics to be rectived into their jaws in deghation, pates betwizt the interHices of the bronchi and the flap that covers them. The comprefion of the water on the bronchi is of con. fiderable wie to the creature, as we dall explain by and br.
powr of a menfruum, and that no trituration happens Of aqueous here.

The rafs in thefe animals are very thoit, making only three turrs; the lat of which cuds in the common cloaca for the feces, urine, and femen, fituated about the midthe of the inferior part of their bodies.

To what we call poncreas, fome give the name of in- pancrem 15 r thinula caca: it conlifts of a very great number of fmall thread, he fo many litte worms, which all terminate at lat in two larger canals that open into the firlt gut, and pour into it a vifcous liquor much about the glase where the bilizy ducts enter. 'lhat kind of pancreas formed of intellinula cxca is peculiar to a certain kind of filles; for the cartilaginous, broad, and flat kind, as the kate, fole, flounder, \&c. have a pancreas refembling that of the former clafs of animals. Their intellines are connected to the back-bone by a n:embrane analogous to a mefentery.
Their liver is yery large, of a whitifh cololtr, and lies Liver, gallalmott in the left fide wholly, and contains a great deal badder, of fat or oil.

The gall-biadder is fituated a confiderable way from duets. their liver; and fencs out a canal, the eytic duct, which joins with the hepatic duct jult at the entry into the gut. Sume fibres being obferved ftretched from the liver to the gall-bladder, but without any apparent cavity, the bile was fuppofed not to be carried into the gall-bladder in the ufual way, but that it muft either be fecerned on the fides of the fac, or regurgitate into it from the canalis cholcdochus. It is certain, however, that hepato-cyttic duets exift in fifh as well as in fowls. This, for example, is very obvious in the falmon, where large and diftinct ducts run from the biliary ducts of the liver, and oper into the gall-bladder.

The foleen is placed near the back-bone, and at a spiteen, its place where it is fukjected to an alternate preffure from wie dr wa the combriction and dilatation of the air-bag, which is frum onafituated in the neighowrhood. Since, in all the dif- logy. fereut animals we have diffected, we find the fpleen attached to fomewhat that may give it a conquaflation ; as ia the human fubject and quadrupeds, it is contiguons to the diaphragin; in fowls, it is placed betwixt the back-bone, the liver, and flomach; in fifhes, it lics on the faccus ac̈rius: and fince we find it fo well ferved with blood-veffels, and all its blood returning finto the liver; we mult not conclude the fpleen to be au imile pourdus, onty to fate as a balance to the animal fro dyuilibriz, but particularly defigned for preparing the blood to the liver.
The con'y orycuas of generation in this animal are two Organs of bags fituated in the abdomen uniting near the podes. trencration. Thefe in the male are filled with a whitifh firm fub. fence called the mill; and in the femate with an infi1.itc number of liticic ova cluttered tugether, of a raddif yellow chlour, called the roc. Both thefe at Ifawning-time we find very much diftended; whercas at atrother time the male organs can farce be diftinguilned from thie female ; nor is there any proper inItrument in the male for throwing the ted into the or Goms of the female, as in other creatures. We fhall not take upon 1 s to determine the way whercby the female fiperm is impregnated: but we find that the fpawn of frogs confitts in the finall feecks wrapped up ia a whitin glatincus liquor; thefe fpecks are the rudiments of the young frogs, which are nowrihed in that liguor
of aqueous till they are able to go in fearch of their food. In the Animals fame way, the ova of lihes are thrown out and deponted in the fard, the male being for the moll part ready to impregnate them, and they are incubated by the heat of the fun. It is curious enough to remark with what care they feek for a proper place to depufite their ova, by fwiming to the frallow, where they can better enjoy the fun's rays, and flun the large jaws of other fibhes. 'Ilte river-fiftes, again, fpawn in fome creck free from the hazard of the imperaows ftrean. But whether this misture be brought about in filhes by a dimple application of the genitals to each other, or if buth of them throw out their liquors at the fame time in one place, and thus bring about the delired mixture, it is not eafy to determine. Spallanzani has found, that the eggs of frogs, toads, and water mewts, are not fecundated in the body of the female; that the male emits his femen upon the fpawn white it is flowing from the female; and that the futus pre-exiths in the body of the fenale: but whether impregnation takes place in the fame manner in fifhes, he has not yet been able to determine, thougtre liems to think it proballe. 'Thofe creatures are for Py, that we canot cally get to obfesse their way of copulation, and are confequently but little acquainted with their natural hiltory. Frogs, it is very evident, do not copulate ; at leaft no farther than to allow both fexes an oppertunity of throwing their fperm. Early in the fring the male is found for fereral days in clule cuntact apon the back of the female, with his fore legs round her body in fuch a manner that makes it very difficult to feparate them, but there is no communication. At this time the female lays her (pawn in fome place that is moll fecure, while the male emits his fperm upon the female fatw.

After raifing up the black peritoneum in fifhes, there comes in view an oblong white membranous bay, in which there is nothing contained but a quantity of elallic air. This is the froimming-llahlor: it liss clufe to the back bone; and has a pretty frong mulcular cuat, wherehy it can contract itfelf. By contracting this bag, and condening the air within it, they can make their bodies fpecifically heavier than water, and fo readily fall to the buttom; whereas the mufular fibres ceafing to act, the air is again dilated, and they become fpecifically lighter than water, and fo fwim above. According to the difierent degrees of contraction and d!latation ol this bladder, they can keep higher'or lower in the water at pleafure. Hence flounders, foles, raia or fkate, and fuch other filhes as want this fac, are found alvays groveling at the bottom of the water: it is owing to this that dead fithes (unlefs this membrane has been previoully broke) are fond fivimming a-top, the mufcular fibres then ceafing to ait, and that with their bellies uppermot ; for the backbone cannct yield, and the dillended fac is protruded into the abdomen, and the back is confequently heavielt at its upper part, according to their pofture. There is here placed a glandular fubttance, containing I56 a good quantity of red blood; and it is very probable that the air contained in the fwimming bladder is dcrived from this fubltance. From the anterior pat of the bag go cut two froceffes or appendices, which, according to the gentlemen of the Erench academy, ter-
minate in their fances: In a paricty of other fithes we OfAqueous tind commonications with fome parts of the alimentary Amans. canal, particulaly the cefupharus and tomach. The falmon has an opening lom the fore end of the airetary into the cefophagus, which is farmomed by a kind of muleular fibres. 'The hernin, has a funnol like paffage leading foom the buttorn of the Aonath into the aitbag; but it is not detemmed whether the air cuters the ain-bag by this opening, or comes unt by it : the latter, however, leems to be the more probable opinion, as the glasedular body is fund in atl fhes, whercas there are feveral without this patfare of communication.

157
At the fuperior part of this bag there are other red. Ifreiers va. coloured bodies of a glandular nature; which are con- fica urimnected with the kidneys. From them the ureters go Urathra. down to their infertion in the vefiea urinaria, which lies in the lower part of the abdomen; and the urethra is there prodnced, which terminates in the podex.

Thele lat-mentioned parts have not hitherto been obferved in fome fpecies of fifhes; whence authors too hatlily denied them in all. Thefe ereatores have a menlionous diaplarugn, which forms a fac in which the $15^{58}$ heart is containd. It is very tenfe, and almolt perpendicular to the vertebre.

The heart is of a triangular form, with its bafe The lisert downwards, and its apex uppermont; which dituation has but ane it has becaufe of the lranchis. It has but one auricle airicteand and one ventricle, becaute they want lungs; and one tricle vengreat artery. The fize of the amicle and that of the ventricle are much the fame; the artery fends ont numberlefs branches to the branchix or gills. And what is rather curions, this artery, inflead of fupporting all parts as in the frog, is ditributed entirely upon the gidls ; every branch ierminatins there, and becoming foextremely forall as at latt to efcupe the maked cye.

160
The branchie lie in two large lits at each fude of Tholranthe ir leads, and feem to be all they have that bears chix any analogy to lungs. Their form is femicirenlar ; thenrerashey haved wathere and cy have a vaft namber of red fibrille Itarding out on ufe. cach fide of them like a frinere, and very much refemble the vane of a feather. Thefe branchieare perpetually fubjected to an alternate mution and pretare from the water; and we may hore umath, that we have not found any red bluod but in places fuljected on this al. ternate preffurc. This obfervation will help us in explaining the action of the lungs upon the blood. Over thefe gills there is a large frap, allowing a communication externally; by which the water they are obliged (as take into heir moutles with their food finds an exit without pafling into their fomacli: it is owing to thefe flaps coming fo lar down that the heart is faid commonly to be fituated in their heads. The blood is collected again from the gills by a vaft number of fmall veins, fomewhat in the ferme manner as in our pulmonary vein; but iuflead of going back to the heart a fecond time, they immediatuly unite, and form an aotta defeendens, without the intervention of an auricle and ventricle. Hence a young anatomitt may be puzzled to find out the power by which the blond is propelled froan the gills to the different pares of the body; but the difficulty will be confiderably leffened when we conder the manner in whel the blood is 2

Qfaquenvearried through the liver from the intefines in man Amimats. and quacrupeds. The aorta in fifhes fends of branches which fupply all the parts of the body excepting the gills. From the extremity of thofe branches the blood returns to the heart fomewhat in the fame manncr as in the former clafs of animals; only there are two inferior vene cave, whereas the former has but one.

Abforkent Syferm in Fïhes. We fhall take the haddock as a general example: for the other fifhes, particularly thofe of the fame flape, will be found in general to agtee with it.
If
On the middle of the belly of a haddock, immediately below the outer fkin, a lymphatic vefficl runs upwards from the anus, and receives branches from the parites of the belly, and from the fin below the anus: near the head this lymphatic pafles between the two pectoral fins: and having got above them, it receives their lymphatics. It then goes under the fymphytis of the two bones which form the thorax, where it opens into a net-work of very large lymphatics, which lie clofe the the pericardium, and aln ift entirely furrounds the heart. This net-work, befdes that part of it behind the heart, has a large lymphatic on each fide, which reeeives lymphatics from the kidney, runs upon the bone of the thorax backwards; and when it has got as far as the middle of that bone, it fends off a large branch from its infide to join the thoracic duct. After detaching this branch, it is joined by the lymphatics of the thoracic fins, and toon after by a lymphatic which tuns upon the fide of the lifh. It is formed of branches, which give it a beautiful penniform appearance.

Befides thefo branches, there is another fet deeper which accompanies the ribs. After the large lymphatic has been joined by the above-mentioned veffels, it receives lymphatics from the gills, orbit, nofe, and nowth. A little below the abit, another net-work appears, confilting in part of the veffels above deferibed, and of the thoracic duct. This net-work is very complete, fome of its vefiels lie on each fide of the mufeles of the gills; and from its internal part a trunk is fent out which terminates in the jugular vein.

The lacteals run on each lide of the mefenteric arteries, anaflomofing frequently acrofs thofe veffels. The receptaculum into which they enter is very large, in proportion to them; and coufits at its tower part of two branches, of which one lies between the duodefrum and flomach, and runs a listle way upon the pancreas, receiving the lymphatics of the liver, pancreas, thofe of the lower part of the Itomach, and the kactals from the greatelt part of the fanll intellines. The other branch of the receptaculum receives the lym; hatics from the reft of the alimentary cand. The receptaculum formed by thele two branches lies on the right fide of the upper part of the tlomach, and is joined by fome lymphatics in that part, and alfo by tome from the found and gall-bladder, which in this Efh adheres to the receptaculum. This thoracie duet takes its rife fron the tecoptaculum, and lies on the :ight dide of the offophagus, teeciving lym hatics from :hat part; and ruming up about hati an iuch, it divids into two ducte, one of which pafles over the wrion phagus to the left fide, and the other goes itraight upon the right fide, paffes by the upper part of the miney, from which it roceivos loanc imall banches, N"37.
and foon afterwards is joined by a brancil from the of Aqueous large lymphatic that lies above the bone of the tho. Anmats. rax, as formerly mentioned: near this part it like. wife fends off a branch to join the duct of the oppofite fide; and then, a little higher, is joined by thofe large lymphatics from the upper part of the gills, and from the fauces.

The thoraeic duct, after being joined by thefe veffels, communicates with the net-work near the ortit, where its lymph is mixed with that of the lymphatics from the polterior part of the gills, and from the fuperior fins, belly, sic. and then from this net-work, a veffel goes into the jugular vein jutt below the orbit. This laft veffel, which may be called the termination of the whole fyltem, is very fnall in proportion to the network from which it rifes; and indeed the lymphatic3 of the part are fo large, as to exceed by far the fize of the fanguiferous veffets.

The thoracic duct from the left fide, having paffed under the ofophagus from the right, runs on the inlide of the vena cava of the left fide, receives a branch from its fellow of the oppolite fide, and joins the large lymphatics which lie on the left dide of the pericardium, and a part of thofe which lie behind the heart; and afterwards makes, together with the lynuphatics from the gills, upper fins, and fide of the filh, a network, from which a veffel paffes into the jugular vein of this fide. In a word, the lymphatics of the left fide agree exattly with thofe of the right fide above deferibed. Another part of the fytten is deeper feated, lying between the roots of the fpinal proceffics of the back-bone. This part confifts of a large trunk that begins from the lower part of the fifh, and as it afcends receives branches from the dorfal tins and adjacent parts of the body. It goes up near the head, and fiends a branch to each thoracic duct near its origin.

The train in filles is formed pretty much in the cerebrum. fame way as that of fowls; only we may obferve, that the poftrior lobes bear a greater proportion to the anterior.

164
Their organ of fmelling is large; and they have a organ of power of contracting and dilating the entry into their fmell. nofe as they have occalion. It feems to be monlly by their acute fmell that they difoover their fuod: for their tongue feems not to have been defigned for a very nice fenfation, being of a pretty tirm cartilaginous fubtance; and common experience evinces, that their fight is not of fo much ufe to then as their fmell in fearehing for their nourihment. If you throw a freh worm into the water, a fifn fall difinguifh it at a confiderable dilance; and that this is not done by the eye, is plain from obferving, that after the fame worm has been a confiderable time in the water and lof its fmell, no finhes will come near it : but if you take ont the bait, and make feveral little incifions into it, fo as to let out more of the odoriferous entluvia, it flall have the fame effeet as furmerly. Now it is certain, had the creatures difoorered this bait with their eves, they would have come equally to it in both cafes. In confequence of their finell being the principal means they have of difcovering their food, we may frequently obferve their allowing themfelves to be carried down with the ftream, that they may afcend again leifurely againft the curnent of the water: thus the odoriferous particles fwimming in that medium, being
of Aqrenus applice more forcibly to the er finelling organs, produce $\underbrace{\text { Abimals. }}$ a 1 lronger fenfation.

The optic nerves in thefe animals are not confounded with one another in their middle progrefs betwixt their origin and the orbit, but the one paffes over the other without any communication; fo that the nerve thet eomes from the left fide of the brain goes diftinetly to the right cye, and viaceroja.

Indeed it would feem not to be neceflary for the optic nerves of tinhes to have the fame kind of connection with each other as thofe of mon have: for their eyes are nut placed in the fore-part, but in the lides of their head: and of confequence, they cannot fo conveniently look at any object with both eye's at the fane time.

The lens cryfallina is here a complete fphere, and more denfe than in terreftrial animals, that the rays of light coming from water might be fufficiently refracted.

As fithes are continually expofed to injuries in the uncertain element they live in, and as they are in perpetual danger of becoming a prey to the larger ones, it was neceflary that their eyes fhould never be fhut; and as the cornea is fufficiently wathed by the element they live in, they are not provided with palpebræ: but then, as in the current itfelf the eye ruft be expofed to feveral injuries, there was a necoffity it thould be fulfeiently defended; which in efsect it is by a firm pellucid membranc, that feems to be a continnation of the cuticula, being flretched over here. The epidermis is very proper for this purpofe, as being infenfible and dettitute of veffels, and confequently not liable to obltructions, or, by that means, of becomiur opaque. In the eye of the nate tribe, there is a digited curtain which hangs over the pupil, and may Mut out the light when the animal redts, and it is fimilar to the tunica adnata of other animals.

Although it was formerly much doubted whether fifhes puffified a fenfe of hearing, yet there can be little doubt of it now; fince it is found that they have a complete organ of hearing as well as other animals, and likewife as the water in wheh they live is proved to be a good medium. Fifies, particularly thofe of the flate kind, have a bag at fome diftance behind the eyes, which contains a fluid and a foft cretrceous fub? tance, and fupplies the place of veltibule and cochlea. There is a nerve dittributed upon it, finilar to the portio mollis in man. They have three femicircular eanals, which are filled with a fluid, and communicate with the bag: they have likewife, as the prefent profefor of anatomy at Edinburgh has lately difcovered, a meatus externus, which leads to the internal ear. The cod filh, and others of the fame flape, bave an organ of hearing fomewhat fimilar to the former ; but inftead of a foft fubltance contained in the bag, there is a hard eretaceous llone In this kind of filh no meatus exterrus has been yet ohferved: And Dr Monro is inchened to think that they rally have not one, from the confderation that the common eanal or veitibule, where the three femicirculan canals communieate, is feparated from the eavity of the canium by a thin membrane only; that this cavity, in the greater number of fifhes, contains a watery liquor in confiderable quantity; and that, by the himuefs of the cranium, the tremor excited by a fonorous bods may radily and eafily be tranfmitted
low. V. Part I.
through the eranum to the water within it, and fo to of ufeets the car.

## Сhap. IV. The Anatomy of Infects.

As infects and worms are fo exceedingly numerous, it would be endlefs to examine all the different kinds, nor would it ferse any ufful purpofe to the anatonift. We fhall therefore be content with making a few general ubfervations, and thefe chiefly on the ftrmeture of their body; leaving the variety of their colour, hape, \&e. to the maturalifts. Infects differ from the former claftes, by their budies being covered with a hard cruft or feale, by their having feelens o: antennx arifing from their head, and many of them breathing the air throngh lateral pores. As to the fhape of their hodies, though it fomewhat differs from that of biecls, being in general not fo tharp before to cut and make way through the air, yet it is whll adapted to their manner of life. The bafe of their bodies is not formed of bone, as in many other animals, but the hard external covering fures them for finin and hone at the fame time. 'Their feelers, befide the ufe of cleaning their eyes are a guard to them in their walk or flight. Their legs and wings are well fitted for their intended fervice; but the latter vary fo much in different infects, that from them naturalits have giver names to the feveral orders of the clafs. As, firlt, the

Coleoptra, or bectle tribe, which have a crulaceous elytra or fhell, that thuts together, and forms a longio tudinal future down their back.

Hamiptera - as in cimex, cockroaeh, bug, \&c. which have the upper wines half eruftaceous and half mene branaceous; not divided by a longitudinal future, but incumbent on each other.

Lepidoptera-as the butterfly, have four wings, co. vered with fine foales in the form of powder.

Neurotera-as the dragon-fly, fyring-fly, Sic. lave four membranaceous tranfparent naked wingra, generally reticulated.

Hymenoptera-as wafps, bees, \&e. have four inmbranaceous wings, and a tail furnifaed with a fing.

Diftera - as the common houfe-fly, have only two wings.

Aftera-as the lobfler, crab, fcorpion, finder, \&c. have no wings.

The flructure of the ege in many infeets is a mof curious piece of mechanifm. The outer part is remarkably hard, to guard againt injuries; and has commonly a reticular appearance, or the whole may be looked upon as an ademblage of fimaller coes; but whether they fee objects multiplied before them, has not yet been determined.

Limneus, and feveral others fullowing him, deny the exiltence of a brain in thefe creatures. But it is certain, that at leaft a number of the larger kinds, as the lobfter, crab, \&e. have a foft fubitance fimilar to the brain, from which the optic and other nerves take their rife ; befides, when this fubtance is irritated, the animal is thrown into convulfions: hence we would conclude, that infects have a brain as well as the former claffes, although this is fmaller in propurtion to their bodies.

Their ear has been lately difeovered to be placed at the root of their antennæ or feelers, and can be M m

OfInfear. difinctly feen in fome of the larger kinds, as the lob——A Ater.

They lave a fomach, and other organs of disention; and it is curions, that in fome, as the lobfer, the teecth are fomend in the flomach.

They have a heart and blood- veffls, and citculation i. carried on in them fome:shat as in the former clafs; but the blood is without red clubules; ar, as naturalifts feak, is coloulefs. In the lob ter, and others of the larger kind, when a piece of tie futll is brokell, the pulfation of the heart is feen dilifinctly, and that fonetimes for feveral hoors aftee it has been laid bare.
$L_{\text {ingrs. }}$. The exidence of thefe by feme has been denied. But late experinients and obfervations thow, that no frecies want them, or at learl fomething fresihar to them; and in many infects, they are larger in proportion than in other aninals: in mo't of them they lie on or near the furface of their body; and fend out lateral pores or trachex, ly which, if the animal is bifrieared with oil, it is inflautly fofocated.
Generation. The fame difierence in fex exils in infects as in othcr animals, and they eren appear more difipored to increafe their fpecies; many of then, when bècome perfect, feening to be createll for no other purpofe but to propagate their like. Thes the filk\%oum, when it arrives at its perfect or moth-llate, is incapable of eating, and can lardly fy; it endeavours only to propagate its fipecies: after which the male inmediately dies, and fo does the fenale as foon as fle bass depofited her efys.

Bufides thofe of the nale and female, a third fex exits in fome infects, which we call neater. As thefe have not the dillinguithing parts of either fex, they may be confidered as eunuchs or infertile. We know of no iuftance of this kind ia any other clafs of animals; and it is only found among thofe infeets which form themfilves into focicties, as bues, wafps, and aunts: and here thefe ebuchens are real thaves, as or then lics the whole butinets of the economy. No hermaphrodites have as yet been difcovered anmong inreets.

Many have imagined that the generality of infects were merely the moduction of putrefation, becable they have been obierved to arife from putrelied fubSances: but a contrary opinion is now more generally adopted; and it is presty cetain, that if putrid boo dies be thut up in a clofe veffel, no infects are ever generated ualefs their owa have been originally depofited there. They are oriparous animais, aid lay their egers in places moll convenient for the nourihment of their young ; fome in water, others in fleh; fome in fruit and leaves: while onlers make nefts in the earth or in rood, and fometimes even in the hardert fome. The
egges of all infects firtt become (hrva) caterpillar or Of Worms. magyot; from which they are changed into (pupa) clurfalis or aurelia, fo named from their being inclofed in a cafe; and thefe dying, or feeming to die, the (inuago) Hy, or butterfly or perfect fate, fucceeds; and during each of thefe changes their appearance differs wonderfully.

## Chap. V. Of Worms.

With refpeit to this clafs of animals, they have charaters correfponding with thofe of the furmer tribe, but are diftinguifhed from them in having no antenne, and in being furnifhed with tentacula.
Many of them, particularly thofe without thells, are rerarkably tenacious of life, fumetimes capable of being new formed from a part which may have been feparated. By much the greater number of them are deNitute of head, ears, nofe, eyes, and feet.
Some of thofe in the frit order, as the common round worms, have a vafcular and nervous fythem, with the parts of generation, which can be dillinctly feen. Some, as the cuttle filh, form a kind of connectio: between fithes and worms, in pofleffing gills but wanting fins, \&c. while others, as thofe of the lowett order, or zoophyta, join the properties of the animal and vegetable kingdom together.

The clafs is divided by Limereus, 2 cc . into the following orders, viz.

Intylina--as the carth worm, leech, \&c. which are the not fimple animals, being perfectly naked, and without limbs of any kind.

Mollyy ca- as the naked fuzil, fea-far, cuttle fin; which are likewife fimple animals without any thell, lut they are brachiated or furnified with a kind of limbs.

Tefluca-as the frail, of ter, \&c. which have the fame characters as the former order, but are covered with a thell, and include the greater part of what we commonly call hoil-ffh.

Lithephyth-as corals, madrepors, \&c. which are compuand animals fixed upon a calcareous bafe, couAtructed by the creatures thenfelves.
Zoophyta-as the fponire, polypus, \&ic. Tinefe are likewife compound animils, furnifhed with a kind of flowers, and having a vegetating root and flem.

Some of there creatures inhabit the earth, others live on the rest of the animal or on the vegctable kingdom, and many are found in the lardef Hones; while an innumerable tribe of them live in the waters. In general, they are faid to be of the hermaphrodite and oviparous kind; while the loweit clafs, as the polypi, in a great meafure refemble the vegetable kingdom in their manner of growth.

## C O M

Comparatins Disgree, among grammerians, that between the pofitive and fuperlaitive degrees, exprulfing any paricular quality anove or bencath the level of another.

COMIPARISON, in a general fenfe, the confideration of the rclation between two perfons or thinge,

when oppofed and fet againf each other, hy which we judge of their agreement or difference.

Compgrison of Ideas, an act of the mind, whereby it compares its ideas one with another, in refpeet of extent, degree, time, place, or any other circuraftances. See Idea.

## C OM

## Conpari-

 fon. they have not at all. comparare degce. See Grammar. is common to then both. lufophy.Brutes feem not to have this facally in any great degree: they have, probably, feveral idcas ditinct enough ; but cannot compare them farther than as to fore renlible circumflances anmexed to the objects themfelves; the power of comparins sentral idtas, which we observe in men, we may Frobsioy conjoeture

Cumparison. in grammar, the inh. Eiom of the
Companason, in rheturic, is a hatuc whereby two thirgs are confored with regard worme thind, whinh

Iafluction is che primiph, tut not the on! y end of comparion. It may becmployed with fuccels in putting a fubje it in a forng point of view. A lively idea is formed of a man's courage by likening it to that of a lion; and cioquence is cosolted in one imagiman compang it t, a rive ovenduwing its bank, and inv lvine all in its ionpetuous courle. The fane effect is protuced by econtall : a man in profperity becomes more fenlabe of his happants, by comparime his condition with that of a perfon in want of Eread. 'Plus comparifon is habfervitit to poctry as well as to phi-

Comparifons herve two purpoles: when aderefod to the tandentanding, their purpofe is to influct; when to the heart, their purp 0 e is to pleafe. Various mands contribute to the latuer: ath, the fuspelling fome wnulfel refemblance or contrat ** 2 d, the fettine an objeet in the Alronget light; 3 d, the affuchang an ebject with others that are arreeal.le; $4 \%$, the the ati:!g an otject ; and 5 th, the deprefing ic. And that comparifons any give plafure by the vaions muans, will be made evident by examples which hall be given, afier premiling fome sentral olfervations.

Objects of different fenfes cannot be compared together; for fuch objects are twally feparated from each other, and have no circumflance in common to admit cither refemblance or contralt. Objets of haring may be cempared regethes, as alfo of tafte, of fmeil, and of touch: but the chief fund of comparifon are otjecte of hight; becauf, in writing or feeaking, things can only be compared in idea, and the ideas of fight are more diftinct and lively than thofe of any other fenfe.

When a nation emerging out of barbatity begins to tnink of the fine arts, the beaties of language cannot long lie concealed; and when difoovered, they are fenerally, by the force of noveity, carried beyond all bounds of moderation. Thus," in the earlieft poems of every nation, we find metaphors and fimilies foundcd on the fightef and moll ditant reftmblances, which, lofing their grace with their novelty, wear gradually out of itpute; and now, by the improvement of tafte, no metaphor nor fimile is admitted into any polite compofition but of the moft flriking kind. To illuftrate this oblervation, a fpecimen fhall be given afterward of fuch metaphors as we have been desinibing: with refpect to fimiles take the following fpecimen:
"Bchold, thou art fair, my love: thy hair is as
" a flock of goats that appear from Mount Gilend:

* thy teeth are like a fock of fheep from the wafh-
* ing, every one bearing twins: thy lips are like
" a thread of farlet : thy meck like the tower of
" David built for an armoury, whereon hans a
"thoufand thields of mighty inco: thy two bicatits
" like two young reses that are twins, which feed
" among the lilies: thy eyes like the for-poots in
"Henou, by the gate of loathombin: thy mofe
" like the tower of Lebanon, looking toward Na.
" matcus."
Soug of Schomen.
"Thou art bike fuow on the heath; thy bair like
" the mift of Cromia, when it curls on" the sock
" and thates to the beam of the wotl: thy breahe
" are like two frooth rocks feen from Lianno of
"the itreams: thy ams like two white pillars in
" the hall of the mighty limgal." Jingril.
It has no goed efice to compare things by way of frnile that are of the fame hind; nor to contait thines of differnt kinds. The reaton is given in the article above cited on the marcia, and thall be here ithettrated by examples. The firt is a comparifur buitt upon a refonblance fo obvious as to make little or no improthon. Speaking of the fallen angels farching for mines of gold :

A nomerous bri gade liatten'd: as when bands
Of pioncers with frade and pick-ax am'd,
Forerun the royal camp io trench a liedd
Or calt a rampart. Arifuthe
'Thenext is of things contrafted that are of dificent kinds.

## Suen. What, is my Richard both in fhape and mind <br> Transform'd and weak? Hath Eangbroke depos'1

 Thine intellect? Hath he been in thy heart?The lion, dying, thrufteth forth his paw, And wounds the eath, if nothing offe with rage
To be o'erpowis'd: and wilt thou, pupil hike,
Take thy correction mildly, kifs the lod,
And fawn on rage with bafe humility ?

\text { Richad 15. af. } 5 \cdot \text {. } \mathrm{c} \text {. } \text {. }
$$

This comparifon has fearce any force: a $x$ and a hon are of different fpecies, and therefore :. proper fulject for a fimile ; but there is no fuc : femWance between them in general, as to pre any ftrong eficet by contralting particular attribute wa circumfances.

A thind gencral obfervation is, "That abtrae :omms can never be the fubject of comparifon, ot:arwife than by being perfonificd. Shakefpear compares ad. verfity to a toad, and flander to the bite of a crocodile; but in fuch comparifons thefe abflact terms mull be imagined fenfible beings.

To have a jaft rotion of comparifons, they muft be diftinguihed into two kinds; one common and familiar, as where a man is compared to a lion in courage, or to a horle in fued; the other more dllant and ice fined, where two things thit have in themfelven no refemblance or oppofition, are compared with wefect to theie effucts. 'There is no refemblance between a fower-ploi and a cheerful fong; and yet they may be compared with retpeef to their effects, the cmotions they froluce in the mird being extremely fimilar. There is as little wfemblance between fraternal comcond and precious ointment; and jet ubferve how fuccefofmly they are compared with refpect to the impueffrons they make.
"Behold, how good and how plafant it is for
" brethren to dwell together in unity. It is like $M \mathrm{mz}$ sthe
＂the precious ointment upon the head，that ran
＂down upon Aaron＇s beard，and defended to the
＂skirts of his garment．＂Pfu＇m 133.
For illuitrating this fort of comparifon，we hall add come more examples ：
＂Delightful is thy prefence，O Fingal！it is like
＂the fun on Coma，when the hunter mourns his
＂，absence for a feafon，and lees him between the
＂t clouds．
＂Did not Offan hear a voice？or is it the found ＂of days that are no more？Often，like the evening－
＂．finn，comes the memory of former times on my
＂fol．
＂His countenance is fettled from war；and is ＂calm as the evening－beam，that from the clod ＂of the weft looks on Coma＇s filet vale．＂Fingal．

We now proceed to ilhuftrate，by particular inftan－ es，the different means by which comparifons，whee－ thee of the one fort or the other，can afford pleafure； and，in the order above eflablifhed，we foal begin with fuch infances as are agreeable，by luggenting rome unufual refemblance or contrail．

Sweet are the ufes of Adverfity，
Which，like the toad，ugly and venomous，
Wears yet a precious jewel in her head．
As ya like it，act 2．dc．I．
See，how the Morning opes her golden gates，
And takes her farcwel of the glorious fun ；
How well refembles it the prime of youth，
Trimm＇d like a jonker prancing to his love．
Second Part Home VI．aet．2．fo．I．
Thus they their doubtful confultations dark
Ended，rejoicing in their matchless chief：
As when from mountain tops，the dufy clouds
Ascending，while the Nurth－isind sleeps，o＇erfpread
Heavens cheerful face，the lowering element
Scowls over the darken＇d landicape，frow，and mower；
If chance the radiant fun with farew fleet
Extends his ev＇ning－beam，the fields revive，
The birds their notes renew，and bleating herds
Attest their joy，that hill and valley rings．
Paradife Left，book． 2.
None of the foregoing firmiles tend to illuftrate the principal Subject：and therefore the chief pleafure they afford molt arife from fuggeting refemblances that are not ubviuss：for undoubtedly a beautiful subject introduced to form the fimile affords a feparate plea－ fare，which is felt in the fimiles mentioned，particular－ lo in that cited from Milton．

The next effect of a comparifon in the order men－ tioned，is to place an object in a Prong point of view； which effect is remarkable in the following fimiles．

As when two feales are charg＇d with doubtful loads，
From file to ide the trembling balance nods，
（While rome laborious matron，jut and poor，
With nice exactnefs weighs her woolly fore），
Till pois＇d aloft，the retting beam fufpends Each equal weight；nor this nor that defends： So flood the war，till Hector＇s matchlefs might， With fates prevailing，turn＇d the feale of fight． Fierce as a whirlwind up the wall he flies， And lives his holt with loud repeated cries． Iliad．b．xii： 523.
－－She never told her love；
But let concealment，like a worm i＇th＇bul， Feed on her daman cheek：the pined in thought； And with a green and yellow melancholy， She fat like patience on a monument， Smiling at grief．Twelfth Night，wa．2．fo． 6.
＂There is a joy in grief when peace dwells with ＂the Sorrowful．But they are walled with mourn－ ＂ing，$O$ daughter of Tolar，and their days are ＂few．They fall away like the Rower on which ＂the fun looks in his frength，after the middens ＂has palfed over it，and its head is leary with the ＂drops of night．＂

Fordo．
——— Out，out，brief candle！
Life＇s but a walking harrow，a poor player，
That frets and frets his hour upon the 代age，
And then is heard no more．

$$
\text { Moctrath, ait } 5 \cdot \mathrm{fc} \cdot 5 .
$$

O thou goddefs，
＇I how divine nature！how thy felf thou blazon＇f In theft two princely bors！they are as gentle As zephyrs blowing below the violet，
Not wagging his feet head；and yet as rough （Their royal blood inchaf＇d）as the rud＇t wind， ＇That by the top）doth take the mountain－pine， And make him fop to this vale．

$$
\text { Cymbeline, } a \text { at fo. f. }
$$

＂Why did not I pars away in secret，like＊e
＂flower of the rock that lifts its fair head unpen；
＂and trows its withered leaves on the blat＂＂
Fingal．
As words convey but a faint and obscure notion of great numbers，a poet，to give a lively notion of the object he defribes with regud to number，does well to compare it to what is famizar and commonly known． Thus Homer compares the Grecian army in point of number to a farm of bees：in another paliage he compares it to that profusion of leaves and flowers which appear in the firing，or of infects in a fummer＇s evening：And Milton，
－＿As when the potent rod
Of Amram＇s for in Egypt＇s evil day
Waved round the cont，up called a pitchy cloud Of locults，warping on the caltern wind， ＇That o＇er the realin of impious pharaoh hung Luke night，and darken＇d all the hand of Nile： So numberlefs were thole bid angels feen， Hovering on wing under the cope of hell，
＇Twixt upper，nether，and furrounding fires． Puradije Loft，book 1.
Such comparifons have，by fume writers，been con－ demoed for the lowness of the images introduced： but furely without reafon；for，with regard to nom－ bets，they put the principal fubject in a itrong light．

The foregoing comparifons operate by refemblance； others have the fame effect by contralto．

Cork．I am the lat of noble Edward＇s．fons， Of whom thy father，prince of Wales，was firlt；
In war，was never lion rag＇d more fierce；
In peace，was never gentle lamb more mild；
Than was that young and princely gentleman．＊
His face thou lift，for even fo look＇d he，
acoumpith＇d with the number of thy hours．

Cumparitun. And not againt his friends. His noble hand

But whea he frown'd, it was againft the French, Did win what he did fpend; and feent not that Which his triumphant father's hand had won. His hands were gruilty of no kindreds blood, But bloody with the enemies of his kin. Oh Richard, York is too far gone with gricf, Or clie he nevcr would compare between. Richard 11. at $2 . \sqrt{1} \cdot 3$.
Milton has a peculidy talent in embellifling the primcipal fubject, by affeciating it with others that are agreeable; which is the third end of a comparifon. Similes of this kind have, belide, a leparate effect: they diverffy the narration by new images that are not fricily necefary to the comparifon: they are thort epifodes, which, without drawing us from the principal fubject, alford great delight by their bealuty and waries.
Fe fearce lad ceas'd, when the fuperior fiend
Was moving toward the brove; his pondrous hield,
Ethercal temper, mafly, large, and round,
Behind him catt : the broad circumference
Hang on his frouldars like the moon, whofe o: b
Through optic glafs the Tufcan artill views
At ev'ning from the top of Fefole,
Or in Valdarno, to defcry new lands,
Rivers, or mountains, in her feotty globe. Milton, book, I.
-_-Thus far thefe beyond
Cumpare of mortal prowefs, yet obferv'd
'Their dread commander. He, above the reft, In hape and fature proudly eminent, Stood like a tow'r ; his form had not yet loft
All her original brightnefs, nor appear'd
Lefs than archangei ruin'd, and th' cxecefs
Of glory oblcur'd: as when the fan new-rifen Looks through the horizontal mifly air Shorn of his beams; or, from behind the moonIn dim eclipfe, difatrous twilight theds On half the nations, and with fear of change I'erplexes monarchs.

Nillon, book I.
As when a vulture on Imaus bred,
Whofe fnowy ridge the roving Tartar bounds,
Diflodying from a region fearce of prey
To gorge the fleth of lanks, or yeanling kids, On hills where flocks are fed, fies toward the furings
Of Ganges or Hydalpes, Indian fleams,
But in his way lights on the barren plains
Of Scricana, where Chinefes drive
With fails and wind their cany waggons light:
So on this windy fea of land, the fiend
Walk'd up and down alone, bent on his prey. Milton, book 3.
Next of. comparifons that aggrandife or elevate: Thefe affect us more than any other fort: the reafon of which will be cuident from the following inftances:

As when a flame the winding valley fills, And runs on crackling thrubs between the hills, 'Then o'er the flubble up the mountain flies, Fires the high woods, and blazes to the flies, This way and that, the fpreading torrent roars; So fweeps the hero through the waited fhores.

Around him wide, immenfe defruztion pours, And earth is delug'd with the fanguine thow'rs.

Iliad. xx. 50 g.
Methinks, king Richard and myfelf hould meet
With no lefs terror than the elements
Of fire and water, when their thundring mock,
At meeting, tears the cloudy cheeks of licaven.
Richated II. ati.3. Jc. 5.
"As rufhetha a foamy frean from the dark fhady
": Acep of Cromla, when thunder is rolling above,
" and dark brown night refts on the hill: fo fieree,
"f fo vatt, fo terrible, ruff forward the Cons of Erin.
" The chief, like a whate of ocean followed by all "، its billows, pours valour forth as a ftream, rolling " is might along the thors." Fingul, book 1.
"As roll a thoufand waves to a rock, fo Swa" ran's holl came on; as meets a rock a thoufand " waves, fo Irisfdil met Swaran."

Ibid.
The lafl articie mentioned, is that of leffening or deprefing a hated or difagreable object; which is effectually done by refembling it to any thing low or de Cpicable.

Thus Milton, in his defeription of the rout of the re-bet-ungels, happly expreffes their terror and dimay in the following fimile:

> Of goats or tirrorous flock together throng'd
> Drove them before him thunder-ftruck, purfin'd:
> With terrors and with furies to the bounds And cryitd wall of heav'n, which op'ning wide, Roll'd inward, and a fpacious gap difclos'd Into the wafeful deep; the monilrous fight Struck them with horror backward, but far worfe Urg'd them behind; headiong themfelves they threw Down from the verge of heaven.

## Milton, book 6.

By this time the different purpofes of comparifon, and the various impreffions it makes on the mind, arefufficiently illultrated by proper examples. This was an eafy work. It is more difficult to lay down rules about the propriety or impropriety of comparions; in what circumltances they may be introduced, and in what circuniflances they are out of place. It is evident that a comparifon is not proper upon every oc. cation: a man in his cool and fedate moments, is not difpofed to poetical flights, nor to facrifice truth and reality to the delufive operations of the imagination: far lefs is he fo difpoled, when oppreffed with care, or interefted in fome important tranfaction that occupies him totally. On the other hand, it is obfervable, that a man, when elevated or animated by any parfron, is difpofed to elevate or animate all his fubjects: he avoids familiar names, exalts objects by circumlocution and metaphor, and gives even life and voluntary action to inanimate beings. In this warmth of mind, the higheft pottical flights are indulged, and the boldett imiles and metaphors relifhed. But without foaring fo high, the mind is frequently in a tone to retifl chafte and moderate ornament; fuch as como parilons that fet the principal object in a ftrong point of view, or that embellifh and diverfify the narration. In general, when by any animating paffion, whether plafant or painful, an impulfe is given to the imagination;

Comparifon.

- "nopari- nation; we are in that condition ditpoied to cuery 101. fort of figurative exprefion, and in particular to corn- parifons. This in a great madure is avilent from the comparions already mentioned; and thall be further ilhatrated by otherintances. Love, for exaraple, in is infancy, rouling the imarination, prompts the heart to difplay itfelf in figurative languye, and in fimiles:

Troilus. Tell me, Apollo, for thy Daphae's love, What Cieffid is, what l'andar, and what we? Her bed is India, there he lies a peanl: Petween our Iliun, and where fhe relides. Let it be calid the widd and wandoring focd; Onirlf the merchant, and this faling Pardat Our doubtful hope, our convoy, and our bark.

Troilus and Crefuch, act. I. fc. I.
Acain:
Come, gent!: night; come, laving black-brow'd night!
Give me my Romeo; and, when he fhall die, Take him, and cut him oue in little Itars, And he will make the face of heav'n to tine, That all the wold hall be in love with night, Aad pay no worthip io the garihh fun.

$$
\text { Romen end Julit, a } 3 . / \mathrm{c} .4
$$

But it will be a beticr illultration of the prefeut head, to give examples wibere comparifons are inproperly introduced. Similes are not the languge of a man in his ordinary fate of mind, difpatching lis daily and ufual work: for that reafon, the follosing fpeech of a gardener to his fervant is extremely improper:

Go bind thou up yon dangling aprieots, Which, like unruly children, make their fire Stoop with oppreflion of their prodigal weight : Give fome fupportance to the bending twigs. Go thou, and, like an executioner, Cut off the heads of too-faft growing furays, That look too lofty in our commonwealth: All muft be even in our government.

$$
\text { Rikard II. a.g. 3. jc. } 7
$$

The fertility of Sinakefpeare's veia betrays him fiequently into this error.

Rooted grief, decp anguih, terror, remorfe, defpair, and all the fevere difpiriting paffions, are declared enemies, perhaps not to figurative language in general, but undouttedly to the pomp and folemnity of comparifon. Upen this account, the fimile pronounced by young Rueland, under terror of death from an inveterate enemy, and praying mercy, is unnatural :

So looks the pent-up lion o'er the wetch
That trembles under his devouring paws;
And to he walks infulting o'er his prey, And fo he comes to rend his limbs afunder.
Ah, gentle Clifford, kill me with thy fword
And not with fuch a crvel threat'ning look.
Third part Henry VI. ad 1. fi. 5.
A man fpent and difirited after lofing a battle, is not difpoled to heighten on illufurate his difcourfe by Emiles.

York. With this we charg'd again ; but ont ! alas, Ve bodg'd again; as I have feen a fwan With bootlefs labour fwim againft the tide, And fpend her flrength with over-matching waves. Al! hark, the fatal followers do purfue;

Aud I am faint and cannot fly their fury. 'Ilhe fands are number'd that make up my life;
Here mult I ftay, and here my life muft end. Third part Henay V I. at t. f. G.
Similes thus unfeafonably introduced are finely ridiculed in the Rehearfal.
" Bayes. Now bere fie mut make a fimile.
"Sinith. Where's the neceflity of that, Mr Bayes?
"Buyes. Becaufe Me's furprifed; that's a gene-
" rai rule ; you muft ever make a fimile when you
" are furprifed; 'tis a new way of writing."
A comparifon is not always faultefs, even where it is properly introduced. A conparifon, like other ha. man productions, may fall hort of its end ; of which defect iuftances are not rare even amoug good writers: and to complete the prefent fubject, it will be raccifary to make fome obfervations upon fuch faulty compaifons. Nothing can be more erroneous than to inlitute a comparifon too faint : a difant refemblance or contrath fatigues the mind with its obfomity, infleat of amuling it; and tends not to fulfil any one end of a comparifon. The following fimiles feem to labour undur this defect.
K. Rich. Give me the crown.-Here, confi, feize the crown,
Here, on this fide, my hand; on that fide, thins.
Nuw is this golden crown like a deep well,
That owes two buckets, flling one another;
The omptier ever dancing in the air,
The other down, unfeen, and full of water ;
That bucket down, and full of tears, am I,
Drinkirg my griefe, whit you mount up on high.
Ricbard II. act. 4. $\int$ c. 3 -
Ki. Fubs. Oh! coufin, thou art come to fer mane cye;
The tackle of my heart is crack'd and burnt;
And all the throuls wherewith my life hould fail, Are turned to one thread, one little hair: My heart hath one poor fring to fay it by, Which holds but till Liy nows be uttered.

King Julun, act 5. fe. Ic.
2ork. Ny uncles both are llain in refouing me: And all my followers to the eager fore
Turn back, and fly like fips before the wind, Ot lambs purfu'd by hunger ftarved wolves. Third part Iemry VI. at i. fc. 6.
The latter of the two fimiles is good: the former, becaufe of the faintnefs of the refemblance, produces no good effeet, and crouds the narration wiih an ulelefs image.

In an epic poem, or in any elevated fubject, a witer onght to avoid raifing a fimile upon a low image, which never fails to bring down the principal fubject. In general, it is a rule, that a grand object ought never to be refembled to one that is diminutive, however delicate the refemblance may be: for it is the peculiar character of a grand object to fix the attention, and fiwell the mind; in which flate, it is diragrecable to contract the mind to a minute object, however elegant. The refembling an object to one that is greater, has, on the contrary, a good effect, by raifing or fwelling the mind: for one paffes with fatisfaction from a fmall to a great object; but cannot be drawn down, without reluctance, from great to foall. Hence the following fimiles are fally.

Meanwhile

## $\mathrm{C} O \mathrm{M} \quad[279] \quad \mathrm{C} O M$

## $\underbrace{\text { Compari- }}$

Meanwhile the troops beneati Patroclus' care, Invade the Trojans, and commence the war. As wafps, provok'd by chiddren in theit play, Pour from their manfions by the broad highway, In fwarms the fruittefis traveller energen, Whet all their itiogs, and call forth ali their rage; All rife in atme, and with a general cry Afiert theis waxen domes and buazing progeny: Thus from the tents the fervent lerrion lwarms, So luod their chanours, and fo keen their amm. Ihivd, xvi. 3 12.
So burns the vengreful hornet (fonl all o'er) Repuls'd in vain, and thinlly till of gore ; (boll fon of air and heat) on angry wingry Untam'd, untird, he turns, attacks, and llings. Fir'd with like ardour, fierce Atricts few, And fent his foul with ev'ry lance he thew.

Iliud, xvii. Cfz.
An error oppofite to the former, is the introducing a tefembling image, io elevated or great as to bear no proportion to the principal fabject. Their remarkable difarity, being the moft lliking circumthance, feizes the mind, and never fails to depiefs the principal fubject by contraft, inltead of raining it by refemblance: and if the difpatity be exceeding great, the fimile takes on an air of burdefque; nothing being more ridiculous than to force an object out of its propor rank in nature, by equalling it with one greatly fuperior or greatly inferior. This will be evident fiom the following comparifor.

Loud as a bull makes hill and valley rimg,
So roar'd the lock when it releas'd the pring. $0 b_{6} F_{5} y, x \times 1.5 \mathrm{I}$.
Such a fimile upon the fimpleft of all acriuns, that of opesing a lock, is pure birlefque.

A writer of delicacy will avoid dawing his comparifons from any image that is naufoue, ugly, or remarkably difagreable; for however flong the refemblance may be, more will be lof than gained by fuch comparifon. 'Therfore we camot help condemning, though with fome reluctancy, the following fimile, or rather metaphor.

O thou fond many! with what loud applaufe
Didft thou beat heav'n with blelling Bolingbroke
Defore lie was what thou would't lave him be?
And now being trimm'd up in thine own detires,
Thou, bealty feeder, are fo full of him,
That thou provok'ft thyfelf to caft him up.
And fo, thou common dog, didf thon difgorge
Thy glutton bofom of the royal Richard,
And now thou would't eat thy dead vomit up,
And howl't to dind it.
Second Part Menry IV. ait I. fc. K.
The frongef objection that can lie againtt a comparifon is, that it conlifs in words only, not in fenfe. Such falfe coin, or baftard-wit, does extremely well in barlefque; but it is far below the dignity of the epic, or of any ferious compofition.

The noble fifter of Poplicola,
The moon of Rome; chatte as the icicle
That's curdl'd by the froit from purell fnow,
And hangs on Dian's temple.
Coriolanus, ad $5 \cdot f c: 3$. There is evidently no ifemblance between an icicle and a woman, chafte or unchafte: but chaftity is cold
in a metaphorical ferfe, and an icicle is culd in a pro- Cumpar:per lenfe; and this werbal refemblance, in the harry and glow of compoliner, lias been thourght a fuficisnt fomdation for the limile. Such phantom limiles ate mere witticions, which ought to have no grartor, except where purpofly intriduced to provolse langhter. Lomian, in his difertation upon hifory, talkins of a certain author, makes the fullowins coinparifon, which is verbal merely.
"This athor's deferiptions are focold, that they
"lurpafs the Cafpian fuos, and all the ice of" ll: " north."
-_- But for their fpirits and forls
This word ratelion had froce them un
As fith are in a pond.
Scond Part Henry IV. at 1. Co. So

Pope has fereral fimiles of the fane ftamp.
And hence one matler patron in the breat,
Like Aaron's ferpent, lwallows up the rett,

COMPARTITION, in architecture, denotes the ufeful and graceful difpofition of the whole gronad. plot of an edifice, into rooms of office, and of reception or ertertainment.

## $\mathrm{CO} \mathrm{Mi} \quad\left[\begin{array}{ll}280\end{array}\right]$ <br> C O M

Compart. ment, Compafs.

COMPARTMENT, in gencral, is a dugign compofed of feveral different figures, difpofed with fymmetry, to adorn a parterre, a ceiling, Sc.

A compartment of tiles or bricks, is an arrangement of them, of different colours, and varnifhed, for the decoration of a buildiar. Compartnents in gardening, are an affemblage of beds, plots, horders, walks, \&c. difpofed in the moft advantageons manner that the gromud will adnit of. Compartn, cnts in heraldry, ere otherwise called fartions.

COMPASS, or Mariver's Stecting Comens, is an inftrument ufed at fea by piluts to divect and afcertain the courfe of their thips. It confilts of a circular brafs hox, which contairs a paper card with the $3 \geq$ points (f the compafs, fixed on a magnetic needle that always turns to the noth, excepting a fmall declination sariable at differeat places. See Variation.

The needle with the card turns on an upright pin fixcd in the centre of the bos. In the centre of the needle is fixed a brafs conical focket or cap, whereby the card hanging on the pin turns freely round the centre.

The top of the box is covered with a glafs, that the card's motion may not be difturbed by the wind. The whole is rinclofed in another box of wood, where it is fufpended by brafs hoops or gimbals, to prefer we the card horizontal. The compafs-box is to be fo placed in the fhip, that the middle fection of the box, parallel to its fides, may be parallel to the middle fection of the thip along jts keel.

The compafs being of the utmoft confequence to ravigation, it is reafonable to expect that the greatelt attention thould be ufed in its contruction, and every attempt to inprove it carefully examined, and, if proper, adopted. But fo carelefs are the generality of commanders of this moft ufecfil inttrument, that almont all the compafles ufed on buard merehant-dheps have their needles formed of two pieces of thel-wite, each of which is bent in the nidsle, fo as to form an obtufe angle ; and their ends, being applied together, make ar acute one; fo that the whole reptefents the form of a lozenge; in the centre of which, and of the card, is placed the brals cap. Now, if we examine a number of thefe cards, we fall rarely, if ever, find the:n all in the fame direction, but they will all vary more or lefs, not only with regard to the true direction, but from one another.

Thefe integularities are owing to the ftructure of the needle; for the wires of which it is compofed are only hardencl at the ends; now, if thefe ends are not equally hard, or if one end be hardened up higher than the other, when they come to be put together, in fixing thern to the card, that end which is lardeft. will deftroy much of the vistue of the other; by which means the hardelt end will have the moft power in directing the card, and confequently make it vary toward its own direction: and, as the wires are difpofed in the form of a lozenge, thefe cards can have but little force, fo that they will often, when drawn afde, Itand at the dittance of feveral degreces on either fide the point from whence they are drawn : for all magnetical bodies receive an additional flrengh thy being placed in the direction of the earth's magnetifin, and act proportionably lefs vigoromby when turned out of it: wherefore, when thefe kind of needles are drawn

[^12]alide from their trate point, two of the paralice rides Compors. of the lozenge will confire, more dircetly than before, with the earth's magnctifin; and the other two will be lefs in that direction: by which means the two fides will very much impede its return; and the two latter will have that imprdiment to overcome, as well as the friction, by their own force alone.

To memove thefe inconveniences, fome ncelles are made of one picce of fteel of a fpring temper, and broad towards the ends, but tapering towards the midille, where a hole is made to reccive the cap. At the ends they terminate in an angle, greater or hes according to the thill or fancy of the workman. 'lhefe needles, theugh infinitely preferable to the other, are, however, far from being perfect; for every needle of this form hath lix poles initead of two, one at each end, two where it becomes lapering, and two at the hole in the middle; this is owing to their flape; for the middle part being very flender, it has not fubftance enough to conduct the magnetic flream quitc through, from one end to the other: all there poles appear very diftinctly, when examined with a glafs that is fprinkled over with magnetic fand. This circumflance, however, does not hinder the needle from pointing true; but as it has lefs force to move the card than when the magnetic flream moves in large curves from one end to the other, it is certainly an imperfection.

Thrfe inconveniences induced the ingenious Dr Snight to contrive a new fea-compafs, which came into ufe on board all the fhips of war. The needle in this inttument is quite Atraight, and fquare at the ends; and conlequently has only two poles, though about the hole in the middle the curves are a little confufed. Needles of this conltution, after vibrating a long time, will always point exactly in the fame dirction; and if drawn evir fo little on one lide, will return to it again, without any fenfible difference. We may therefore conclude, that a regular parallelopiped is the beft form for a needle, as well as the fimplett, the holes for the caps being as fmall as perfible.

And as the weight fhould be removed to the greateft diftance from the centre of motion, a circle of brats, of the fame diameter of the card, may be added, which will terve alfo to fupport the card, which may then be made of thin paper, without any thing to tiffen it. This ring being fixed below the card, and the needle above it, the centre of gravity is placed low enough to admit of the cap being put under the neadle, whereby the hole in the needle becomes unnecellay.

The above obfervations will be eaflly underfood from viewing t!e feveral parta of the inftrument as reprefented oullate CXLIV. where fig. 6 . is the card, wath the need!: KL, and its cap M, fixed upon it, heing one third of the diameter of the real cald. Fig. 8. is a perfuective view of the backlide of the card, where ABreprelencs the cu:ning down of the brais edge, $C$ the under part of the cap, D and E two hiling weights to balance the card, and $F, G$, wo fows that ix the brafs edge, see. to the needle. The invention of the compars is uffully aferibed to Flavio da Melti, or Favio Gioia, a Neapolitan, about the year 1302 ; and hence it is, that the territory of Principato, which makes part of the kingelom of Naphes, where he was bom, has a compais for its arms. Others fay that Marcus Paulus, a Venetian, making a journey to China, brought back the invention with him in 1260 . What contioms this conjucture is, that at firt they ufed the compars in the fame manner as the Chinefe Aill do; i.e. they let it float on a little piece of cork, inflead of lifpending it on a pivot. It in added, that their emperor Chiningus, a celebrated altologer, had a knowlegge of it I 120 years before Chrith. The Chinefe only divide their compars into 24 pints. Fauchetre relates bome verfes of Guoyot de Provence, who lived in France about the year 1200, which feem to make mention of the compars under the name of metribetise or mutiner's fone ; which fhow it to have been nifed in Frunce near 100 years before cither the Mellite or Ventian. 'The French even lay chain to the invention, from the flear de lys wheren ith all uations thall diflinguifh the north point of the card. With as much reafon Dr Wallis aficibes it to the Englifh, from its name compra/s, by which name molt nations call it, and which be efferves is ufed in many parts of England to figuify a circle.
'Though the mariner's compals has been long in ure, the beft confluction of it was attended with many inconveniences, ill the bate improvement which it has received from the invention and experiments of Dr Gowin Knight, and the farther emendation of Mr Smeaton, as has been deferibed under the anticle Aatmuth (Vol. II.)

The compafs hath fometimes been obferved to be difurbed by the elcetricity of its glats cover; and this from fo llight an application of the finger as was bately necoffaly to wipe off a litile dull. The fame glafs, rubbed a little more with the finger, a bit of mullin, or paper, would attract eitherend of the needle, fo as to hold it to the glafs for feveral minutes, far ont of the due direction, according to that part of the glafs which was mollexcited. Atad when the needle, afiter adhering to the glafs, has dropped loofe, and rade vibrations, thefe would not be bifeeted as ufuai by that point where the needle hould relk, but wouid either be made all on one lide, or be very unequally divided, by means of fome remains of clectrical virtue in that part of the glafs which had attracted the needle, until at length, after is minutes or aore, all the electricity being difcharged, the magnetical power took place. The remedy for this inconenience is to moifen the furface of the mlafs; a wet finger will do it immediately and effectually. The mariner's compafs with a chart is much lels dargeroufly moved than the common compafs with a bare needle: and the deeper, or farther ditant, the needle hangs below the glafs, the lefs difurbance it is likely to receive.

Notwithftoming the various contrivances that have becn made to prevent the card from being much affected by the motions of the hip, they have atways been found too delicate to encounter the flucks of a

"In one particular this patent compafs is conlidered as an inprovemunt on the common compaffes, in as far as the needle is both lugger and broader; hence its magaetifin mult be ftronger, and of courfe the line of its magnetic direction correlpondent with the card. In another paticular, in order to prevent the motinas of the veffel from affecting the needle, which is the mot detirable otjeet, the patent compari-box, inltead of fwinging in rimbals at right angles to each other, is fuppoted in its very ceatre upon a prop; and whatever motion the other parts of the hox may have, this centre being in the vertex of the hollow cone, may be conldered as relatively at reft; and therefure sives little or an diturbance to the needle. anain, the fivot or centre upon which the needle tans, is fo contrived as to ltand always perpenticular over the centre of the compafs-box, or apex of the hullow cone, ss upon a fixed point; and is therefore will lefs afeeted N \&

Compars by the motions of the veffel. Thus the centres of motion, gravity, and of magnetifm, are brought almoft all to the fame point; the advantages of which will be readily perceived by any perfon acquainted with mechanical principles. Experience therefore will afcertain the utility of this improvement." $N 1^{6}$ Culloch's Account.

Of Dr Knight's Azimuth Comparf, as improved by Mr Sneaton, a defcription was given under the article Azmuth, and a figure in Plate LXXVII. The ufe of the azimuth compafs is for finding the fun's magnetical azimuth, or amplitude; and thence the variation of the compafa. If the obfervation be for an amplitude at fun-rifeng, or for an azimuth before noon, apply the centre of the index on the weft point of the card, within the box; fo that the four lines on the edge of the card, and thofe on the inlide of the box, may incet. If the obfervation be for the fun's amplitude fetting, or an azimuth in the afternoon, tuin the centre of the index right againt the eall point of the card, and make the lines within the box concur with thofe on the card: the inltrument thus fitted for obfervation, turn the index bc towards the fun, till the fhadow of the thread ae fall directly on the fit of the fight, and on the line that is alung the middle of the index: then will the innar edge of the index cut the degree and ninute of the fun's magnetical azimuth from the north or fouth. But notc, that if, when the compafs is thus placed, the azimuth is lcis than $45^{\circ}$ from the fouth, and the index turned towards the fun, it will pafs off the divifions of the limb: the inftrument therefore in this cale muit be turned jult a quarter of the compa's, i.e. the centre of the index mull be placed on the noth or fouth point of the card, according as the fun is from you; and then the edge will cut the degrec of the magnetic azimuth, or the fun's azinuth from the north, as before.

The fun's magnetical amplitude thus found, the variation of the needle is thus determined. Being out at fea the 15 th of May 1717, in $45^{\circ}$ north latitude, the tables give me the fun's latitude $19^{\circ}$ north, and his eat amplitude $27^{\prime} 25^{\prime}$ north: by the azimuth compafs, I find the fun's magnetical amplitude at his rifing and fetting; and find he rifes, r. gr. between the $\delta_{2} d$ and 63 d degree, reckoning from the north towards the eaft point of the compafs, i. e. between the 27 th and 28 th degree, reckoning from the eaft. The magretical amplitude, therefore, being here equal to the true one. the needle has no variation ; but if the fun at his tifing fonld have appeared between the 52 d and 53 degree from the north towards the eaft; his mag. netical amplitude would then have been between 37 and 38 dee rece, i.e. about 10 degrecs greater than the irue amplitude: therefore, the needle would vary about to degrees north-eafterly. If the magnetical eift amplitude found by the inftrum nt fhould be lefs than the true amplitude, their difference would fhow the variation of the needle eafterly. If the true caft amplitude be fonthward, as alfo the magnetical amplitude, and this laft be the greater; the variation of the scedie will be north-weft; and vice reerfic.

What has been faid of north-aft amplitudes holds alfo of fouth-weft ; and what of fouth-eatt amplitudes holds of north-welt amplitudes. Lally, if amplicudts be found of different dencminations, 2. gro. if
the true amplitude be fix degrees north, and the margnetical amplitude five degrees fouth; the variation, which in this cafe is north-weft, will be equal to the fum of the magnetical and true amplitudes : underitand the fame for weft amplitudes.
The variation may likewife be found from the azimuth : but in that cafe, the fun's declination, latitude of the place, and his altitude, muft be given, that his true azimuth may be found.
This infrument is alfo ufful in fettling the hip's wake, in order to find the lee-way; and alfo to find the bearings of head-lands, and other objects.
Compass is allo an inttrument of conliderable ufe in furveying land, dialing, \&c.

Its ftructure, in the main, is the fame with that of the mariner's compats : confifting, like that, of a bos and needle: the principal difference confits in this, that intead of the needle's being fitted into the card, and playing with it on a pivot, it here plays alone; the card being drawn on the bottom of the box, and a circle divided in 360 degrees on the limb. See fig. 5 . This inftrument is of obvious ule to travellers, to direct them in their road; and to miners, to thow them what way to dir, with other confiderable ules.

1. To take the dectination of a wall by the Compafs. Apply that lide of the compafs whereon the nortis is marked along the fide of the wall ; the number of degrees over which the north end of the needle fixes will be the declination of the wall, and on that fide; v. $g$. . if the north point of the needle tends towards the north, that wall may be fhone on by the fun at noon; if it fix over fifty degrees, counting from the north towards the eaft, the declination is fo many degrees from north towards eafl.

But fince the needle itfelf declines from the north towards the weft, with us, $13^{\circ}$; it mult be noted, that to retricve the irregularity, $13^{\circ}$ are always to be added to the degrees fhown by the needle, when the declination of the wall is towards; the eatt ; on the contrary, when the declination is towards the weft, the declination of the needle is to he fubtracted.
2. To take an angle with the Compafs. Suppofe the angle required be DAE, fig. 4. apply that fide of the compals whereon the north is marked to one of the lines AD ; when the needle refts, obferve the degrees at which its north point flands, which fuppofe 80: fo many degrees does the line decline from the meridian. In the fame manuer take the declination of the line AE, which fuppofe $215^{\circ}$; fubtract $80^{\circ}$ from 215, the remainder is 135 ; which fubrracted from 180 , there will remain $45^{\circ}$; the quantity of the angle requirtd. But if the difference between the declination of the two lines exceed $180^{\circ}$; in that cafe, $180^{\circ}$ muff be fubtracted from that difference : the remainder then is the angle required.

In meafuring angles by the compafs, there needs not any regard be had to the variation; that being fuppofed the fame in all the lines of the angles.
3. To take a plot of a feld by the Compa/s. Suppore the field A, B, C, D, E, fig. 10 . for the greater accuracy let there be two fights fitted to the meridian line of the compals, place it horizontal, and through the fights look along the fide AB , or a line parallel to it; applying the eye to the fight at the fouth point of the compafs. Draw a rough lketch of the field $b_{3}$

Plate
cxLiv.

## $\mathrm{C} O \mathrm{M} \quad\left[\begin{array}{lll}283\end{array}\right] \quad \mathrm{C} O \quad \mathrm{M}$

Compafs, the eye, and on the correfponding line enter down the Compafee degree to which the needle points, which fuppofe 90 ; meafure the lenrth of the lide, and enter that too, which fuppofe 10 chains.

In this manner proceed with all the reft of the fides and angles of the hield; the fides, which fuppofe 70 , $65,70,44,50$ fathom ; and the angles, which fuppofe 30, 100, 130, 240, 300, degrees. To protract the field, fet down the feveral angles obferved, one after another, and fubtract the leffer from the next greater: thus will you have the quantity of the feveral angles, and the length of the lines that include them. For the relt, fee Geometry.

Note, All the angles of the figure taken together, muft make twice as many right angles; abating two if no mittake las been committed.

Azimutb Confass. See Azimuth.
Compass-Dials, are fmall horizontal dials, fitted in brafs or filver boxes, for the pocket, to thow the hour of the day, by the direction of a needle that indicates how to place them right, by turning the dial about till the cock or Ityle ftand directly over the needle; but thefe can never be very exact, becaufe of the variation of the needle itfelf. Sce Compass, and Dialing.

COMPASSES, or Pair of Comp.ssses, a mathematical inftrument for deferibing circles, meafuring figures, EFc.

The common compaffes confilt of two fharp-pointed branches or legs of iron, fleel, brafs, or other metal, joined together at the top by a rivet, whereon they move as on a centre. Thofe compaffes are of the belt fort in which the pin or axle on which the joint turns, and alfo half the joint itfelf, is made of feel, as the oppofite metals wear more equable. The perfection of them may be known by the ealy and uniform opening and thutting of their legs; one of which is fometimes made to take in and out, in order to make room for two other points to defcribe with ink, blacklead, or other materials.

There are now ufed compaffes of various kinds and contrivances, accommodated to the various ufes they are intended for ; as,

Compasses of three Legs, or Triangular Compaffes, are, fetting afide the excefs of a leg, of the fame ftructure with the common ones: their ufe being to take three points at once, and fo to form triangles; to lay down three politions of a map, to be copied at once, $B C$.

Beam Compasses confift of a long branch, or beam, made of brafs or wood, carrying two brals eurfors, the one fixed at one end, the other fliding along the beam, with a fercw to falten it on occafion. To the curfors may be forewed points of any kind, whether fteel for pencils, or the like. It is ufed to draw large circles, to take great extents, \& $\mathcal{H} c$. To the fixed curfor is fometimes applied an adjulting or miciometer forew, by which an extent is obtained to extrome nicety. Mr Jones of Holhorn has made beam compafles to adjult to the $\frac{x}{50 \sigma O} d t h$ of an inch.

Caliber Compassfs. See Caliber.
Clockmaker's Compasses are joined like the common compaffes, with a quadrant, or bow, like the fpring compaffes; only of different ufe, ferving here to keep the inftrument firm at any ofening. They are made very flrong, with the points of their legs of well tem.
pered fteel, as being ufed to draw lines on patte-board Compaties, or copper.

Cylindrical and Spherical Comp.tsses, confift of fuur branches, joined in a centre, two of which are circular, and two flat, a little bent on the ends: thecir ufe is to take the diameter, thicknefs, or caliber of round or cylindric bodies; fuch as cannons, pipes, Esc.

Elliptic Compasses. Their ufe is to draw ellipfes, or ovals of any kind: they connit of a beam \& $B$ about a foot long, bearing three curfors; to one of which may be forewed points of any kind: to the bottom of the other two are rivited two niding diovetails, adjufted in grooves made in the crofs branches of the beam. The dove-tails having a motion every way, by turning about the long branch, go backwards and forwards along the crofs; fo that when the heam has gone half-way about, one of thefe will have moved the whole length of one of the branches; and when the bean has got quite round, the rame dove-tail bas got back the whole length of the branch. Underftand the fane of the other dove-tail.

Note, the ditance between the two fiding dove-tuils is the diftance between the two foci of the elliphis; fo that by changing that diftance, the ellipfis will be rounder or flenderer. Under the ends of the branches of the crofs are placed four tteel points to keep it falt.

The ule of this compals is eafy; by turning round the long branch, the ink, peacil, or other point, will draw the elliplis required. Its figure thows both its ufe and conftruction.

German Compasses have their legs a little bent outwards, towards the top; fo that when fhut, the points only meet.

Hair Compasses are fo contrived within fide by a fmall adjulting forew to one of the legs, as to take an extent to a hair's breadth.

Lapiclary's COMPASSEs are a piece of wood, in form of the thaft of a plane, cleft at top, as far as half its length ; with this they meafure the angles, $E * c$. of jewels and precious fones, as they cut them. There is in the cleft a little brafs rule, fattened there at one end by a pin ; but fo that it may be moved in the manner of a brafs level: with this kind of fquare they take the angles of the flones, laying them on the fhaft as they cut them.

Proportional Compasses are thofe whofe joint lies between the points terminating each leg: they are either fimple or compound. In the former fort the centre is fixed, fo that one pair of thefe ferves only for one proportion.

Compound proportional Compasses confil of two parts or fides of brafs, which lie upon each other fo nicely as to appear but one when they are hlut. Thefe fides eafily open, and move about a centre, which is itfelf moveable in a hollow canal cut through the greateft pait of their leagth. To thiz centre on each lide is affixed a fliding piece $A$ of a fmall length, with a fine line drawn on it ferving as an index, to be fet againt other lines or divifions plated upon the compalfes on both fides. Thefe lines are, 1. A line of lines. 2. A line of fuperficies, areas, or planes. 3. A line of folids. 4. A line of cincles, or rather of polygons to be infcribed in circles. Thefe lines are all uncqually divided; the three firt fiom i to 20 , the lat from 6 to 20. Their ufes are as follow:

Plate cx!se: fig. $\%$

## $\mathrm{C} O \mathrm{M} \quad[28+] \quad \mathrm{C}$ O MI

Comps. By the line of lines you divide a given line into any number of equal parts; for by placing the iadex A again!t 1 , and ferewirg it faft, if you open the compaties, then the diftance between the points at each end will be equal. If pon place the index againt? and npen the compaffes, the difance between the points of the longer legs $1 ; 13$, will be twice the diftance between the horter ones $C C$; and thus a line is bifected, or divided into two equal parts. If the index be placed argaint 3 , and the compaflies openeci, the ditances be. tween the poins will be as 3 to $t$, and for a line is disided into three equal parts; and fo you proceed for any otler number of parts under 10 .

The numbers of the line of planes anfwer to the fquares of the fe in the line of lines; for becaule luperficies or blanes a:e to each wher as the furates of their like fids; thetefore, if the index be placed againt 2 in ahe lias of planes, thon the ditance between the fmall points will be the hode of a plane whene area is one; but the ditance of the larger points will be the like fide of a plane whofe ara is two or twice as large. If the index be placed at 3 , and the compaffes opened, the diftances hetween the points at each end will be the like hue of clanes whole area are as I to 3 ; and for of rthers.

The rumbens of the line or folds anfwer to the cubes of the fe in the line of lines; becaufe all folids are to each other as the cubes of their fides or diarse ters: therefore, if the index be placed to number $2,3,4$, \&ic. in the line of folds, the diflarice between the leffer aud larger points will be the like hides of folids, which are to each other as 1 to 2,1 to 3, to $\frac{4}{4}$, ac. For example: If the indes be placed at io, and the compaffes be opened fo that the finaill puints may take the diameter of a bullet whofe weight is one ounce, the difance hetween the large poiacs will be the diameter ef a bullke or globe of 10 ources, or which is 10 tinics as larce.

Latly, The numbers in the line or circles are the fides of polygons to be inferibed in a miren circle, or by which a circle moy be diwided into the ecual parts, from 6 to 20. Thus, if the index be placed at 6 , the points of the companies at either end, when opened zo the tadias of a given circle, will contain the fite of a hexagon, or divide the citcle into fix equal parts. It the index he placed againlt 7 , and the compaffes opened fo that the larger points may take in the radius of the circle, then the fhorter points will divide the circle into feven equal pats for inferibing a hep. iagun. Again, placing the inclex to 8 , and openiny the compaffes, the larger points will contain the radius, and the irfler points divide the cincle into eight equal jarts for inderibing an octagon or fquare. And thus you may proceed for others.

Prapertional Comprisses witis the fetaor limes. The Atricture of thele is ro like that of the common proportional compafes, only a little nicer, that it needs no particular defcription. The lines on the firlt face are the line of lines, marked lims ; it is divided into 100 equal parte, every tenth numberal: and the line of chiceds, which goes to 60 , is marked chords. On the -ither face are a line $u$ fines to $5^{\circ}$, and a line of iangerts to $45^{\circ}$. On cne fice are the tangents from $45^{\circ}$ to $71^{\circ} 34^{\prime}$; on the uiler, feants from $0^{\circ}$ to $70^{\circ} 30^{\circ}$,

For the ufe of there compaffes: I. 'To divide a line Compafo inte any number of equal parts lefs than 100 : divide ico hy the number of parts required; flip the curfer till the line on the niding dove-tall be againt the quotient on the line of lines: then, the whole line being taken between the points of the compaffes moft remote from the centie, the aperture of the other will thow the divifion reguired. 2. A right line given, fuppofed to be divided into 100 parts, to take any number of thofe parts; flip the line on the fliding dove-tail to the number of parts required: the whole line heing taken between the poins farthe? from the centre, the aperturs of the other two whil include the number of divitions required. 3. 'Ilse radius being wiven, so find the chord of any awh under $\left(0^{\circ}\right.$; fip the lime on the fliding dure-tail to the degres requited on the liace of chords: the radius being taken between the points farthed from the centre of the curfor: the aperture of the other line will te the chord required, proviled the number of degrees be greater than 20: if it beleds, the aperture taken from the radiss will leave the chord requined. 4. It the chord of an arch under $60^{\circ}$ be given, and the radius required; thip the line on the duve tail to the degress siven on the line of chords: the given chord being taken between the two points next the cuifor, the aperture of the other will be the radius required. 5. The radius being given, to find the the of any number of degress; flip the line on the dore-tall to the degree on the line of fines whofe fine is reçuired: the radius taken between the points furtheit from the curfor, the aperture of the other will give the hine of the angle required. But if the fine fought be lels than $30^{\circ}$, the difference of the apertures of the oppofite points will be the fine rcquired. 6. The radius being given, to find the tangent of any number of degrees under $7 t$ : if the tangent required he under $26^{\circ} 30^{\prime}$, then llip the line on the dove tail to the degree propofed on the tangent line; the radius taken between the points farthelt from the curfor, the aperture of the others will be the tangent of the degrees required: if the tangent requited be above $26^{\circ} 30^{\circ}$, but under $45^{\circ}$, the line on the curfor mult be flipped to the degrees given on the tangent line : then the radius being taken between the points furtheft from the curfor, the aperture of the others will be the tangent. If the tangent required be greater than $45^{\circ}$, but lefs than $56^{\circ} 20^{\prime}$, hip the notch on the tangent fide of the turned cheek to the degree $O$ in the cangent line on the dide of the compafs; the radius taken between the poin:s fartheft from the curfor; the difference between the aperture of the other and thefe, added together, will be the langent required. 'Thus, for the targents of other degrees under 71. After the like manner may the fecant of any number of degrees under 7 t be fonnd.

Mr Heath, a mathematical infrument-maker in Londen, contructed a pair of proportional compaffes, in 1,46, with a curious and ufeful contrivance for preventing the florter legs from changing their polition, when thele compafles were ufed. It confitted of a fmall beam foldered to a fcrew, and running parallal to the leg of the compaffes, nearly of the length of the groove : in this beam a nit was made, which admitted of a fliding-nut, the other end of $u$ hich $f \in l l$ into a hole in the bottom of the forew, belonging to the great nut

－Ning．

COMPII＇ALIA，a Compitalita，feat，heda a mong the ancients in inotour of the lares．＇The word comes from the Latin cominum，a crols way；by rea－ fon the fealt was held in the meeting of feveral roads． The compitulia are more ancient than the building of Rome．Dionytius Halicarnaffeus，and Pliny，indced， fay，they were indlitutad by Servius Tullus；but this ondy figniaes that they were then mtroduced into Rome．The feall being moveable，the day whicreon it was to be obferved was proclainned every year．It was ordinarily held on the fth of the nones of Pc－ bruary，i．$c$ ．on the ad of that month．Macrobins obferves，that they were he！d not only in honour of the lares，but alfo of mania，madnels．The pricits who officiated at them were Aaves and liberi，and the facrifice a fow．They were re－eflablified，after a long neglect，by Tarquan the Proud，on occafon of an anfiver of the orack，that they foould furifue beads for heads ；i．e．that for the iaeath and profpe－ rity of each family，children were to be facrifiecd： but Brotus，after expelling the kings，in lian of thofe tuabarous victims fubttitnted the heads of garlic and poppy；thus fatisfying the oracle which had enjoined capita，heads．During the celebration of this fealt， each family placed at the door of their honfe the ftatue of the goddefs Maria：they allo hung up at their doors figures of wool，reprefenting men and women ；accompanying them with fupplications that the lares and mania would be contented with thofe fi－ gures，and fpare the people of the houfe．

COMPLEMENT，in geometry，is what semains of the quadrant of a circle，of $90^{\circ}$ ，after any certain arch has been taken away from it．Thus，if the arch ta－ ken away be $40^{\circ}$ ，its complement is 50 ；becarfe $50+40=90$ ．The fine of the complement of an arch is called the co－fine，and that of the tangent the cotument，EOC．

COMPLETUSflos，in botany．A 月ower is faid to be complete，which is provided with both the co－ vers，viz．the ealyx or flower－cup，and the petals．The term was invented by Vaillant，and is fynonymous to calyculatus fios in Linnrus．Berkenhout erroneonfy confounds it with the augus and calyculatus calyex of the fame author．

COMPLEX，in a more general fenfe，a term $f_{y}$ ， nonymous with compound；though in Arictnefs of fpeech there is fome difference．

Complex is properly applied where a thing contains divers others，or confills of divers parts not really di－ finct from each other，but only maginaily，or in

## C O M

Ennpiex. Cumptis.
in $\xrightarrow{\mathrm{i} \cap \mathrm{n}}$ will complex, in refpect of the underitanding and will, which are two things that our reafon alone ditin. guithes in it.

Compfex Tirm or Idea, is a term compounded of feweral fimple or incomplex ones. Thus in the propolition, A juft God cannot leave crimes umpunt/bed; the fubject of this propofition, viz. a julf Gool, is a complex ierm, or ftands for a complex idea compofed of two fimple or incomplex ones, viz. God and jufl.

COMPLEXION, among phyficians, the tempera. ment, habitude, and natural difpofition, of the body ; but more often the colour of the face and Nkir.

Few queltions in philofoplyy have engaged the attention of naturalifts more than the diverlities anong the human fpecies, anong whieh that of colour is the moft remarkable. The great differences in this refpect have given occafion to feveral authors to affert, that the whole human race lave not fprung from one original; but that as many different fpecies of men were at fintt created, as there are now different colours to be found among them. Under the article America, $n^{\circ}$ Si - -100. we have fown that all the arguments which can be brought for fpecific differences among mankind, whether drawn from a difference of colour, ftature, or difpolition, muft neceffarily be inconclufive. It remains, however, a matter of no fmall difficulty to account for the remarkable variations of colour that are to be found among different nations. On this fubjeft Dr Hunter hath publiffed a thefos, in which he confiders the matter more accuately than hath commonly been done, and determines abfolutely againf any specifie difference among mankind. He introduces his fubject by obferving, that when the queftion has been agitated, whether all the human race conftitute only one fpecies on not, much confufion has arifen from the fenfe in which the term focies has ! f... atopted. He therefore thinks it neceffary to fet out with a definition of the term. He includes under the fame fpecies all thofe animals which produce ifine capable of propagating others refembling the original fock from whence they fprung. This definition he illutrates by having recourfe to the human feecies as an example. And in this fenfe of the term he concludes, that all of them are $t o$ be confidered as belonging to the fame feecies. And as, in the cafe of plants, one fpecies compreliends feveral varieties depending upon chimate, foil, culture, and fimilar accidents; fo he contiders the diverfities of the human race to be merely varieties of the fame fecies, produced by natural caules. Of the different colours obfervable among mankind, he gives the following view:

Black. Africans under the line.
Inlabitants of New Guinea.
Inhabitants of New Holland.
Swartuy. The Moors in the northern parts of Aírica.
The Hottentots in the fouthern parts of it.
Copper-coloured, The Eat Indials.
Red-coloured. The Americang.
froma-colonred. 'Tartars. Perinans. Aratis.

## C O M

Ls attempting to inveftigate the carafes of thefe differences, our author obferves, that there can be no difpute of the feat of colour being placed in the 1 kin ; that it is not even extended over the whole of this, but confined to that part named the cuticle, confifting of the epidernis and reticulum; and that it chiefly occupies the latter of thefe. . The cuticle is much thicker and harder in black people than in white ones; the reticulum in the later being a thin mucus, in the former a thick membrane. He concludes that this feat of colour in whites is tranlparent, and either totally deprived of veffels, or only furnifhed with very few; as the yellow colour appearing in jaundice vanifhes on the caufe of the difeale being removed: which is not the cafe with flains in the cuticle from gunpowder, or fimilar caufes. He next points out three eaufes deftroying the pellucidity of the cuticle, giving it a brown colour, and rendering it thicker. Thefe are, accefs of air, naftinefs, and the heat of the fun. The influence of each of thefe he proves by many examples; and from theie he is inclined to confider the latt as by much the moft powerful. If, however, it be admitted that thefe caufes lave this effect, he thinks that all the diverfity of colour which is to be obferved among mankind, may be thus accounted for. He remarks, that all the inhabilants of the torrid zone incline more or lefs to a black colour. When we obferve the differences which occur anongit them, we muft at the fame time remember, that a black colour is not referred to heat alone, but to the other caules alfo: and when we attend to the diverfity of temperature that occurs even in the torrid zone, the exiftence of a white nation there would by no means defroy the argument. He is father of opinion, that the exitence of a brown colour, and of confiderable varieties from white, in the northern and coldelt parts of Europe, may very eafily be explained. This he accounts for from the manner of life of the inhabitants, by which they are either expofed to the inclemency of the air, or to conflant nattinefs from fmoky houles.

Having thus attempted to account, from natural caufes, for the varieties which occur amoner mankind

Complex- with refpect to colour, our author obferves, that, to all $\underbrace{\text { ion. }}$ this reafoning, an objection will naturally be made, from conlidering that infants bring the fe marks into the world along with them, before they can be expofed to any fuch caufes. Dr Hunter imagines, however, that this may readily be explained upon the fuppofition that many pecultaritics acquired by parents are tranfmitted to their polterity; and of this, he thinks, no one can entertain the leaf doubt who attends to hereditary difeafes. Thus, gout, fcrophuhe, mania, and many other affections, although at firt induced by particular accidenta, will continue to affect families for many generations. In the fame manner, a farent expofed to caufes deftroying the natural whitenefs of his complexion, will beget fwarthy children; and the fame caufes continuing to operate upon the fon, the blacknefs will he increafed. Thus all the different fhades may have been at firft induced, and afterwads continesed.
'The objection here obviated, however, might have betn thortly anfwered by denying the fact; for it is now generally known, that the children of the blackefl negroes are abfolutely born white, as will be afterwards noticed.

This fubject of complexion has been wety well illuftrated by Mr Clarkfon, in a differtation introluced in his Effay on the commerce and favery of the human species. The firft point that occurs to be afcertained, is, "What part of the flin is the leat of colour?' The old anatomits ufually divided the fkin into two parts or lamine; the exterior and thinnelt, calledby the Greeks epidermis, by the Rumans cuticula, and hence by us suticle: and the interior, callsd by the former derma, and by the latter cutis, or true, /kin. Hence they mult neceflatily have fuppofed, that, as the true flin was in every refpect the fame in a!l human fubjeets, however various their extemal hue, fo the leat of colour mult have exifted in the cuticle or upper furface.

Malpighi, an cminent Italian phylician of the laft century, was the inst perfon who difcovered that the skin was divided into thee lamine or parts; the cuticle, the true fin, and a certain coapulated fubftance fituated between bath, which he diftinguifhed by the title of rete mucofum: which coagulated fubtance adhered fo finmly to the cuticle, as, in all former anatomical preparations, to have come of with it; and, from this corcumftance, to have led the ancient anatonifs to believe, that there vere but wo lamina, or divifible portions in the humar flio. See Avatoniz, $n^{2} 74-7^{6}$.

This difcovery was fufficient to afcertain the point in queftion: for it appeased afterwards that the cuticle, when divided according to this difcovery from the other lamina, was femitranfparent; that the cuticle of the blackeft negroe was of the fame tratifarency and colou! as that of the jureft white; and hence the true $\mathbb{R}$ ins of both being invariably the fame, that the rete mucofum was the feat of colour.

This has been faither confomed by all fubfequent anatomical experiments: by which it appears, that, whatever is the colour of this intermediate coagulated fubfance, nearly the fame is the apparent colour ot the upper furface of the fkin. Neither can it be othernife; for the cuticle, from its tranfparency, muft neceffarily tranfuit the colour of the fubitance be-

287 ] C O M
neath it, in the fame manner, though not in the fame degrec, as the cornea tranfmits the colour of the iis of the eye. This tranfparency is a matter of ocular demonftration in white people. It is confpicuous in every blufh; for no one can imagine that the cuticle becomes red as often as this happens: nor is it lefs difcoverable in the veins, which are fo eafy to be difcerned; for no one can fuppofe that the blue freakn. which he contrantly fees in the faireft complexione, are phinted, as it were, on the furface of the upper fixin. From thefe, and a variety of other obfervations, no maxim is more true in phyfology, than that on the rete mucofum depends the colour of the human body ; or, in cther wordo, that the rete mucofum being of a different colour in different inhabitants of the: globe, and appearing through the cuticle or uppe: furface of the flin, gives them that various appearance which ftikes us fo forcibly in contemplating the human race.

As this can be incortrovertibly afectained, it is e. vident, that whatever caufes co-operate in producing. this different appearance, they produce it by acting upon the rete mucofum; which, from the almoft incredible manner in which the cuticle is perforated, is as acceffible as the cuticle itfelf. Thefe caufes are probably thofe various qualities of things, which, combined with the influence of the fun, contribute to form what we call climate. For when any perfon confiders, that the mucous fubtance before mentioned is found to vary in its colour, as the climates vary from the equator to the poles, his mind mull be inftantly ftruck with the hypothefis, and he muft adopt it, without any hefitation, as the genuine caufe of the phenomenon.

This fact, of the variation of the mucous fubllance, according to the fituation of the place, has been clear$l_{y}$ afcertained in the numerous anatomical experiments that have been made; in which Cubjecto" of all nations have come unu. . onfideration. The natives of many of the kingdoms and illis of Alfa are found to have their rete mucofum black; thofe of Africa, fituated near the line, of the fame colour; thofe of the maritime parts of the fame continent, of a duky brown, nearly approaching to it ; and the colour becomes lighter or dasker in proportion as the diftance from the equator is either greater or lefs. The Europeans are the fairetl inhabitants of the world. Thofe fitua. ted in the moll fouthern regions of Enrope, have in their rete mucofum a tinge of the dark hue of their Afican nejghours : hence the epidemic complexion, prevalent among them, is nearly of the colour of the pickled Spanifh olive; while in this country, and thole lituated nearer the north pole, it appears to be nearly, if not abfolutely, white.

Thefe are facts which anatomy has ellablimed; and we acknowledge them to be fuch, that we canoot di. velt ourlelves of the idea, that climate has a confide. rable thare in producing a difference of colou:.

The cnly objection of any confe quence that has ever beco made to the hypotlefis of climate, i., this, that prople under the fame parallels are not exactly of lice fame colour. But this is no objection in ract; for it does not follow that thofe countries which are at a's equal diftance from the equator, monld have their climates the fame. Indeed nothing is more contrary to experience than this. Climatc depends upon a vo.

## C O M [ 288 ]

Cone. ples:on.
riety of accidents. Hich mountains in the acishbourhood of a place make it cooler, by chilling the air that is carried over then by the winds. Large freading fueculent plants, if anong the productions of the inil, have the fame effect; they afford agreabie cooling mades, and a moilt atmofphere from their continual exiralations, by which the ardour of the fun is conli. derably abated. While the foit, on the other hand, it of a fandy nature, retains the heat in an uneommon degrec, and malses the fummers confiderably hotter than thofe which are found to exil in the fane latitute where the foil is different. To this proximity of what may be termed burning finds, and to the duphureous and metallic partieles which are continually exhaling from the bowels of the earth, is afcribed the different degree of blacknefs by which fome African nations are dillinguimable fron each other, though under the fame parallels. To thefe obfervations we may add, that though the inhabitants of the fame parathel are not exactly of the fame hue, yet they differ only by thades of the fame colonr; or, to fpeak with more precifon, that there are no two people, in fuch a fituation, one of whom is white and the other black. To fum up the whole_-Suppofe we were to take a common glube; to begin at the equator; to paint e. very country along the meridian line in fucceftion from thence to the poles; and to paint them with the fame colour which prevails in the refective inhabitants of each, we thould fee the black, with which we had been obliged to begin, infenlibly changiag to an olive, and the olive, throngh as many intermediate colours, to a white: and if, on the other hand, we fhould complete any one of the parallels according to the fame plan, we fhould fee a difference perhaps in the appearance of fome of the countries through which it ran, though the difference would conbit wholly in thades of the fame colour.

The argument, therefore, which is brought argainft the hypothefis, is fo far from being an objection, that it may be eonfidered as one of the tirnt arguments in its favour: for if clinate has really an influence on the mucous fubltance of the body, it is evident, that we mut not only expect to fee a gradation of colour in the inhabitants from the equator to the poles, but alfo different mades of the fame colour in the inhabitants of the fame parallel.
'To this argument may be added one that is uncontrovertible, which is, that when the black inhabitants of Africa are tranflanted to colder, or the white inhabitants of Europe to hotter climates, their children, born there, are of a difierent culour from themfelees; that is, lighter in the firt, and darker in the fecond inftance.

As a proof of the furt, we thall give the words of tic Abbe Raynal, in lis admired publication. "The children," fays he, "which they (the Africans) procacate in Amcrica, are not fo black as their parents were. Aftereach generation the difference becomes note palpable. It is poffibe, that after a numerous fuccelfion of gencrations, the men enme from Africa woth not be ditinguithed from thofe of the country suto which they may have been tranfplanted."
'This circumflance we have hat the pleafure of heareng confirmed by a varicty of perions who have been wripmefies of the fact ; but particularly by many intel-
ligent Africans, who have been parents thenselves in America, and who have deelared, that the diffurence is fo pupable in the mothern provinees, that mot only they themfelves have contantly obferved it, but that they have heard it obferved by othert.

Neither is this variation in the children from the colour of their parents improbable. The children of the blacket Africass are born white. In this ©tate they continue for about a month, when they change 1o a pale yellow. In procels of time they become brown. Their kin fill continues to increafe in darknefs with their age, till it becomea of a dirty fallow black; and at length, after a certain period of yearz, gloffy and thining. Now, if climate has any influence on the mueous fubfance of the body, this variation in the children from the colour of their parents is an event which mult be reafonably expected: for being born white, and not having equally powerful caufes to act upon them in colder, as their parcuts had in the hotter climates which they left, it mult neceffarily fullow, that the fame effect cannot poffibly be produced.

Hence alro, if the hypothelis be admitted, may be deduced the reafon why eren thofe children who have been bronght from their country at an early age into colder regions, have been offered to be of a ligher colour than thofe who have remained at home till they arrived at a flate of manhod. For having undergone fome of the changes which we mentioned to have attended their countrymen from intancy to a certain asee, and having heen taken away befure the rell coull be completed, thele farther changes, which wont: have taken place had they remained at home, feem either to have been checked in their progras, on weakened in their degree, by a colder climate.

We come now to the fecond and oppolite caic: for a proof of which we thall appeal to the words of Dr Mitchell in the Philufophical Tranfactions, $n^{3}+76$. fect. 4. "The Spaniards who have inhabited America under the torrid zone for any time, are become as dark coloured as our native Indians of Virginia, of which Imyfelf have been a vitneis; and were they not to intermarry with the Europcans, but lead the fame rude and barbarous lives with the Iudians, it is very probable, that, in a fuccelfon of many gemerations, they would become as dark in comptexion."

To this inftance we flull ind one, which is mentioned by a late writer, who, deforbing the African coalt and the European fotclements there, has the following paffage. "There are fereval ocher fmall Portuguefe fettlements, and one of fome note at Mitomba, a river in Sierra Leon. The prople here called Partouef, are principally perfors bred from a mixture of the firf Portugnefe difeuverers with the natives, and now become, in their complexion and woolly qualisy of their hair, perfec negoes, retaining, however, a fmattering of the Portugute language."

Tnefe facts with refpect to the colonits of the Elaropeans are of the highell importance in the prefent cale, and deferve a ferious attention. For when we know to a certainty from whom they are defeended; when we know that they were, at the time of their tranflantation, of the feme colour as thefe from whom they feverally fprung; and when, on the other hand, we are credibly informed that they have changed it for the native colour of the place which they now inhabit:

Cone
mexiot.

## C O M

the cridence in fupport of thefe facts is as great as if a perfon, on the removal of two or there families into another climate, had detemmed to afeetain the cir comfance; as if he had gone with them and watched their children; as if he had commenicated his obfava tions at his death to a fuccefor; as if his fuce tfor hasd profecued the plan: and thus an uninternupted chain of evidence had been kept up from their firit removal to any determined period of fucceeding time.

But though thefe facts feem fuficient of themfelves to confirm our opiaion, they are not the only facts which can be adfuced in its fupport. It can be hown, that the nembers of the very lame fimily, when divided from each other, and removed into different countries, have not oaly changed their family complexion, but that they have changed it to as many different colours as they have gone iato diffenent regions of the werld. We canot have, perlaps, a mure ftriking inAtance of this than in the Jews. The ic people are featterch over the face of the whole earth. 'lyey have preferved themelves ditinct from the vell of the world by their religion; and as they never intermarry with any but thofe of their own fect, fo they have no misanre of blood in their veins that they fould differ from each other: and yet nothing is more true, than thit the Englih Jew is white, the Portuguefe fwarthy, the Armenian olive, and the Arabian copper; in hort, that there appear to be as many dificreat fpecies of Jews as there are countries in which they refide.

To thefe facts we fhall add the following obfervation, that if we ean give crodit to the ancient hittorians in generad, a change from the darkef black to the purelt white muf have actually been aceomplified. One inftance, perhaps, may be thought fufficient. Herodotus relates, that the Colchi were black, and that theyhad crifped hair. Thefe people were a detachment of the Pethiopian army under S.fotris, who followed him in his expedition, and fetted in that part of the world where Colchis is wiually repretented to have been fituated. Had not the fame author informed us of this circumftance, we fhonld have thourht it frange that a people of this deforipeion fondd have been found in fuch a latitude. Now as they were undoubtedly fettled there, and as they were neither fo totally defteoyed, nor made any fuch rapid conquetts, as that hiftory thould notice the event, there is great reafon to prefume that their defcendants continued in the fame, or fettleal in the adjactnt, country; from whence it will fullow, that they mut have changed their complixion to that which is offerved in the inhabiants of this particular region at the profint day; or, in otleer words, that the black inhabitants of Colchis mult have been changed into the fair Circaffan. Suppofe, withont the knowledge of any hiftorin, they had made fuch condiderable cor qualts as to have lettled themfelves at the diftance of 10 miles in any one direction form
 had they gone in an eatern or weltern direction, they mult have ben of the fame celow as the Cireafions; if to the noth, "Jitur: if to the fouth, of a copper. There are no prople within that diftance of Colchis who are tlack.

From the what of the preceding obferations on the lubject, wa may conchide, that as ail the inhathitants of the earth canut be vihenwife tabin Voz. V. Part 1.
the ehildren of the fame parents, and at ele diference comof theirappearance muth hate of courfe pacecededform plexion. incidental catufes, thefe confers are at combinstion of - -mad thofe qualitics which we call dimete: that the blacknefs of the A ficans is fo far cugrafied in thatir conta. tution, in a courfe of many generations, that thatio children wholly inherit it if brought up in the fume fpot; but that it is not fo wholly interwoven in their nature, that it cannot be removed if they are born and fettled in another.

The fame principles with the above we lind adoptal and further illuftrated by Pofeffor Zimmerman of Brunfuick, in his celebrated wark The Gicgraplicab Hi/pory of Man, \&e. He thare proves in the nott fatisfactory manner, That the complesion of the haman fpecies is uniformly correfpondent with the degrece of hat or cold to which they are habitually experfed. In maintaining this poltion, he makes a very proper diAtinction with regard to dimate. Dy chmares we are to underfand, not fimply or folely thole dittinguilled by the geograghical divifons of the globe, to the exchafon of what he terms pidgical climate, or that which depends on the chamses produced in any given latitude by fuch adventitious circumdances as the luwar or more clevated dituations of a country, its being encompaffed by water or latge tracts of land, overfpread or furrounded with forefts, placed in an extenfive plain, or environed by loffy monntains. l'eculiaritis of the hike kind, as las been already noticed, frequontly prevent the phyaral climate from corrcfonding entirely with the grographical, as a conntry infuenced loy them is often much warmer on culder than other resious placed under the fame degree of latitude. The iafluence of thefe fecondary or modifying circumtanecs has been already adverted to, and need not be further enlarged upon: we fhall here only obferve, that the crroneous reafoning of Lord Kames on this fubject feems to have been owing to his inattention to the difference above mentioned. At Senegal, and in the adjacent lands, the thermometer is often at 112 or 157 degrees in the thade; and here we find the inhabitants jet back, with woully hair. The heat is equally great in Congo and Loanco, and thefe counties are inhabited by negroes only; whereas in Morocco, to the north of thefe regions, and at the Cape of Good Hope, to the fouth, the heat is not fo intenfe, nor are the inhabitants of fo deep a hue. Lord Kames anks, Wharcf reare not the Abyflnians and the inhabitants of Zara of as dark a complexion as the Moors on the coalt of Guinca? M. Zimmerman anfwers, that "t thefe eanntrics are mueh cooker. The defert is nut only farther from the equator, but the winds blowing over the Atlas mountains, whech i.ke the $A_{f s}$ are covered with fiow, and the weflenly wind coming from the fea, mut confiderably mitigate the heat. Nor is Abyffuia fo warm as citt a Mon on whata or Gunca. 'The north-ealt winds from the fide of Perfis and Arabia are cuoled by their palfage over the Red Sea: the northena winds from Egypt lofe much of their leat on the chain of momtains that is extended between the conatices: the winds from the fonth and the wed are fiabiads. Thas the only enderter firem which they can derive excefive licat is firm the wetl, as the air on this ride mutt pals over racks of heated lads." In a fmilur reafom it is that negrocs are not fomed either in Alia or South A-

O 0
maica

ConyIlixio: Compisafion.
merica under the equator. The fituations of thefe eountrigs, our author ohferves, expofe then to feabreezes and cooliner winds from the continent. He contirms this hypothefis by obferving, that the mountaineers of warm climates, as in Barbary and Ceylon, are much fairer than the inhabitants of the valleys: that the Saracens and Moors, who conquered the north-calt part of Afriea in 1700, from being brown, are become like the negroes near the equator : that the Portuguefe, who futtled at Senegal in 1400 , became blacks; and Tudela the Jew afferts, that his countrymen in Abyffinia acquired the dark complexion of the original natives.

Upon the whole: Colour and figure may be ftyled habits of the body. Like other habits, they are created, not by great and fudden imprefions, but by continual and almolt imperecptible touches. Oit habits both of mind and body, nations are fufeeptible as well as individuals. They are tranfinitted to offspring, and augmented by inheritance. Long in growing to maturity, mational features, like national manners, become fixed only after a fucceffion of ages. They become, however, fixed at laft; and if we can afeertain any cffect produced by a given flate of weather or of chimate, it requires only repetition during a fufficient Jength of time to augment and imprefs it with a permanent eharacter. The fanguine eourtenance will, for this reafon, be perpetual in the highell latitudes of the temperate zone; and we fhall for ever find the fwartly, the olive, the tawny, and the black, as we defcend to the fouth.

The unifurmity of the effect in the fame climate, and on mes in a fimilar flate of fociety, proves the power and certainty of the caufe. If the advocates of different human fperies fuppofe that the bencficent Deity hath ercated the imbabitants of the carth of dif. ferent colours, becaufe thefe colours are bett adapted to their refpective zones; it furely places his benevolence in a more advantageous light to fay, he has given to human nature the power of accommodating iffelf to every zone. This pliancy of nature is favourable to the unions of the mofl dillant nations, and facilitates the accuifition and the extenfion of foience, which would otherwife be contined to few objects and to a very limited range. It opens the way particulanly to the knowledge of the globe which we inhabit ; a fubjeet fo important and interefting to man. It is verifed by experience. Mankind are fur ever ehancring their habitations by conquells or by commerec; and we find them in all climates, not only able to endure the change, but fo affimilated by time, that we canot fay with certainty whofe ancelor was the native of the elime, and whofe the intruding foreigner.

All the foreguing obfervations have been well recapitulated, illuttated by new facts, and enforced by additional reafoning founded on experience, by the Revereni Ir S.S. Smith, profefor of moral plikufofhy in the college of New Jerfey, in his Efuy on the
 man Sprics; to which the reader who withes for further fatisfaction on the fuhject is referred.

COMIPLEXUS; and Comeleves Minor, or Trashomedrowans: two mufles in the polterion part of the trimk. Ste Anatoms, Tahle of the Mufles.

COMIPLICATION, in general, denotes the blend.
ing, or rather interweaving, of feveral different things Compline together : thus, a perion aflicted with feveral diforders at the fame time, is faid tu labour under a complica. tion of diforders.

COMPLINE, the lat divifion of the Romifh breviary. It was infituted to implore God's protection during the night, as the prime is for the day. It is recited after fun-fet; and is fo called, becaufe it completes the office for the 24 hours.

COMPLUTENSIAN bible. See Bible (Grepk). COMPONE, or Componed, or Gobony, in heraldry. A bordure compone is that formed on compofed of a row of angular parts, or chequers of two colours.

COMPONED, or COMPO:ED, is alfo ufed in geneneral for a bordure, a pale, or a fefs, compofed of two different colours or metals difpoled alternately, feparated and divided by fillets, excepting at the corners; where the junctures are made in form of a goat's foot.

COMPOSITE, in general, denotes fomething compounded, or made up of feveral others united together: thus,

Composite Nrumbers, are fuch as can be meafured exactly by a number exceeding unity; as 6 by 2 or 3 , or io by 5 , \&c. fo that 4 is the lowed compofite number. Compolite numbers, hetween themfelves, are thofe which have fome common meafure befides unity ; as 12 and 15 , as being both meafured by 3 .

Composite Order, in architedture, the lall of the five orders of columns; fo called becanfe its eapital is conpefed out of thufe of the other columns, borrowinis a quarter-round from the Tufcan and Doric, a row of leaves from the Corinthian, and volutes from the Ionic. Its corniche has fimple modillions or dentils. It is alfo ealled the Koman or Ifolic order, as having been invented by the Romans. By moll authors it is ranked after the Corinthian, either as being the noxt richell, or the laft invented. See Architecture, $n^{\circ} 4^{8}$.

COMPOSITION, in a general fenfe, the uniting or putting tegrether feveral things, fo as to form one whole, called a compound.

Comfosition of Ideas, an act of the mind, whereby it unites feveral fimple ideas into one conception or complex idea.

When we are provided with a fufficient flock of fimple ideas, and have by habit and ufe rendered them familiar to our minds, they become the component parts of other ideas ltill more complicated, and form what we maly ca'l a fecond order of compound notions. 'This proceds may be continued to any degree of compofition we pleafe, mornting from one flage to another, and tularging the number of combinations.

Composition, in grammar, the joining of two worgis together; or pretixing a particle to another word, to augment, diminith, or clange its tignification.

Composition, in logic, a method of reafoning, whereby we proceed from fome general felf-evident truth to other farticular and lingular ones.

In difpering and putting together our thoughts, there are two ways of proceeding equally within our cheice: for we may fo fuppofe the truths, relating to any pare of knowledge, as they prefented themfelyes to the mind in the manner of inveltigation ; carrying on the leries of procfs in a veverfe order, till they at laft ter-

## C O M

Compoli- minate in firf principles: or beginning with thefe printion. ciples, we may take the contrary way; and from them deduce, by a direct train of realoning, all the feveral propofitions we want to eftablifh.
'This diverfity in the manner of arranging our thoughts gives rife to the twofokl divifion of method ethablithed among lngicians; the one called matrotic method, or the method of rigolution, inafmuch as it traces things back to their fonce, and refolves knowledge into its firf and original princiedes. This method flands in contradiltinction to the method of compolition; or, as it is otherwifi calleal, the finthetic inthou: for here we proceed by gatherinir together the feveral leattered parts of kiowledge, and combining them into one fytem, in luch a manner as that the andertanding is enabled ditinctly to follow truth thronsh all the diflerent Itages of gradation.

Composition, in multe, is the art of inventing and writing airs: of accompansing them with a fuitable harmuny; in thort, of forming a complete piece of mufic in all its parts.

The knowlege of molody, farmons, and ita rules, is the foundation of compofition. Withont doubt, it is neceffary to know in what manner cho:ds fhould be tilled, how to prepare and refolve diffonances, how tor find the fundamental bals, and how to put in practice all the other monutize of elementary knowledge; but with the mechanical rules of harmony alone, one is by no means better qualitied to underitand the ant, and operate in the practice of compotition, than to form himfelf for eloquence upon all the thetorical precepts exhifitcd in grammar. We need not fay, that befides this, it is necellary to undertand the genius and compafs of voices and int ruments; to judge what airs may be of eafy, and what of difficult, execution ; to obferve what will, and what will not, be productive of any effect; to feel the character of diferent movements, as well as that of different modulations, that both may be always tuitally applied ; to know the different rules eftablifhed by convention, by tafte, by caprice, or by pedantry, as fugues, imitations, or in pieces where the fubject is confined to uniform laws in its harmony, melody, hhithmus, \&c. All thefe acquifitions are fill no more than preparatives for compolition: but the eompofer mult fund in his own genius the fources of beautiful melody, of fublime harmony, the picturefque, and the expreflive in mulic; he mut, in fhort, be capable of perceiving, and of forming, the order of the whole piece; to follow the relations and aptitudes of which it is fufeeptible in every kind; to inflame his foul with the fpirit and enthufiafin of the poet, rather than childifhly amufe himfelf with punning in harmony, or adapting the mutic to each particular word. It is with reafon that our muficians have given the name of quords to the poems which they fet to mufic. It appears evident from their manner of expreffing then, that, in their apprehenfion, they feemed words, and words alone. One would be tempted to imagine, particularly during fome of thefe lalt years, that the rules for the formation and fueceffion of chords have caufed all the rell to be neglected or forgot; and that harmony has made no aequifitions but at the expence of what is general and effential in the mufical art. All our artifts know how so fill a chord with its conflituent founds, or a piece of
harmony with its conflituent parts; but not a foul Componiamonglt them feels a ray of compolition. As:o what remains, thought the fundmental rales of counterpoint, or mulic in parts, continue lill the fame, they are more or lefs rigorous and intlexible in proportion as the parts increafe in nmoubr for accordings as the patts are multiplied, the dificulisy of compotition is heightened, and the rales are lefis fevere- Compofitions in two parts are called dattos when the two perfonners fing equally; that is to fay, when the fubject is no further extended, but divided between them: but if the fubject is in one part alone, and the fubordinute harmony no more than an accompanyment, the tirll part is then either called a witative or a for and the wther an uccompanymont, or continued bafs, if it is a bals. It is the lame cafe wish the min, with conpolitions in three, in four, or in bue pats.

The name of compofation is likewife given to fuch pieces of mufic themfelves as are formed according to the rules of the art. For this reafon the ethats, tirios, quartetess, which lave jut been mentioned, are ealled couprfitions.

Compolitions are either formed for the voice alone, or for inftruments, or for voices and inltruments joined. İull chorufes and fongs are the only compulitions principally intended for the voice, though fometimes inttruments are joined with it to fupport it. Compofitions for intluments are intended to be executed by a band in the orchettra, and then they are called jymphonies, concerlos; or for fome particular fuecies of inftruments, and then they are called pieces or fonalus.

Such compofitions as are deftined both for voices and inftruments, have been generally divided into two capital fpecies, viz. the facred and the fecalur. The compolitions deltined for the eharch, whether pfalms, hymms, anthems, or refponfives, are in general diltinguifhed by the name of church-mufri, and elaracterised by their intention to be fung with words. Secular mulic in general may likewife be divided into two kinds; theatrical and chamber mufic. Of the furlt kind is that ufed in the operas; the fubdivilons of the fecond are endlets. Solos, coneertos, cantatas, fongs, and airs, almoll of every kind, which are not adapted to the chureh or the llage, may be included in the idea of chamber-mufic.

In general, it is thought, that facred mufic requires deeper fcience, and a more accurate obfervation of rules; the fecular fpecies gives more indulgence to genius, and fubfits in greater variety.
But we mult here obferve, that the ecclefiatical mulic now ufed, or rather profaned and murdered, amonglt us, though regular in its harmony, is timple in its componition, and demands not that profound knowledge in the art, either to form or comprehend it, which Roufleat, whom till now we have followed in this article, feems to imagine. His affertion can only be applicable to the chureh-mufic of Italy. That which is now eftablithed anongtt us feems not to be indigenous, but transfered with the Calvinillical liturgy from Geneva; and as it is intended for pıpular ufe, it can by no means be efteemed an high excrtion of the mulical art : yet, however fimple, it is pleating; and, when properly performed, might clevate the foul to a degree of derotion, and even of rapture, which

## C O M [ 292 ] C O M

eompon- at frefent we are fo far from feeling, that we rathes tiln. feem to neep or to howl, than to ling the praife of God. Perhaps our clergy may find more advantage in coltivating their farms: but they would furely feel a higher and diviner pleafure in cultivating the tattes and roices of their people. The one, lowever, is not incumpatible with the other. An hour of relaxation in $\therefore$ winter evening might ferve for the accomplifhment of this pious purpofe; and one thould imagine, that, itdependent of religious confderations, the fpirit of the craft might dictate fuch a meafure as calculated to produce popular emtertainment and gain popular affertion.

In compofion, the author either confenes himfelf, as a fubject, to the mere mechanical modulations and arrangements of found; and, as his end, to the pleafure of the ear alone; or otherwife he foars a nobler height; he affires to imitative mufie; he endeavours to render the hearts and fouls of his anditors ductile by his art, and thus to produce the nobleft emotions and molt falutary effects. In the firit view, it is only neceffary that he fhould look for beautiful founds and arreeable chords; but in the fecond, he ought to confider mulic in its conformity with the accents of the human voice, and in the expreffive powers of notes harmonically combined to fignify or paint fuch objects as are fufceptible of imitation. In Rouffeau's article Opera, fome ideas may be found by which the art may be ennobled and elevated, by forning mufic into a language more powerful and pathetic than eloquence itfelf. See Opera.

Composition, in literature, the art of forming and arranging fentiments, and cloathing them with language fuitable to the nature of the fubject $r$ difcourfe. See the articles Language, Oratory, Poetry, Dialogue, Epistle, and History.

Conposition, in chemiftry, is the union and combination of feveral fubtlances of different natures, from which a compound body refults. From this union of bodies of different natures, a body is tormed, of a mixed nature, which Becker and Stalal have called a mixture, and which may be called a combination, or chemical complition, to aroid the equivocal fenfe of the word mixture. By this lait, we underftand only a mere appolition of parts; and which would thersfore give a sery falfe idea of chemical compofition, in which a mutual adhefion takes place between the combined fubtances.

Composition, in painting, includes the invention as well as difpofition of the figures, the choice of attitudes, \&c.

Compofition, therefore, confifts of two parts; one of which finds out, by means of hitlory, proper objects for a picture; and the other difpofes them to advantage. See Painting.

Composition, in pharmacy, the art or act of mixing divers ingredients together into a medicine fo as they may affit each other's virtues, fupply each other's defects, or correct any ill qualities thereof. See PharMACY.

Composition, in commerce, a contract between an infolvent debtor and his creditors, whereby the latter accept of a part of the debt in compofition for the whole, and give a general acquittance accordingly.

Composition, in printing, commonly termed com. Conpofifoling, the arranging of feveral types or latters in the compofing-itick, in order to form a line; and of feveral lines ranged in order, in the gralley, to make a

## tion

Compnft. page ; and of feveral pages to make a form. Sce Pkinting.

COMPOSITAS, in botany. The nane of a clafs in Hermannus and Royen ; as likewife of an order in Linnæus's fragments of a natural method, confiftiug in gencral of the plants which have the characters enumerated in the following article. A particular defeription of this order is given under the article Syngenesia, which includes all the compaund flowers.

COMPOSITUS Flos, in butany, an agrocgate flower compofed of many flofuli fediles, on a common entire receptaculum, with a common perianthium, and whofe antherse being five in number unite in the form of a cylinder; the flofculi are monopetalous, and under each of them is a monofpermous germen. Compound fiowers are either ligulati, tubulof, or radiati.

COMIPOST, in agriculture, denotes a certain kind of mixture defigned to alfilt the foil in tee way of vegetation, inftead of dung. The requifites for a compoft are, 1. That it ought to be cheaper than the quantity of dung required for an equal extent of foil. 2. It ought to be lefs buliky ; and, 3. It ought to produce equal effects.

Under the article Agriculturf, we have endearoured to fhow, that the true vegetable foud contilts in reality of the putrid effluvia proceeding from decayed animal and vegetable fubltances. If this theory is admitted, the hope of making compofts as a fuccedaneum for dung is but very finall, unlefs they are made of putrefied animal and vegetable fubttances; in which cale, unlets in very lingular circumfances, they will prove much dearer than dung itfelf. Several attempts, however, have been made by thofe who had other views concerning the nature of the true vegetable food. An oil-compoft is recommended in the Georgical Effays, upon a fuppofition that the food of vegetables is of an oily nature. It is made as follows: "' Take of North American potafh 12 lb . Break the falt into fmall pieces, and put it into a convenient veffel with four gallons of water. Let the mixture ftand 48 hours; then add coarfe train oil 14 gallons. In a few days the falt will be diffolved, and the mixture, upon itirring, will become nearly uniform. Take 14 bufhels of fand, or 20 of dry mold; upon thefe pour the abore liquid ingredients. Turn this compofition frequently over, and in fix months it will be fit for ufe. When the liquid ingredients are put co one or two hogheads water, a liquid compoft will be formed, which muft be ufed with a water cart."
'I'his compoft, however, the inventor himfelf owns to be inferior to rotten dung, as indeed may very naturally be fuppused; yet in fome cafes it feems capable of doing fervice, as will appear from fome of the following experiments which we extract from the effays above mentioned.

Exp. I. By the author of the effays. "I took four pots, in ${ }^{\circ} 1,2,3,4$. N 1. contained r 2 lb . of barren fand, with 1 oz. of the fand oil comport. $\mathrm{N}^{2}$. contained 12 lb . of fand without any mixture. $\mathrm{N}^{\prime} 3$. had s3lb. of fand with half an ounce of flaked lime. $N \sim 4$.

## C. $\mathrm{O} \quad \mathrm{M}$

comport. had 12ll. of fand with 407. of the fand oit-compoft. In the month of March, I put fix grains of wheat into each pot, and during the fummer, I oecafionally watered the plants with filtrated water. All the time the plants were confuming the farina, I conld obferve "rery little difference in their appearance. But after ene month's growth, I remarked that $\mathrm{n}^{\circ} \mathrm{I}$. was the helt; $n^{\text {c }} 2$. the next ; $n^{0} 3$. the next ; and $n^{\circ} 4$. much the wort." The fame differences were obferved in Augult, when $n^{\circ}$ t. the belt, had five fuall ears, which contained a few poor grains of wheat.

Axp. II. By the fame. "In the menth of June, I felceted four lands of equal goodnefs in a field inunded for turnips. The foil was a light fand, with a tolerable quantity of vegetable earth amonglt it. It was ploughed out of fward in November, and had not borne a crop for many years. I thall diftinguifh my experimental lands by $n^{\circ} 1,2,3,4$. N 1. was manured with rotten dung; $n^{\circ} 2$. with oil-comport; $n^{\circ} 3$. with lime; $n^{\circ}$ 4. was left without any dreifing. On the 2oth of June they were all fown with tumip-feed broad-calt, and during the courfe of the feafon were twice hoed. In Novenber I viewed the field, and made the fullowing remarks. $N^{\prime} 1$. the bell : $\mathrm{m}^{\circ}$ 2. the next; $n^{0}$ 3. the worll: $n^{\circ}$. 4 . better than $10^{\circ}$ 3." Here the oil-compoft appears in a favourable light; but other trials, made with equal accuracy, feem rather to prove, that it is not proper for turrijus, barley, or quick growing vegetables. It requires being meliorated by the atmofphere, and therefore is better adapted for winter crops.

Exp. III. by the fame. "In the month of May, I planted 12 alleys that lay between my afparagus beds with cauliflower plants. Each alley took up about 30 plants. One of the alleys I fet apart for an experiment with the oil-empoit, prepared according to the directions already given. About an handful of the compoll was put to the root of each eallifower plant. In all other refpects the alley was managed like the ret. The plants in gencral flowered very well; but thofe to which I applied the compott fyrung up haitily with frall ftalks, and produced very poor fowers. I imputed this unfarourable appearance to the freflnefs of the compot, which was only a few weeks old. In the September following this unfuccefsful experiment, I planted the fame alleys with eally cabbages. The necefity of meliorating the compoit was in this trial fully confirmed. For the cabbages that grew upon the alley, which in May had received the compon, were larger and in all refpects finer than the others."

Exp. IV. by James Stovin, Efq: of Doncalter. "In the year ${ }^{1769}$, I made the following trial with the oil-comport, prepared as above directed. One acre fown with barley, and manured with oil-compolt at 18s. produced five quarters five buhtels. An acre adjoining, fown with batley, and mamured with iz loads of rotten dung at 3l. produced four quarters three buifhels and two peeks. The compoll-barley was bolder and better corn than the other. In the year ${ }^{1770}$, the dunged acre produced of rye, three quaiters. The compol acre of ditto, two quarters fix buthels. In the year 1771, the fame lands were fown with oats, and the produce was greatly in fa. rour of the dimged acre. aktée cxperimental lands
were in a common ficld that had been long under the Compon. plough."

1:xp. V. by Richard 'rownly, Efq. of Belfich. " In the ipring 1770, I prepared a piece of ground for onions. It was laid out iato lix beds of the fame fire, and whicll were all fown at the fane time. Over two of them, the oil compot was featered in a very moderate quantity: Over other two, pigeon's dung; and over the remaining two, fome of my rued-compofs (Gomed of putrefied regutables), which 1 efteem one of the bef manures, for molt vegetables, that can be made. The onions came up very well in all the beds; but, in about fix wecks, thofe that were fed with the oil-compoit, plainly difcovered the advantage they had over the reft, by their luxsrianey and colour, and at the end of the fummer perfected the finelt crop I had ever feen, being greatly fuperior to the others both in quantity and lize. The fame fpring I made an experiment upon four rows of eabbages, fet at the diftance of four feet every way. Two were manured with oilcompoft, and two with my own. All the plants were unluckily damaged, jull before they began to form, by fome turkies getting into the field and \}plucking off the greatelt part of the leaves. However, they fo far recovered, in the September following, from 22 to 281 b . a-piece. The rows proved fo equal in goodnefs, that I could not determine which had the advantage. The fame year, one part of at fied of wheat expoied to the north-eaft winds, which, that fpring, contimued to blow for a month or five weeks, appeared very poor and languid at the time of tillering. Over it 1 ordered fome of the oil-compoil to be fown with the hand; which not only recovered, but alfo puthed forwards the wheat plants in that part of the lield, fo as to make them little inferior, if any, to the redl. The fame fpring, I made a comparative experiment, upon four contiguous lands of oats, between the oil-compolt and my own weed-compott. The latter had manifeltly the advantage, though the other produced a very large and fine crop. I alfo tried the vil-conipofl upon carrots, and it anfwered exccedingly well. I did the fame this year (1771) both upon them and my omions, and have the finctl erops of thefe vergetables I ever faw any where upon the fame compals of ground."

Exp. VI. by Mr J. Broadbent of Berwick, in Elmet near Leeds. "On the firtl of OStober 1771, I fowed two acres of a light channelly foil with wheat, and harrowed in the compoft with the grain. Being at a contiderable diftance from a large town, we tind it very difficalt and expenfive to procure rotten dung in Cuffieient quantity for our tillage lands, for which reafon we have recoun le to land-dreffings both for our winter and fpring-corn. Rape-dult and foot are principally ufed; but the prefent price of both thefe articles is a heavy tax upon the farmer. To obviate that inconvenience, I refolved to make trial of the oilcompoft ; and from what I have obferved in this one experiment, I an encouraged to make a more extenfive ufe of it the next year. Being well acquainted with the nature and cificacy of foot, I am fatisfied, that the above two aeres produced as gond a erop of wheat as if they had been dreffed with that excellent manure."

On be fuppofition that regetables are fupported by

## $\mathrm{C} O \mathrm{M} \quad[294] \quad \mathrm{C} O \quad \mathrm{M}$

Comp in matters of a faline nature, compolts formed of diffe. reat forts of falts have been contrived, but with lefs fuecefs than the one above trcated of. A famous compolition of this kind was iately fold by pretent, under the name of Baron I an Huak's compoll. 'The follow. ing experiment is mentioned in the Georgical Effays, as made with a view to determine the vintues of it compared with the oil-compott and foot mixed with athes.-" In the beginning of April 1773, an acre of land was fown with forward oats. I pitchad upon one land in the middle of the piece, which I efleemed bettur than any of the ref, and upon this I leattered baron Van Haak's compoit, in the quantity directed in his infructions. On one fide I manured a land with the sil-compor, but rather with a lefs quantity than directed; and, on the other firc, I manured two lands with dry coal-ahaes fifted tinc, and an equal quantity of foot. The lands upon which this experiment was made, were much worn out with a long fueceffion of crops. The lands which had the benefit of the afthes and foot, prochued an exceeding fine crop ; the vilcompolt produced a tolemable good one; but that which had only the adliftance of the baron's compoll, produced a very poor one. It conld not have been worfe had it been left deititute of every affiltance."

Compofts, made with putrefied animal fubilances, will no doubt anfwer much better, in mott cafes, than any other kind of manure, but they are diflicult to be procured. The following is recommended by Dr Hunter of York. - " Take a fuficient quantity of fawdutt, incorporate it with the hlood and offal of a inaughter-houfe, putting a layer of one and a layer of the other till the whole becomes a moit and fetid compolition. Two loads of this compult, mixed with tharee loads of earth, will be fufficient for an acre of wheat or fpring-corn. Being a kind of top-dreffing, it fhould be put on at the time of fowing, and hasrowed in with the grain. The prefent ycar I have a fich of wheat manured in this manner, and have the pleafure to fay, that it is extremely clean, and has all the appearance of turning out an cxecllent erop. As this kind of eompoft lies in a fmall compals, it feems wall adapted for the ule of fuch farmers as are obliged to bring their manures from a diftance. It is befides extremely rich, and will probably continue in the land mueh longer than fold-yard or thable-dung. I apprehend that it is copable of retloring wom out land to its original freflnefs; and I am induced to be of that opinion, from the appearance of the above crop, which is now growing upon land much imporerihned by bad management."

Another eompoff, prepared from whates flefh, is recommended by Mr Charles Chaloner.-." I have a particular pleafure (fays he) in defcribing and making public the beft method of forming a compolt from whales flefle, as recommended to me by Dr Huneer. Having marked out the length and breadth of your intended dung-hill, make the firt layer of ealth about a foot in thicknefs. Moor-earth, or fuch as is taken from ant-hills, is the belt for this purpofe. Over the earth lay one layer of long litter, from the fold-yard or ftable, about 12 inehnefs in thicknefs, then a layer of whale-llefh, and over that another layer of dung. Repeat the operations till the heap be rai-
fed about fix feet, then give it a thick covering of Compor. earth, and coat the heap with fods. In this manner each layer of flefh will be placed between $\pm$ wo layers of dung. In about a montli turn the whole in the ufual manner, which will oceafion a ftrong degree of heat and fermentation. When turned, cont with earth as before, with a view to confine the putrid iteam which would otherwife efcape. In a month or two the heap will be fond to be confderably fallen, when it fhould have a feconl turning as before. The operation of turning mutt be repeated at proper intervals, till the whole becomes an uniformly putrid mafs. The whaleAth is of different degrees of firmnefs, fome of it being almoll liquid; and, in proportion to its firmefs, the heap will become fooner or later fit for ufe. In general, the compoft hould not be ufed till 12 months old: but that depends upon circumftances. Guard the heap from Jogs, pigs, badgers, and vermin, as thete animals are remarkably fond of whale-lefh. This aniv mal compott may with great advantage be applied to all purpoles where good rotten dung is required. I have uled it with great fuccefs for cabbages, and find it an excellent drelhing for meadow-ground. According to the bet computation, one hogithead of whale refufe, will make cight loads of dung, which, when we confider the great facility with which this batis of our dung-hill maty be carried, is a momentous concern to fuch fumers as lie remote from a large tuwn." See Manure.

Compost, in gardening, is a mixture of feveral earths, earthy fublances, and dungs, either for the improvement of the general foil of a garden, or for that of fome particular plants. Almolt every plant delights in fome peculiar mixture of \{oils or compolt, in which it will thrive better than in others. The molt remarkable and generally ufeful of thefe, are taken notice of under the defcription of the feveral botanical articles, as they occur in the order of the alphabet.

COMPOSTELLA, a celebrated town of Spain, and capital of Galicia, with an archbifhop's fee, and an miverfity. 'I lre public fquares, and the churches, particularly the Metropolitan church, are very magnificent. It has a great number of monafterics, for both fexes, and about 2000 houfcs. It is pretended that the body of St James was buricd here, which draws a great number of pilgrions from moft parts of Chrittendom. They walk in proceffion to the church, and vifit his wooden image, which ftands on the great altar, and is illuminated with 40 or 50 wax-candles. They kifs it three times with a very refpectful devo tion, and then put their hats on its head. In the church there are 30 filver lamps, always lighted, and fix chandeliers of filver, five feet ligh. The poor pilgrims are received into an hofpital, built for that purpofe, which ftands ncar the chureh; and round it are galleries of free flone, fupported by large pillars. The arehbihop is one of the richeft prelates in Spain, having 70,000 crowns a year. From this town the military order of St Jago, or St James, had its original. It is feated in a peninfula, formed by the rivers ${ }^{\top}$ :ambra and Ulla, in a pleafant plain. W. Long. 7.17. N. Lat. 42 . ; 4.

New Comostalla, a town of North America, in New Spain, and province of Xalifco, built in 5531.

CompoAtcila

Gompound It is feated near the South Sea. W. Long. IIO. 12.
C.
II Conipref. N. Lat. 21. O.

COMPOUND, in a general fenfe, an appellation given to whatever is compofed or made up of different things; thus we fay, a compound word, compound found, compound tafte, \&e.-Compound differs from complex, and tiand oppofed to fimple. See Complex and Simple.e.

Compound Flawer. See Compositu's Flos.
Cospornd Interef, called alfo intereft upon interef, is that which is reekoned not only upon the principal, but upon the intectet itfelf forhorn; which hereby becomes a fort of fecondary principal. See Interest.

Compound Motion, that motion which is effected by feveral confpiing powers. Powers are faid to confine if the dircection of the one be not quite oppolite to that of the other; as when the radius of a circle is conceived to revolve about a centre, and at the fame time a point to move Atraight along it.

Compousd Numbers, thofe which may be divided by fome other number befides unity, withont leaving any remainder; fuch are 18,20 , \&e. the firlt being meafured by the numbers 2,6 , or 9 ; and the fecond by the numbers $2,4,5,10$.

Compound Quantitis. See Algebra.
Compoond Rctio, is that which the product of the antecedents of two or more ratios has to the proluct of their courequents. Thus, 6 to 72 is in a atatio compounded of 2 to 6 , and of 3 to 12 .

Compound (fubfantive), the refult or effect of a compofition of different things; or a mals formed by the union of many ingredients.
COMPREHENSION, in Englifh church-hifory, denotes a feheme propofed by Sir Ortando Bridgnan in $1667-8$, for relaxing the terms of conformity in behalf of proteltant diffenters, and admiting them into the communion of the church. A bill for this purpofe was drawn up by Lord Chief-Baton Hale, but difallowed. The attempt was renewed by Thloten and Stillingfleet in 1674, and the terms were fettled to the fatisfaction of the nonconformilts; but the biflops refufed their affent. This [cheme was likewife revived again immediately after the Revelution; the king and dueen exprefled their delire of an union: however the delign failed after two attempts; and the act of toleration was obtained.
Comprehersion, in metaphyfies, is that ast of the mind whereby it apprehends or knows any object that is prefented to it, on all the fides whereon it is capable of being apprchended or known. To comprethend a thing is defined by the feloolmen, ren cliguam totam et to anliter cognofere.

Compremension, in thetoric, a trope or figure whereby the name of a whole is put for a part; or that of a part for a whole; or a definite number of any thing for an indefinite.

COMPRESS, in furgery, a bolter of foft linen cloth, folded in feperal doubles, frequently applied to cover a plafter, il order not only to preferve the part from the external air, but alfo the better to retain the dreffings or medicines.

COMPRESSION, the aOt of preffing or fqueezing fome matter together, fo as to fet its parts nearer to each nther, and make it poifefs lefs fpace. Compref. fon properly $\mathrm{diF}^{\circ}$. . from condenfation, in that the lat-
ter is performed by the action of cold, the former by fome external violence.

COMPROMISE, a treaty or contract, wherchy two contending parties ellablin one or more arbitrators to judge of and terminate the ir difference in an amieable manner.
COMPTON (Henry), bihop of London, was the youngeth fon of Spencer Earl of Northampton, and born in $1 G_{3}$. Aficr the relloration of Challes It. he became cornet of a regiment of horfe: but foon aftur quitting the army for the church, he was made bifhop of Oxford in 167t; and abous a year after tranfited to the fee of London. He was entrulted with the education of the two princeffes Mary and Anne, whom he alfo aftenwards marricd to the princes of Orange and Denmark: and their firmnefs in the Protellant religion was in a great mealure owing io their tutor, to whom, when popery began to prevail at cout, it was imputed as an unpard noble erime. He was fufpended from his eccletiatlical function by James II. but was reftored by him again on the prince of Orange's invalion. He and the bithop of Bittol made the majority for filling the vacant throne with a king: he performed the ceremony of the coronation; was appointed one of the commifioners for raifing the beurgy ; and laboured with much zeal to reconcile diffenters to the church. His fpirit of moderation made him unpupular with the elergy, and in all probability cheeked his further promotion. He died in 1713 ; but, living in bufy tiftes, did not leave many writing ${ }^{3}$ behiad hin.

Comptraler. See Controller.
COMPULSOR, an officer under the Roman em . perors, difpatched from court into the provirces, to conpel tlre payment of tases, \&c. not paid within the time preferibed. The word is formed of the verb compellere, "to oblige, conitrain." Thefe were charged with fo many exactions, under colour of their office, that Honorius cafhiered them by a low in 412.

The laws of the Vifigoths mention military compulliors; which were officers among the Goths, whofe hafinets was to oblige the tardy foldiers to go into the fight, or t. run to an attack, \&c.

Caflian mentions a kind of monalic compulfors, whole bufinefs was to declare the hours of canunical office, and to take eare the munks went to church as thofe hours.
COMPUNCTION, in theology, an inward grief in the mind for having offended God. The word come from compungere, of pungere, "to prick."-The Romanith own their confeffion infignificant unlefs attended with compunction or pricking of heart.
Among fpiritualifts, compunction bears a more extenfive fignification; and implics not only a grief for having offended God, but alfo a pious fentation of grief, forrow, and difpleafure, on other motives. Thus, the miferies of life, the danger of being lolt in the world, the blindnefs of the wicked, \&c. are to pious people motives of compunction.
COMPURGATOR, one that, by oath, juftifies another perfon's innocence. Compurgators were introduced as evidences in the jurifprudence of the middle ages. Their number varied according to the importance of the fubjcet in difpute, or the nature of the crirac with which a perfon was charged.

COBmetition，in a general fente，the manar of etlimating time，weights，ineature，montys，or quan－ titics of any lind．－The word is fometines alfo ufed amano mathematicians in the like fenfe as calculation．

COMUM（anc．geog．），a town of the Orohii，of an ancient ftudinr，and formerly powerfut，daring to difpute with the Romans：Conereses，the people；Co－ menfis Agre，the epithet．It became afterwards no in－ coniderable municipium，to which Julius Cufar added 5000 new colonitts（Stral，o）；whence it was general－ is called Norocomum，and the people Novocomenfes．But in time it recovered its ancient nante，Comm；Pliny the Younger，a native of that place，calling it by no uther nanse．Now Como，in the duchy of Milan，at the fouth end of the lase of that nanse．L．Long． 9． 35 ．N．Lat． 46.

COMUS，in mythology，the god of jollity or fert－ vity．There is great reaton to bolicve he was the Cha－ mos of the Moabites；Beel－Phegor，Baal－Peor，Pria－ pus，and Baechus．He is leprefented under the ap－ pearance of a yourg man，with an inflamed red coun－ tename，his head inclined，and crowned with fowers； his air drowfy；leaning on a＇lumufmats fpear in his left hand，and holding an inserted torch in his right． His flatue was placed at the chamber dours of new married perfon：his pedefal crowned with flowers．

CON，or Cond．See Cond．
CONANT（Dr John），a learned Englifa divine， boin in 1609 ．He took his degrees at Exeter College Oxford；was，by the parliament，conftituted one of the affembly of divines，though he feldom，if ever，fat with them；and in 1657 was admitted viec－chancellor of the univerlity．On the reftoration he was one of the commiffioners，and afifted at the conferences in the Savoy ；but was deprived by the act of uniformi－ ty：after eight years he was confirmed，and was made arch－deacon of Norwich，and prebendary of Worcef． ter．Ia 1686 he loft his light；and died in 1693 ； leavity a number of admired fermons，afiewands pu－ blifhed in fix volures．

CONARION，or Cosoloes，a nanye fur the pineal gland．See Anatomy， $1 i^{\circ} 132$.

CONATUS，a term frequently ufes in philufophy and mathematics，defined by fume to be a çuantity of motion，not capable of being expreffed by any time or leagth；as the conatus recedendia ab axe motus，is the endeavour whith a body，moved circularly，makes to recede，or fly ofl frum the centre or axis of its mo－ tion．

CONCA（Sebahian），called Cavelier，a celcbrated hillory and portrait painter，was born at Gaeta in 1579，and placed as a difciple with Francefoo Solime－ r．a，an inecmparable matter．Under his direction Conca exerted his utmolt indutry to obtain a proper knowidege of the true principies of the art of paint－ ing；wur did he permit any kind of amufement to withdraw his attention from his fludies．Solimena loon peaceived in his difein解 fuch talents，and fuch a difpofition，as would qualify him to make a very great progtefs；and on that account he conceived fo fltong an affectiun for him，that he not only afiurded thim the bed inftuctions，but often employed him to fleech af－ ter his own defigns；took him along with him to Monte Canno，where the was to paint a chapel in fref－ co：and there made Conca acgudinted with every thing No 8.
relative to that manner of painting．At his return to Na，kes with Solimena，he－was，if poffible，ftill more affiunus to inprove himfelf to the utmott；and en－ tered on a project that might a？once advance his in－ come，and add to his expertnef＇s in his profeffion．That projeet was，to paint portraits in a fmall fize and at a low sate；by which fcheme all ranks of perfons crowd－ ed to him ；and befide the pecunialy advantages refult－ ing from it，he aequired an extraordinary freedom of hand in penciling ard colouring；a good habit of imi－ tating nature with an elegant choice；and likewife great diveafity of airs of heads，which were of extra－ ordinary ufe to him in his future beautiful compofitions． As he had a great defire to fee Rome，he obtained permiffion from Sulimena to indulge his inclination； and although he was near thirty years of age when he vifited that city，yet he fent eight years in conflant ftudy after the antiques，after Buonarcti，Raphacl， and the Caracci，and perfected himifelf in every part of lis profeffion．The fame of his works foon fipread throughout Rome，and procured him the patronage of Cardinal Ottobuoni，who was a princely encourager of artifts；atd Cunca having hown an elegant proof of his abilities in a compolition reprefenting Herod inquing of the wife men the place of the birth of the Mefliah，the tigures being as large as life，the Car－ dinal thought it fo excellent a performance that he rewarotd him in a munificent manner，entertained him in his own palace，and introduced him to Fope Cle－ ment XI．who appuinted Conca to paint the picture of the propliet Jeremiah in the church of S．John Late－ ran；which he executed with univerfal applaufe．On that occafion the pope was defirous to give him fome particular mark of his efteem；and therefore，in a ge－ neral affembly of the academicians of St Luke，he conferred on him the orter of knighthood，and the cardinal prefented him with a rich diamond crofs， which Conca，uut of refpect to his patron，always wore at his bofun．From that time he was inceffiant－ ly employed，and his works were folicited by molt of the priaces of Europe．The churches and chapels of every part of Italy are eariched with fome of his com－ policions；of which he painted an incredible number， as he lived to a very advanced age，and never difcon－ tintued his labours．He was carneltly invited by Flin－ $\mathrm{li}_{\mathrm{p}} \mathrm{V}$ ．of Spain to vifit his court，but he could not be prevailed on to leave Rome．He paiated two admi－ rable pietures for the king of Polind，with figures as large as lite；in one was reprefented Alexander pre－ fenting Bucephalus to Philip，after he had managed him；a grand compofition，with a multitude of fi－ gures，conectly defigned，and charningly grouped and difoted；the whole being adorned with mott ele－ gant architecture，in thue and baatiful perfpective． The other was the marriage of Alexander with Roxa－ na，the dughter of Duins，which was in every re－ fpeet equal io the former．He was at laft Co Atrong－ ly prefled to go to Naples，that he undertook the jountey；and was received in that king dom with all the refpect and honomr due to lis merit；and there he frified feveral uoble defyus，as alfo at Gaeta his na－ tive city．While he continued at Naples，he received ia the royal preface a fnuff－hos of very great value， prefented to him in the king＇s name by the marquis of Tomucei，at that time prime mitifit．；and in the year 175\％：

Concale 1757 , the king was pleafed to ennoble him and all his defcendants. At that time he was 78 , and it is confidently faid that he died in 1761 aged 82 , which is very probable, though not pofitively certain. He underftood perfpective and architecture thoroughly, and added to it a fine undertanding of the chiaro-fcuro. His ftyle of compofition is grand and elegant ; his defign very correct; his difpofition ingenious; his attitudes and expreflion full of truth, nature, and variety; and his colouring is excellent. The hiftory of Diana and Actron, by Conca, is in the poffeltion of the earl of Pembroke at Wilton.

CONCALEbay, is on the coalt of France in Brittany, where the Englifh forces landed in June 1758 , in order to go to St Maloes; which they did, and burnt all the fips in that harbour, which were above 100, of all forts. Cuncale is the town which gives name to the bay, and is famous for oyfters. It is 18 miles eaft of St Maloes, and 197 well of Paris. W. Long. 1. 47. N. Lat. 48. 4 I.

CONCARNEAU, a town of France, in Bretagne, with a harbour and a calle. E. Long. 3.45. N. Lat. 47. 55.

CONCATENATION, a term chiefly ufed in 〔peaking of the mutual dependence of fecond caufes upon each other.

CONCAVE, an appellation ufed in fpeaking of the inner furface of hollow bodies, but more efpecially of fpherical ones.

Concave Glafles, fuch as are ground hollow, and are ufually of a fpherical ngure, though they may be of any other, as parabolical, Scc. All objects feen through concave glaffes appear crect and diminifhed.

CONCENTRATION, in general, fignifies the bringing things nearer a centre. Hence the particles of falt, in fea-water, are faid to be concentrated; that is, brought nearer each other, by evaporating the watery part.

CONCENTRIC, in mathemaics, fomething that has the fame common centre with another: it fands in oppufition to excentric.

CONCEPIION, in loric, the fimple apprehenfion or perccption which we have of any thing, without proceeding to affirm or deny any thing about it. Some writers, as Iord Kames, diltinguifh between conception and perception; making the latter to denote the confcioufnefs of an object when prefent, or to include the reality of its olject ; whereas conception expreffes the forming an idea of an object whether prefent or abfent, or without any conviction of its reality.

Conception, in medicine, denotes the firft formation of the embryo, or foctus, in the womb.

Conception is no other than fuch a concourfe and commixture of the prolific feed of the male with that of the female, in the cavity of the uterus, as immediately produces an embryo.

The fymptoms of conception or pregnancy are, when, in a few days after the conjugal act, a fmall pain is perceised about the navel, and is attended with fome gentle cammotions in the tottom of the abdo. men; and within one, two, three, or even four, months, the menfes ceafe to llow, or prove in lefs unautity than ufual. Upun the finft failure of this kind, the woman begins to count the feries of her weeks, without taking any notice of the time before Vol.V. Fazt I.
elapfed; after this, or between the fecond or third montis, but generally about the third, the motions of the embryo become perceivable to the mother; who hereupon becomes troubled with a naufea, vomiting, loathing, longing, \&c. About this time the brealts begin to fwell, grow hard and painful, and contain a little milk; the nipples alfo become larger, firmer, and darker coloured, a livid circle appearing round them: the eyes feem funk and hollow. During the two firl months of pregnancy, the woman grows thinner and nenderer; the abdomen heing alfo depreffed; though it afterwards difends, and grows gradually larger.

The manner wherein conception is effected is thus laid down by the modern writers: In the fuperficies of the ovailes of women, there are found little pellucid fpherules, confilting of two concentric membranes fill. ed with a lymphatic humour, and connected to the furface of the ovaria, underneath the tegument, hy a thick calyx, contiguous to the extremities of the minute ramifications of the Fallopian tubes.

Thefe fpherules, by the ufe of venery, grow, fwell, raife and dilate the membrane of the ovary into the form of papillæ; till, the head propending from the ftalk, it is at length feparated from it ; leaving behind it a hollow cicatrix in the broken membrane of the ovary; which, however, foon grows up again

Now, in thefe fpherules, while flill adhering to the ovary, foctufes have been frequently found; whence it appears, that thefe are a kind of ova, or eggs, deriving their ftruckure from the veffels of the ovary, and their liquor from the humours prepared therein.

Hence alfo it appears, that the Fallopian tubes being fwelled and liffened by the act of venery, with their mufeular fimbrix, like fingers, may embrace the ovaries, comprefs them, and by that comprefion expand their own mouths: and thus the eggs, now mature, and detached as before, may be forced into their cavities, and thence conveyed into the cavity of the utcrus; where they may either be cherifhed and retained, as when they meet with the male feed; or, if they want that, again expelled.

Hence the phenomena of falfe conceptions, abortions, fortules found in the cavity of the abdomen, the Fallopian tubes, \&ce. For in cuition, the male feed, abounding with living animalcules, agitated with a great force, a brink leat, and probably with a great quantity of animal fpirits, is violently impelled through the mouth of the uterus, which on this occafion is opener, and through the valves of the neck of the uterus, which on this occafion are laxer than ordinary, into the uterus iffelf; which now, in like manner, becomes more active, turgid, hot, inflamed, and moilt. ened with the flux of its lymph and fpirits, by means of the titillation excited in the nervous papilla by the attrition againft the rugae of the vagina.

The femen thus difpofed in the uterus, is retained, heated, and agitated, by the convulfive conliriction of the uterus itfelf; till meeting with the ova, the fineft and moft animated part enters through the dilated pores of the membranula of the ovum, now become glandulous; is there retained, nourimed, dilated; grows to its unbilicus, or navel; fliffes the other lefs lively animalcules; and thus is conception effected.

Hence it appears, that conception may happen in any part where the femen meets with an ovum: thus
whethe:

Concep.
tion.

Concep- whether it be carritd through the Fallopian tube to tina. $\xrightarrow{\text { cinc. }}$ the ovary, and there caft upon the ovum; or whether it meet with it in fome recels of the tube itfelf; or, laflly, whether it join it in the cavity of the uterus, it may till have the fame effect, as it appears fiom obfervation actually to have done. But it is probable, that conception is then moft perfeet when the two, viz. the femen and ovum, are carried at the fame time into the uterus, and there mised, sc.

Other anatomilts choofe to fuppofe the male feed taken up, before it arrives in the uterus, by the veins which open into the vagina, \&c. and thus mixed with the blood; by which, in the courfe of circulation, it is carried, duly prepared, into the ovary, to impregnate the eggs.

It has been advaneed by feveral writers, that women may poffibly conceive in their fleep, and be with child without any knowledge of the occalion of it. As ridiculous and abfurd as this detrine may appear to thie generality of the world, no lefa an author than Genfill has thought it worthy a particular diffrtation.

Conception Immarulate of the Holy Thigin, is a feat eftablifhed in honour of the holy virgin, particubarly with regard to her having been conceived and born immacelate, i. e. without original fin, held in the Romifh church on the 8th of December. The immaculate corception is the great lead of controverfy between the Scotilts and Thomilts; the former inaintaining, and the latter impuguing it. In the three Spanif military orders, of St James of the fword, Calatrava, and Alcantara, the knights take a vow at their admiffion to defend the immaculate conception. This refolution was firt taken in 1652 . Peter d'Alva has publifhed 48 huge volumes in folio on the myfteries of the conception.

Conception, an epifepal town of Chili in South America. It is fituated in W. Long. 79. I2. S. Lat. 35.43 ; and is the oldet European Cettement in Chili, and the fecond in point of dignity. On their firt fettlement here, the Spaniards were repeatedly driven of by the Indians, fo that they were obliged to take ap their refidence at St Jago. Since that time both the cities of Conception and St Jaro have been frequently deftroyed by earthquakes. In the year 1730 both of them were laid in ruins by a dreadful thock, the firt concuffions of whicli were attended with an unufual fwelling of the fea, that overturned the few houfes which had efcaped the ravages of the earthquake. The harbour is good, and pretty much frequented; on which account the city is regarded as a place of confequence. The king allows annually 350,000 pieces of eight for the fupport of a garrifon of 3500 men ; a corps that is feldon complete. None of the fortifications are coniderable; but thofe towards the land are wretched. The Spaniards now live in tolerable fecurity with refpect to the Indians, and have no notion of any attack from the land fide. It is faid indeed, that not only this but all the fettlements in Chili and Peru would fall an ealy prey to the attacks of a foreign enemy; the fortifications being in ruins, and the garrifons fearce half the number required by the king: owing to the avarice, ignorance, and fupine negligence of the governors, who itudy nothing but to enrich themfelves.
Gonefption, a town of North America, in New

Spain, and in the Audience of Guatimali. It is feated near the fea-coalt, 100 miles weft of Porto-bello, and a fmall river that runs into the fia. W. Long. 83.5. N. Lat. 10.0.

Conce:t
II
Conclam:2tio.

CONCERT, or Concerto, in mufic, a number or company of murictians, playing or finging the fame piece of mufic or fong at the fame time.

CONCE RTATO intimates the piece of mufic to be compofed in fuch a manner,' as that all the parts may have their recitativos, be it for two, three, four, or more voices or inftruments.
CONCERTO GRosst, the grand chorus of a concert, or thofe places where all the feveral parts perform or play together.

CONCESSION, in general, fignifies cither the act of granting or yielding any thing, or the thing itfelf which is fo granted or yielded.
Conctssion, in rhetoric, a figue, whereby fomething is frecly allowed, that yet might beat difpute, to obtain fomething that one would have granted to him, and which he thinks cannot fairly be denied, as in the following conceffion of Dido, in Virgil:
"The nuptials he difclams, 1 urse no more;
"Let him puifue the roi. isd Latian hore.
"A flort delay is all i afk him now;
"A prafe of gricf, a: interval from wo."
CONCHA, in zoology, a fynonine of the MyTilus, Solen, and other fhcll-filh.

CONCHES, a town of Normandy, with a Benedietinc abbey, which carries on a confiderable trade. It is feated on the top of a mountain, in the territory of Ouche, 45 miles north-weft of Paris. E. Long. 0.51. N. Lat. $4^{8} .5^{8}$.

CONCHITES marnor, a name given by the ancients to a fpecies of marble dug near Megara, and remarkable for containing a great number of fea-fhells, and other marine bodies immerfed in it.

CONCHOID, in geometry, the name of a curve, given to it by its inventor Nicomedes. See Fluxions.

CONCHYLIA, a general name for all petrified fhells, as limpets, cochlex, nautili, eonchæ, lepades, ix.

CONCIATOR, in the glafs art, is, for the cryftalglafs, what the founder is at the green-glafs houfes. $H e$ is the perfon that weighs and proportions the falt on athes and faud, and works them with a ftrong fire till they run into lumps and become white; and if the metal be too hard, and confequently. brittle, he adds falt or athes, and if too foft, fand; ftill mixing them to a fit temper, which is only known by the working.

CONCINNOUS intervals, in mufic, are fuch as are fit for mufic, nest to, and in combination with concords; being neither very agrecable nor difagreeable in themfelves; but having a good effect, as by their oppofition they heighten the more effential principles of pleafure : or as, by their mixture and combination with them, they produce a variety neceflary to our being better pleafed.

Concinnous Sylem, in mufic. A fyftem is faid to be concinnous, or divided concinnoully, when its paits, confidered as fimple intervals, are concinnous; and are befides placed in fuch an order between the extremes, as that the fucceffion of founds, from one extreme to the other, may have an agreeable effect.

CONCLAMATIO, in antiquity, a thout raifed by thofe prefent at burning the dead, before they fet fing

Conclave fire to the funeral pile. See Shout. The word was alfo applied to the fignal given to the Roman folders to decamp, whence the exprefion conclamare vafa; and conclumari arnut, was a fignal for battle. It was likewife ufed for a pratice of calling to a perfon deceafed three times by his name; and when no reply was returned, they thus expreffed his deceafc, conclamatum ofl. Whence the fame term was afterwards applied to the ceffation of the Roman empire.

CONCLAVE, the place in which the cardinals of the Romilh church meet, and are fhut up, in order to the election of a pope.

The conclave is a range of finall cells, 10 feet fquare, made of wainfeot: thefe are numbered, and drawn for by lot. They ftand in a line along the galleries and hall of the Vatican, with a finall face between tach. Every cell has the arms of the cardinal over it. The conclave is not fixed to any one determinate place, for the contitutions of the ehurch allow the cardinals to make choice of fuch a place for the conclave as they think molt convenient ; yet it is generally held in the Vatican.

The conclave is very ftrictly guarded toy troops: neither the cardinals, nor any perfon thut up in the conclave, are fpoke to, but at the hours allowed of, and then in Italian or Latin ; even the provifions for the conclave are examined, that no letters be conveyed by that means from the minitters of foreign powers, or other perfons who may have an intereft in the election of the pontiff.
Conclave is alfo ufed for the affembly, or meeting, of the cardinals fhut up for the election of a pope.

CONCLUSION, inlogic, the confequence or judgement drawn from what was afferted in the premifes; or the previous judgments in reafoning, gained from combining the extreme ideas between themfetves.

CONCOCTION, in medicine, the change which the food undergoes in the fomach, $\mathcal{F} \%$ to become chyle. See Chyle.

CONCOMITANT, fomething that accompanies or goes along with another.

CONCORD, in grammar, that part of couftruction called /ymax, in which the words of a fentence agree; that is, in which nouns are put in the fame gender, number, and cafe; and verbs in the fane number and perion with nouns and pronouns. See Grammar.

Concord, in mulic, the relation of two found that are always agreeable to the car, whother applied in fucceflion or confonance.

Fom of Concord, in ecclefiatical hiftory, a ttandardlook among the Lutherans, compofed at 'Torgaw, in 1576, and thence called the Book of Torgaw, and resiewed at Berg by fix Lutheran doctors of Gemmany, the princiral of whom was James Andrexe. This book contains in two parts, a fyftm of doctrine, the fubfeription of wlich was a condition of communion, and a formal and very fevere condemation of alt who differed from the compilers of it, particularly with refpect to the majefty and omniprefence of Chrilt's body, and the real manducation of his fleh and blood in the eucharift. It was firlt impofed on the Saxons by Augullus, and occationed great oppofition and difurbance. The difpute about it wasrevived in Switgerland in 1718 , when the magittrates of Bern publifhed an order for
adopting it as the rule of faith; the confequence of Concord. which was a conteft, that reduced its credit and authority.
CONCORDANCE, a dictionary or index to the Bible, wherein all the leading wonds, ufed in the courfe of the infpired writings, are ranged slphabetically ; and the various places where they occur 1 eferred to: to aflit in finding ont paffages, and comparing the feveral fignifications of the fame word.

Cardinal Hugo de St Charo, is faid to have employ ed 500 monks at the fame time in compiling a Latin concordance: befides which, we have feveral other concordances in the fame language; one, in particalar, called the concorlance of England, compiled by J. Darlington, of the order of Prccticants; another mor: accurate one, by the Jefuit de Zamora.
R. Mordecai Nathan has furnifhed us with a He brew concordance, firf printed at Venice in 1523, containing all the Hebrew roots branched into their various fignifications, and under each fignification all the places in feripture wherein it oceurs: but the beft and moft ufeful Hebrew concordance is that of Buxtorf, pinted at Bafil in 1632.

Dr Taylor publifred, in 5754 , a Hebrew concordance in two volumes folio, adapted to the Englifh Dible, and difpofed after the manner of Buxtorf.

The Greek concordances are only for the New Teflament : indeed we have one of Conr. Kircher's on the Oid; but this is rather a concordantial dictionary than a concordance ; containing all the Hebrew words in an alphabetical order; and underneath all the interpretations or fenfes the LXX. give them ; and in each interpretation, all the places where they occur in that verfion.

In 1718, Trommins publifhed his Greek concontance for the Septuagint at Amfterdam, in two volumes folio: and Schmidius improving on a dimilar work of H. Steplien, has miven an excellent Greek concordance for the New Teitament, the beft edition of which is that of Leiphe, an: 1717.

Calafius, an Htalian Cordelier, has given us concordancts of the Hebrew, Latin, and Greek, in two columns: the firt, which is Hebrew, is that of R. Mordecai Nathan, word for word, and according to the order of the books and chapters: in the other column is a Latin interpretation of each paffage of feripture quoted by R. Mordecai ; this interpretation is Calafius's own; but in the margin he adds that of the LXX. and the Vulgate, when different from his. The work is in 4 vols folio, printed at Rome in 162 I.

We have feveral very copious concordances in Englith, as Newnann's, \&c. but the latt and beft eftecmed, is that in 4 to. by Alex. Cruden.

CONCORDANF virses, fuch as have feveral words in common; but which, by the addition of other words, convey an oppofite, at leat a different meaning. Such are thofe,
Et $\left\{\begin{array}{c}\text { canis } \\ \text { hupas }\end{array}\right\}$ in fliva $\left\{\begin{array}{c}\text { venatur } \\ \text { nutrinur }\end{array}\right\}$ \& onnia $\left\{\begin{array}{c}\text { firalat. } \\ \text { vallut. }\end{array}\right.$
CONCORDAT, in the Canon law, denotes a covenant or agreement concerning fome beneficiary matter, as a refignation, permutation, promotion, or thelike.

The council of Trent, ieff. vi. de reform. cap. 4. fpeaking of concordats made without the authorit

## $\mathrm{C} O \quad \mathrm{~N} \quad[300] \quad \mathrm{C} O \quad \mathrm{~N}$

Coneer- and approbation of the pope, ealls them concordias quaz tantum fios olligant aublores, non fucteflores. And the congregation of catdinals, who have explained this de-
cree, declares alfo that a concordat cannot be valid fo as to bind fucceffors, unlefs confirmed by the pope.

Coscordat is alfo ufed, abfoluthly, among the French, for an agreement comelnded at Bulogna in r5ib́, between pope Leo X . and Francis I. of France, for regulating the manner of nominating to benefices.

The concordat ferves in lien of the Pragmatic fanction, which has been abrogated; or, rather, it is the prasmatic fanction foftened and reformed. The concordat between the pope and the republic of Venice retembles the former.

There is alfo a German coneordat, made between the enpesor Frederic III. and the princes of Germany, in $1+48$, relating to beneficiary matters, confmed by pope Nicholas V.

CONCORDIA, a town of Italy, in the duchy of Mirandola; feated on the river Sechia, 5 miles weit of Mirandola, and 15 miles fouth-ealt of Mantua; fubject to the houfe of Aultria. E. Long. 11. 22. N. Lat. 44.52 .

Concordia (anc. geog), a town of the Veneti, fituated at the confuence of the rivers Romatinus Najor and Minor, 3 a miles to the welt of Aquileia, (Pliny, Ptolemy, Antonine) ; a colony furnamed Fuliz. It s ruins itill go by the name of Conoordia. - Another Concordia (Prolemy), of Lufitania, to the north-wett of Trajan's bridge, on the Tagus. - A third of the Nemetes in Eelgica, on the wett fide of the Rhine; a Roman fortrefs, fituated hetween Brocomagus and Noviomagus. Now Drufonhein, in Alface. E. Long. S', Lat. $4^{8}+30$.

Concordia, a Pagan divinity of the Romans. She had a temple on the declicity of the capitol; another in the portico of Livia; and athird on Mount Palatine, built of brafs by Cn. Flavius, on account of a vow made for reconciling the Semate and people. She was pictured with a cup in her right hand; in her left was fometimes a feeptre, and fometimes a comecopia. Her fymbols were two hands joined, as is feen in a coin of Aurdius V゙enus, and another of Nero; alro two forpents twifting about a caducens. She was addreffed to promote the peace and union of families and citizens.

CONCOU, in botany, a name given by: the people of Guinca to an herb, which is in great eiteem among them for kiling that troublefone fort of worm called the Guinez-worm, that breeds in their flefh. They bruife the leaves, and mixing them with oil, apply them in form of a cataplafm.

CONCRETE, in the fchool-philofoply, an affemblage or compound.

Concrete, in natural philofoplyy and chemitry, fignifies a body made up of different principles, or any mixed body : thus, foap is a factitions conerete, mixed together by art; and antimony is a natural concrete, or a mixed body compounded in the bowels of the earth.

CONCRE'PION, the uniting feveral fmall particles of a natural body into fendible maffes or concretes, whereby it becomes fo and fo figured and determined, and is endued with fuch and fuch properties.

Concretros is afo the act whereby foft bolies are
rendered hard; or an infenfible motion of the patticles of a fluid or foft body, whereby they come to a con-Concibififtence. It is indifferenty ufed for induration, conden. nage. fation, congelation, and coagulation.

CONCLBINAGE fometimes exprefles a cimmal or prohibited commerce between the two dexes; in which fenfe it comprehends adultery, incen, and timple fornication.

In its more reftrained fenfe, concubinage is wed for a man's and a woman's cohabiing together in the way of marriage, without having pafled the ceremony thereof.

Concubinage was anciently tolerated: the Roman law calls it an allowed cultom, licita conjadudo. When this exproffon occurs in the conititutions of the Chritian cmperors, it dignifies what we now call a marriage in conicitace.

The concubinage tolerated among the Romans in the time of the republic, and of the heathen emperors, was that between perfons not capable of contracting marriage together: nor did they even refufe to let inheritances defeend to children which fprons from fuch a tolerated cohabitance. Concubinage between fuch perfons they lowked on as a kind of marriage, andeven allowed it feveral privileges; but then this concubinage was confined to a fingle perfon, and was of perpetual obligation as much as marriage itfelf. Hottoman cbferves, that the Roman laws had allowed of concubinage longr before Julius Cafar maje that law whereby every one was allowed to marry as many wives as he plafed. The emperor Valentinian, Socrates tells us, allowed every man two.

Concubinage is alfo ufed for a marriage performed with lefs folemnity than the formal matriage; or a marriage with a woman of inferior condition, and to whom the hufband does not convey his rank or quality. Cujas oblerves, that the ancient laws allowed a man to efpoule, under the title of corabine, certain perfons, fuch as were ettemed unequal to him, on account of the want of fome qualitics requifite to futtain the full honour of marriage. He adds, that though concubinage was beneath marriage, both as to dignity and civil effects; yet was concubine a reputable title, very different from that of millefs an:ong us. The commerce was etlemed fo lawful, that the concubine miglit be accufed of adultery in the fame manner as a wife.

This kind of concubiange is fill in ufe in fome countries, particularly in Germany, under the title of a balf-mamude, morgengabe marridge, or nurriage quith the lefl-banl; alluding to the manner of its being contracted, viz. by the man's giving the woman his left hand inttead of the right. This is a real marriage, though without folmmuiy: the parties are both bound for ever; though the woman be thus excluded from the common rigthts of a wife for want of quality or fortune.

The children of concubines were not reputed either legitimate or baftards, but natural children, and were capable only of donations. They were deemed to retain the low ran's of the mother; and were on this ground unqualified for inberiting the effects of the father.

Concubisage, in a legal fenfe, is ufed as an exception againt her that fueth for dower, alleging there-

## CO N

Concubine by, that the was not a wife lawfully married to the par-
If ty, in whofe lands fhe feeks to be endowed, but his
Cund. concubine.

CONCUBINE, a woman whon a perfon takes to cohabite with him, in the manner, and under the character, of a wife, without being authorized thereto by a legal marrage.

Concubine is alfo ufd for a real, legitimate, and only wife, diltinguithed by no other circumftance but a difparity of birth or condition between her and the hufband. 1)u Cange obferves, that one may gather from feveral paffages in the epiftles of the popes, that they anciently allowed of fuch concubines. The feventeenth canom of the firf council of Toledo declares, that the who, with a fathful wife, kceps a concubine, is excommanicated; but that if the concubine ferved him as a wife, fo that he had ouly one woman, under the title of concubine, ne foould tut be rejected from communion: which thows that there werelegitimate wives under the title of concubines.

In effect, the Roman laws did not allow a man to efpoufe wiom he plealed; there was required a kind of parity, or proportion, betwecn the conditions of the contraking parties: but a woman of inferior condition, who could not be efpoufed as a wite, might be kept as a concubine; and the laws allowed of it, provided the man had no other wife.

It is certain the putriarchs had a great number of wives, and that theie did not all hold the fame rank; fome being fubaltern to the priacipal wife; which were what we call comoubes or half-mives. The Romans prolibierd a plurality of concubines, and only had regand to the chidden intuing from a fiagle concubine, bucaufe the might beconse a legitimate wife. Solomon had 700 wives and 300 concubines: the emperor of China has fonnetimes two or three thoufand concubines in his palace. O. Curtius obferves, that Darius was followed in his army by 365 concubines, all in the equipage of queens.

CONCUPISCENCE, according to divines, an irregular appetite, or luft after carnal things, inherent in the nature of man ever fince the fall.

COND, Con, or Cons, in fea language, fignifies to guide or conduct a thip in her wight courfe. He that cons her, flands aloft with a compafs before him, and gives the wrord of direction to the man at the helm kow he is to feer. If the mip go before the winct, or, as they call it, betwixt the fheets, the word is cither fanboard, or purt the helm; according as the eonder would have the helm put to the right or left hide of the fhip, upon which the flip always goes the contrary way. If he fays, helm a mid-hin, he would have the thip to go right belore the wind, or directly between ker two fhects. If the thip fail by a wind, or on a quarter wind, the word is, aloof, keep your luff, fall not off, veer no more, keep her to, touch the wind, hove a care of the lee-latch: all which exprefions are of the fame inport, and inply that the ftecrman fhould keep the fhip near the wind. On the contrary, if be would have her fail more large, or more before the wind, the word is, eafe the hetm, no near, bear up. If he cries fieady, it means, keep her from go. ing in and out, or making yaws (as they call it), howfoever the fails, whether large or before a wind: and
when he monld lave her go juft as the does, he cries, keep her thus, thas, \&e.

## Condate,

CONDATE (anc. greog.), a town of Armorica in Gaul: called Civitus Rbotoram, in the Notitia; afterwards Redomae; Kedonica Kegio, the diltrict. Hence the modern nane Remes, in Brittany. W. Long. I.45. Lat. 48. 5. Another Condate of Ibritain (Antonine); now thought to be Conglcton, in lorkihire ; cuthers fay in Lancafhire.

CONDE (Lewis de Bourbon prince of), was hom at Paris Sept. 7. 162 t . Hewas thyled Dake d'Enguicn, till hee fucceeded to the title of Prince of Conde by lis father's death in 1646 As he wess of a tender and delicate conllitution, the prince fent him to the calle of Montrond in Berry, that he might breathe a more pure and falutary arr. I年e he was edncated in his iufancy by fome experienced and prudent citizens wises. When he was of a proper age, the prince took upon himfelf the tafk of rovemor, and appointed for his affitant M. de la Bonlieres, a private gentle. man, a man of honour, fidclity, and good nature, and who made it a rule to oblerse inviolably the orders that were given him. Two Jefuits dilinguifhed for their genius and knowledge were alfo given him fur preceptors. He formed him a houfehold of 15 or 20 uticers, all men of the greatelt virtue and difcretion.

With thefe attendants the duke d'Enguien went to fert'e at Bourges, where he frequented the college of Jeluits. Here, berides the ordinary fudies, he was targht ancient and modern hiftory, mathematics, geography, declamation; alfo riding and dancing, in which latt he foon excelled. He made fuch a furprifing progrefs, that before the age of 13 he defended in public fome quetions in philofophy with incuedible applaufe. At his return from Moncrond, he had for his tutor M. de Merille; a man deeply verfed in the knowledge of common law, of ancient and modern. laws, of the holy fcriptures, and of the mathematics. Under his direction the duke went through that new courle with prodigious fuccefs. He acquired a critical talte in the arts and feiences, which he retained all his life; he never fuffered a day to pals without dedicating two or three hours at leaft to reading; his thint for knowledge was univerfal, and he cndeavoured to farch cvery thing to the bottom. His chief inclination, however, lay towards the military art; and at the age of 18 he obtained permifion to mase his firt campaign as a volunteer in the army commanded by M. de la Meilleraye. This campaigrn was unfortunate; and the duke d'Enguien was only a witnefs of the marthat's impradence and difgrace. Neverthelefs, in this campaign he laid the foundation of that renown which made him afterwards confidered as the greateft general of his age.

On lis return to Paris, the duke waited upon cardinal Richelieu at Ruel. That minifter was fo pleafed with his converfation, that he foon after made prow pofals of an alliance with the prince of Conde, by marrying the duke elenguien to Claire Clemence dc Maille Breza, the cardinal's niece. The duke confented to this match out of obedience to his father; but the force he put upon limfelf by yielding to it was fo great, that he fell dangergufly in. It

## C O N

Conde. was long before he got the better of his diftemper; ———but at length he not only recovered, but becane fo flrong as afterwards to bear the greatelt fatigues with eate.

The duke made two more campaigns as a volunteer; the one under the marfhal de lia Meilleraye, the other in the army of Louis XIII. which conquered Kouffillon. In 1643 , at the age of 22 , he obtained from the king, at the perfuation of cardinal Mazanime, the command of the army deftined to cover Champaignc and Picardy; which command was confirmed to him after the king's death by the queen regent, Ame of Aultria, to whofe interelt he was itrongly deroted. In this itation, though he never had been prefent at any battle, he froon gave fuch a feccimen of lic abilities as crowned him with glory. The Spaniads, who threatened France with an invaitn, were defeated by him at Rocroi; and this fignal victory made him from that time confidered as the guardian genius of his country. He next formed the project of befieging Theonville, and propofed it to the council of regency. They conferted with fear and diftruft ; but the duke carricd it into execution with fuch fkill, activity, and courage, that he became juitly the fubject of general admiration. In two months time Theonville furrendered. At length, haring covered Alface and Lorrain from the enterprizes of the Imperialits, the duke returned to Paris, where he obtained the government of Champaigne, and of the city of Stenai.

The three following years were littic more than a feries of military operations. The three battles of Fribourg, in which the duke d'Enguien triumphed over Velt Marfhal count de Mercy, the greatell general in all Germany; the taking of Philipfbourg, and a great number of other places, which rendered him mather of the palitinate, and of the whole courfe of the Rhine ; the victory of Nortlingue, by which he revenged the vifcomut du Turenne's defeat at Mariendal; the fiege and conqueft of Dunkilk; the good and bad fuccefs of his arms in Cataloma, where, though he was forced to raife the fiege of Lorida, he kept the Spaniards in awe, and cut to pieces their rear guard; thefe are the principal events which diltinguilh the campaigns of $1644,16+5$, and 1646 .

The victorics of the duke d'Enguien, his great reputation and efteem with the people, hegain now to give umbrage to Mazarin. The cardinal's dillike to him appeared on the death of the duke de Breze, admiral of France. The prince of Conde earnelty demanded for his tom the duke de Breze's places. But Mazarin, afraid of increaling the wealth and power of a prince whom his vizories and the love and confidence of the people and the army had already rendered tou formidable to him, evaded his requett, by perfuading the queen to take the admialty to herfolf. On the de athe of his father, the minitler's difike to the young prince of Conde became till more apparent. By the miniter's perfuafon he had accepted of the command of the army in Catalonia; but, on his arrival at Barcelona, he found neither troups, money; arzillery, provifions, nor ammunition. Enraged at this deception, he vented his refentment in bitter comphaints and fevere threats; bat by the refource that
he found in this dikmma, the prince added new luftre to his glory.

Tlue campaign of 1648 was as glorious to Conde as thofe which preceded it had been. To difconcert at once the projects of the arch-duke Leopold, the prince refolved to attack him even in the heart of the Low Countries; and notwithtanding the confiderable difficulties which he had to furmount, he befieged the inportant city of Ypres, and took it in liglit of all the enemies forces.

Notwithitanding this fuccefs, Conde faw himfelf at the point of experiencing the greateft reverfe of fortune. His army was a prey to fcarcity, to nakednefs, contagious diftempers, and defertion. For eight months it received no fupply from the miniter, but half a mutter. Every thing was fupplied by the prince himeflf; he lavihed his money, and borrowed more to lupply his troops. When it was reprefented to hind that he was in danger of ruining himfelf by fuch an enormous expence, he replied, that "fince he every day ventured his life for the fervice of his country, he could very well facrifice his fortune to it. Let but the government exitt (added he), and I hall want for nothing."

The French army having been reinforced by 4000 of the troops of Weimar, Conde attacked the Spaniards advantageoufly encamped near Lens, and gained a complete vichory over them, which difabled them from attempting any thing more, and even from fup. porting themfelves. Afterwards he befieged Furnes, the garrifon of which, 500 men, furrendered themfelves prifoners of war. But the prince was wounded there in the trenches by a muflet-lhot above the right hip; and the contulion was fo great, that he was forced to fubmit to feveral incifions.

The French court, anmated with the victory at Lens, thought this a proper time to take vengeance on the factions which for fome time had violently agitated the kingdom; and accordingly imprifoned Erouffel and Blancmenil, two of the principal leaders of the country party. This vigorous proceeding, however, occafoned a general revolt. Two hundred thoufand inen took arms in Paris, barricaded the ftreets, invetted the palais-royal, and demanded the prifoners. It was neceffary to releafe them; but from that time the recral authority was amaililated; the queen was expofed to a thoufand infults, and Mazarin dared no longer venture out of the palais-royal. In this embarralliment the queen recalled the prince of Conde, as the colly one from whom the could hope for fupport. He retired to Ruel, whither the regent had gone with the young king and Mazarin. Anne of Aulvia propofed to him the relucing of Paris by force of arms: but he calmed the refentments of that princefs; and inftead of being acceefary to her vengeance, he directed all his views to pacify the kingdon, and at length brought about an accommodation between the partits, who defired it with equal ardour. But new incidents foon rekindled the combutlion. The treachery of Mazarin, and the arrifices of the leaders of the country party, occafioned new cabals and frelh troubles. Conde was careffed by the lemulers of both parties; but at latt, enraged at the arrogance of the malcontents, who every day formed new pretemions,

## $\mathrm{C} 0 \mathrm{~N} \quad\left[\begin{array}{lll}303\end{array}\right] \quad \mathrm{C} O \quad \mathrm{~N}$

Conde. he took part openly with the court, though he thought it ungrateful, and protected the minilker, though he did not efteen him.

The royal family, the duke of Orleans, Conde, and Mazarin, left Paris privately in the night between the 5 th and 6th of January 1649 , and went to St Germains. The pasliament fent deputies to learn from the queen herfelf the reafons of her departure, and to beg her to name the eitizens whom the fufpected, that they might be tried. Mazarin had the impudence to difmifs them without any anfwer. Exafperated at this, the people again took up arms in order to defend themfelves againlt the enterprizes of the court, who had determined to block up and to ftarve the capital, in order to fupprefs the party of malcontents. With 7 or 8000 men, the broken relics of the lath campaign, the prince of Conde formed a defign of reducing abose 500,000 intrenched behind walls. He had neither money nor magazines; he faw himielf in the depth of a molt fevere winter ; neverthelefs he tiumphed over laris, and this great fuccefs completed his glory. It did him fo much the more honour, as during the fiege he conitantly defeated the troops of the malcontents; he prevailed on the army that marched to their affifance under Tureme, to abandon that general ; he Itopped the progrefs of the duke de Longueville, who had caufed an infurrection in Normandy; and got the flart of the Spaniards, who were advancing to give him battle.

Condi de Retz, co-adjutor of Paris, and afterwards cardinal, was the life and foul of the revolters, and direced all their motions. He had taken Catiline for his model ; and was equally intrepid and capable of the greatet actions; of an exalted genius, but governed by his ambition. He diftinguifhed his hatred to Mazarin by arming the malcontents: and he himfelf raifed at his own expence a reginent which he called the regiment of Corinth: as foon as this corps took the field during the blockade of Paris, it was defeated and difperfed. This check was called the firlt to the Corinthions. The peace was figned at St Germains; but neither party carried its point, and fcarce any one but Conde acquired glory by this war. After the conclufion of the treaty, the prince repaired to the capital, and traverfed all the freets in his coach alone. All perfons of any confequence paid their compliments to him, and the parliament fent a folemn deputation to thank him for the peace to which he had fo powerfully contributed. The people, however, made loud complaints on account of the king's ablence (for the court was not yet returned to Paris), and the malcontents gave reafon to apprehend a new infurrection. Conde encouraged the king and queen to return ; and at length brought them to Paris, amidft the acclamations and bleffings of the public.

The important fervice which Conde had juft done the court intitled him to the acknowledgements of the queen, and efpecially of Mazarin ; but the dark foul of that cardinal only remembered it to punifh a too fortunate and too powerful protector. He privately fwore the prince's deftruction; at leat that he fhould give the whole kingdom a pattern of fubmiffion and dependence on his will. However, not to excite the puhlic indignation, he flill kept up appearances with the prince, while be fecretly furcadibout him difgults,
fufpicions, fnares of every kind, and the molt heinous calumnies. The ungrateful miniter deceived the prince by making him the mon flattering propufals; and with the moll alluring pronifes which he dhways found means to avoid fulfiling. The emaged punce defpifed the minifler, and treated him with diftain. After this they were reconciled again only to be again at variance. Each of them in their turn courted the country party, in order to make it fubfervient to their defigns. At laft Mazarin thought of an expedient, which but too effectually anfwered his purpofe, of making an irreconcileable quarrel between that party and the prince. 'There was among the malcontents one narquis de la Bonlaie, a man of an infamons characker, who had obtained the contidence of the party by falle appearances of hatred to the cardinal, but who fecretly kept up a correfpondence with him. It is pretended that he made him an offer of pivately killing Conde. Mazarin was charmed with the propofal; yet he only required Bonlaic to exhibit all the proofs of an affaffation, and to act in fuch a manner that every thing might concur to render the country party fufpected of that crime. He was punctually obeyed; the coach was flopped; fome pittols were fired at it ; by which two of the footmen were dangerouly wounded; and, after that fhameful exploit, la Boalaie took refuge in the hotel of the duke of Beaufort, who was the hero of the party, in order no dotiht to countenatnce the prince's fufpicion of the malcontents. Lackily Conde was not in his coach when it was thopped; the cardinal had fpread the report of his intended affallination; and in concert with the queen and the prince he had prevailed to have the coach fent away empty, to prove the reality of the attempt. Mazarin counterfeited a zeal for the prince's life; he furioully declaimed againlt the malcontents, who, he pretended, had made an attempt on a life fo precious to the fate: and he inflamed Conde's refentment againft the duke of Beaufort and the coadjutor, whom he fuppoled to be the authors of this heinous outrage. The prince was fo ftrongly prejudiced, that he refufed to hear them when they appeared before him to julify themfelves. He demanded jultice againt them of the king: he formally accufed them before the parliament, and remained inflexible in fpite of the pains wl ich the leaders of the party took to demonitrate to him that he had been impofed upon. However, the affair was brought before the parliament ; the accufed defended themfelves, and the coadjutor, who had difcovered the cardinal's fecret, unmajked him fo well, that the prince agreed to a private negociation with the malcontents: he required nothing more than the coadjutor's leaving Paris, but with the rank of ambaffador to Rome or Vienna. 'That prelate would have confented to it, to fatisfy Conde, if Mazarin, fome days after, had not given lim the choice of any recompence, in order to engage his concurrence in the prince's deftruction. Affairs were now in fuch a dangerous fituation, that the cardinal faw clearly it was neceffary to halten to the winding up of the plot. Mafter of the queen's mind, which he guided as he pleafed; and fure of having inflamed againft Conde all the refentment of the malcontents ; he fought and obtained, by means of the duchefs Chevreufe, the fupport of that powerful faction, which comedied itfelf

## 

Conds. the more readily with him, in hopes that the prinee's fall would foon erable it to erufh without dificulty the cardinal himfelf. The eoadjutor had private conferenees with the queen and the miniter. Conde had notice of it : and in order to difcover if it were truc, he endeavoured to furprife it from Mazarin's own mouth. "Cardinal (faid he, one day), it is publicly reported that you have nightly meetings with the coadjutor, difguifed like a trooper." He aecompanied this fpeech with a quick and penetrating look: but the eardinal, who was a perfect maller of difimulation, antwered him in fuch a free, artlefs like manner, that he entirely removed Conde's apprelienfions; and he flighted the information he had received, of the plot forming againt him.

Mazarin wanted nothing but the fupport of the duke of Orleans; and at latt found means, by the duchefs of Chevreufe, to inflame the jealoufy of that fickle and inconfant prince, and to engage him to corfent to the imprifonment of Conde. Having thus united all :arties, and fearing no other obtlacle, this ungratuful and peffidions miniter made preparations for privately arretting the prince; the order for it was figned January 18th 1650 . Conde having that day repaired as ufual to the palais-royal, to affitt at couneil with the prince of Conti and the duke of Longueville, the queen gave orders to arrelt them all three, and convey them without any noife to the caftle of Vincennes. She was inflantly obeyed, and the prinees were itrictly guarded in that prifon.

In this unexpected reverfe of fortune, the fortitude and greatnefs of Conde's mind appeared only the more remarkable. Confined with the other two princes in the tower of Vincennes, where neither fupper, furn:ture, nor beds, were provided, he contented himfelf with two new laid eggs, and threw himfelf in his cloaths, on a trufs of fraw, where he flept 12 hours without waking. He ftill retained his cheerfulnefs, and dedicated the greatett part of his time to reading, the relt to converfation, playing at battle-door and ghuttle-cock, to bodily exereifes, and the cultivation of flowers.

Mazarin triumphed at the difgrace of the princes, proferibed all thrye who were attached to Conde, and belaved in the moft infolent and arbitrary manner. The prince's friends, however, notwithitandin' their being itrictly watehed, found means to keep up a punctual correfpondence with him. They made various attempts to relcale him: they raifed toops; in particular, the dukes of Bocuillon and Rochefoeault, and the vifeount de Turenne. The princefs of Conde engaged the prosince of Guienne to declare in his favour; the made war, in crecr to force the contry to releafe him ; at lngth the partizans of the pince figned a treaty with the Spaniards, to labour in concert for his enlargenent. But all thefe efforts would, perinaps, have been ineffectual, if other more powesful refuurces had not been employed.

In that gallant and warlike age, every thing was managed by the pafions and intrigues of five or fix women, who poffeffed the confidence of the leaders of the ftate, and of the varions parties. The prinecfs of Mantua, wife to one of the iens of the clector lalatine, king of Bohemia, priticipetly directed the counfols in the party of the princes. She found mears to ñ $8 \Omega$.
reeoncile the duke of Orleans, the conujutor, and the Conde, malcontents, with the friends of the prince, and united Condemnstheir efforts againt the cardinal. The parliament, on the other fide, loudly demanded the releafe of the prifoners. All the orders of the ftate united in foliciting it, infornuch that the queen was at lait prevailed on to give her confent. At this news, Mazarin was fo confounded, that he fed in the difguile of a trooper, and arrived at the gates of Richlieu, where a body of horie waited for him. The partianent, informed by the queen of his flight, thandered forth an arret, by which he was olliged to leave the kingdom, with his family and foreign ferrants, in the fpace of 15 days, under the penalty of being expofed to a criminal profecution. The queen defired to follow him with the king; but the $n$ hiles and burghers invetted the palais royal, and prevented the execution of this project, which would have kindled a civil war. Mazarin, therefore, pereciving that it was impomble for the queen to join him, determined to go himfelf to reltore the princes to their liberty, and to get the ftat of the deputies who were coming to acquaint them with it. On his arrival at Havre, he informed the princes that they were fice; he entreated Conde's frienJhip; and was fo abject as to proftrate himfelf at the feet of him whom he had fo bafely oppreffed. Conde gave him a polite reception, and fpoke to him in a free and cheerful tone; but tired with the mean fubmifions which the cardinal lavifhed upon him, he left him without making any promife, and fet out on his return to Paris, which he entered as it were in triumph, amidf the acclamations of all orders of men, and the demontrations of a molt fincere and general joy.

After this a civil war eafued, in which the prince of Conde fided with the malcontents. Being preffed by the king's army, he retired into the fuburbs of St Arthony, where he behaved with the utmoft bravery; when the citizens opened their gates and received him in ; and a peace enfued foon after. His hatred of the cardinal, however, made him quit Paris, and take refuge among the Spaniards, who made him generalifinoo of thei* forces; and he took Rocroi. The peace of the Pyrenees reftored him to his eountry; and he again fignalized himillf at the lead of the king's armies. Bcing aflicted with the gout, he refufed the command of the army in 1676 , and retired to Chartilley, where he was as much eAleemed for the virtues of peace, as he had been before for his military ones. He died in 1686, at Fontainblcau.
Conds, a town of the French Netherlands, in the province of Hainhault, with the title of a principality, and a caffic. It is one of the frongelt towns in this country, and feated near the confurnce of the rivers Haine and Scheld. E. Long. 3. 29. N. Lat. 50. 27.

Covde, a town of France, in Normandy, and in the Beffin, which earries on a confidcrable trade; feated on the river Nercau. W. Long. O. 37. N. Lat. $4^{8.50}$
CONDEMNATION, the aEi of giving judgment, pafing or pronouncing fentence againt a perfon fubjected thereby to fome penalty or punifinent, citlocr in relpect of life, reputation, or foituse.

CON-

Condenra- CONDENSATION, the aet whereby a body is tion rendered more denfe, compact, and heavy. The word condor is conmonly applied to the converfion of vapour into
water, by ditillation, or naturally in the clouds. The way in which vapour commonly condenfes, is by the application of fome cold fubtance. On touching it, the vapour parts with its heat which it had before abforbed; and on doing fo, it immediately lofes the proper chara\&teriftics of vapour, and becomes water. But though this is the mot common and ufual way in which we obferve vapour to be condenfed, nature certainly proceeds after another method: fince we often olferve the vapours moft plentifully condenfed when the weather is really warmer than at other times. See the articles Cloud, Evaporation, Esc.

CONDENSER, a pneumatic engine, or fyringe, whereby an uncommon quantity of air may be crowded into a given fpace; fo that fometimes ten atmofpheres, or ten times as muchair as there is at the fame time in the fame fpace, without the engine, may be thrown in by means of it, and its egrefs prevented by valves properly difpofed. See Plate C̈XLVI.

It confitts of a brafs eylinder, wherein is a moveable pifton; which being drawn out, the air ruhhes into the cylinder through a hole provided on purpofe; and when the pifon is again fored into the cylinder, the air is driven into the rectiver through an orifice, fur nifhed with a valve to hinder its getting out.

The receiver or veffel containing the condenfed air, fould be made very ftrong, to bear the foree of the air's fpring thus increafed; for which reafon they are generally made of brafs: its orifice is fitted with a female ferew to receive the male forew at the end of the condenfer.

If glafs be ufed for a condenfer, it will not fulfer fo great a degree of condenfation; but the experiment will be more entertaining, fince the fubject may be viewed in the condenfed air.

CONDITION, in the civil haw, a claufe of obligation Alipulated as an article of a treaty or a contract; or in a donation of a teftament, legacy, © 6 . in which latt cale a donee does not lofe his donative if it be charged with any dithonell or inspoffible conditions.

CONDITIONAL, fonething not abfolute, but fubject to conditions.

Conditional. Conjidaiturs, in grammar, are thofe which ferve to make propofitions conditional; as if, mn-

Conditional Prop(yitions, in logic, fuch as confita of two parts connected tugether by a conditional partick.

Conditionth Syllogifm, a fyllogifm where the major is a conditionat propofition. Thus,

If there is a Cod, he ought to be worhipped.
Dut there is a God;
Therefure he ought to be worhipped.
CONDIVICNUM, (ane. geng.), the capital of the Namnetes, in Armorica. Now Nants in Brittany; on the Loire, from its name Civitas Numnetum. W. Long. 1. 30. Lat. 77.15.

CONDCM, a town of Gafcony in France, capital of the Condomois, with a bifhop's fee. It is lint a poor place, and the trade is very fmall. It is feated on the river Geliffe, in E. Long. O. 22. N. Lat. 44 .
CONDOR, orContor, inorhithology. See Vulter.
Vos. V. Fart I .

CONDORMIENTES, in church-hifory, rdigious fectaries, who take their name from lying all togecher, men and women, young and old. They arofe in the $1^{\text {th }}$ century, near Cologne; where they are faid to

Cominr-
micritey II Conefi. have worthipped an image of lucifer, and to have received anfwers and oracles from him.

CONDRILU, a town of Lyonnois in France, re. markable for it excellent wines. It is feated at the foot of a hill near the river Rhone, E. Long. 4. $33^{\circ}$ N. Lat. 45. 28.

CONDRUSII, (anc. geog.), a people of Belgica, originally Germans, dwelling about the Macfe. Their country is now called Condrotz, in the bihopric of Liege, between Luxemburg and the Maefe.

CONDUCTOR, in furgery, an infrument which ferves to conduct the knife in the operation of cutting for the fone, and in laying up finufes and fiftulas.

Conductors, in electrical experiments, are thore bodies that receive and communicate electricity; and thofe that repel it are called nou-conduturs. See Elecricity.

CONDUIT, a canal or pipe for the conveyance of water, or other fluid.

There are feveral fubterraneous conduits through which the waters pafs that form furings. Artificial conduits for water are made of lead, itone, caft-iron, potter's earth, timber, Esc.

CONDYLOID and Coronom proceffes. See Anatomy, n 26.

CONDYLOMA, in medicine, a tubercle, or callous eminence, which arifes in the folds of the anus, or rather a fwelling or hardening of the wimkles of that part.

CONDYLUS, a name given by anatomi?s to a knot in any of the joints, formed by the epiphy fis of a bone.

CONE, in geonetry, a folid figure, hawing a circle for its bafe, and its top terminated in a point or vertex. See Conic Sections.

Meltirg Cone, in chemilty, is a hollow cone formed of copper or brafs, with a handle, and with a flat bottom adjoining to the apex of the conc, upon which it is intended to reft. Its ufe is to receive a mafs of one or mose metals melted together, and call into it. This mafs, when culd, may be cafly thook out of the veffel, from its figure. Alfo, if a melted mafs confifting of two or more metals, or other fubfances not combincd together, be poured into this vetiel, the conical figure facilitates the feparation of thefe fublances aceording to their refpective dennities. The cone ought to be well heated before the melted mals is thrown into it ; that it may not coutain any moifture, which would oceafion a dangcrous explofion. It ought alfo to be greafed internally with tallow, to prevent the adhefion of the fluid mater.

Coare of Ruys, in optics, includes all the feveral rays which fall from any radiant point upon the furface of a glafs.

Cone, in botany. See Contrs.
CONESSI, a furt of bank of a tree, which grows on the Coromandel coalt in the Eall lndics. It is recommended in a letter to Lr Monro, in the Medical Effays, as a fpecific in diarchocas. It is to be finely pulverized, and made into an electuary with fyrup of oranges. The bark hould be fieth, and the clectua-

Confarre- ry new made every day, or fecond day, otherwife it ation lofes its auftere but grateful bitternefs on the palate, li
Confeflion and its proper effects on the inteftines.

CONFARREATION, a ceremony among the an- cient Romans, ufed in the marriage of perfons whofe children were deftined for the honour of the prieft-hood.

Confarreation was the moft facred of the three modes of contracting marriage among that people; and confifted, according to Servius, in this, that the pontifox maximus and flamen diulis joined and contracted the man and woman, ly making them eat of the fame cake of falted bread : whence the term, fur fignifying mal or flour.
Ulpian fays, it confited in the offering up of fome pure wheaten bread; rehearfing, withal, a certain formula, in prefence of ten witneftes. Dionyfus Halicarnaffeus adds, that the huband and wife did eat of the fame wheaten bread, and threw part on the victims.

CONFEC CION, in pharmaey, fignifies, in general, any thing prepared with fugar: in particular it imports fomething preferved, efpecially dry fubftances, It alfo fignifies a liquid or foft electuary, of which there are various forts directed in difpenfatories. See Pharmact.

CONFECTOR, among the ancient Romans, a fort of gladiator, hired to figlat in the amphitheatre again't beafts ; thence alfo denominated beffitrius.

The confectores were thus called à conficiendis befliis, from their difpatching and killing beafts.

The Greeks called them *roxら, q. d. daring, ralh, siperato; whence the Latins borrowed the appellations paralulani and parabelarii. The Chritians were fometimes condemned to this fort of combat.

CONFECTS, a denomination given to fruits, fowers, herbs, roots, \&c. when boiled or prepared with fugar or honey, to difpofe theni to keep, and render them more agreeable to the tafte.

CONFEDERACT, in law, is when two or more perfons combine to do any damage to another, or to commit any unlawful act. Conftderacy is punihable, though nothing be put in execution; but then it mult have thefe four incidents: 1. That it be declared by fome matter of profecution, as by making of bonds or promifes to one another; 2. That it be malicious, as for unjuf revenge; 3. 'That it be falfe, i. e. againtt the imnocent ; and, laftly, That it be out of court, voluntary.

CONFERVA, in botany: A genus belonging to the cryptogamia clafs of plants; and in the natural method ranking under the $57^{\text {th }}$ order, Alges. The tubercles are of different fizes, on eapillary, very long fibres. There are 21 fpecies, molt of them growing on Atones in flow ftreams, on the fides of eifterns, or in ponds.

CONFESSION, in a civil fenfe, a declaration or acknowledgement of fome truth, though againft the interelt of the party who makes it; whether it be in a court of jultice or out of it. It is a maxin, that in civil matters, the confeffion is never to be divided, but always taken entire. A criminal is never con-

- demmed on his fimple confffion, withont other collascral proofs: nor is a voluntary extrajudicial confeffion admitted as any proof. A perfon is not admitied to aceufe himfelf, according to that rule in law, Aun auditur ferire volens. Sce Arrabgment.

Confession, among divines, the verbal acknow- Confetion ledgement which a Chrifian makes of his fins.

Among the Jews it was the cultom, on the annual fealt of expiation, for the high-prieit to make conferfion of fins to God in the name of the whole people: befides this general confeffion, the Jews were enjoined, if their lins were a breach of the firlt table of the law, to make confeffion of them to God; but violations of the fecond table were to be aeknowledged to their brethren. The confeflion of the primitive Chriftians were all voluntary, and not impoled on them by any laws of the church; yet private confelfion was not only allowed, but encouraged.

The Romifh chureh requires confefion not only as a duty, but has advanced it to the dignity of a facrament : this confeffion is made to the prief, and is private and auricular ; and the prieft is not to reveal them under pain of the lighef punihment.

Confession of Faith, a lift of the feveral articles of belief in any chureh.

CONFESSIONAL, or Confessionary, a place in churches under the great altar, where the bodies of deceafed faints, martyrs, and confeflors, were depofited.

This word is alfo ufed by the Romanits for a delk in the church wheie the confefor takes the confeflions of the penitents.

CONFESSOR, a Chritian who has made a folemn and refolute profeftion of the faith, and has endured torments in its defence. A mere faint is called a conferfor, to diftinguith him from the roll of dignified faints; fuch as apoftes, martyrs, \&e. In ecelefiaftical hitory, we frequentiy find the word confeffors ufed for martyrs: in after-times, it was confinced to thofe who, after haring been tormented by the tyrants, were permitted to live and die in peace. And at laft it was alfo ufed for thofe who, after having lived a good life, died under an opinion of fanctity. According to St Cyprian, he who prefented himfelf to torture, or even to martyrdom, without being called to it, was not called a confeffor but a profefer: and if any out of a want of courage abandoned his country, and beeame a voluntary exile for the fake of the faith, he was called exterris.

Confessor is alfo a prieft, in the Rominh church, who has a power to hear fimners in the facrament of penance, and to give them abfolution. The church calls him in Latin confeffarius, to dilinguif him from confeffor, which is a name confeerated to faints. The confelfors of the kings of France, from the time of Henry IV. have been conftantly Jefuits: before him the Dominieans and Cordeliers fhared the office between them The confeffors of the houre of Auitria have alfo, ordinarily, been Dominicans and Cordeliers; but the latter emperors have all taken Jefuits.

CONFIGURA'TION, the outward figure which bounds bodies, and gives them their external appearanee; being that which, in a great meafure, conllitutes the fpecifie difference between budies.

CONFIRMATION, in a general fenfe, the act of ratifying or rendering a title, claim, report, or the like, more fure and indifputable.

Cosfirmation, in law, a conveyance of an eftate, or right in effe, from one man to another, whereby a voidable eftate is made fure and unavoidable, or a particular eftate is increafed, or a poffetion made perfect.

Cun-

Confica- Confirmation, in theology, the ceremony oflaying
inn,
Conllagration.
on of hands, for the conveyance of the Holy Ghoft.
The antiquity of this ceremoay is, by all ancient writers, carried as high as the apofles, and founded upon their example and practice. In the primitive church, it ufed to be given to Chritians immediately after baptifm, if the billop happened to be prefent at the folemnity. Among the Greeks, and throughout the Eaf, it Itill accompanies baptifm : but the Romanifts make it a diltinet independent facrament. Seven years is the flated time for confirmation: however, they are fometimes confirmed before, and fometimes after, that ag. The perion to be comfirned has a god-father and god-mother appointed him, as in baptifm. The order of confirmation in the church of England, does not determine the precife age of the perfons to be confirmed.
CONFISCATION, in.law, the adjudication of goods or effects to the public treafury; as the bodies and effects of crininals, traitors, \&c.

CONFLAGRATION, the general burning of a city, or other confiderable place.

This word is commonly applied to that grand period or cataltrophe of our world, when the face of nature is to be changed by fire, as formerly it was by water. The ancient Pythagoreans, Platonilts, Epicureans, and Stoics, appear to have had a notion of the conflagration: thongh whence they flould derive it, unlefs from the facred books, is difficult to conceive; except, perhaps, from the Phomicians, who themfelves had it from the Jews. Seneca fays exprefsly, Tempus alvenerit quo Jidira fideriluas incurrent, $\leftrightarrow$ omni flagrante materia uno igne, quicquid nunc ex depofito lucet, ardebit. This general diffolution the Stuics call txavparti, ecpyrgfis. Mention of the contlagration is alfo made in the books of the Sybils, Sophocles, Hyitalpes, Ovid, Lucan, EJc. Dr Burnet, after F. Tachard and others, relates that the Siamefe believe that the earth will at laft be parched up with heat ; the mountains melted down ; the earth's whole furface reduced to a level, and then confuned with fire. And the Bramins of Siam do not only hold that the world thall be dellroyed by fire; but alfo that a new earth thall be made out of the cinders of the old.

Various are the fentiments of authors on the fubject of the conflagration; the caufe whence it is to arife, and the effects it is to produce. Divines ordinarily account for it metaplyfically; and will have it take its rife from a miracle, as a lire from heaven. Philofophers contend for its being produced from natural caufes; and will have it effeeted according to the laws of mechanics. Some think an eruption of the central fire fufficient for the purpofe; and add, that this may be occalioned feveral ways, riz. either by having its intenfion increafed; which again, may be eflected either by heing driven into leis ipace by the encroachments of the fuperficial cold, or by an increafe of the inflammability of the fuel whereon it is fed; or by laving the refifance of the imprifoning earth weakened; which may happen, either from the diminution of its naater, by the confumption of its central parts, or by weakening the cohefion of the contlituent parts of the mafs by the excefs of the defect of moifture. Others look for the caufe of the comiagration in the atmofphere; and fuppofe, that fome of the
meteors there engendered in unufual quantities, and exploded with unufual vchemence, from the concurrence of various circumitances, may effect it, without feeking any further. The aftrolugers account for it from a conjunction of all the plancts in the fign Cancer; as the deluge, fay they, was occafioned by their conjunction in Capricorn. Laftly, others have recourfe to a fill more effectual and flaming machine, and conclude the world is to undergo its conflagration from the near approach of a comet in its return from the fun.

CONFLUENT, among phyficians, \&c. an appellation given to that kind of Smale-rox wherein the pultules run into each other.

CONFLUENTES (anc. geog), a place at the confluence of the Rhine and Mofelle, luppoled to be one of the 50 forts erected by Drufus on the Rhine, in Gallia Belgica: Now Coblentiv, a town of Triers. E. Long. 7. 15. Lat. 50. 30.

CONFORNATION, the particular confiflence and texture of the parts of any body, and their difpolition to compofe a whole.

Conformation, in medicine, that make and conftruction of the laman body which is peculiar to every individual. Hence, a mala conformatto fignifics fone fault in the firft rudiments; whercby a perfon comes into the world crooked, or with fome of the vifcera or cavities unduly framed or proportioned. Many are fubject to incurable althmas, from a too finall capacity of the thorax, and the like vitious conformations.

CONFORMITY, in the fehools, is the congruency, or relation of agreement between one thing ind another; as between the mealure and the thing incalured, the object and the underftanding, the thing and the divifion thereof, st.

CONFRONTATION, the act of bringing two perfons in prefence of each other, to difcover the truth of fome fact which they relate dificently.

The word is chicfly ufed in crininal matters; where the witnefles are confronted with the racculed, the accufed with one another, or the witnefles with one another.

CONFUCIUS, a Chinefe philofopher, who lived about 500 years before our Saviour's birth, in the kingdone of Lu, now called the province of Nantuns. His wit and judgment got him a reputation from his very youth; and being a mandarin, and employed in the government of the kingdom of Lu, his profound knowledge of morals and politics made him be greatly admired. Notwithlanding lis care, his prince's court was much difordered; and Confucius linding the king would not liften to lis advice, quitted the court, and taught moral philofophy with fuch applaufe that he foon liad above 3000 fcholars, where of 72 furpaffed the rett in learning and virtue, for whom the Cininefe have flill a particular veneration. He diviced his doctrine into four parts, and his fcholars into four claffes : the firlt order was of thofe who ltudied to acquire virtue; the 2d, thofe who learned the art of reafoning well; the 34 fludied the government of the thate and the duty of marillates; the 4 the were wholly taken up in noble difcoufes of all that concerned morals. In fpite of atl his pains to ettablith pure morality and religion, he was nevertheds the innocent caule of their corruption. It is fuid, that when

## $\mathrm{C} 0 \mathrm{~N} \quad[308] \quad \mathrm{C} \quad \mathrm{O} \quad \mathrm{N}$

Confulion. he was complimented upon the excellency of his philofophy, he replied, that he fell greatly flort of the perfect degree of virtue; but that in the welt the mont holy was to be foum. This made a ftrong inpreffion on the learned; and in the 66th year after Chrit's birth, the emperor Mon-ti fent ambafladors toward the weft to feek this holy man. They ftopped at an ifland near the Red Sea, and found a famous idol named Fohi, reprefenting a philofopher that lived 500 years before Confucius. They carried this idol back with them, with inftructions eoncerning the worfhip rendered to it ; and fo introdueed a fupertlition that abolifhed in feveral places the maxims of Confucius. His tomb is in the academy where he taught, near the town Xio-fu, upon the banks of the riere Xu . This phitofopher has been in great veneration in China above 2000 years; and is fill io etteemed, that each town has a palace confecrated to his memory. There was one of his defeendants who was very confiderable in the kingdom in 16 46 , whom Xanchi king of Tartary, who then conquered China, received with a great deal of honour. All thofe of his fanily are mandarins by birth; and have a privilege common with the princes of the blood, not to pay any tribute.

CONFUSION, in a general lenfe, is oppoied to order, in a perturbation whereof confufion conilits; c. gr. when things prior in nature do not precede, or pofterior do not fullow, \&.c.

In a logical fenfe, confuion is oppofed to diftinctnefs or perfpienity; and may happen either in words, as when mifcontrived or mifapplied; or in ideas, as when the idea of any thing prefents fomething along with it, which dues not properly belong to that thing. See Idea and Notion.

In a phyfical fenfe, confufion is a fort of union or mixture by mere contiguity. Such is that between Ruids of contrany nature, as oil and vinegar, \& c .

Confusion, in Seots law, is a, method of fufpend. ing and extinguifhing obligations. See Law, Part III. $\mathrm{N}^{\circ} \mathrm{clxxvi} .8$.

Covsuston of Tongues, in the hiftory of mankind, is a memorable event, which happened in the one hundred and firft year aceording to the Hebrew chronology, and the four hundred and firft year by the Samaritan, after the flood, at the overthrow of Babel; and which was providentially brought about in order to facilitate the difperfion of mankind and the population of the earth. Until this period there had been one common language, which formed a bond of union that prevented the feparation of mankind into diffinct nations; and fome have fuppofed, that the tower of Babel was erected as a kind of fortrefs, by which the people intended to defend themfelves againft that feparation which Noah had projected.

There has been a confiderable difference of opinion as to the nature of this confufion, and the manner in which it was effected Some learned men, prepoffeffed with the motion that all the different idioms now in the world did at firt arife from one original language to which they may be reduced, and that the varicty among them is no more than mult naturally have happened in a long courfe of time by the mere feparation of the builders of Babel, have maintained, that there were no new languages formed at the confution; but that this event was accomplifhed by creating a mifun-
dertanding and variance among the builders without Coffifion. any immediate infuence on their language. But this opinion, advaneed by Le Clerc, \&c. feems to be directly contrary to the obvious meaning of the woid -sw", Bapha, "lip," ufed by the facred hiltorian. Others have imagined, that this was brought about by a temporary confution of their \{peceh, or rather of their apprelentions, canfing them, whilf they continued together and fpoke the fame language, to underfand the words differently. Scaliger is of this opinion. Others, again, account for this event by the privation. of all language, and by fuppofing that mankind were under a neceffity of affuciating together, and of impofing new names on things by common confent. Another opinion afcribes the confufion to fuch an inditinct remembrance of the original language which they fooke before, as made them fpcak it very differently; fo that by the various inflections, terminations, and pronunciations of divers dialects, they could no more underftand one another, than they who underfland Latin ean undertand thofe who fpeak French, Italian, or Spanif, though all thefe languages arife out of it. This opinion is adopted by Caufabon, and by Bihop Patrick in his Commentary in loc. and is cettainly much more protable than either of the former. And Mr Shuckford maintains, that the eonfufion arofe fron fmall beginnings, by che invention of new words in either of the three fanilies of Shem, Han, and Japhet, which might contribute to feparate them from one another; and that in each family new differences of fpeech might gradually arife, fo that each of thefe families went on to divide and fubdivide among themfelves. Others, again, as Mr Jof. Mede and Dr Wotton, \&e. not fatishied with either of the foregoing methods of accounting for the diverfity of languages among man. kind, have recourfe to an extraordinary interpoftion of divine power, by which new languages were framed and communieated to different families by a fupernatural infufion or infpiration; which languages have been the roots and originals from which the feveral dialects that are, or have been, or will be fooken, as long as this earth fhall latt, have anifen, and to which they may with eafe be reduced. As to the number of languages thus introduced, many opinions have been adopted. If there were no more than there were nations or heads of nations, then the number would be feven for Japhet, four for Ham, and tive for Shem; but if there were as many as there were families, which is the more probable opinion, their number eannot be certainly affigned. However, the Hebrews fancy they were 70 , becaufe the defcendents from the fons of Noah, enumerated Genelis $x$. were jult fo many. Allowing, then, the languages of the chief families to have been fundamentally different from eaeh other, the fub-languages and dialects within each branch would probably have had a muxual affinity, greater or lefs $2 s$ they fettled nearer or farther from eaeh other. But whichfoever of thefe hypothefes is adopted, the primary object of the confufion at Babel was the feparation and difperfion of mankind.
Dr Bryan:, in the third volune of his Analyfis of Ancient Mythology, has advaneed a fingular hypothefis, both with refpect to the confution of tongues and the difperfion. He fuppofes that the confufion of language was local and partial, and limited to Babel only.

Confut tion 1 Congetation.

By עnk ha, Gen. xi. I. and 8. which our tranfators render the whole earth, he underfindsevery region: and by the fame words in ver. g. the rebole region or province. This confufion was occafioned, as he fuppofes, by a labial failure; fo that the people could not articulate. Thus their \{peech was confonnded, but not altered; for, as foon as they feparated, they recovered their trne tenor of pronunciation, and the language of the earth continued for fome ages nearly the fame. The interviews between the iitboews and other nations, recorded in Scripture, wete conducted without an interpreter; and he farther obferves, that the varions languages which fubfitt at this day retain fufficient relation to khow, that they were once dialects from the fame matrix, and that their variety was the effect of time. See Dispersion.

CONFUTATION, in rhetoric, \&c. a part of an oration, wherein the orator feconds his own arguments and Atrengthens his caule, by refelling and deftroy. ing the oppofite arguments of the antagonit. 'This is done by denying what is apparently falle, by detecting fome flaw in the reafoning of the adverfe party, by granting their argument, and howing its invatidity, or retorting it upon the advetfary.

CONGE, in the French law, a licence, or permiffion, granted by a fuperior to an inferior, which gives him a difpenfation from fome duty to which he was before obliged. A woman cannot obligate herfelf writhout the conge or licence of her humand; a monk cannot go out of his convent, without the corge of his fuperiors.

Conge' de lire, in ecelefialtical policy, the king's permiffon royal to a dean and chapter in the time of a vacancy, to choofe a bithop; or to an abbey, or priory, of his own foundation, to choofe their abbut or prior.

The king of England, as fovereign patron of all archbifhoprics, bithoprics, and other ecclefialtical benefices, had of ancient time free appointment of all ecclefiaftical dignities, whenfoever they chanced to be void; invelling them firf per bucctum $\delta$ annulum, and afterwards by his letters-patent; and in courfe of time he made the election over to others, under certain forms and limitations, as that they fhould at every vacation, before they choole, demand the king's congé de lire, and after the election crave his royal affernt, Eic.

Conge', in architecture, a mould in form of a quarter round, or a cavetto, which ferves to feparate two members from onee another; fuch as that which joins the fhaft of the column to the cincture, called alfo apopbyge.

Conges are alfo rings or ferrels formerly ufed in the extremities of wooden fillars, to keep them from fplitting, afterwards imitated in fone-work.

CONGELATION, fignifies the paffing of any body from a finid to a folid ftate: fo that the term is thus applicable to metals when they refume their folid form after being heated, to water when it freezes, having been rendered lluid by heat; and in general to all proceffes, where the whole fubftance of the fluid is converted into a folid: but it differs from cryftalliza- tion; becaufe in the latter procefs, though the falt gafles from a fluid to a Cclid ftate, a confiderable
quantity of liquid is always left, fo that the term congelation is never applied in this cafc.

The procefs of congelation in all cafes depends upon, or at leak is accompanied with, the emifion of heat, as has been evinced by experiments made not only in water, bat on fpermaceti, wax, \&e. for in all of thefe, tho' the thermoneter umerfed in them while fluid continurd to defcend graduaily till a certain period, yet it ls alrvays was as conllantly obferved to remain \{ationary, or even atended to afeend while the congelation went ons. The princi- with an en ple on which the phenomenon depends is thus afcertain-heat. ed; but why this heat thoull be emitted, is a quellion which has not ytt been thoroughly inveltigated. Some conjectures relative to this are indeed mentioned in the article Chemrstry, when treating of elementary fire, though experiments are fill to be wifhed for on the fubject.

It is net known whether all kinds of fuids are naturally capable of congelation or not ; though we are certain that there are very great differences among them in this refpect. The molt difficult of all thofe of Cungelawhich the congetation has been actually afcertained istion of quickfliver. 'This was long thought capable of refitt-quickfilver. ing any degree of cold whatever; and it is only within a few years that its congelation by artilicial means was known, and itill more lately that fome chimates were found to be fo fevere as to congeal this fluid by the cold of the atmofpliere.

The congetation of quickfilver was firlt afcertained by ExperiM. Jofeph Adam Braun proteffor of philofophy at Pe- ments of terflu-g. He lad been employed in making thermome- Mr Braun. trical experiments, not with a view to make the difcovery he actually did, but to fee how many degrees of cold he could produce. All excellent opportunity for this oc. curred on the 1 qth of December 1759, when the mercury flood naturally at -34 , which is now known to be only live or fix degrees above its point of congclation. Mr Braun, having determined to avail himfelf of this great degree of natural cold, prepared a freezing mixture of aquafortis and pounded ice, by means of which his thermometer was reduced to - 69 . Part of the gnickfilver had now really congealed; yet fo far was M. Braun from entertaining any fufpicion of the truth, that he had aimot deifled from further attempts, being fatisfied with having for far exceeded all the philofophers who went before him. Animated, however, by the hopes of producing a itill greater degree of cold, he renewed the experiment; but having expended all his pounded ice, he was obliged to fubfitute fnow in its place. With this frefh mixture the mercury funk to $-100,240$, and $352^{\circ}$. He then fuppofed that the thermometer was broken; but on taking it out to obferve whether it was fo or not, he found the quickfilver fixed, and continuing fo for 12 minntes. On repeating the fame experiment with another thermometer which had been graduated no.lower than -220, all the mercury funk into the ball, and became folid as before, not beginning to reafcend till after a ftill longer interval of time. Hence the profed. for concluded that the quickfilver was really frozen, and prepared for making a decifive experiment. 'This was accomplifhed on the 25 th of the fame month, and the bulb of the thermometer broken as foon as the metal was congealed. The mercury was now convert -

## C O N [ 3ro $1 \quad$ C O N

Conzela- ed into a folid and fhining metallic mafs, which extendtion. ed under the flrokes of a peflle, in hardnefs rather inferior to lead, and yielding a dull found like that metal. Profefor 庣pinus made fimilar experiments at the fame time, employing both thermometers and tubes of a larger bore ; in which laft he remarked, that the quickfilver fell fenfibly on being frozen, affuming a concave farface, and likewife that the congealed pieces funk in fluid mercury.

The fact being thus eftablifhed, and fuidity no longer to be confidered as an cffential property of quickfilver, Mr Braun communicated an accourt of his experiments to the Peterhurg Academy, on the 6th of September 1760; of which a large extract was inferted in the Philofophical 'Tranfactions, vol. hii. p. 156. Five years afterwards he publifhed another treatife on the fame fubject, under the title of Supplements to his former differtation. In thefe he declared, that, fince his former publication, he had never fuffered any winter to elapfe withont repeating the experiment of congealing quickfliver, and never failed of fuccefs when the natural cold was of a fufficient Atrength for the purpofe. This degree of natural cold he fuppofes to be -: 0 of Fahrenheit, though fome conmencement of the congelation might be perceived when the temperature of the air was as high as +2 . The refults of all his experiments were, that with the abovementioned frigorific mixtures, and once with rectified fpirits and fnow, when the natural cold was at $-28^{\circ}$, he congcaied the quickfilver, and difcovered that it is a real metal which melts with a very fmall degree of heat. Not perceising, however, the neceffary confequence of its great contraction in freezing, he, in this work, as well as in the former, confounded its point of congelation with that of its greatelt contraction in freczing, and thus marked the former a great deal too low ; though the point of congelation was very uncertain according to him, various difficulties having occurred to his attempts of finding the greateft point of contraction while freering.
of ${ }^{\frac{k}{2}}$ Blu- The experiments of M. Braun were not repeated menbach. by any perfon till the ycar :774, when lifr John Frederic Blumenbach, then a Aludent of phytic at Gottingen, perforned them to nore advantage than it appears Mi. Braun had ever done. He was encouraged to make the attempt by the exceffive cold of the winter that year. "I put (fays lic), at five in the evening of January it th, three drachms of quickfilver into a mall fugar-glafs, and covered it with a mixture of frow and Egyptian fal-ammoniac. This mixture was put loofe into the glafs, fo that the quickfilver lay perfectly free, being only covered with it as by pieces of ice: the whole, together with the glafs, weighed fomewhat above an ounce. It was lumg out at a window in fuch a pofition as to expofe it freely to the northeft ; and two drachms more of fal-ammoniac mixed with the fnow on whicla it tood. The frow and fal-ammoniac, in the open air, foon froze into a mafs like ice: no fenfle change, however, appeared in the quickfilver that evening; but at one in the morning it was found frozen folid. It had divided into two large and four finatler pieces: one of the former was hemifpherical, the otler cylindrical, each feemingly rather above a drachm in weight; the four fnall bits might amount to haif a feruple. They were all with their flat bede frozen hard to the glafs, and no
where immediately touched by the mixture ; their colour was a dull pale white with a bluifh caft, like pine, very different from the natural appearance of quickfilver. Next morning about feven o'clock I found that the larger hemifphere began to melt, perhaps becaufe it was moft expofed to the air, and not fo near as the others to the fal-ammoniac mixture which lay beneath. In this flate it refembled an amalgam, finking to that fide on which the glafs was inclined; but without quitting the farface of the glafs, to which it was yet firmly congealed: the five other pieces had not yet undergone any alteration, but remained frozen hard. Toward eight o'clock the cylindrical piece began to foften in the fame manner, and the other four foon followed. About eight they fell from the furface of the glafs, and divided into many flaid flining globules, which were foon lof in the interfcices of the frozen mixture, and reunited in part at the bottom, being now exactly like common quicklilver." At the time this experiment was made, the thermometer ftood at - $10^{\circ}$ in the open air.
The circumftances attending this experiment are fill Renarks unaccountable; for, in the firft place, the natural cold on this exwas fearcely fufficient, along with that of the artificial periment. mixture, which produces $32^{\circ}$ more, to have congealed the quickfilver; which yet appears to have been very effectually done by the length of time it continued folid. 2. It is not eafy to account for the length of tine required for congealing the quickfilver in this experiment, fince other frigorific mixtures begin to act almoft immediately; and, 3. There was not at laft even the alpzarance of action, which confifts in a folution of the fnow, and not in its freezing into a mafs. "The whole experiment (fays Dr Blagden*) remains involved in fuch obfcurity, that fone perfons have fuppofed the quickfilver itfelf was not frozen, but only covered over with ice; to which opinion, however, there are great objections. It is worthy of remark, that Gottingen, though fituated in the fame latitude as London, and enjoying a temperate climate in general, becomes fubject at times to a great feverity of cold. This of 1th of January 1774 is one inflance: I find others there where the thermometer funk to - $12^{\circ},-16^{\circ}$, or $-19^{\circ}$; and at Cattlenburg, a funall town about two German miles diftant, to - $30^{\circ}$. By watching fuch extraordinary occations, experiments on the freezing of quick filver might eafly be performed in many places, where the polibility of them is at prefent little fufpected. The cold obferved at Glafgous in 1780 would have been fully fufticient for that purpofe."

In confequence of the publication of Mr Braun's Experiments, the Royal Suciety defired their late-feerctary Dr Maty to make the neceffary application to the Iludion's Bay company, in order to repeat the experiment in that conntry.' Mr Hutchins, who was Experithen at London, and going out with a commilfon as ments of governor of Albany Fort, offered to undertake the ex- Mr Hutperiments, and executed them very completely, freezing ${ }_{\text {Bicker, }}^{\text {chins }}$ de quickfilver twice in the months of January and February 1775. The account of his fuceefs was read before the Royal Society at the commencement of the feverett winter that had been known for many years in Europe; and at this time the experiment was repeated by two gentlemen of different countries. One was Dr Lambert Bicker, fecretary to the liatavian fociety at Rotterdain; who on the 28 ch of Jaunary $17 / 6$, at
point to the fame degree, provided it has been made and graduated with aceuracy."

The apparatus recommended by Mr Cavendifh, and which M: Hutchins made ufe of, confitted of a findll mercurial thermometer, the bulb of wheh reaehed about $2 \frac{1}{1}$ inehes below the feale, and was inciofed in mended by a glafs eylinder fuclled at the botum into a ball, which Mr Cavenwhen ufed was filled with quickfleer, fo that the bulb of the thermometer was entirely covered with it. If this eylinder be im nerled in a freezing mixture till great part of the quickfilver in it is frozen, it is evident that the degree fhown at that time by the inelofed tiermameter is the precite point at which mercury freezes; for as in this cafe the ball of the thermometer mult be furrounded for fome time with quicklifver, part of which is actually frozen, it feems impuffible that the thermometer flould be fenfibly above that point ; and whale any of the quickfilver in the cylinder remains fluid, it is impofible that it fhould fink fenfibly below it. The diameter of the bullb of the thermoncter was rather lefs than a quarier of an inch, that of the fwelled part of the eylinder two-thirds; and as it was eafy to keep the thermometer conftantly in the middle of the cylinder, the thicknefs of quiekfilver betwixt it and the glafs eould never be much lef than the fixth part of an inch. The bulb of the thermometer was purpofely made as fimall as it conveniently cond, in order to leave a fufficient face between it and the cylinder, without making the fwelled part larger than neceflary, which would have caufed more difficulty in freezing the mercury in it.

The firlt experiment with this apparatus was made on the 15 th of December 178 I; the thermumeter had fcounts Hood the evening before at $-18^{\circ}$. A bottle of fpiri-perimenss. tus nitri fortis was put on the houfe-top, in order to cool it to the fame temperature. The thermometers made ufe of had been hung up in the open air for thiree weeks, to compare their feales. On the morn. ing of the experiment they were about $23^{\circ}$ below o.-In making it, the thermometer of the apparatus was fufpended in the buib of the cylinder by means of fome red worfted wound about the upper part of its Aten, to a fufficient thicknefs, to fill the upper part of its orifice; and a fpace of near hallf an inch was left empty between the quichilver and worlted.

The apparatus was placed in the open air, on the top of the fort, with only a few deer kins fewed to gether for a fhelecr; the fnow lay 18 inches deep on the works, and the apparatus was tuck into the fnow, in order to bring it the fooner to the temperature of the air. The inltruments were aftewards placed in three frefl freezing mixtures, in hopes of being able by their means to produce a greater degree of cold, but without cffect; nor was any greater cold produced hy adding more fpirit of nitre. The mereury, however, was very completely frozen, that in thie thermoncter defcendiug to $448^{\circ}$. On plunging the mer. cury into the freezing mixture, it defeended in le's than one minute to 40 helow 0 .
The fecond experinent was made the day following; and the fame quantity of quickfilver emploved that lad been ufed in the former. As too inall a quantity of the freczing mixture, however, had been originally made, it was neceflary to add mose during

Congela$\xrightarrow{\text { tion. - }}$ 10 :if.
"Provide a few wide and fhurt tubes of thin. glafs, fealed at one end and open at the other; the widenefs of thefe tubes may the from lalf to three quaters of an inch, and the length of them about three inches. Put an ineh or an inch and a half depth of mencury Put an ineh or an inch and a half depth of mencury
into one of thefe tubes, and phunging the bulb of the thermometer into the mereury, fet the tube with the mercury and the thermometer in it into a freezing mismercury and the thermometer in it into a freezing mixmon tumbler or water-glals: and, $N$. $\mathcal{H}$. in making a
freezing mixture with fnow and firit of nitre, the mon tumbler or water-gla!s: and, $N$. $\mathcal{B}$. in making a
freezing mixture with fnow and firit of nitre, the quantity of the acid fould never be fo great as to difquatity of the acid hould never be fo great as to dif-
folve the whole of the fnow, but only cnough to reduce it to the confiftence of panada. When the mercury in the wide tube is thes fet in the fieemercury in the wide tube is thus let in the free-
zing nixture, it muft be ftired gently and frequently with the bulb of the thermometer; and if the cold be fufficiemty floone, it will congeal by becoming cold be fuffieienty fiong, it wit congeal by becoming
thick and bronfy like an amalgam. As foon as this is obferved, the thermumeter fhould be examined without lifting it out of the congealing mercury; and I have no doubt that in every experiment thus made, with the fame mercury, the intrument will always
Congeia- eight in the morning, made an experiment to try how low he could bring the thermometer by artificial cold, the temperature of the atmofphere being then +2 . Hc could not, however, bring it lower than -94 , at which point it flood immoveable; and on breaking the thermometer, part of the quickfilver was found to have loft its fluidity, and was thiekened to the confiltence of an amalgam. It fell out of the tube in little bits, which bore to be flattened by preffure, without running into globules like the inner fluid part. The experiment was repeated next day, when the thermometer llood at $+8^{\circ}$, but the mercury would not then defeend below- $80^{\circ}$; and as the thermometer was nat broken, it could not be known whether the mereury had congealed or not. All that could be inferred from thefe experiments therefore was, that the congealing point of mercury was not below -94 of Fahronkeit's thermometer. The other who attempted the congelation of this 月luid was the late Dr Anthony Fothergill ; but it could not be detemined whether he fucceeded or not. An account of his experiment is inferted in the Philofophical Tranfactiuns, Vol. 1 xii.
